Cerro Gordo, a celebrated battle-field and mountain-pass in Mexico, through which the National road from Vera Cruz to the city of Mexico passes. Here Gen. Scott defeated a greatly superior force of Mexicans under Santa Anna, April 18, 1847. Following up his success at Vera Cruz, Scott's army had arrived at Plan del Rio, a small plain 50 miles from Vera Cruz, when intelligence reached him that the pass of Cerro Gordo had been fortified by Santa Anna. The level ground terminates at Plan del Rio, from which the road ascends in a long circuit among lofty hills, whose commanding points had been fortified by the enemy. His right rested on a precipice overhanging an impassable ravine, his entrenchments extending to the road, on which was placed a battery. On the other side the lofty and difficult height of Cerro Gordo commanded the approaches in all directions. Half a mile to the rear of this height the Mexican army, numbering upwards of 13,000, with five pieces of artillery, were encamped. Resolving to attempt to turn the enemy's left and attack in rear while threatening his front, Scott caused daily reconnoissances to be made in the hope of finding a route by which to reach the Jalapa road and cut off the retreat of the Mexicans. A road was made through difficult slopes and over chasms, which was only abandoned when a further prosecution of the work would have brought on an action. Scott now determined to gain the Jalapa road by assaulting and carrying the height of Cerro Gordo, and on the night of April 17 issued his plan of battle, which provided for the attack in front of the enemy's whole line of intrenchments, at the same time turning them. At an early hour on the morning of the 18th, Twiggs' (second) division of regulars, already far advanced towards the enemy's left, was to move before daylight and take up position across the National road in the enemy's rear, to cut off retreat towards Jalapa; reinforcements were also provided for for Twiggs; Worth's (first) division to follow at sunrise; Pillow's brigade to march at 6 A. M. along an already carefully reconnoitred road, and hold itself in readiness as soon as the attack on our right commenced to pierce the enemy's line of batteries at a point to be selected by him, and once in the rear of that line to attack the enemy in reverse, or pursue with vigor if the enemy abandoned their line. The cavalry to be held in reserve, also Wall's battery; and, looking to the success of the movement, a vigorous pursuit of the enemy was to be continued until stopped by darkness or fortifications.

This plan of attack was successfully executed. Twiggs was reinforced during the night by Shields' brigade, consisting of one New York and two Illinois regiments. In selecting their ground for bivouacking and an opposing height for a battery, a sharp combat took place, but the height was occupied and a battery of three 24-pounders placed thereon. During the night an 8-inch howitzer was with great difficulty and labor placed opposite the enemy's right battery.

Early on the 18th the general attack commenced. Pillow's brigade twice assaulted the enemy's line of batteries on the left; but, though unsuccessful, they served to distract their opponents: Twiggs' division, storming the strong and vital point of Cerro Gordo, pierced the centre, gained command of all the intrenchments, and cut them off from support; Riley's brigade of infantry pushed on against the main body of the enemy, and the guns of their own fort being turned on them, they fled in confusion; Shields' brigade bravely assaulted the left, carried the rear battery of five guns on the Jalapa road, and rendered important aid in completing the rout of the enemy. At an early part of the engagement Gen. Shields received a severe but not fatal wound, being shot through the lungs. The moment the fate of the day was decided the reserve forces were pushed on towards Jalapa in advance of the pursuing columns of Twiggs' division and Shields' brigade (the latter now under Col. E. D. Baker), and Gen. Patterson was sent to take command. The rout was complete; 3000 prisoners were taken, 4000 or 5000 stand of arms, and 43 pieces of artillery. Our loss in the two days was 431, of whom 63 were killed. The immediate results of this important battle were the occupation of Jalapa the next day, the abandonment of the works and artillery at La Hoya, and the occupation by Worth's division of the castle and town of Perote, with fifty-four guns and immense supplies of ammunition.

Cer'ro Gor'do de Potosi', a famous mountain of Bolivia, is immediately S. W. of Potosí. It contains rich silver-mines. Altitude, 16,150 feet.

Certal'do, a town of Italy, in the province of Florence, is picturesquely situated on the Elsa, 18 miles S. W. of Florence. It was the birthplace of Boccaccio, whose house is still preserved. Pop. 6562.

Certi'ficate [from the Lat. *certus*, "certain," and *facio*, to "make"], in law. (1) A writing made by a court, or signed by a judge or officer, giving notice of the existence of certain facts. A certificate of a judge is frequently resorted to for the purpose of determining the amount of costs to be recovered in an action, as, for example, to state whether the title to real property came in question at a trial. (2) A writing issued by any one, though not a judge or officer of court, having the means of knowledge, stating certain facts, such as a "certificate of registry" by custom-house officers setting forth the national character of a ship. Certificates of various kinds became of much importance under the recent stamp acts of Congress, stamps being imposed upon them by law. (See the stamp laws *passim*.)

Certiora'ri [Lat. "to be made more certain"], a writ issued from a supreme court to an inferior court or a special body having judicial powers, such as commissioners, magistrates, assessors of taxes, etc., acting in a summary manner or in a method different from the common law. Its object is to review the proceedings of the inferior court or tribunal, or to remove them before trial and judgment, and it is applicable either to civil or criminal cases. When used as a means of review of an actual decision or determination made by the inferior tribunal, its office is to correct errors made in point of law, rather than to reconsider the subject on matters of fact. Thus, if a board of assessors of taxes should decide that a bank could be taxed under State au-

* This metal takes its name from the planet Ceres, following the analogy of the names Mercury, Palladium, etc. Old writers speak of gold as "Sol," the Latin for "Sun," silver as "Luna," the "Moon." Copper was called Venus; lead, Saturn; tin, Jupiter; and iron, Mars. These terms were used by the alchemists, and seem to have had some reference to astrology.

thority upon that portion of its property which is invested in the bonds of the U. S. government, it would decide a point of law which might, by means of a writ of *certiorari*, be submitted to the various State courts, and finally to the Supreme Court of the U. S. This writ may also be resorted to for the purpose of supplying any defects in the return of its proceedings by the inferior tribunal to the superior court. It may be considered in this aspect as auxiliary to the main purpose of removing the record itself.

Certo'sa di Pavi'a, La, a celebrated monastery near Pavía, in Italy, in the province of Pavía, in the Gothic style, was founded in 1396 by Visconti, the first duke of Milan. Here is a magnificent church 235 feet long, adorned with fine paintings, sculptures, and mosaics.

Ceru'men [from the Lat. *cera*, "wax"], a Latin term denoting the yellow waxy matter secreted by certain glands lying in the passage that leads from the external opening of the ear to the membrane of the tympanum. It possesses a peculiarly bitter taste, and physiologists have believed that in consequence of this property it prevents insects from entering the auditory canal.

Ce'ruse [Lat. *cerussa*], a name of white lead, which is a carbonate of lead, and is extensively used by house-painters, who mix it with linseed oil. It has been employed by ladies as a cosmetic.

Ce'rusite, or **Cerussite,** native carbonate of lead, occurs in fibrous, compact, and earthy masses, and in numerous crystalline forms which may be referred to a right rhombic prism. When pure, it consists of 16.42 per cent. of carbonic acid and 83.58 of oxide of lead, or 77 per cent. of metallic lead. When perfectly pure, it is colorless and transparent, with an adamantine lustre, which is resinous on fractured surfaces. Next to galena, cerusite is the most common ore of lead.

Cerut'ti (Giuseppe Antonio), an Italian Jesuit, born June 13, 1738. His principal work is an "Apology for the Order of Jesuits." He was a friend of Mirabeau, whom he assisted in some of his works. Died Feb. 2, 1792.

Cervan'tes Saave'dra, de (Miguel), a celebrated Spanish author, born at Alcalá de Henares Oct. 9, 1547. He was educated in the universities of Salamanca and Madrid. He enlisted about 1570 in the papal army, and was wounded at the famous naval battle of Lepanto in 1571. Having been captured by the Algerines about 1575, he was detained in slavery at Algiers and endured great sufferings. He was ransomed in 1580, returned to Spain, and served several campaigns in the Spanish army. In 1584 he produced "Galatea," a pastoral romance; the same year he married Catalina de Palacios Salazar y Vozmediano. He afterwards wrote numerous dramas, among which was a tragedy called "Numancia." Some of these were performed with success, but they did not enrich him, and he continued to suffer from poverty. He resided at Seville between 1588 and 1600. His celebrity is founded on a satirical work called "Don Quixote de la Mancha," which was designed to correct the taste of his countrymen, who delighted in the extravagant romances of chivalry. The first part of "Don Quixote" appeared in 1605, and obtained immediate and immense popularity. The second part was published in 1615. Cervantes resided at Madrid from 1605 until his death. Among his other works are his "Novelas Exemplares" ("Moral Tales," 1613), and a poem entitled "Viaje al Parnaso" ("Journey to Parnassus," 1614), which is greatly admired. He died on the same day as Shakspeare, April 23, 1616.

"'Don Quixote,'" says Hallam, "is the only book in the Spanish language which can now be said to possess much of a European reputation. It is to Europe in general what Ariosto is to Italy and Shakspeare to England. Numerous translations, and countless editions of them, in every language, bespeak its adaptation to mankind; and no critic has been found paradoxical enough to withhold his admiration. . . . Few books of moral philosophy display so deep an insight into the mechanism of the mind as 'Don Quixote.' And when we look also at the fertility of invention, the general probability of events, and the great simplicity of the story, we shall think Cervantes fully deserving of the glory that attends this monument of his genius." (*Introduction to the Literature of Europe.*) (See T. Roscoe, "Life and Writings of Cervantes," 1839; Lockhart, "Life of Cervantes," 1822; Pellicer, "Vida de Cervantes," 1800; Ticknor, "History of Spanish Literature," vol. ii.; A. Nisard, "Revue Francaise VII.," 1838.)

Cer'via, a town of Italy, in the province of Ravenna, on the Adriatic, 12 miles S. S. E. of Ravenna. It has a cathedral and several convents; also salt-works, from which about 50,000 tons of salt are annually obtained. Pop. 5820.

Cer'vidæ [from *cervus*, a "deer"], a family of animals of which the deer is the type.

Cervin, Mont [Ger. *Matterhorn*], a sublime peak of the Pennine Alps, is on the frontier between Piedmont and Switzerland, and 12 miles W. N. W. of Monte Rosa. It has an altitude of 14,825 feet above the level of the sea. The part which is above the height of 11,000 feet is almost inaccessibly steep, and is described as an obelisk of naked rock. The pass of Mont Cervin is practicable in summer for horses and mules at an elevation of 10,938 feet.

Cesalpi'no, often Anglicized as **Cæsal'pin** (Andrea), an eminent Italian physiologist and botanist, born at Arezzo, in Tuscany, in 1519. He was professor of medicine and botany at Pisa, and became about 1595 physician to Pope Clement VIII. He wrote several medical treatises, among which is "Ars Medica" (1601), and an important work "On Plants" ("De Plantis," 1583), in which he propounded an improved system of botany. He was the first who proposed a natural system of classification on philosophical principles. Died Feb. 23, 1603. (See Fuchs, "Andreas Cæsalpinus," etc., 1798.)

Ce'sar Creek, a township of Dearborn co., Ind. Pop. 556.

Ces'ari (Giuseppe), an Italian painter, sometimes called Il Cavaliere d'Arpino and Giuseppino (Fr. *Le Joséphin*), was born at Arpino or Rome about 1565. He worked mostly in Rome, was patronized by several popes, and was very successful and popular. He was the chief of the conventional school, opposed by the naturalists, the Caracci, Caravaggio, and their scholars. His works display much skill in execution, but are deficient in simplicity. Died in 1640.

Cese'na, a town of Italy, in the province of Forlì, and on the railway between Bologna and Ancona, 18 miles by rail S. E. of Forlì. It is situated on the slope of a hill which is close to the river Savio. It has a cathedral; a Capuchin church, in which is a fine painting by Guercino; a library founded in 1452; and several convents. It has sulphur-mines in the vicinity. Pop. 7777.

Cesenat'ico, a seaport-town of Italy, in the province of Forlì, on the Adriatic, 8 miles E. N. E. of Cesena. It is partly enclosed by walls. Pop. 5725.

Cesnola, di (Luigi Palma), Count, was born near Turin July 29, 1832. He belongs to an old family; his uncle, Count Alarino Palma, who was distinguished in the Italian revolution of 1821, fought for Greek independence, was president of the tribunal at Missolonghi, and a judge of the supreme court at Athens. Di Cesnola graduated at the Italian Royal Military Academy, after having fought in the war of Italian independence, and was afterwards on the staff of General Ansaldi in the Crimea. In 1860 he came to America, and after the battle of Bull Run in 1861 he entered the volunteer service, and was made colonel of the Fourth New York Cavalry. "His regiment entered the service 1200 strong, received 800 recruits, and returned at the close of its term 190 men. Di Cesnola distinguished himself upon many occasions, especially at Perryville, Brandy Station, and Aldie. At the last-named battle his gallantry so impressed Major-General Kilpatrick that he presented him his own sword upon the field. That day he led five charges, and at the last his horse was shot under him; he was wounded, and fell into the hands of the enemy. He was confined many months in Libby Prison, where he acted as military instructor to his fellow-prisoners. He was specially exchanged upon the unanimous request of the officers of his regiment, and was thus enabled to take part in the closing scenes of the war. The war over, he was brevetted brigadier-general, became an American citizen, and received the appointment of consul at Cyprus, where he made a successful resistance to Turkish tyranny. In 1869 he took sides with Greece against Turkey, and in the absence from Cyprus of the Greek consul he acted for him with great tact and discretion, closing in three days the civil and criminal affairs of 300 Hellenic subjects and issuing passports to 500. The Greek population of the island showed the liveliest appreciation of his services, and the president of the Greek cabinet, M. Boulgaris, tendered him the chief command of the Greek cavalry in the event of a war with Turkey."

Such were the distinguished antecedents of Di Cesnola when he began those explorations which have made his name famous wherever the serious art and the scientific investigation of the sources of history are held in honor. Instead of resting in ease in his quiet consular post, his active mind and body sought occupation, and soon found it in the task of exploring the soil of Larnica, a seaport of the island of Cyprus, and long reputed the site of the ancient Citium. Upon reaching Cyprus, Di Cesnola had heard of the great bronze tazza recently discovered at Amathunta, and presented by Napoleon III. to the Louvre. He at once began his researches among tombs that had been opened years before, and was rewarded with

the discovery of many terra-cottas. Besides many statuettes of the crowned Venus, he found a number of little figures bearing plain marks of Assyrian, Egyptian, and Phœnician influences, such indeed as the varying history of the island might have led him to expect to come across; and he now pushed on his diggings eagerly, seeing that the result of them must surely be to throw new light upon the ethnography, history, religion, and art of the East. His excavations were not confined to Larnica. He soon discovered the necropolis of the ancient Idalium, and in these tombs made discoveries of marbles, coins, bronzes, engraved gems, and objects in gold, with hundreds and hundreds of terra-cottas. The mere catalogue of these things would take up many pages of this book; and it does not need to be said that the report of discoveries so important to the historian, the archæologist, and the artist roused an enthusiasm among the learned and cultivated classes everywhere such as has not been known since the discovery of Herculaneum or the later finding of Nineveh.

Di Cesnola kept on his plodding work with high hopes and quiet zeal, and soon made his crowning discovery of the necropolis and temple of ancient Golgos—a discovery made under the very noses of the French archæologists, the count de Vogüé, Mas-Latrie, and others, who had spent several hundred thousand francs in searching for the temple of Venus, but had only succeeded in defining the site of the ancient city, now occupied in part by the village of Athieno. In the temple of Venus, which had been thrown down, were found buried in the ruins a thousand statues, and no less than thirty-four inscriptions in the Cypriote language—a most important addition to our means of studying this tongue, since, according to the duc de Luynes in his "Numismatique et Inscriptiones Cypriotes," Paris, 1852, there existed only three Cypriote inscriptions, and they were not deciphered. It is impossible to state exactly the number of articles brought away from Cyprus by Di Cesnola, and included in the now famous collection known over the civilized world by his name. In Aug., 1870, when the representative of the Russian Imperial Museum examined it, there were about 13,000 pieces, comprising statues and small figures, 1800 lamps, 5000 vases, 2000 coins, 600 gold ornaments, 1700 pieces of glass, 300 pieces of bronze, and 100 inscriptions.

The collection was coveted by every country in Europe; but though Di Cesnola was ready to sell it to any purchaser who would keep it together and call it by his name, the "Di Cesnola Collection of Cypriote Antiquities," yet he desired above all things that it should belong to America—a country to which he was bound by the name of citizen and by tenderest domestic ties. For a long time it seemed most probable that the British Museum would become the purchaser, but as the authorities refused to comply with Di Cesnola's conditions, efforts were made to secure it for America. Mr. Hiram Hitchcock, who had been with Di Cesnola in Cyprus, and who warmly desired to see the collection lodged in some institution of America, prepared an admirably complete and interesting account of Di Cesnola and his discoveries, which he first delivered as a lecture in several places, notably in New York before an audience invited by the trustees of the Metropolitan Museum of Fine Art, and also before the students of Dartmouth College. This lecture was afterwards printed in "Harper's Monthly Magazine" for July, 1872, with many effective illustrations. To Mr. Hitchcock, more than to any other American, is due the wide interest excited in our country by Di Cesnola's discoveries. Another American, Mr. W. T. Blodgett, being in London while the British Museum was debating the purchase of the collection, wrote to a public-spirited citizen of New York, Mr. John Taylor Johnston, the president of the Metropolitan Museum of Fine Art, strongly advising the purchase of the whole collection; and Mr. Johnston, who had been already much interested in Mr. Hitchcock's description, directed the purchase by Mr. Blodgett of the whole collection on his own personal account. The bargain was struck without delay, and Di Cesnola came at once to New York, bringing a large part of his noble trophy with him, the rest following not long after. During the whole of the winter of 1872–73, and the greater part of the following summer, he was occupied in arranging, classifying, and cataloguing the articles, some of which had been broken in the transit. After this labor was completed, and the whole made ready for the public, Di Cesnola returned to Cyprus in the autumn of 1873, to take possession of his consular office again and to renew his diggings; the results of which cannot fail to be of the highest interest to the learned and the artistic world. (This article is mainly drawn from Mr. Hitchcock's paper in "Harper's Magazine," above alluded to. See also "L. P. di Cesnola, Generale e Console Americano in Cipro," Di Agostino e Gallo, Vercelli, 1869; and "L. P. di Cesnola in Cipro," Narrazione di Giov. di Agostino Vercelli, 1871. For a fuller account of the discoveries in Cyprus see article Cyprus and the works cited there.) Clarence Cook.

Cespe'des (Manuel Carlos), the leader of the Cuban insurrection, and president of the Cuban republic, born April 18, 1819, was educated at the University of Havana, became a lawyer at Bayamo, issued in Oct., 1868, an address to the Cubans, in which he proclaimed the republic and the independence of Cuba. On April 10, 1869, Cespedes was elected by the Constituent Cortes president of the republic. Killed by the Spaniards Feb. 27, 1874.

Cessart, de (Louis Alexandre), a French engineer, born in Paris in 1719, planned the naval works at Cherbourg, and published a valuable treatise on hydraulic works. Died in 1806.

Ces'sio Bono'rum [Lat., the "giving up of goods"]. This is a proceeding derived from the civil or Roman law, whereby a debtor surrendered his property for the benefit of his creditors. The effect of it in the later law was to exempt the debtor's person from imprisonment. The same phrase is used in modern times to denote the surrender of his property by an insolvent for the benefit of his creditors. It will be observed that it is much more limited in its effect than a modern bankrupt law as adopted in England and the U. S., which not only relieves the debtor from imprisonment, but discharges him, if his assets amount to a certain percentage of his debts, from the residue which they do not suffice to pay.

Cess'na, a township of Hardin co., O. Pop. 732.

Cess-pool, a well for the reception of the drainage of a locality. It is apt to be a source of very unwholesome emanations.

Ces'tius, Pyr'amid of, an antique Roman monument standing close to the Porta San Paolo of Rome, is 125 feet high. It is built of brick and tufa, faced with Carrara marble. The internal walls were decorated with paintings. This pyramid is supposed to have been erected before the Christian era.

Ces'toid Worms [from the Lat. *cestus*, a "band," alluding to their ribbon- or tape-like form], a family of entozoa, including the tapeworms (of which some ten species are found in man) and nearly 200 smaller species, some barely visible, some 100 feet or more in length. They are found in all classes of vertebrate animals, living when perfect in the intestines, but in the scolex or larva state inhabiting the living tissues. Cestoid worms are divided into more or less perfectly marked androgynous or bisexual segments (proglottides), which are formed successively behind the neck of the cestoid, each segment acquiring a sort of individual life. Cestoid worms are remarkable for having no mouth or digestive apparatus; the animal which they inhabit performs the operation of digestion for them, so that they have only to absorb nutriment by osmotic action. Each segment impregnates itself, becomes in time detached, passes out of the intestine, and finally bursts and discharges its numerous ova; which, scattered by wind and water over grass, etc., are devoured by various animals. Then the ovum hatches into a free embryo or "proscolex," which pierces the walls of the intestinal canal, enters the blood-vessels, finds a lodgment in an appropriate tissue, where it encysts itself, and changes into the "scolex" or "hydatid" state, as in "measly pork." Now, if the living scolex is swallowed in food, it is almost sure to develop into the complete tapeworm. Sometimes it imperfectly develops its segments even while in the cystic state, and is then called a strobila.

Cestra'cion, a genus of sharks including the "nurse" or Port Jackson shark (*Cestracion Philippi*) and the cat shark (*Cestracion Zebra*) of the China Sea, interesting to naturalists as the sole surviving relics of the once extensive family Cestraciontidæ, the family of sharks whose remains first appear in the lowest Devonian rocks. They differ from the true sharks in having the mouth at the anterior extremity, instead of under the head, and in having the mouth paved with solid bony plates for crushing their victims.

Cestui que Trust, in law. This is a phrase derived from the Norman French, and means the person for whose benefit property, either real or personal, is held in trust. The phrase grows out of the distinction which English jurisprudence maintains between courts of law and equity.

Property may be owned in such a manner that in a court of law one person will be recognized as the owner, while in the view of a court of equity his ownership will be deemed to be formal and for the benefit of another. The formal owner can in that court be called to an account by the beneficial owner. The legal owner is called a trustee, while the beneficial owner is the *cestui que trust*. Sometimes this relation is created by express words; at other times it is

implied by law from the relations of the parties. There has been an attempt on the part of some legal writers to substitute in the place of the somewhat barbarous term "cestui que trust" a supposed equivalent, "beneficiary." This course has not met the approval of the legal profession, and its members still adhere tenaciously to the ancient form. The topic is of growing importance in law, and the whole subject will be more fully considered under the terms TRUST and TRUSTEE.

Cestui que Vie, in law, a person for whose life an estate in land is granted or devised. An example is an estate granted to A during the life of B. The latter person is termed *cestui que vie*, and the owner is termed *tenant pur autre vie* ("for the life of another"). Though such an estate is a freehold, it is not of so high a character as an estate for one's own life.

Ces'tus [Fr. *ceste*, from the Gr. κεστός, "embroidered"], a girdle or band which women wore round the waist in ancient times. The cestus of Venus was supposed to have the power of exciting love. The gauntlet used by ancient pugilists to protect their hands was called *cestus* or *cæstus*.

Ceta'cea, or Cetaceans [from the Gr. κῆτος, a "whale"], an order of mammals characterized by a fish-like form and adapted to strictly aquatic life. Regarded as of a "degradational" type, they are by some associated with the Sirenia in a subdivision called Mutilata. Many writers call the Sirenia "herbivorous cetacea," but some assign them to the pachyderms, while others assign them a position as an independent order. Whatever their position, the extinct Zeuglodontia appear to furnish a connecting link between them and the true Cetacea. (See SIRENIA.) The true Cetacea have the hind legs reduced to two small bones concealed in the flesh, the fore legs transformed into fins; a fish-like tail which spreads horizontally; warm blood; respiration by lungs (though in some species it can be suspended for a considerable time); and the young are born alive and nourished by the mother's milk. The right whales and fin-backs are reckoned as constituting a sub-order called Toothless cetaceans (Mysticete), while the other living species are placed in the sub-order of Toothed cetaceans (Denticete). The restricted order comprises the Balænidæ, or right whale family, the Balænopteridæ, or fin-backs, the Physiteridæ, or sperm whales, the Ziphiidæ, the Delphinidæ, or true dolphins, the Iniidæ and Platanistidæ, or fresh-water dolphins, and the extinct sub-order Zeuglodontia; to which many authors add the sub-order Sirenia or "herbivorous cetacea." Fossil cetaceans first appear in the eocene, and are found in all the cenozoic formations. Nearly all the families are represented by extinct species. Among the more remarkable may be mentioned a huge *Zeuglodon*, whose vertebræ abound in the Gulf States.

Cetot'olites [from the Gr. κῆτος, a "whale," οὖς, ὦτος, an "ear," and λίθος, a "stone"], fossil cetacean teeth and ear-bones found in the red crag of Suffolk (England), belonging to the pleiocene period. They appear to have been washed out of some earlier stratum. They are valuable as a source of superphosphate manure.

Cetraria. See ICELAND MOSS.

Cette, a fortified seaport of France, in the department of Hérault, on the Mediterranean, on a strip of land between the sea and the broad inlet of Thau, the outlet of the Canal du Midi, and on the railway to Bordeaux, 18 miles S. W. of Montpellier. It has a good harbor and a considerable coasting and inland trade, large fisheries, manufactures of made wines, perfumery, glass, soap, etc., large shipyards and salt-works, and the extensive export trade of the Canal du Midi, of which it is the port, and with which it is connected by the canal of Cette across the tongue of land. The harbor is protected by two large moles and a breakwater. The city was founded in 1666. It forms a half circle about the cliff-like hill, on which is the fortress. Pop. 24,177.

Cetti'gne, the capital of the principality of Montenegro, is situated 19 miles E. of the Austrian town of Cattaro, about 3000 feet above the sea. It contains a convent, which was founded in 1458, and is the residence of the bishop; the state prison, and the palace of the prince. In the Peace of Cettigne of Sept., 1862, Montenegro recognized the sovereignty of the Porte. Pop. 700.

Ce'tus [Gr., "the Whale"], a great constellation, one of those called southern by Ptolemy. It contains a number of nebulæ and the variable star Mira, or o Ceti.

Ceu'ta (anc. *Septa* or *Septum*), a fortified seaport-town on the N. coast of Africa and on the Mediterranean, opposite to Gibraltar, which is 17 miles distant. It is in Morocco or Fez, but it has belonged to Spain since 1640. The castle occupies the summit of a mountain which is the ancient *Abyla* and one of the Pillars of Hercules. Ceuta is the chief of the Spanish *presidios* on the African coast. It is the seat of a Roman Catholic bishop, and has several convents and a convict establishment. Pop., without the garrison and convicts, 7114.

Cévennes (anc. *Cebenna Mons*), a mountain-range in the S. of France, forms the watershed between the Rhone and the Garonne. It extends from the vicinity of Carcassonne in a N. N. E. direction to the Canal du Centre. The central mass of the Cévennes is in the departments of Ardèche, Lozère, and Upper Loire. The highest summit is Mont Mezin or Mézen, which has an altitude of 5764 feet. Some of the peaks are extinct volcanoes. These mountains were a stronghold of the Protestants called Camisards, and were the scenes of several religious wars.

Ceylon, see'lon [native *Singhala*; anc. *Taprobane*], an island of Asia, belonging to the British, in the Indian Ocean, about 55 miles from the S. extremity of Hindostan, from which it is separated by Palk Strait. It lies between lat. 5° 56′ and 9° 50′ N., and between lon. 80° and 82° E. Length from N. to S., 271 miles. Area, 24,705 square miles. The southern and eastern coasts are bold and rocky, and present a very picturesque appearance, which is increased by the luxuriant tropical vegetation, the verdant slopes of its mountains, and groves of noble palms draped in perennial green. The surface is finely diversified by mountains, valleys, and plains. The highest summit is Pedrotallagalla, which rises 8280 feet above the level of the sea. The celebrated mountain called Adam's Peak is 7240 feet high, and is remarkable for its conical form and the sacred associations with which it is connected. The Singhalese have a tradition that Booddha ascended to heaven from this peak. The mountains of Ceylon are mostly formed of gneiss and granite, and dolomite occurs in the more level parts of the island. Among the minerals are iron, tin, coal, plumbago, and salt. Many sapphires, rubies, amethysts, and other precious stones are found here. The climate is humid and hot, but more pleasant and moderate than the mainland of India. The average annual rainfall is about eighty inches.

Ceylon is remarkable for the luxuriance and variety of its flora. Among its indigenous trees are the cocoa-palm, palmyra, and other species of palms, the coral tree (*Erythrina Indica*), the bread-fruit, the cinnamon, the satin-wood, and ebony. The bo tree or peepul (*Ficus religiosa*) attains a great age, and is deemed sacred by the natives. Coffee, cotton, rice, tobacco, and pepper are cultivated here. The chief articles of export are coffee, cinnamon, cocoanuts, cocoanut oil, coir, hides, pearls, and plumbago. Among the wild animals found here are the buffalo, bear, deer, leopard, and elephant. The last are very numerous.

The native population is composed mostly of Singhalese, whose historical records, extending back through many centuries, are partially corroborated by existing ruins of cities and temples, which indicate that Ceylon in a remote antiquity was inhabited by a numerous and civilized people. The most celebrated among its monuments is the cave-temple of Dambool, which was built about 100 B. C., and is profusely adorned with images and sculpture. It was dedicated to Booddha. Booddhism is still the prevailing religion of the island. The Roman Catholic Church has two vicariates apostolic, with an aggregate population of 157,000, while the native Christians connected with the Protestant missions number 16,000. There are also many Mohammedans, called Moors. Among the remarkable antiquities of Ceylon are numerous colossal ruined tanks, constructed for the irrigation of the soil.

Among the peoples of the island are the singular Veddahs, one of the most degraded races of mankind. Besides the above races, there are many Kandyans in the interior, and Hindoos, Malabarians, and naturalized descendants of the old Dutch and Portuguese colonists on the coast.

Ceylon has two harbors—Point de Galle on the S. coast, and Trincomalee on the N. E. coast. The latter is one of the finest harbors in the world, and is capable of admitting any number of the largest ships. The Oriental mail-steamers, which ply between England and Calcutta, touch at this island, which has an extensive commerce. The value of the exports from Ceylon to the United Kingdom in 1870 was £3,450,974; of the imports from the United Kingdom, £941,344; public revenue in 1869, £946,494; expenditures, £881,373; public debt, £701,000. In ancient times it was visited for the purpose of traffic by the Egyptians, Greeks, and Romans. The Portuguese formed a settlement at Colombo in 1517, and were expelled from the island by the Dutch and natives in 1658. The British invaded the island in 1795, and captured the Dutch forts and towns. The island was formally annexed to the British crown in 1802. Civil pop. in 1871, 2,405,287. Ceylon is divided into six administrative provinces, called the Western, Central, Southern, Northern, North-western, and Eastern provinces. Cap-

ital, Colombo. (See Sir James E. Tennent, "Ceylon, Physical, Historical, and Topographical.")

Revised by A. J. Schem.

Ceylon, a township of St. Croix co., Wis. Pop. 348.

Cezim'bra, a seaport-town of Portugal, in Estremadura, on a bay of the Mediterranean, 19 miles S. of Lisbon. It has valuable fisheries. Pop. 5797.

Chablais, the most northern part of Savoy, bordering on Lake Geneva. It was the oldest possession of the House of Savoy, and was ceded to France by King Victor Emmanuel in 1860. Capital, Thonon.

Cha'brias [Χαβρίας], an able Athenian general, who had command of an army in 392 B. C. In 378 he commanded in a war against the Spartans. He gained a naval victory over the Spartans at Naxos in 376, and was killed at the siege of Chios, where he commanded a fleet, in 357 B. C. He was the inventor of a famous manœuvre, which consisted in receiving a charge in a kneeling posture, with shields resting on the ground and the spears pointed against the enemy.

Chachapoy'as, a town of Peru, capital of the department of Amazonas, 400 miles N. E. of Lima, was founded by Francisco Pizarro in 1536, and was formerly flourishing, but in consequence of the continued revolutions has gradually decreased. It is the seat of a Roman Catholic bishop, and has a theological seminary and a beautiful cathedral. Pop. about 8000.

Cha'co, El Gran, an extensive region of South America, is near the middle of the continent. It is partly in Bolivia and partly in the Argentine Republic. It is bounded on the E. by the Paraguay River, and traversed by the Pilcomayo. The surface is generally level, and the S. portion is said to be an arid and desert plain, but the soil in some parts is fertile. It has no civilized inhabitants.

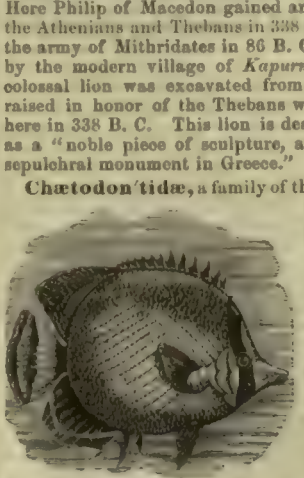
Chacornac (Jean), a French astronomer, born at Lyons, France, June 21, 1823. During the years 1853–54 he was in charge of the observatory of Marseilles, and in the latter year was appointed astronomer of the Paris Observatory. He was an astronomer of reputation, and distinguished for his discoveries of asteroids, as well as for his writings on the planetary systems. Napoleon III. made him chevalier of the Legion of Honor 1858. He contributed the atlas to the "Annals of the Observatory of Paris," 1858 and 1863. Died at Paris Sept. 26, 1873.

Chad'bourne (Paul Ansel), born at North Berwick, Me., Oct. 21, 1823, was professor of chemistry and natural history in Williams College (1853–67) and in Bowdoin College (1859–66), elected pres. of the University of Wisconsin and prof. of metaphysics in same (1867–70). He published "Natural Theology" (1867) and "Instinct in Animals and Men" (1872); chosen pres. of Williams College in 1872.

Chadd's Ford, a post-village of Birmingham township, Delaware co., Pa., 30 miles S. W. of Philadelphia, on the Brandywine Creek, at the junction of the Wilmington and Reading and the Philadelphia and Baltimore Central R. Rs. Near here was fought the battle of Brandywine, Sept. 11, 1777.

Chad'wick (Edwin), an Englishman, noted as a sanitary reformer, was born in the environs of Manchester Jan. 24, 1801. He was appointed secretary to the poor-law board in 1834, and published in 1842 an important "Report on the Sanitary Condition of the Laboring Population." As a member of the new board of health appointed in 1848, he distinguished himself by his efficient efforts to improve the sanitary and social condition of the people, and to reform the distribution of the poor-law funds.

Chære'mon, an Athenian tragic poet, from several of whose dramas passages are quoted by Athenæus, although Suidas in his brief notice of him calls him a comic poet. Little is known of his life, but he is referred to by Ephippus, who seems to speak of him as a contemporary, and he is criticised by Aristotle. He may be placed therefore about 380 B. C. He fell below the dignity of the great tragic poets of the preceding century, and wrote dramas better fitted to be read than to be acted. Ten titles of plays written by him are known, besides the "Centaurus," which is called by Athenæus a "drama in many metres," and by Aristotle a "mixed rhapsody of all metres." There are also three epigrams in the Anthology bearing his name. (The fragments of his tragedies are collected in Wagner's and in Nauck's "Fragmenta Tragicorum Græcorum.")



Henry Drisler.

Chære'mon of Alexandria, a Stoic philosopher and historian who flourished in the times of the early Roman emperors. He is often spoken of as librarian of the Alexandrian Library, but this is probably an incorrect inference from the language of Suidas, who calls him the teacher of Dionysius, who was librarian of this library, and who succeeded Chæremon in his philosophical school. He went from Alexandria to Rome to take charge, along with Alexander of Ægæ, of the education of Nero. He wrote a work on hieroglyphics, and one on the history and religion of Egypt, a fragment from which, concerning the Egyptian priests, is preserved, and makes the loss of the rest regretted. He wrote a treatise on comets and a grammatical work. (The fragments of his writings are collected in Müller's "Hist. Græcorum Fragmenta," vol. iii., pp. 495–499.)

Henry Drisler.

Chærone'a [Gr. Χαιρώνεια], an ancient town of Bœotia, 5 miles N. of Lebadea, was the native place of Plutarch. Here Philip of Macedon gained an important victory over the Athenians and Thebans in 338 B. C., and Sulla defeated the army of Mithridates in 86 B. C. The site is occupied by the modern village of *Kapurna.* A few years ago a colossal lion was excavated from the mound which was raised in honor of the Thebans who were killed in battle here in 338 B. C. This lion is described by Colonel Mure as a "noble piece of sculpture, and the most interesting sepulchral monument in Greece."

Chætodon'tidæ, a family of the acanthopterous marine fishes named *Squamipennes* ("scaly-finned"), because of the incrustation of parts of the dorsal and anal fins with scales. The scales are strongly ctenoid (comb-shaped). The typical genus *Chætodon,* and those nearly allied to it, have hair-like teeth; some of the family, however, have trenchant teeth, and some have teeth both on the jaws and palate. Their colors are often gay, and disposed in stripes or bands. Many singularities of form occur in this family. The flesh of most of the Chætodontidæ is of fine flavor. *Chelmon rostratus* and *Toxotes jaculator,* both Asiatic fishes, are remarkable for catching insects by shooting drops of water at them from their mouths; but some of the latest authorities exclude these fishes from the family, of which the southern coasts of the U. S. have several species.

Chætodon.

Chaff [Lat. *palea;* Fr. *paille*], the common name of the dry and membranaceous scales which constitute the floral envelopes of the graminaceous plants, and enclose the grain or seed. These scales are the glumes and palets (*paleæ*) of botanical language.

Chaffinch [from *chaff* and *finch,* because the bird searches in chaff for grain], a common European, Asiatic, and African song-bird, the *Fringilla cœlebs,* which devours not only seeds, but young plants, but is very valuable as a destroyer of noxious insects. It is esteemed for the table in Southern Europe, and in Germany is prized for its loud song, in which some birds greatly excel. Good singers are sold for extraordinary prices.

Cha'gres, a small seaport-town of Colombia, on the Isthmus of Panama and on the Caribbean Sea, at the mouth of the Chagres River, about 9 miles W. S. W. of Aspinwall. It is a miserable collection of huts, with a shallow harbor.

Chagrin' Falls, a post-village of Cuyahoga co., O., on the Chagrin River, 17 miles E. S. E. of Cleveland. It has several iron-foundries and paper-mills. Pop. 1016; of the township, 1321.

Chain, or **Gunter's Chain,** in surveying, is a measure twenty-two yards long, composed of 100 iron links, each of which is 7.92 inches long. Ten square chains make an acre = 4840 square yards.

Chain Cable. See Cable.

Chain Mail, or **Chain Armor,** consisted of hammered iron links connected together in the form of a garment. Such armor, which was much used in the twelfth and thirteenth centuries, was more flexible and convenient to the wearer than that which was formed of plates.

Chains, Hanging in. It was once customary for judges in England to direct the bodies of malefactors, after execution, to be hung in chains upon a gibbet, in order to strike terror into other offenders, and that it might afford "a comfortable sight to the relations and friends of the deceased." An act to abolish the practice was passed July 25, 1834, by Parliament.

Chain-Shot, a name of missiles used in naval warfare, consisting of two balls which are connected by a chain about eight inches long, and are discharged from a cannon.

Chala'za [Gr. χάλαζα, a "hailstone"], in botany, a membrane which unites the nucleus and integuments at the base of the ovule. It often differs in color from the rest of the integuments, and is conspicuous in the ripened seed. The cords which attach the yolk of an egg to the lining membrane at the ends of the shell are also called chalazæ.

Chalce'don [Gr. Χαλκηδών], an ancient Greek city of Bithynia, on the Bosphorus, opposite to Byzantium, from which it was about 1½ miles distant. On all the coins of Chalcedon the name is written Καλχηδών. It was founded 685 B. C., and became a large town, containing numerous temples. The Romans obtained possession of it in 74 B. C., and under the Roman empire it was a free city. The philosopher Xenocrates was born here about 396 B. C. In 451 A. D. a general council of the Church was held at Chalcedon, on the subject of the doctrinal disputes of the Nestorians and Monophysites. This, the fourth œcumenical council, condemned the heresy of Eutyches.

Chalced'ony [Gr. χαλκηδών], a precious stone which was so named because it was found near the ancient Chalcedon, is a beautiful variety of quartz. It is identical with common quartz or silex in chemical composition. It occurs in trap and other rocks in many parts of the world. It is generally translucent, sometimes semi-transparent, and exhibits various colors, among which are milk-white, reddish-white, blue, green, and brown. Chalcedony is much used in jewelry for necklaces, brooches, etc. Among collections of antique gems are many beautiful engraved specimens of chalcedony.

Chalced'onyx, a name given to agates formed of cacholong, or a white opaque chalcedony, alternating with a grayish translucent chalcedony.

Chal'cis [Gr. Χαλκίς], an ancient maritime town of Greece, on the island of Eubœa and on the Euripus, which is here only 40 yards wide, 18 miles N. E. of Thebes. A bridge across the Euripus connects the town with the coast of Bœotia. Chalcis was a city of great antiquity, and retained its importance down to recent times. Its greatness was attested by the numerous colonies which it planted on the coasts of Macedonia, Italy, and Sicily. Its first colony was Cumæ, in Campania, which it is said to have founded about 1050 B. C. Chalcis was successively subject to the Athenians, Romans, and Venetians, and as an important military point was often taken and retaken by armies. It contained numerous temples and theatres, and was about nine miles in circumference. Here the orator Isæus was born and Aristotle died. The site is occupied by the modern Egripo or Negropont, which is the chief town of the island, and has an old castle built on a rock in the middle of the Euripus.

Chalcis, a genus of reptiles found in warm regions in both continents, which gives its name to the family Chalcidæ. This family is by some made to include the glass-snakes, the blind-worms, the amphisbæna, etc., but is generally limited so as to include a few tropical species. Many of these reptiles are popularly considered snakes, but they are really saurians, having generally no visible legs, those members when they exist being in most cases concealed beneath the skin. They have movable eyelids, small ears, and a short thick tongue. In spite of these facts, some few naturalists still class them with serpents.

CHALCIS is also the name of a genus allied to the ichneumon-flies, and the type of the great family Chalcididæ. These insects are of great service in the destruction of noxious insects upon which their larvæ feed.

Chaldæ'a [Gr. Χαλδαία], the ancient name of a country of Asia, bordering on the Euphrates and the Persian Gulf, and bounded on the S. W. by Arabia Deserta. Chaldæa proper was the southern part of Babylonia, but the name was sometimes used to designate a more extensive region. The term Chaldæans (or Chaldees) was applied by the Hebrew prophets and other ancient writers to the inhabitants of the city of Babylon and all the subjects of the Babylonian empire. Thus, Isaiah calls Babylon "the beauty of the Chaldees' excellency" (chap. xvii. 19), and Pliny speaks of Babylon as *Chaldaicarum gentium caput*. The Chaldæans appear to have been the great pioneers in the cultivation of astronomy. They were also famous as astrologers and magicians. (See BABYLONIA.)

Chaldæ'an Chris'tians, a branch of the Church of Rome, consisting of those Nestorians who acknowledge the pope. They are of the Eastern rite, and are under the patriarch of Babylon and twelve bishops, three of whom reside in Persia. They number about 70,000 souls.

Chal'dee Lan'guage, or **East'ern Arama'ic,** a Semitic dialect, in which parts of the books of Daniel and Ezra were written, as well as several verses in Genesis, Judges, etc. It resembled the Hebrew and Syriac. It does not appear to be certain that this was the common language of ancient Babylon. The Targums were written in a later Chaldee. (See WINER'S "Chaldee Grammar," and HUPFELD in the "Theologische Studien" for 1830.)

Chal'der, an old Scottish dry measure containing sixteen bolls.

Chaldron, chaul'dron or chau'dron [Lat. *caldarium;* Fr. *chaudron*], a dry measure used for coals, and containing thirty-six bushels. Coal is now sold by weight in the U. S.

Chaleurs Bay, an inlet of the Gulf of St. Lawrence, Canada, separates Quebec from New Brunswick. It extends E. and W. about 90 miles, and is about 22 miles wide at the broadest part. It affords good anchorage, and can be navigated without danger. It has important mackerel fisheries.

Chal'ice [Lat. *calix*, a "cup, a goblet;" Fr. *calice*, a "drinking-cup," a "bowl"]. This term was formerly used as a name for an ordinary drinking-cup, but it is now almost exclusively applied to a communion-cup, a vessel used for the wine in the sacrament of the Eucharist. Chalices are commonly made of silver or gold.

Chalk, chawk [Lat. *creta;* Fr. *craie*], a calcareous earth, a soft variety of limestone or carbonate of lime. Its color is generally white. It is friable, easily pulverized, has an earthy fracture, and is very meagre to the touch. In geology, it is a sedimentary rock of great extent and importance, and a member of the cretaceous formation, which is more recent than the Jurassic and older than the tertiary formation. Chalk is abundant in England and in several other countries of Europe, and good commercial chalk is reported to exist in Dakota. The strata often contain flint nodules, distributed in layers through it like the hornstone in the earlier limestone. They are more or less rounded, and are all of concretionary origin. Chalk is a mineral of animal origin, and is mostly composed of the shells or carapaces of microscopic marine animals. According to Ehrenberg, a cubic inch of chalk often contains more than a million of microscopic organisms, among which far the most abundant are the rhizopods (called also Foraminifera). Chalk is extensively used in the preparation of lime, and is commonly employed by carpenters to mark boards. The material sold under the name of whiting or Spanish white, and used to make putty, is chalk in a purified state. Purified chalk is also employed by artists as a pigment, and is administered in medicine as an antacid. (See CRETACEOUS SYSTEM.)

Chalk, Black, also called **Drawing Slate,** a mineral used by artists for drawing and writing, is a variety of clay which derives its color from the carbon which it contains. It is easily cut or broken, and makes a black mark on white paper.

Chalk Bluff, a township of Greene co., Ark. Pop. 1030.

Chalk Level, a post-township of St. Clair co., Mo. Pop. 851.

Chalk, Red, or **Reddle,** is an argillaceous oxide of iron, of a brownish-red color, containing a large portion of clay. It is used by carpenters and painters.

Challenges. See JURY, by PROF. T. W. DWIGHT.

Chal'mers, a township of McDonough co., Ill. Pop. 1484.

Chalmers (ALEXANDER), a Scottish writer, born at Aberdeen Mar. 29, 1759. He is famous as the author of a "General Biographical Dictionary," in 32 vols. (1812–17), and as the editor of a well-known edition of the British poets, with notes. Died Dec. 10, 1834.

Chalmers (GEORGE), a Scottish antiquary and lawyer, born at Fochabers in 1742. He was clerk to the board of trade from 1786 to 1825. His greatest work is entitled "Caledonia: An Account, Historical and Topographical, of North Britain" (3 vols., 1807–24), which displays profound research and much erudition. Among his other works is a "Life of Mary Queen of Scots" (1818). Died in 1825.

Chalmers (THOMAS), D.D., LL.D., D. C. L., a Scottish divine, was born at Anstruther, Fifeshire, Mar. 17, 1780, and was educated in the University of St. Andrew's. In 1803 he was ordained minister of the parish of Kilmany. His favorite studies for some years before and after this event were mathematics and natural philosophy. He published in 1808 an "Inquiry into the Extent and Stability of the National Resources." While composing an article on "Christianity" for Brewster's "Encyclopædia" in 1809, he examined the evidences of its truth, and acquired convictions which rendered him a more earnest and devout preacher of the gospel. He married Miss Grace Pratt in 1812, and was elected minister of the Tron Church, Glasgow, in 1815. He soon gained distinction as an eloquent and powerful pulpit orator, and delivered a series of dis-

courses on astronomy in connection with religion, which were published in 1817, and were immensely popular. In 1819 he became minister of St. John's parish, Glasgow, in which he established schools and made strenuous efforts to improve the morals of his parishioners. He was appointed professor of moral philosophy in the University of St. Andrew's in 1823, and obtained the chair of theology in the University of Edinburgh in 1828. He published in 1832 a work entitled "Political Economy," and in 1833 his Bridgewater treatise "On the Adaptation of External Nature to the Moral and Intellectual Constitution of Man," which was received with great favor. Dr. Chalmers was the leader of the Evangelical party, which was involved with the "Moderate" party in a contest in relation to patronage. This contest resulted in the disruption of the Church of Scotland in May, 1843. Dr. Chalmers and 470 other clergymen then seceded and organized the "Free Church." He expended the latter years of his life in perfecting his "Institutes of Theology" and in officiating as principal of the Free Church College. He died May 30, 1847. (See "Memoirs of his Life and Writings" (4 vols., 1850–52), published by his son-in-law, Rev. WILLIAM HANNA; FRANCIS WAYLAND, "Memoirs of the Christian Labors of Thomas Chalmers.")

Chalonnes-sur-Loire, a town of France, department of Maine-et-Loire, on the river Loire, here crossed by a suspension bridge, 11 miles S. W. of Angers. Pop. 6505.

Châlons-sur-Marne (anc. *Catalauni* or *Catalaunum*), a city of France, capital of the department of Marne, is on the right bank of the Marne and on the railway from Paris to Strasburg, 107 miles E. of Paris. It is situated in a fertile plain, which is part of the former province of Champagne, and has a stone bridge across the river. It is a bishop's see, and contains a fine cathedral, a botanic garden, and a public library of about 25,000 volumes; also manufactures of cotton, linen, and woollen fabrics. Champagne wine is produced in the vicinity. In the Catalaunian Plain adjacent to Châlons the Roman general Aetius and Theodoric the Visigoth gained a great victory over Attila in 451 A. D. In the early part of the Dark Ages, Châlons was one of the most important commercial cities of Europe, and had about 60,000 inhabitants. In 1857 the celebrated Camp de Châlons was established near Châlons, in which always one or two French army corps were kept for drilling; it was evacuated by the French in Aug., 1870, and entirely abandoned in 1871. Pop. 17,692.

Châlon-sur-Saône, or **Châlons-sur-Saône** (anc. *Cabillonum*), a town of France, department of Saône-et-Loire, is on the right bank of the Saône and on the railway from Dijon to Lyons, 77 miles by rail N. of Lyons. It is at the head of steamboat navigation, and has an active trade, being the eastern terminus of the Canal du Centre, which connects the Saône with the Loire. The chief public buildings are a cathedral founded in the thirteenth century, St. Peter's church, and the town-hall. It has a theatre and a large public library; also manufactures of glass, jewelry, hosiery, linen fabrics, pottery, etc. Pop. 19,982. *Cabillonum* became the capital of Burgundy under Gontran, who died in 593 A. D.

Chalybä'us (H. M.), D. D. See APPENDIX.

Chalyb'eate [from the Gr. χάλυψ (gen. χάλυβος), "iron" or "steel"], containing iron in solution, applied to waters which are impregnated with iron. There are two kinds of chalybeate water—the carbonated, which contains carbonate of iron, and may be recognized by forming an ochreous deposit of red oxide of iron on the stones near the mouth of the spring; and the sulphated, which contains sulphate of iron (copperas) in solution.

Cham [French for Ham, son of Noah], assumed name of AMÉDÉE DE NOÉ, a French caricaturist, born Jan. 26, 1819, studied with Delaroche and Charlet. His first grotesque sketches appeared in 1842, and since then has followed an uninterrupted series in almanacs and in "Charivari."

Chamæ'leon [Gr. for "ground-lion"], a genus (*Chamæleo*) of saurian reptiles constituting a family (Chamæleontidæ), and according to some writers a separate tribe (Dendrosaura) of lizards. Ten or twenty species are known, of which one is found in Southern Europe. None are American. They have a compressed body, with granular scales in circular bands; the head almost fixed, but the eyes with a wonderful power of motion, each eye being covered by a lid pierced with one small hole; ears concealed beneath the skin; the tail prehensile; the movements extremely slow; the tongue cylindrical and extensile, in appearance resembling a common angle-worm; the toes in two opposable sets, fitted for grasping boughs, etc. Many fables have been related of the chamæleon, such as that it lives upon air, has the power of changing color at will, or assuming the color of the object upon which it is placed. The food of the chamæleon is insects, which it catches by darting out its long, sticky tongue: but its lungs are large, and it has a habit of enormously dilating itself with air. Its changes of color are not altogether voluntary, and it does not appear to assimilate its color to the object upon which it is placed. But its colors are somewhat changeable. This has been explained (1) by the action of the nervous energy, which, as in blushing, may perhaps affect the circulation of the blood in the skin, and it is certain that fear or other emotions will cause the color to change; (2) by the varied amount of air in the animal's lungs; (3) by the action of light; (4) by the presence of two differently colored layers of pigment-cells in the skin, so arranged as to move upon each other and produce various effects of color. It is probable that all these conditions may contribute to the result.

Chamæleon.

It is said that that lack of nervous co-ordination between the two sides which in most animals is only seen in diseased or defective organizations, is either normal to the chamæleon or is very easily produced in it. It is even asserted that one side of the reptile may be awake while the other is asleep. If modern science finds this creature so remarkable, it is not strange that the ancients made the chamæleon the possessor of many marvellous powers.

Chamæleon, of Heraclea on the Pontus, a Peripatetic philosopher, a disciple of Aristotle or Theophrastus. He was the author of several philosophical treatises, chiefly on moral subjects, and of a variety of writings on the ancient Greek poets—*e. g.* Æschylus, Anacreon, Thespis, Homer, Lasus, Pindar, Sappho, Simonides, and Stesichorus. These essays seem to have treated of the lives of the poets, as well as to have entered into the criticism of their works. His commentary on Homer must have been of considerable extent, as the fifth book is referred to by Tatian. Titles of fifteen different works, with a few fragments, are preserved by Athenæus and others. (An account of his life and writings is given by KÖPKE, Berlin, 1856; CLINTON, "Fasti Hellenici," vol. iii., p. 493.)

HENRY DRISLER.

Chamæ'rops, a genus of palms having fan-shaped leaves and flowers in spathes about six to eight inches long. The *Chamærops humilis*, often called palmetto, is the only species of palm indigenous in Europe. The fruit is a triple, spongy drupe, which is edible. The leaves are used for making brooms, hats, and seats of chairs. The fibre of the leaves is a valuable material for cordage and paper, and is imported into France to be used in the manufacture of carpets. The blue palmetto of the Southern U. S. is *Chamærops Hystrix*. Other species of this genus are found in tropical countries.

Cham'ber, an apartment of a house, a private apartment, a lodging-room; a hollow or cavity, as the chamber of the ear. In politics, the term is applied to a legislative assembly, as the (former) Chamber of Deputies in France. The room which the U. S. Senate occupies is called the Senate Chamber. Chamber of commerce is the title of an association or body of merchants which is commonly formed in each large commercial city for the promotion of the mercantile interests and general prosperity of the place.

CHAMBER of a cannon or of a small firearm is a contracted part of the bore at the breech end. The chamber contains the charge of powder, but it is too small to admit the shot or shell. These cavities are of various forms, spherical, cylindrical, conical, etc. Carronades and mortars are usually chambered.

Chamber-Counsel, a lawyer or counsellor-at-law who gives opinions in his private chamber, but does not conduct causes in court.

Cham'berlain [Lat. *camerarius*; Fr. *chambellan*; It. *camerlingo*], an officer attached to the court of a monarch, and who formerly had charge of the private apartments of the palace. He was originally the keeper of the treasure-chamber. The office of chamberlain was one of the grand offices of the Crown in France. The lord chamberlain of England is an officer of high rank in the royal household, and has the function of endorsing the king's answer on petitions presented to him, and often communicates His (or Her) Majesty's pleasure to Parliament and to the council. He has control over all the officers and servants of the royal chambers except those of the bed-chamber. All tradesmen and artificers in the service of the sovereign

are appointed by him. He is a member of the privy council.

The lord great chamberlain, another officer, is an official of the British court of noble birth and holding the title by inheritance. He has charge of the House of Lords during sessions, walks by the right hand of the sovereign in certain processions, and performs many other duties, chiefly of a ceremonial character.

Chamberlain (Joshua L.), LL.D., a distinguished American general and educator, born in Bangor, Me., Sept. 8, 1828. He graduated at Bowdoin College in 1852, entered the volunteer service of the U. S. in 1862, and became a major-general in 1865. He received six wounds while in the army. From 1866 to 1870, inclusive, he was governor of Maine, and in 1871 he became president of Bowdoin College.

Cham'berlen (Hugh), an English physician, born in 1664, practised in London. He invented the obstetric forceps. Died in 1728.

Cham'bers, in law. A judge is said to act at "chambers" when a legal proceeding is carried on before him out of court, either at his office or residence or other convenient place, including the court-room itself. Business done before a judge at chambers, as distinguished from that transacted in court, is increasing in modern times. The codes of procedure in some of the American States expressly provide that certain acts shall be done by the *court*, and others by a *judge*, referring in the last instance to an act done at chambers. Through the same medium a great change has been worked in England in the practice of the court of chancery. Formerly the details of business in that court were transacted by an officer termed "master in chancery," who exercised an almost independent jurisdiction, acting without communicating with the judge until he made his report of his conclusions, which was then submitted to the court as a basis for its decree. By the 16 Vict., ch. 80, the office of master was abolished, and the business formerly committed to him was directed to be transacted under the direction and control of the judge, or, in other words, at chambers. Under this system each of the judges has under his control chief clerks and junior clerks, who act in his behalf in taking accounts and making inquiries, and who are more directly responsible to him than were the masters under the earlier practice. Under the law of 1873 for the reorganization of the English courts (36 and 37 Vict., ch. 66), the duties of chamber clerks after that act goes into effect (Nov. 2, 1874) are to be performed by officers of the court in the permanent civil service of the Crown. The same law also provides for official and special referees, who may, under the direction of a court or judge, perform acts similar to those formerly entrusted to masters in chancery.

T. W. Dwight.

Cham'bers, a county of Alabama, bordering on Georgia. Area, 700 square miles. It is partly bounded on the E. by the Chattahoochee River, and is traversed by the Tallapoosa. The soil is mostly fertile. Cotton, grain, and wool are the staples. This county is intersected by the East Alabama and Cincinnati, the Savannah and Memphis, and the Atlanta and West Point R. Rs. Capital, Chambers Court-house (or La Fayette). Pop. 17,562.

Chambers, a county of Texas, bordering on the Gulf of Mexico. Area, 900 square miles. It is bounded on the W. by Galveston Bay, and intersected by Trinity River. The surface is nearly level. Cotton, corn, fruit, cattle, swine, and sugar-cane are raised. The county is well timbered. Capital, Wallisville. Pop. 1503.

Chambers (Ezekiel F.), LL.D., born in Kent co., Md., Feb. 28, 1788, graduated at Washington College, Md., in 1805, became a lawyer, served in the war of 1812–15, and was made a brigadier-general of militia. He was U. S. Senator from Maryland (1826–35), taking a prominent position; was a judge in the State courts (1834–51), and in 1852 declined the secretaryship of the navy. Died Jan. 30, 1867.

Chambers (George), LL.D., born in 1786 at Chambersburg, Pa., graduated at Princeton in 1804, became a very prominent lawyer, was a member of Congress (1833–37), and became in 1851 a justice in the supreme court of Pennsylvania. He prepared a number of valuable papers on the early history of the State, some of which were destroyed at the burning of Chambersburg in 1863. Died Mar. 25, 1866.

Chambers (Robert), LL.D., a Scottish writer and publisher, born at Peebles July 10, 1802. He became a bookseller in Edinburgh, and wrote several works, among which is "Traditions of Edinburgh" (1824). He entered into partnership with his brother William in 1832, after which they published many cheap and popular works entitled "Information for the People," "Cyclopædia of English Literature," "Papers for the People," "Chambers's Encyclopædia" (1859–68), etc. Died in 1871.

Chambers (William), a Scottish author and editor, a brother of the preceding, was born at Peebles April 16, 1800. He founded Chambers's "Edinburgh Journal" in 1832, and became a partner with his brother in an extensive publishing-house of Edinburgh. They were distinguished for their enterprise and their successful efforts to supply the people with cheap and instructive literature. (See Chambers, Robert.) He was the author of several works, among which is "Things as they are in America." He was chosen lord provost of Edinburgh in 1865.

Cham'bersburg, a post-township of Pike co., Ill. Pop. 788.

Chambersburg, a township of Iredell co., N. C. P. 949.

Chambersburg, the capital of Franklin co., Pa., on the Conococheague and Falling Spring creeks, at the terminus of the Cumberland Valley and Franklin R. Rs., 52 miles S. W. of Harrisburg. It is in the southern portion of the fertile limestone valley between Blue and South mountains. It has three newspapers, a national bank, manufactories of wool, paper, and iron, an academy, a female seminary, and well-conducted public schools. It was settled by the Scotch-Irish. On the 30th of July, 1863, a body of Confederate cavalry under Gen. McCausland entered the town and laid it under tribute of $200,000 in gold or half a million in currency; this demand not being complied with by the inhabitants, McCausland ordered the town to be fired. About two-thirds of the place was destroyed, 2500 persons were deprived of homes, and property to the value of $1,000,000 was destroyed. It has been entirely rebuilt. Pop. 6308.

Jean Cook, Ed. "Repository."

Chambers Court-house, or **La Fayette,** a post-village, capital of Chambers co., Ala., is about 70 miles E. N. E. of Montgomery. Pop. 1382.

Chambéry [It. *Ciamberi*], a city of France, capital of the department of Savoy, is beautifully situated on the river Leysse, in a rich vine-clad valley about 60 miles E. S. E. of Lyons. It is on the railway which connects France with Italy and passes through a tunnel near Mont Cenis. It contains an old castle of the dukes of Savoy, a cathedral, several convents, and a public library. Here are manufactures of silk gauze, lace, hats, etc. It was formerly subject to the king of the Sardinian States, but was ceded to France in 1860. Pop. 18,270.

Cham'bliss (John R.), an American Confederate officer, born in Virginia in 1833; graduated at West Point 1853, and resigned from the army in 1854 to devote himself to agricultural pursuits in Virginia. He was actively identified with the State militia, being colonel, etc. At the outbreak of the civil war he espoused the Confederate cause, and was appointed a brigadier-general, serving with gallantry. At the battle of Deep Bottom, Va., Aug. 16, 1864, while leading a brigade of cavalry, he was killed.

G. C. Simmons, *Clerk Board of Eng'rs.*

Chambliss (William P.), an American lawyer and soldier, born in Virginia; served during the war with Mexico as lieutenant, subsequently captain, Third Tennessee Volunteers. At the close of the war he resumed the practice of his profession at Pulaski, Tenn.; was elected member of the State legislature 1853–54; Mar., 1855, he was commissioned in the army a first lieutenant Second Cavalry, and stationed in Texas, where he was mainly engaged, till 1861, against the Camanches and other hostile Indians; promoted captain Fifth Cavalry April, 1861, and major Fourth Cavalry 1864. He was engaged in the actions of Manassas and Peninsular campaigns of 1862 up to June 27, when, at the battle of Gaines's Mill, after having been wounded six times, he was taken prisoner while leading a cavalry charge. Resigned from the army Nov., 1867, and became superintendent of a railway and mining company in Canada.

G. C. Simmons, *Clerk Board of Eng'rs.*

Cham'blissburg, a township and post-village of Bedford co., Va. The village is 35 miles W. S. W. of Lynchburg. Pop. 3428.

Cham'bly, a county of Canada, in Quebec, has an area of 211 square miles. It is bounded on the E. by the Sorel River, and on the W. by the St. Lawrence, which separates it from Montreal. It is intersected by the Grand Trunk R. R. Capital, Longeuil. Pop. in 1871, 10,498.

Cham'bly Ba'sin, a beautiful post-village of Chambly co., province of Quebec (Canada), at the mouth of the Chambly and St. John's Canal and on Richelieu River, 16 miles E. of Montreal, has an important trade with Lake Champlain, and is the seat of Chambly College. It has a large hospital for the sick and poor, under the care of the Sisters of Charity. Pop. about 800.

Cham'bly Can'ton, a manufacturing village of Chambly co., province of Quebec (Canada), 1 mile above Chambly Basin, at the rapids of the Richelieu, which furnishes water-power for extensive lumber and woollen mills, a foundry, etc. Pop. about 700.

Chambon-Feugerolles, Le, a French town in the department of Loire. Its manufactures consist chiefly of iron and steel fabrics. Pop. 6954.

Chambord, a village and royal château of France, department of Loir-et-Cher, 8 miles E. of Blois. Here is a magnificent château begun by Francis I. in 1526, and finished by Louis XIV. It is in the midst of a beautiful park 21 miles in circumference. This castle was given to Marshal Saxe by Louis XV., and was presented to Marshal Berthier by Napoleon I. In 1821 it was purchased by subscription for the duke of Bordeaux, who is usually styled Count de Chambord. It is surmounted by a great number of turrets and minarets. Its most prominent features are six enormous round towers, each sixty feet in diameter. Pop. 332.

Chambord, de (Henri Charles Ferdinand Marie Dieudonné d'Artois), Comte and Duc de Bordeaux, was born in Paris Sept. 29, 1820. His father was the duke of Berry, a son of King Charles X., who abdicated in his favor in Aug., 1830. Since that date he has been recognized by the French legitimists as the heir to the throne, and has received the title of Henry V. He married in 1846 a daughter of the duke of Módena, but he has no children, and remains the only surviving member of the elder branch of the Bourbon family. He passed many years at the castle of Frohsdorf, near Vienna. He claims the throne by divine right, and avows his devotion to the antiquated political ideas of which the white flag is the symbol. After the deposition of Napoleon III. (1870) he issued a proclamation to the French people, which was not approved even by the royalists.

Chambre Ardente [Fr. "fiery chamber"], an extraordinary court, chiefly held for the trial of heretics, was first convened by Francis I. of France in 1535. Its name was given on account of the unusual severity of its sentences, burning alive being one of its most common punishments. Henry II.'s reign was especially distinguished for the cruelties practised by this court against the Huguenots. The last victim of the Chambre Ardente was one Voisin, executed in 1680, in the reign of Louis XIV., on a charge of sorcery.

Chambre Introuvable, a sarcastic name given to the French Chamber of Deputies which was elected after the second restoration of Louis XVIII., in July, 1815. The majority of it were fanatical royalists, were hostile to the ministry, and supported an extremely reactionary policy. They showed no inclination to repress the outrages committed in the south of France by mobs of royalists and fanatics, who massacred many Protestants and liberals. This chamber was dissolved in 1816.

Chamis'so, von (Adelbert), a poet and naturalist, born in Champagne, in France, Jan. 27, 1781. He removed with his parents to Berlin in 1790, learned the German language (in which all his works are written), and served for some years in the Prussian army. In the capacity of naturalist he accompanied an exploring expedition which sailed from Russia in 1814, and circumnavigated the globe. He wrote several works on natural history, but his reputation rests chiefly on his lyrical poems and ballads, which are very popular, and the highly original tale of "Peter Schlemihl" (1814), translated by William Howitt (1843). Died Aug. 28, 1838. (See J. E. Hitzig, "Leben und Briefe von A. von Chamisso," 2 vols., 1839.)

Chamois [Ger. *Gemse*], a goat-like antelope (*Rupicapra Tragus*) of the mountains of Central and Southern Europe and Western Asia, found especially in the Alps. It is about the size of a large goat, and is remarkable for its great speed, for its ability to leap enormous chasms, and for its delicate power of scent. It is highly prized as food, and chamois-hunting is a favorite though perilous amusement in Switzerland and the Tyrol. Its summer haunts are in the high Alps, near the snow-line. Its skin furnishes true chamois leather, but the article generally sold under that name is made of sheep skin.

Chamois.

Chamois, a post-village of Osage co., Mo. It is situated on the Missouri River and the Missouri Pacific R. R., 100 miles W. of St. Louis. It has one weekly newspaper.

Cham'omile, a name given to several herbs of the order Compositæ, but especially to *Anthemis nobilis* and *Matricaria Chamomilla*, both European herbs closely resembling each other, and nearly identical in order and properties, though the latter is milder, and in Germany is more generally esteemed as a medicine. The one first mentioned is common in American gardens. Chamomile is much used in domestic medicine, has tonic, stimulant, and diaphoretic powers, and was once used as a febrifuge. Its smell is agreeable, and depends upon the presence of a volatile oil. The chamomile flowers imported from England are of the first, those from Germany of the second, species. They are largely, but illegally, used in England in flavoring beer—a practice which is said to be injurious to health.

Chamouni, Valley of, in the French department of Haute-Savoie, a wonderful valley in the Alps, 15 miles long and three-quarters of a mile broad, traversed by a small stream, the Arve, 3400 feet above the sea. It is entered on the N. E., from Martigny, by the Col de Tête Noire, and at the other end by diligence from Geneva, 53 miles distant, through the valley of the Arve. It is enclosed by Mont Blanc and the Aiguilles Rouges and Mont Breven. The glaciers Mer de Glace and Argentière are the most remarkable in Switzerland. This beautiful vale, now visited by innumerable travellers each summer, was scarcely known until it was explored and described by the Englishmen Pococke and Wyndham in 1740. Many peculiar plants grow in the valley, and furnish a remarkably rich-flavored honey. In 1099 a Benedictine monastery was established at the village Chamonix or Prieuré. In early times this region was known as *Les Montagnes Maudites*—a name still retained for the roughest part between the Dome of Mont Blanc and the Mer de Glace.

Champagne, a former province in the N. E. part of France, was bounded on the E. by Lorraine and on the S. by Burgundy. It was drained by the Marne, Seine, Aube, and other rivers. It is now mostly comprised in the departments of Marne, Aube, Ardennes, Haute-Marne, and Yonne. The surface is diversified with plains and hills, on which latter is grown the famous Champagne Wine (which see). In the twelfth century Champagne was independent or governed by native princes. Thibaud, count of Champagne and king of Navarre, who died in 1253, was the most powerful feudatory of the French king. By the marriage of Philip IV. of France with Joanna, the heiress of the king of Navarre about 1285, Champagne was annexed to France.

Champagne Wine, a name applied to wines of vari-

ous kinds, white or red, still or sparkling, which are produced in Champagne. Of these the sparkling and foaming varieties (*vin mousseux* and *demi-mousseux*) are best known. After the vintage-season this wine stands till December, is then racked off, and fined or purged with isinglass; in the following March it is bottled and corked with care, the bottles being placed with the corks downward, so that the sediment may be drawn off. When this has been removed, some brandy and sugar are introduced, and the bottles are recorked. While this process is going on the breakage of bottles is often very great, and buyers estimate the value of the wines partly by the breakage—the best wines breaking the most bottles.

Even in France, but still more in other countries, a very large part of the so-called champagne wine is factitious, being made of cider, light Rhenish and other cheap wines, and other substances. Happily, in most cases these preparations are quite as harmless, and often quite as palatable, as the genuine product of the Champagne vineyards; for some of the imitations are nearly perfect representatives of the appearance, taste, and bouquet of the original article.

Champagne wine is prized in medicine as a restorative in certain low conditions, especially when the stomach is very irritable and will hardly tolerate any other stimulant, the carbonic acid present acting as a sedative to that organ.

Champagnolle, a township of Calhoun co., Ark. Pop. 505.

Champaign', a county in the E. of Illinois. Area, 1000 square miles. It is drained by the Sangamon and Vermilion Rivers. The surface is nearly level; the soil is deep and very fertile. A large proportion of the county is prairie. Live-stock, grain, wool, tobacco, and dairy products are extensively raised. Its manufactures are of growing importance, those of carriages, lumber, and flour being at present the largest. It is intersected by the Central, the Indianapolis Bloomington and Western, and the Toledo Wabash and Western R. Rs. Capital, Urbana. Pop. 32,737.

Champaign, a county in the central part of Ohio. Area, 390 square miles. It is intersected by Mad River. The surface is partly undulating, and in some parts nearly level; the soil is highly productive. Cattle, grain, wool, and dairy products are the most important staples. The manufactures are increasing in extent, those of flour, lumber, and carriages being at present the largest. It is traversed by the Atlantic and Great Western, the Pittsburg Cincinnati and St. Louis, the Cleveland Columbus Cincinnati and Indianapolis, and the Cincinnati Sandusky and Cleveland R. Rs. Capital, Urbana. Pop. 24,188.

Champaign, a city and township of Champaign co., Ill., on the Chicago division of the Central R. R., 128 miles S. S. W. of Chicago, and on the Indianapolis Bloomington and Western R. R., 48 miles S. E. of Bloomington, and is favorably situated in the midst of a fertile agricultural district. There is a finely improved park of ten acres in the place. Street-cars connect it with Urbana, the county-seat, 2 miles E. The public library contains about 1000 volumes. There are four banks, eleven churches, three public-school buildings, a young ladies' seminary, and three newspapers. It has increased rapidly in the last decade. Pop. 4625, or, including the township, 5335. Ed. Champaign County "Gazette."

Cham'pak, or **Chum'pac** (*Michelia Champaca*), an East Indian tree remarkable for the beauty of its flowers and foliage. The flowers are of a pale yellow tint, and have a sweet, oppressive perfume, much celebrated in Oriental poetry, and alluded to in the writings of Shelley. This tree is venerated by the Brahmans and Booddhists.

Champ de Mars, a large oblong park or public square in the environs of Paris, between the Seine and the Military School. It is devoted to military exercises and public gatherings, and was the site of the temporary buildings of the Exposition of 1867. Its name has a double reference to the *Campus Martius* of ancient Rome and other Italian cities, and to the old Frankish field-meetings for legislative and other purposes, held annually in March or May, and historically known as *Champs de Mars* or *de Mai*.

Champeaux (William of). See Guillaume de Champeaux.

Cham'perty [remotely from the Lat. *campi pars*, "part of the field"], in law, is the act of aiding a person in the prosecution of a lawsuit or other legal proceeding, with an agreement to share in the proceeds of the litigation or to make some profit from it. It is distinguished from "maintenance," in which there is no such element of gain. The two acts are, however, closely allied, and governed by substantially the same principles. Champerty may present itself either in the civil or criminal law. Criminal proceedings are not frequently prosecuted against champertors, as they scarcely accord with existing public opinion. The topic is of most importance in the civil law. A contract affected by champerty is usually void, though sometimes this rule is modified by statute. It was a doctrine of the English common law, based on this general idea of opposition to champerty, that a right of action cannot be assigned. This proposition has long been discarded in equity courts, both in England and America, and the assignee has been regarded as a beneficiary, and the assignor as a trustee, so that an action can only be brought in a common-law court in the name of the assignor. This mere formality has been abolished in a number of the American States under the lead of the legislation of New York, and the assignee is now permitted to sue in his own name. The old doctrine has been wholly swept away in England during this year (1873), and the assignee is now declared to have the title both in law and equity, acquiring, however, in substance the same rights as before in equity. Accordingly, the assignee can there sue in his own name, and in general act as legal owner (36 and 37 Vict., ch. 66, § 25). There has not been a disposition to extend the doctrine of assignability to pretended titles to land. Should an owner who has been evicted from his land by one claiming title assume to transfer it, the act would be void. This doctrine is recognized in a considerable number of the American States; and even in New York, under the legislation already referred to, the assignee in this case cannot acquire a right to sue in his own name. This doctrine is in part grounded on the opinions of an English statute passed in the time of Henry VIII., and recognized here. The doctrines of champerty would prevent an attorney from entering into an agreement with his client to receive a portion of the subject in litigation as a compensation for his services. This rule has been changed in a number of the American States by legislation, though even there it might be considered as illegal for an attorney to take an assignment of a claim with a view to its prosecution. The rules of the ancient law on this subject would seem to be giving way, and the modern view would seem to tend to allow freedom to deal in rights of action as well as in tangible property. In the progress of time it is probable that scarcely any trace of the old law will remain, except so far as to prohibit attorneys from purchasing claims with intent to collect them, and to prevent combinations or conspiracies to promote litigation, which should be dealt with in the same manner as other conspiracies are treated. (See Maintenance.)

T. W. Dwight.

Champfleury, the assumed name of Jules Fleury, a French author, chief of the realistic school, born Sept. 10, 1821. He was a companion of Mürger, Dupont, and De Banville, and produced in 1847 "Chien-Caillu," immediately pronounced by Victor Hugo a chef d'œuvre. Among his numerous works are "Les Excentriques" (1852), "Aventures de Mariette" (1853), and "Les Bourgeois de Molinchart" (1854).

Champigny, a village near Paris, France, on the Marne, was on Nov. 30 and Dec. 2, 1870, the scene of protracted and bloody encounters between the French troops under Ducrot and the Germans. On Dec. 3 the French recrossed the Marne.

Cham'pion [from the Lat. *campus*, a "field" of battle], a person in the Middle Ages, and even in more recent times, who appeared and took part in judicial combats (see Battel) as the hired representative of women, children, feeble persons, and other non-combatants. The practice was of very ancient origin, but the occupation of the professional champion came to be looked upon as very disreputable. In the more romantic periods of chivalry, however, knights and gentlemen might contend, especially with those of their own rank, in behalf of injured ladies and children, and were called champions. The crown of England since the time of William the Conqueror has had a champion at coronations—a mounted yeoman, armed to the teeth, who challenges all who deny the king to be the true sovereign.

Champion, a post-village and township of Jefferson co., N. Y., about 15 miles E. of Watertown, and on the Utica and Black River R. R. Pop. of the township, 2156.

Champion, a township of Trumbull co., O. Pop. 820.

Champion Hills, Hinds co., Miss., about midway between Jackson and Vicksburg, the scene of a desperate struggle May 16, 1863. The forces under Gen. Grant were marching from Jackson, Miss., towards Vicksburg, when they were met at this point by a Confederate force under Gen. Pemberton. A desperate battle of five hours' duration ensued, the Confederates being forced to retire to the Big Black River. The Confederate loss was heavy in men and artillery. The battle was mainly fought on the side of the U. S. forces by Hovey's division of McClernand's, and Lo-

gan's and Crocker's division of McPherson's corps, which suffered heavily in killed and wounded. This battle is also known as that of Baker's Creek.

Champlain', a county of Canada, in Quebec, is bounded on the S. E. by the St. Lawrence, and intersected by the river St. Maurice. Among its products are oats, flax, and maple sugar. Cap. Ste. Geneviéve. Pop. in 1871, 22,052.

Champlain, a post-village of Champlain co., Quebec (Canada), on the N. side of the St. Lawrence, 75 miles above Quebec. It has a lighthouse. Pop. about 400.

Champlain, a post-village of Clinton co., New York, on the Chazy River and on the Ogdensburg and Lake Champlain R. R., about 20 miles N. of Plattsburg. It has a national bank, a newspaper, and manufactures of iron, etc. Pop. 1850. Champlain township is on Lake Champlain, at its N. extremity. It contains four villages—Champlain, Perry's Mills, Cooperville, and Rouse's Point. Pop. 5080.
A. N. Merchant, Prop. Champlain "Journal."

Champlain (Samuel), a French navigator and pioneer, the founder of Quebec, was born at Brouage, in France, about 1570. He made a voyage to Canada in 1603, and soon returned to France. In 1608 he ascended the river St. Lawrence to the site of Quebec, where he planted a colony. He discovered Lake Champlain in 1610, after which he passed several years in Canada. He was appointed governor of Canada in 1620. He wrote several narratives of his voyages. Died at Quebec in 1635.

Champlain, Lake, forms part of the boundary between New York and Vermont, and extends from Whitehall, N. Y., northward to Canada. It is about 125 miles long, and is narrow in proportion to its length. The southern half averages less than two miles wide, and in many places is less than a mile. In the northern part, where large islands occur in it, the width is ten miles or more. The greatest depth is about 280 feet. The water of this lake is discharged by the Sorel or Richelieu River, which issues from its N. extremity. The chief towns on its shores are Burlington and Plattsburg. Occupying a basin between the Adirondacks and the Green Mountains, this lake is remarkable for its beautiful and picturesque scenery. Numerous steamboats ply daily between Whitehall and Canada in the summer. A naval battle was fought on Lake Champlain between Gen. Arnold and the British Oct. 13, 1776, in which the latter had the advantage. Sept. 11, 1814, Com. McDonough gained an important victory over the British fleet near Plattsburg. This lake is connected with the Hudson River by the Champlain Canal.

Cham'plin, a post-township of Hennepin co., Minn. Pop. 292.

Champlin (James Tift), D. D., born in Colchester, Conn., June 9, 1811, valedictorian of the class of 1834 Brown University, where he was tutor 1835–38. From 1838 to 1841 pastor of Baptist church Portland, Me.; from 1841 to 1857 professor of ancient languages in Waterville College (now Colby University); from 1857 to 1872 president of that institution. During his connection with the college (which contributed greatly to its prosperity) Dr. Champlin published an edition of "Demosthenes on the Crown" (1843), "Demosthenes' Select Orations" (1848), "Æschines on the Crown" (1850), "A Text Book on Intellectual Philosophy" (1860), "First Principles of Ethics" (1861), "A Text Book of Political Economy" (1868), besides other works which are in less general use.

Champlin (Gen. Stephen G.) entered the U. S. service at the outbreak of the late civil war as major of the Third Michigan Volunteers, was severely wounded at Fair Oaks, became a brigadier-general of volunteers in 1862, and took part in the battles of Antietam and Fredericksburg. Died Jan. 29, 1864.

Champ'ney (Benjamin), artist, born at New Ipswich, N. H., Nov. 20, 1817, practised lithography in Boston, and studied art in Europe, which he visited several times. He has painted many landscapes of the Alps and the White Mountains.

Champney (James Wells), a genre painter, born at Boston, Mass., July 16, 1843, practised wood-engraving and designing, served for a time as a volunteer in the late civil war, taught drawing for some years, practised painting in Europe four years, and returned to the U. S. in 1870.

Champollion (Jean François), a celebrated French linguist and Egyptologist, born at Figeac (Lot) Dec. 23, 1790. He studied several Oriental languages in Paris, and became in 1809 professor of history in the academy of Grenoble. In 1814 he published a "Geographical Description of Egypt under the Pharaohs." From the inscriptions on the Rosetta Stone he obtained a key to the mysterious symbols and hieroglyphics of ancient Egypt. His reputation is founded chiefly on this important discovery, which he announced to the Academy of Inscriptions in 1822. In 1824 he published a "Summary of the Hieroglyphic System of the Ancient Egyptians," in which he proves that the phonetic alphabet is the key to the whole hieroglyphic system. In 1828 he visited Egypt, the monuments of which he explored in company with Rosellini. Having spent sixteen months in Egypt, he returned home, and was admitted into the Institute in 1830. A chair of Egyptian antiquities was founded for him in the College of France. He died Mar. 4, 1832. Among his chief works (published after his death by his brother Jean Jacques) are an "Egyptian Grammar" (1836–41) and an "Egyptian Dictionary" (1842–44). The results of the researches of Champollion and Rosellini in Egypt appeared in a great work entitled "Monuments of Egypt and Nubia considered in Relation to History, Religion, etc." (4 vols., 1835–45). Bunsen expressed the opinion that his discovery of the art of deciphering the hieroglyphics was the greatest discovery of the century. (See Silvestre de Sacy, "Notice sur Champollion," 1833; Rosellini, "Tributo di Riconoscenza alla Memoria di G. F. Champollion," 1832.)

Champollion-Figeac (Jean Jacques), a French antiquary, a brother of the preceding, was born at Figeac in 1778. He published, besides other works, "Chronicles of the Greek Kings of Egypt" (1819), a "Treatise on Archæology" (1843), and "Paleographic Documents Relating to the History of Fine Arts and Belles Lettres in the Middle Ages" (1868). He became in 1849 librarian to Louis Napoleon. He edited some posthumous works of his brother. Died May 9, 1867.

Chanahatch'ee, a post-township of Elmore co., Ala. Pop. 1095.

Chance [from the late Lat. *cadentia*, a "fall" or "throw" of the dice], a word popularly used to denote that which happens without special causation or evident design; a convenient term which does not, however, correspond to the real facts of any supposable case. To the religious mind the idea of chance is objectionable, as not harmonizing with the doctrine of the Divine providence; to the philosopher it is equally objectionable, as being inconsistent with the uniform operation of natural laws. The word as used in the expression "theory of chances" is simply synonymous with Probability (which see).

Chanceford, a post-village and township of York co., Pa., about 40 miles S. E. of Harrisburg and 6 from the Susquehanna River. Total pop. 2501.

Chan'cel [from the Lat. *cancelli*, "lattice-work"], the part of a church where the altar or communion-table is placed, or the portion of a church occupied by the clergy, and usually separated from the nave by a screen of lattice-work. The chancel of Gothic churches corresponds in position to the apsis of the ancient basilicas. In England the term chancel is usually confined to parish churches which have no aisles or chapels around the choir.

Chancellor, a township of Spottsylvania co., Va. Pop. 1446.

Chan'cellor [Lat. *cancellarius;* Fr. *chancelier;* Ger. *Kanzler*], the title of a civil officer of high rank in several countries. The cancellarius was a notary or scribe under the Roman emperors. The chancelier of France was for several centuries one of the most powerful ministers of state and keeper of the seal. His office was abolished about 1790, and the functions of chancellor were transferred to the minister of justice. In the new German empire, established in 1871, the Kanzler is one of the chief functionaries, and Prince Bismarck now holds the office. The British cabinet always includes two ministers of state, called respectively chancellor of the exchequer and lord chancellor. The former acts as minister of finance (see Exchequer), and the latter is keeper of the great seal. (See Chancellor, Lord High.)

Chancellor of a University is the chief officer of a collegiate institution, sometimes elected for a term of years, and sometimes for life.

Chan'cellor, an American law officer in some of the American States who has the powers of a court of equity, and whose proceedings are based on the practice and jurisdiction of the English court of chancery. In other States jurisdiction in law and equity is vested in the same court, as in the State of New York, where the supreme court has this compound jurisdiction.

Chancellor, The Lord High, an officer in England who presides over the high court of chancery, and who also has various special powers of a legal nature. He is also prolocutor of the House of Lords. His office is conferred upon him by the delivery of the great seal. There may also be an officer termed "the lord keeper of the great seal," whose functions are substantially the same. The duties of the office are sometimes discharged by commissioners, instead of by a single person, when the great seal

is said to be "in commission." Some of the powers of the chancellor are in that case, by statute, exercised by the senior commissioner. The judicial powers of the chancellor are considerably changed by 36 and 37 Vict., ch. 66, which goes fully into effect on Nov. 2, 1874. After the chancellor then in office ceases to hold it the duties attached to it will be principally of an appellate character, the chancellor becoming president of "Her Majesty's court of appeal," which tribunal will exercise the appellate powers at present vested in the House of Lords and in the judicial committee of the privy council. (See Foss, "Judges of England." CAMPBELL'S "Lives of the Lord Chancellors," and BLACKSTONE'S "Commentaries," for further information.) The chancellor of the duchy of Lancaster may also be referred to in this connection. He has a jurisdiction in certain matters of equity resembling that exercised by the lord chancellor, though not so general in its nature.

Chan'cellorsville, a small village of Spottsylvania co., Va., near the Rappahannock River, about 65 miles N. by W. from Richmond.

On assuming command of the Army of the Potomac, Jan., 1863, Gen. Hooker found it in a weakened and despondent condition; its numerical force had been greatly decreased by sickness and desertions, which latter were still frequent. On the contrary, the recent successes of the Confederates had inspired them with boldness and enthusiasm. Hooker devoted the remaining winter months to repairing the demoralized condition of his army, and gathering back those away from duty; his efforts were so far successful that by April he had not only restored confidence, but by additions found himself in command of a well-equipped army of upwards of 132,000 men, composed of (about) 120,000 infantry and artillery, and the remainder cavalry, encamped around Falmouth, Va. The Confederate army under Lee, still encamped on the opposite bank of the Rappahannock, held a line running north-east to south-west, its right wing extending to Port Royal on the Rappahannock, its left wing resting about two miles above Fredericksburg on the same river; thus affording only two lines of retreat—one to Richmond, the other to Gordonsville. Its strength was probably upwards of 60,000 men.

Everything being in readiness, Hooker decided to move at once upon Lee. The larger portion of the cavalry was placed under Gen. Stoneman, and (April 13) despatched in advance of the main army for the purpose of destroying the Confederate communications and harassing the retreat which it was deemed must result from the contemplated advance. Owing to frequent rains, which swelled the rivers, Stoneman did not get fairly away till the 27th, and Hooker gave orders for his general movement to commence the next day.

Gen. Hooker's plan of attack was as follows: His army was divided into seven corps—of these three were to be massed about two miles below Fredericksburg, to cross there and make a bold feint, two of the corps to immediately return and join Hooker; in the mean while the remaining four corps were to cross above Fredericksburg.

This plan was successfully executed. The 1st Corps (Reynolds), 3d (Sickles), and 6th (Sedgwick), all under command of Sedgwick, were moved on the 28th to the position assigned them, and on the 29th one division of the 6th crossed the river about two miles below Fredericksburg and drove in the pickets; a division of the 1st crossing about two miles lower down; the other divisions, with the 3d Corps, remaining on the north bank in plain view of Lee's army, whose columns were soon seen coming up from Port Royal. On the 30th, Sickles silently withdrew his corps and proceeded to join Hooker. In the mean while the crossing of the Rappahannock above had been going on; the 11th Corps crossed first (28th), followed by the 12th, then the 5th (29th); this column moved along, crossed the Rapidan at Germanna and Ely's Ford; both columns then advancing towards Chancellorsville, at the junction of the Gordonsville turnpike with the Culpeper and Orange C. H. plank road. By the evening of the 30th the 2d Corps (two divisions) had crossed and were massed at the same point, and Gen. Hooker had arrived and taken up his headquarters at Chancellorsville. Lee though thus far outgeneraled appears to have been undismayed, and quickly realizing the movement below to be a feint, concentrated his army in front of Hooker, leaving but a small force in his works on the Fredericksburg heights.

Reconnaissances having been made by Hooker on Friday morning (May 1) towards Fredericksburg without opposition, an advance of the 5th and 12th Corps was ordered to be made on two roads leading towards Fredericksburg, which was soon met by the Confederates; a favorable position had been secured, however, when orders were received from Gen. Hooker to fall back to the inferior one of the night before. The right of Hooker's army was held by Howard (11th Corps), then a division of Sickles (3d Corps), who had now arrived from below, then Slocum (12th Corps), Couch (2d Corps), with Meade (5th Corps) on the left. The other divisions were held in reserve.

During the night and on Saturday a movement of Confederates was observed along Sickles' front and in direction of our right, which being continued Birney (in command 1st div. 3d Corps) reported to Sickles, who received orders to make a reconnaissance in force and ascertain the nature of the movement, which being promptly executed struck the rear of the advancing column, capturing many prisoners, from whom the intelligence was gained that the movement was under command of Stonewall Jackson. Up to this time the movement had been interpreted as a retreat, but in anticipation of its purpose being a flank attack, Howard had been notified of the fact, and ordered to be on the alert. Sickles now obtained permission to move in force upon the flank of the advancing column, and being reinforced by a brigade from the 12th and one from the 11th Corps, together with 1000 cavalry and a horse-battery under Pleasonton, had completed his preparations, when informed that Jackson had struck his blow and was in his rear. Although not entirely unanticipated, it was believed the attack on the right would be resisted; but, being surprised, Devens' division gave way, followed by that of Schurz, and though Burbeck's brigade gallantly resisted, it was finally compelled to fall back, and the woods now swarmed with the fugitive corps, closely pursued by the victorious Confederates, and the position of Sickles was critical; but fortunately, at this moment, Pleasonton, returning from the front with about 500 cavalry, and comprehending the disaster, ordered the 8th Pennsylvania to charge into the woods, while he hastily got his own battery and such other guns as he could stop, twenty-two in all, into position, double shotted them, and aiming low was just in time to receive the enemy, who, having overcome the slender opposition of the cavalry, now rushed furiously and repeatedly right up to the guns, but were each time repelled with great loss; and the further advance in this direction was finally stayed. Meantime, Berry's division (3d Corps), with Hays' brigade (2d Corps), and the artillery under Captain Best, though unable to check the flying troops of the 11th Corps, had, after a severe contest, checked the advance in front. It was during this attack that Stonewall Jackson was mortally wounded—at the hands of his own men, it is said—the greatest loss the South had yet been called upon to bear.

During the day Lee kept up a vigorous attack in front of Hooker, especially along Hancock's line, but was always handsomely repulsed by the troops in the advanced line of rifle-pits. During the night Hooker contracted and reformed his lines. The 1st Corps (Reynolds) arrived during the evening, and was posted on the right with Meade; the 11th Corps, which had been reorganized, was placed in the intrenchments on the left.

At daylight the attack was renewed, the Confederates opening a musketry fire along the whole line; but the great effort was in the same direction as the day before, the possession of the plank road to Chancellorsville; and here they met the same troops which had sustained and repelled their assaults of the day before. Berry's and Birney's divisions (3d Corps), supported by Whipple's (3d) and Williams' (12th Corps), supported the artillery of Sickles, against which the Confederates threw themselves again and again, only to be cut down and hurled back, until Sickles for want of ammunition was compelled to retire to a second line. Sickles had before retiring sent for assistance to enable him to hold his position; but Hooker, who had been stunned by a ball which struck a pillar against which he was leaning, was unconscious at the time, and his appeal was unanswered. French and Hancock of the 2d Corps had done gallant work in charging and driving back the Confederate left; but Sickles was not reinforced; yet though his ammunition was exhausted he continued to maintain his position, repelling successive charges at the point of the bayonet till he was again compelled to retire, and the whole line was now withdrawn a mile back from Chancellorsville, which position was strongly fortified.

Sedgwick meanwhile (May 2) had received orders to cross the Rappahannock and advance on Chancellorsville until he should come up with the rear of Lee's army, which he was to attack simultaneously with Hooker's attack on the front. This order was not received by Sedgwick till nearly midnight, but he soon had his corps in motion, and by noon had stormed and carried Cemetery and Marye heights, and after reforming his command moved on the road to Chancellorsville; but he was soon met by the force he had driven from the heights, reinforced by a portion of the army of Lee, who being now disengaged from Hooker

turned to check Sedgwick's advance; severe fighting continued till dark Sedgwick being unable to force the confederates from the strong position they had taken; the chance of joining Hooker was now small and the next day made it impossible, for the army of Lee now concentrated against him in large numbers forcing him by night time across the river at Bank's ford he having rescued his corps from its critical position by desperate fighting but with fearful loss.

On the 5th Hooker recrossed his whole army over the Rappahannock without opposition and the terrible struggle was ended. The losses on the Union side, 18,000; Confederate, 13,000.

Stoneman returned on the 8th having been nine days in the rear of Lee's army, and had advanced to within two miles of Richmond but his operations conferred no benefit to the Federal army.

Chance-Medley, in law, the killing of a person in self-defence upon a sudden and unpremeditated encounter or a casual affray.

Chancery, Court of. See COURTS, by GEORGE CHASE, LL.B.

Chan'da, or **Chandah,** a town of Hindostan, on the Upper Godavery, 105 miles by the Peninsular Railway S. of Nagpoor. High stone walls flanked with round towers enclose a space seven miles in circuit, occupied by houses, plantations, and a citadel.

Chandâl'a, the name given in India to a member of the lowest of all the impure classes. (See CASTE.)

Chandeleur Islands, a range of low islands in the Gulf of Mexico, off the E. coast of St. Bernard's parish, La., separating Chandeleur Sound from the Gulf. The sound has also numerous small islands. At the N. end of the northernmost island stands Chandeleur lighthouse, in lat. 30° 3′ 8″ N., lon. 88° 51′ 38″ W. It is built of brick, and is 56 feet high, with a fixed white light.

Chan'deree', a decayed town of India, in Malwah, near the river Betwa, about 110 miles S. of Gwalior. Here is a hill-fort which was formerly deemed impregnable. The ruins seen here indicate former splendor and importance.

Chandernagore, a French town in India, on the river Hoogley, about 20 miles above Calcutta; lat. 22° 50′ N., lon. 88° 23′ E. It was founded by the French in 1676, and for some time rivalled Calcutta, but it is now decaying. It was taken by Lord Clive in 1757, and restored to the French in 1816. Pop. 28,512.

Chand'ler, a township of Manitou co., Mich. P. 190.

Chandler (ABIEL), born at Concord, N. H., Feb. 26, 1777, graduated at Harvard in 1806, taught school eleven years, and became a successful merchant of Boston, Mass. He died at Walpole, N. H., Mar. 22, 1851, and left $50,000 to found the scientific school connected with Dartmouth College, and bequeathed a considerable sum to the New Hampshire Insane Asylum.

Chandler (Prof. CHARLES FREDERICK), PH. D., M. D., LL.D., was born at Lancaster, Mass., Dec. 6, 1836, was educated at the Lawrence Scientific School of Harvard College, at Göttingen, and Berlin, and received the degree of doctor of philosophy in Göttingen in 1856. In 1857 he took charge of the chemical department of Union College at Schenectady, N. Y. In 1864 he was appointed professor of analytical and applied chemistry in the School of Mines of Columbia College, about to be organized in New York, which position he still holds. In 1858 he was appointed to the chair of chemistry in the New York College of Pharmacy, and in 1872 a portion of the duties of the chair of chemistry in the College of Physicians and Surgeons was assigned to him. In 1865 he became chemist to the metropolitan Board of Health, which position he retained till 1873, when he was appointed president of the board. In the same year he received the degrees of M. D. from the University of New York and LL.D. from Union College. In 1869 he was elected a member of the Chemical Society of Berlin, in 1871 of London, in 1872 of Paris. In 1870 he established, with his brother, Prof. W. H. Chandler of the Lehigh University of Bethlehem, Pa., the "American Chemist," a monthly journal devoted to chemical science. Though chiefly devoted to the work of instruction, he has published a number of papers on chemical subjects, among which are "The Inaugural Dissertation," Göttingen, 1856, containing miscellaneous chemical researches; "Report on Waters for Locomotives and Boiler Incrustations," 1865; "Examinations of Various Rocks and Minerals," published in the geological reports of Iowa and Wisconsin; "Investigations on Numerous Mineral Waters of Saratoga, Ballston, Chittenango," etc., and of various waters designed for the supply of cities; as well as papers on the purification of coal-gas, on petroleum, and on milk. Most of these papers have appeared in the "American Chemist" and in the annual reports of the health department of New York.

Chandler (JOHN), born in what is now Monmouth, Kennebec co., Me., then a part of Massachusetts, in 1760. He was the son of parents in the most humble circumstances, and although apprenticed to learn the trade of a blacksmith, he became afterwards, by his own industry and perseverance, very wealthy. On the outbreak of war with Great Britain in 1812, he was commissioned a brigadier-general, being at that time a major-general of militia. He represented his district in Congress from 1805 to 1808, and was U. S. Senator from Maine from 1820 to 1829. Died at Augusta, Me., Sept. 25, 1841.

Chandler (JOSEPH R.), a distinguished philanthropist and diplomat, born in Kingston, Mass., in 1792. He was for several years a member of Congress from Philadelphia, where he was a lawyer and journalist, and was U. S. minister at Naples at the time of the expulsion of the Bourbon monarchy (1858–61).

Chandler (RALPH), U. S. N., born Aug. 23, 1829, in the State of New York, entered the navy as a midshipman Sept. 27, 1845. He served on the W. coast of Mexico during the Mexican war, and participated in several slight engagements with the enemy near Mazatlan. In the sloop-of-war Vandalia at the battle of Port Royal, Nov. 7, 1861, commanded the steamer Maumee in both attacks on Fort Fisher, and was recommended for promotion by Rear-Admiral Porter. FOXHALL A. PARKER, U. S. N.

Chandler (RICHARD), an English antiquary and traveller, born in Hampshire in 1738. He explored Asia Minor and Greece in company with the artists Revett and Pars in 1763–66. They published in 1769 "Ionian Antiquities, or Ruins of Famous Buildings in Ionia." Chandler was the author of "Travels in Asia Minor" (1775) and "Travels in Greece" (1776), which are highly esteemed. Died in 1810.

Chandler (ZACHARIAH), born at Bedford, N. H., Dec. 10, 1813, became U. S. Senator from Michigan in 1857; was twice re-elected. He has been a very successful merchant.

Chand'lerville, a post-twp. of Cass co., Ill. P. 1047.

Chan'dore, a fortified town of British India, in the presidency of Bombay, is on a hill-range, and commands an important pass about 130 miles N. E. of Bombay. It was taken by the British in 1804. Pop. about 7000.

Chand'poor', a town of British India, in the North-west Provinces, about 75 miles N. E. of Delhi. P. 12,000.

Chang and Eng. See ENG AND CHANG, by PROF. ABRAHAM JACOBI, M. D.

Changarnier (NICOLAS ANNE THÉODULE), a French general, born at Autun April 26, 1793. He served with distinction in Algeria, to which he went in 1830, became a colonel in 1838, and a general of division in 1843. In May, 1848, he was appointed governor-general of Algeria, but before the end of the year he obtained the command of the national guard at Paris and of the first military division. He became a member of the National Assembly in 1849, but continued to command the army or garrison of Paris until 1851. At the *coup-d'état* of Dec. 2, 1851, he was arrested and confined for a short time. He afterwards passed many years in exile. After the outbreak of the Franco-German war he offered his services to the emperor, and although he did not receive a command, he took a leading part in the defence of Metz, and signed, with Bazaine and other generals, the capitulation.

Chang-Chau-Foo, a city in China, in the province of Fo-Kien, 25 miles N. W. from the port Amoy, on a tributary of the Kian-Long-Kiang. The city is surrounded by a wall four and a half miles in circumference. The entrance is over a bridge 780 feet in length, with twenty-two water-passages. In the city is a magnificent Booddhist temple built in the eighth century, which has two towers of seven stories. The streets are unusually broad, and are adorned with fine shops, ornamented arches, and trees. The inhabitants are amiable. There is a considerable manufacture of silk, besides sugar, mirrors, crystal, and quicksilver. The exports consist mostly of tea, sugar, porcelain, and paper. Pop. 1,000,000.

Chang-Choo-Foo, a large city of China, province of Kiang-Soo, 75 miles S. E. of Nankin; lat. 31° 55′ N., lon. 121° 43′ E.

Chang-Sha', a city of China, capital of the province of Honan, on the river Heng-Kiang, about 360 miles N. of Canton.

Chanhas'sen, a township of Carver co., Minn. Pop. 1084.

Chank Shell, the popular name of the shell of several species of *Turbinella*, a genus of gasteropodous mollusks, natives chiefly of the Indian and Pacific oceans. These shells are worn as ornaments by Hindoo women, and some specimens are said to be valued at £100 sterling. More

than two million of them have been exported from Madras in one year. Some of them are used as medicine-cups, and are held sacred.

Chan'nahon, a township and post-village of Will co., Ill., 35 miles E. N. E. of Ottawa and 45 miles S. W. of Chicago. Pop. 1164.

Chan'nel, a port of entry in Newfoundland, is the most western town of any importance in that island. The cod and halibut fishery is carried on here. It is connected by steamers with St. John's, 300 miles distant. It has considerable trade. Pop. 584.

Chan'nel Isl'ands, a group of islands off the N. W. coast of France, belonging to Great Britain, but governed by their own laws. They are the only parts of the dukedom of Normandy now belonging to the English crown. King John in 1204 lost all the rest. The chief islands of the group are Jersey, Guernsey, Alderney, and Sark. The area of the whole is 73 square miles. Pop. in 1871, 90,563.

Chan'ning (Edward Tyrrel), LL.D., an American scholar, born at Newport, R. I., Dec. 12, 1790. He was one of the founders of the "North American Review," to which he contributed many critical and biographical articles. He became professor of rhetoric at Harvard in 1819, and retained that position nearly thirty-two years. Died Feb. 8, 1856.

Channing (Walter), M. D., an American physician, a brother of the preceding, was born at Newport, R. I., April 15, 1786; studied medicine in Edinburgh, and began its practice in Boston in 1812; was professor of obstetrics and medical jurisprudence at Harvard from 1815 to 1854, and published several works. D. at Boston July 27, 1876.

Channing (William Ellery), D. D., eminent alike in the Unitarian ministry and as one of the first of American writers, was born at Newport, R. I., on the 7th of April, 1780. The surroundings of his childhood and early youth seem to have favored the early development of that spirituality and moral dignity which marked his character in after life. He entered Harvard in 1794, where he graduated in 1798 with the highest honors. The oration delivered by him on this occasion was received by the audience with tumultuous acclamations. Soon after this, while living in Richmond, Va., in the capacity of tutor, the evils of slavery seem to have impressed him most painfully: at this time also he writes in a letter (showing that he already looked forward to entering the ministry), "Religion is the only treasure worth pursuing. I consider the man who recommends it to society as more useful than the greatest sage and patriot who adorns the page of history." In the summer of 1800 he returned by sea to Newport, and to the hardships he endured on that voyage may be ascribed the permanent indisposition with which he had to contend during all his after life. In 1802 he took the position of regent at Harvard, meantime continuing his theological studies. In 1803 he became pastor of the Federal Street church in Boston. As a preacher he attained at once a brilliant distinction, and he was soon recognized as standing in the foremost rank of the Unitarian ministry, both as respects eloquence and personal influence. In 1814 he delivered, on the fall of Napoleon, what is perhaps the finest of all his efforts as an orator—viz. a discourse on "The goodness of God in delivering the Christian world from military despotism." In 1820 Harvard College conferred upon him the degree of doctor of divinity. In 1822 he visited Europe, and while in England made the acquaintance of Wordsworth, Coleridge, and many others. The rare sweetness and earnestness of his character caused Coleridge to say of him, "He has the love of wisdom and the wisdom of love." He was deeply interested in the peace movement, to which he lent his support, without, however, taking the extreme ground of entire non-resistance. His "Remarks on the Life and Character of Napoleon Bonaparte," which appeared in the "Christian Examiner" in 1828, probably contributed more than any other of his writings to carry his fame into all civilized countries. Perhaps the greatest of his theological discourses is that on the "Evidences of Christianity," delivered in 1821 at Harvard; the subject has seldom, if ever, been more admirably treated. He gave his earnest sympathy to the anti-slavery and temperance movements, and his last public discourse was in commemoration of the abolition of slavery in the British West India Islands. He died Oct. 2, 1842, and was buried at Mount Auburn.

Channing's range both of thought and study was very large, and he appears to have possessed in an eminent degree that comprehensive sympathy which belongs only to great and gifted natures. He was averse to controversy, fearing to be led or to lead others away, by the excitement of such discussions, from the simple quest of truth. He appears to have been, moreover, most anxious not to bias the convictions of others by his personal influence or by his eloquence, but to leave every mind in the enjoyment of absolute freedom. So deep, indeed, was his sense of the sacredness of the human mind and conscience, that he was unwilling to force them even with the power of irresistible persuasion. He sought, above all, to teach the love of truth, and desired not so much that others should accept his opinions or convictions as that they should be perfectly true to their own.

It has been said, by a writer in "Fraser's Magazine," "Channing is unquestionably the finest writer of the age." His style is always forcible, clear, and elegant, and it often rises into graceful and lofty eloquence. "I do not believe," says Dr. Peabody, "there is a line in all his writings which ever received a different coloring from any thought of its influence on his own reputation. . . . He wrote not for himself, but as one dedicated to truth." His works have been collected in six 12mo volumes, published in Boston (1848), and again in crown 8vo (London, 1855). Some of his writings have also been translated into French and German. (See "Memoirs," by his nephew, W. H. Channing, 1848.)

J. Thomas.

Channing (William Ellery), a son of Dr. Walter Channing, born June 10, 1818, has been connected with various journals, has published several volumes of poems, and has written in prose, "Thoreau, the Poet-Naturalist" (1873), and "Conversations in Rome."

Channing (William Henry), a Unitarian minister, a nephew of William E. Channing, was born in Boston May 25, 1810. He graduated at Harvard in 1829, and preached in the cities of New York, Boston, Cincinnati, and Liverpool, England. He contributed to the "North American Review," and published, besides other works, a "Memoir of William Ellery Channing" (3 vols., 1848).

Chant [from the Lat. *cantus*, a "song;" Fr. *chant;* It. *canto*], a name originally given to plain vocal music, especially to such as was used in Christian congregations. It is now limited to such musical compositions as are sung to words which are not metrical, or if metrical words are used, the verbal cadences are not observed in the music. St. Ambrose and Pope Gregory the Great greatly improved the chant, which was, and still is, chiefly used in liturgical worship, though in non-liturgical services passages of Scripture are often chanted in simple harmonies.

The reading of the service in a half-chanting style by the clergyman is called *intonation;* and a somewhat similar method of reading the Scripture in Jewish synagogues is called *cantillation.*

Chantenay, a town of France, in Loire-Inférieure, on the Loire, 1 mile S. W. of Nantes. Pop. 9066.

Chantilly, a beautiful town of France, department of Oise, on the railway from Paris to Amiens, 23 miles N. N. E. of Paris. It has a fine hospital, and celebrated manufactures of blond lace and porcelain. Annual races are held here. Here is a ruined castle which was the residence of the great prince of Condé. This castle, which was one of the finest in France, was destroyed during the Revolution in 1793. The forest contains 6500 acres. Pop. 3322.

Chantil'ly, a post-village of Fairfax co., Va., about 20 miles W. of Washington. On the afternoon of the 1st of Sept., 1862, the right of Gen. Pope's army was attacked by the Confederate army under "Stonewall" Jackson. A severe struggle ensued, which was continued in the midst of a terrific thunder-storm till dark. Gens. I. I. Stevens and Phil Kearney of the U. S. army were both killed in this engagement.

Chan'trey (Sir Francis), an English sculptor, born in Derbyshire April 7, 1781, was a son of poor parents. He learned the trade of carver in Sheffield, and removed to London about 1804, after which he devoted himself to sculpture. He was a pupil of Nollekens, and excelled in portraits and monumental sculpture. In 1818 he was chosen a member of the Royal Academy. Among his best works are a bronze statue of William Pitt in London, a statue of Canning at Liverpool, and a statue of Washington in the State House at Boston, Mass. He was knighted in 1837. Died Nov. 15, 1841.

Chan'try [Fr. *chantrerie*, from *chanter*, to "sing"], a term signifying (1) an endowment or bequest to provide masses to be sung for the soul of the testator or the souls of others; (2) the office or position held by one who celebrates such masses; (3) a chapel erected especially for the celebration of the masses thus provided for. Such chantries are sometimes within, or perhaps more frequently outside, but attached to, some church or monastery, and are often richly adorned with paintings and statuary.

Chanute, a village of Neosho co., Kan. It has one weekly newspaper.

Chanzy (Auguste), a French general, born Mar. 18,

1823, in the department of Ardennes, distinguished himself in the Italian campaign of 1859, became a colonel and commander of a subdivision of the Algerian province of Oran in 1864, and a general of brigade in 1868. In Oct., 1870, he was called to France with the rank of a general of division, and in December he so distinguished himself in the battles near Orleans that the provisional government appointed him commander-in-chief of the Army of the West, consisting of four corps. In Jan., 1871, his army was almost annihilated by Prince Frederic Charles in the battles at Le Mans. In Feb., 1871, he was elected a member of the National Assembly, and in March he was for a time held as a prisoner by the insurgents of Paris. He wrote "The Second Army of the Loire" (1871).

Chapa'la, a lake in Mexico, is an expansion of the Rio Grande de Lerma, and lies on the table-land of Anahuac. It is mostly included in the state of Jalisco. Area, estimated at 1350 square miles.

Chap-Books, the name given to a humble variety of literature which was formerly vended by itinerant chapmen. They were small volumes printed on coarse paper, dealing with popular theology or history, the lives of godly or famous personages, fortune-telling and the reading of dreams, and giant, witch, and goblin tales in verse or in prose. The older black-letter chap-books, without dates, are extremely rare.

Chap'el [Lat. *capella*; Ger. *Kapel*; Fr. *chapelle*], a building erected for the purposes of public worship, but not possessing the full characteristics of a church. In this sense places of worship erected by dissenters are called chapels in England, and the term is also applied to supplementary places of worship in the Established Church, such as parochial chapels, chapels-of-ease, free chapels, and the like. It is sometimes applied to a domestic oratory or to a place of worship erected by a private individual. Chapels-of-ease are structures built to accommodate parishioners who live at a great distance from the church.

Chapel, a township of Talbot co., Md. Pop. 2791.

Chapel, a township of Clarke co., Va. Pop. 1793.

Chapel Hill, a post-village of Orange co., N. C., on New Hope River, 28 miles W. N. W. of Raleigh. It is the seat of the University of North Carolina, founded in 1789. Pop. of township, 2799.

Chapel Hill, a post-village of Washington co., Tex., is on the Houston and Texas Central R. R., 60 miles N. W. of Houston. Pop. 602.

Cha'pin, a post-village of Morgan co., Ill., on the Toledo Wabash and Western R. R. where it is crossed by the Rockford Rock Island and St. Louis R. R., 44 miles W. of Springfield.

Chapin, a township of Saginaw co., Mich. Pop. 258.

Chapin (Alonzo Bowen), D. D., an American Episcopalian divine, born in Connecticut Mar. 10, 1808. He became a lawyer when a young man, but was ordained in 1838, and afterwards became distinguished as an author and editor of religious periodicals. Died July 9, 1858.

Chapin (Aaron Lucius), D. D., an American clergyman, born Feb. 6, 1817, in Hartford, Conn., graduated at Yale in 1837, and at the Union Theological Seminary in New York in 1842. He was professor in the New York Institution for the Deaf and Dumb 1838–43. He was ordained pastor of the First Presbyterian church in Milwaukee, Wis., Jan. 24, 1844, and was inaugurated as the first president of Beloit College, Wis., July 24, 1850, which office he still retains. He received the degree of D. D. from Williams College in 1853, was for some years one of the editors of the "Congregational Review," and has contributed several articles to that and other like journals, and published occasional sermons.

Chapin (Calvin), D. D., an American Congregational divine, born at Springfield, Mass., July 22, 1763, graduated at Yale in 1788, and was eminent for his services in the missionary, Bible, and temperance societies. Died Mar. 17, 1851.

Chapin (Edwin Hubbell), D. D., born in Union Village, Washington co., N. Y., Dec. 29, 1814, educated at the seminary in Bennington, Vt., was made D.D. at Harvard University in 1856, commenced preaching in 1837, first settled over a society of Universalists and Unitarians in Richmond, Va.; removed to Charlestown, Mass., in 1839; thence to Boston in 1846, to New York in 1848, where he is still pastor of the Fourth Universalist church, corner Fifth avenue and Forty-fifth street, one of the wealthiest societies in the city. Dr. Chapin is a powerful and effective pulpit orator, has been a frequent lecturer before lyceums, etc., and has exercised great influence for good. His speech before the Peace Convention at Frankfort-on-the-Main, in 1850, commanded great attention. He is the author of "Moral Aspects of City Life" (1853), "True Manliness" (1854), several volumes of sermons and religious lectures, and some occasional discourses. His "Crown of Thorns" had a large circulation.

Chap'lain [Lat. *capellanus*, from *capella*, a "chapel"], a clergyman attached to a chapel without a parish, to the household of any dignitary or nobleman, to a public institution, regiment, or an army post, or ship of war. Army chaplains once carried the relics of a patron saint at the head of the troops. The U. S. army has both post and regimental chaplains. The U. S. Senate and House of Representatives, as well as most State legislatures, also have chaplains. Many prisons and large almshouses have chaplains attached. The British army and navy have chaplains from the churches of England and Scotland and the Roman Catholic Church. Forty-eight Anglican and six Scottish ministers are chaplains to the British sovereign.

Chap'let [Fr. *chapelet*], a garland or wreath to be worn on the head; the circle of a crown; a string of beads used by the Roman Catholics (see Rosary) by which they enumerate their prayers; in architecture, a little moulding carved into round beads, pearls, olives, etc.

Chap'lin, a post-township of Windham co., Conn. Pop. 704.

Chaplin (Daniel), an American officer of volunteers, born in Bridgeton, Me., Jan. 22, 1820. During the civil war Col. Chaplin displayed admirable qualities, and rose to the command of the first regiment of Maine heavy artillery, which became, through his strict discipline, one of the finest artillery regiments in the defences of Washington. On the opening of Gen. Grant's campaign in 1864, Col. Chaplin's regiment was attached to the Army of the Potomac, and participated in all the battles of that memorable campaign; and it was at the head of his men, in the battle of Weldon R. R., Aug. 20, 1864, that Col. Chaplin was mortally wounded. He was brevetted brigadier and major-general for gallant and meritorious conduct.

G. C. Simmons, *Clerk Board of Engr's.*

Chaplin (Jeremiah), D.D., born at Rowley, Mass., Jan. 2, 1776, graduated at Brown University in 1799, was three years tutor in Brown University, pastor of Baptist church Danvers, Mass., 1802–18, and president of Waterville College 1820–32. Died at Hamilton, N. Y., May, 1841.

Chap'line, a twp. of Jefferson co., West Va. P. 1867.

Chap'man, a township of Clinton co., Pa. Pop. 1301.

Chapman, a borough of Northampton co., Pa. P. 388.

Chapman, a post-township of Snyder co., Pa. P. 1007.

Chapman (Alvan Wentworth), M. D., born at Southampton, Mass., Sept. 26, 1809, graduated at Amherst College, and removed to Appalachicola, Fla., where he attained fame as a botanist. He was a judge of the probate and county courts (1865–66), collector of U. S. internal revenue (1865–66), and collector of customs at Appalachicola (1866–69). The genus *Chapmannia* was named in his honor. He has published "Flora of the Southern U. S." (1860).

Chapman (George), an English poet and translator, born in 1557. He became a resident of London and a friend of Shakspeare and Spenser. He produced numerous comedies and tragedies, and was the first translator of Homer into English verse. His version of the "Iliad" was published in 1598, and that of the "Odyssey" in 1614. Died in 1634.

Chapman (George Thomas), D. D., an Episcopalian minister, born in England Sept. 21, 1786, came to the U. S. in 1795, and graduated at Dartmouth in 1804. He received ordination in 1816, became a popular preacher, and published several volumes of sermons, etc.

Chapman (J. A. M.), D. D. See Appendix.

Chapman (John Gadsby), an American artist, was born in Alexandria, Va., and received his training as a painter in Italy, which was for many years his home. He executed the painting called the "Baptism of Pocahontas," in the Capitol at Washington, and published a drawing-book.

Chapman (Nathaniel), M. D., born in Alexandria co., Va., May 28, 1780, was educated at Philadelphia and in Europe. In 1804 he settled in Philadelphia, where he was professor of materia medica (1813–16) and of the practice and institutes of medicine and clinical medicine (1816–50) in the University of Pennsylvania. He wrote several medical works, among which was "Lectures on the Theory and Practice of Medicine." Died July 1, 1853.

Chapman (Reuben) was elected governor of Alabama in 1847, and served his term with the sympathy of his party and the respect of all.

Chapman (William), an American officer, born in 1810 in Maryland, graduated at West Point in 1831, and Feb. 20, 1862, became lieutenant-colonel of Third Infantry. He

served chiefly at frontier posts 1831–61; in Black Hawk expedition 1832; at Military Academy as assistant instructor 1832–33; as adjutant Fifth Infantry 1833–38; in military occupation of Texas 1845–46; in the war with Mexico 1846–48; engaged at Palo Alto, Resaca de la Palma, Monterey, Vera Cruz, San Antonio (wounded), Churubusco (brevet major), Molino del Rey (brevet lieutenant-colonel), Chapultepec, and city of Mexico; in Florida hostilities 1857; on Utah expedition 1857–60. In the civil war he served in the Virginia Peninsula 1862; engaged at Yorktown and Malvern Hill; in North Virginia campaign 1862, engaged at Manassas (brevet colonel). Retired from active service Aug. 26, 1863, and chiefly employed in command of draft rendezvous at Madison, Wis., 1863–65, and various special duties.

GEORGE W. CULLUM, *U. S. Army.*

Chap'manville, a post-township of Logan co., West Va. Pop. 924.

Chapoo, a town of China, in the province of Che-Kiang, on the estuary of the Tshen-Tang. Although its harbor is shallow and the tides very rapid, Chapoo has become a place of great commercial importance, as the whole Chinese trade with Japan is carried on from this town.

Chap'paqua, a post-village of New Castle township, Westchester co., N. Y., on the Harlem R. R., 32 miles from New York. This place is known as the country residence of the late Hon. Horace Greeley, and also that of I. T. Williams, for twenty years his friend and legal counsellor. It has one shoe establishment employing some forty-five hands, one sash and blind factory, three stores, and one hotel. It has an excellent boarding-school, under the patronage of the Society of Friends; there is also a saline chalybeate spring near the place.

Chappe (CLAUDE), a French engineer, born at Brûlon in 1763, was the inventor of a telegraph. He produced in 1792 a system of signals and a machine which he called a telegraph, by which a despatch was transmitted from Paris to Lille, 48 leagues, in thirteen minutes and forty seconds. Numerous lines of his telegraph were soon extended through other parts of France. Died Jan. 23, 1805.

Chapped Hands are sometimes a sort of chilblain on the hands, and, like chilblain, this disease appears to pass by insensible gradations into a form of eczema, while many cases of chapped hands are simply eczematous, without any recognizable connection with chilblain. Glycerine, borax, benzoated oxide-of-zinc ointment, and various like applications are useful.

Chaptal (JEAN ANTOINE), COMTE DE CHANTELOUP, an eminent French chemist, born at Nogaret, Lozère, June 5, 1756. He graduated as M. D. at Montpellier in 1777, and became professor of chemistry at that place in 1781. He supported the popular cause in the Revolution, and introduced the manufacture of certain chemicals for which France had previously been dependent on foreigners. About 1796 he was chosen a member of the Institute. He was minister of the interior for five years (1801–05), and afterwards a senator. His chief works are "Chemistry Applied to the Arts" (1806) and "Elements of Chemistry." Died in 1832. (See FLOURENS, "Éloge historique de Chaptal," 1835.)

Chap'ter [Fr. *chapitre*, from the Lat. *capitulum*, a diminutive of *ca'put*, a "head"], a division of a book. The division of the Bible into chapters as at present is commonly ascribed to the cardinal Hugo de St. Cher, who lived in the thirteenth century, but there is reason to suppose that it may be much older. In many histories the chapter is the principal division. The term is also applied to the canons of a cathedral, who in a collective capacity form a chapter, over which the dean presides. This chapter is the bishop's council. The place in which it meets is called the chapter-house.

Chapter-house, a building or apartment where the monks of an ecclesiastical establishment, or the dean, canons, and prebendaries of a cathedral or collegiate church are convened. Chapter-houses are often joined to or built near a church, and sometimes are richly adorned. In some cases they are used merely as burial-places.

Chap'tico, a post-village and township of St. Mary's co., Md., 40 miles S. S. E. of Washington. Pop. 3553.

Chapul'tepec, a strong Mexican fortress, stormed by the American forces under Gen. Scott Sept. 13, 1847. It is situated about 2 miles S. W. of the city of Mexico, and consists of an isolated eminence about 150 feet high, fortified by a strong citadel which crowns the hill, designed to protect the causeway forming the approach to the city. Its approaches were also strongly guarded by outworks at its base and on its acclivities. The castle contained, besides a strong garrison, the military school of the republic.

In the plan for the capture of the city of Mexico the reduction of Chapultepec was considered indispensable to success. The extraordinary natural strength of this place, and the skill and money which had been expended to make it impregnable, rendered this a hazardous undertaking. To mask the intended attack, Twiggs, with Riley's brigade and Taylor's and Steptoe's batteries, was left at the southern gates of the city, and kept up an effectual fire during the 12th Sept., and down to the afternoon of the 13th, compelling the enemy to withdraw within the walls of the city, and thus holding a good part of the Mexican army, under Santa Anna, on the defensive. Heavy batteries at well-selected points were established on the night of the 11th, and a vigorous fire was opened on the castle and outworks on the morning of the 12th, continuing with good effect throughout the day and on the morning of the 13th, while preparations for the attack were being made. Pillow's and Quitman's divisions were to assault the former on the W., and Quitman on the S. E. side, Worth's division to support Pillow, and Smith's brigade of Twiggs' division to support Quitman. An assaulting party of 260 men, under Capt. McKenzie, Second Artillery, was furnished Pillow, and Twiggs' division supplied a similar one, under Capt. Casey, Second Infantry, to Quitman. The signal for attack was to be the momentary cessation of firing from the heavy batteries. About 8 A. M. of the 13th notice was sent to Pillow and Quitman that the concerted signal was about to be given, and both columns shortly after moved forward with great vigor, the batteries throwing shot and shell upon the enemy over the heads of the attacking columns.

Pillow's approach on the W. side lay through an open grove filled with sharpshooters, who were quickly dislodged; on emerging into an open space at the foot of a rocky hill, Pillow was severely wounded, the immediate command devolving upon Gen. Cadwalader. Clark's brigade of Worth's division was now sent to Pillow's support. A strong redoubt, midway, was to be carried before reaching the heights. The advance was over rocks, chasms, and mines, and in the face of a heavy fire of cannon and musketry. Without wavering the redoubt was carried, and the enemy driven from shelter to shelter, without time to fire a single mine unless endangering the lives of their own men. The ditch and main wall of the work was reached, scaling-ladders were brought in use, and a lodgment soon made, followed by streams of troops.

Simultaneously with Pillow's advance on the W., Quitman approached the S. E. of the same works over a causeway strongly fortified and defended. Smith's brigade had been thrown out to the right to turn the batteries near the foot of Chapultepec and support Quitman's storming-party. The contest was desperate for a short time, but the valor of the Americans overcame every obstacle, the batteries and works were carried, and the ascent was continued; the enemy were driven from their stronghold, and the Stars and Stripes floated from the heights of Chapultepec. This victory virtually ended the war, the city of Mexico being entered the next day, the 14th. The American loss in killed and wounded during the 12th, 13th, and 14th was 863; the Mexican loss was much greater.

Chara'ceæ [from *Chara*, one of the genera], a natural order of aquatic cryptogamous plants, approaching the Equisetaceæ in their acrogenous habits and their verticillate tubular branches, but differing from them in having lateral, scattered fruit of two kinds. Some of the species have also incrustations of carbonate of lime, analogous to the siliceous coating of some Equisetaceæ. But their simple cell-structure is believed by many theorists to ally them with the lower Algæ. The phenomena of cyclosis were first observed in the cells of characeous plants. The fossils called gyrogonites are calcareous incrustations which once covered the reproductive organs (nucules) of these plants. The Characeæ are abundant in fresh and salt stagnant water, especially in temperate regions. The species are few.

Char'acter [Gr. χαρακτήρ; Fr. *caractère*; Ger. *Charakter*], a mark or figure engraven on an object; a letter or type used in writing or printing; the peculiar qualities impressed on a person by nature or habit; distinctive qualities of heart, mind, and manners. The term is often used to denote a person or actor in an epic poem or drama. In art, the expression of character, either of animate or inanimate objects, is, after correct delineation, the most important part of the work. In botany, and other branches of natural history, character is an enumeration or brief description in scientific terms of the essential and distinctive marks of a species, genus, order, etc.

Charade [Fr.], a social amusement, consisting sometimes of the division of a word into its constituent syllables or letters, and then making some statement as to each syllable and the whole word, the company being required to guess the word. In "acting charades" each syllable is

introduced prominently, but not too conspicuously, into the successive scenes of a dialogue, the whole word being brought into the last scene. Sometimes the name *charade* is used to designate any parlor drama.

Charadri'adæ [from *Charadrius*, one of the genera], a family of wading birds which includes several genera of plovers, lapwings, turnstones, etc., mostly found in the temperate climates of both continents. Many of its species are prized as game-birds.

Cha'rax of Per'gamus, priest and philosopher, flourished probably in the times of Antoninus Pius and M. Aurelius. He wrote a Greek history in forty books, in which he speaks of Augustus as having lived long ago, and of Nero and his successors. This history must have been very prolix, as in the ninth book he is treating of the return of the Heraclidæ. He wrote also a work entitled Χρονικά, in at least sixteen books, and philosophical treatises. (The fragments of his writings are collected in MÜLLER'S "Fragmenta Historic. Græcorum," vol. iii., pp. 636–645.)

HENRY DRISLER.

Char'coal [Fr. *charbon;* Lat. *carbo*], a common name of a variety of carbon; a carbonaceous substance obtained by the partial combustion of wood. The term is also applied to the solid residuum which results from the destructive distillation of animal matter and peat. (See BONE BLACK or ANIMAL CHARCOAL.) Except the diamond, charcoal is the substance in which carbon exists nearest to purity. It burns without flame or smoke, and produces a greater heat than an equal weight of wood. It is used as an ingredient in the composition of gunpowder, as an agent in clarifying liquors, and for other purposes, among which is the smelting of ores. Charcoal contains, besides carbon, oxygen and hydrogen, with a small proportion of ashes. It has an extraordinary capacity for absorbing gases. It is said that it will absorb ninety times its bulk of ammoniacal gas. It is infusible, is not soluble in acids or other liquids, is not liable to decay, and is not altered by any degree of heat if it be not exposed to the air or to oxygen. It is a very bad conductor of heat, and hence powdered charcoal is placed round tubes to prevent the escape of heat. Powdered charcoal is used to preserve or sweeten tainted flesh. Common charcoal intended for fuel is made by burning or heating a pile of wood without free access of air. The sticks of wood, which are not more than four feet long, are arranged in a conical pile around a central aperture, and covered with turf, sods, or other material which prevents the free access of air. Charcoal-dust, mixed with earth and moistened, makes a good outer covering. An opening is left at the top for the escape of smoke and vapor. The pile is usually ignited at the top, and continues burning with a slow smouldering fire for a week or more. The charcoal used as an ingredient of gunpowder is made from wood which is free from resin. Charcoal is often prepared by roasting wood in iron cylinders. By this method there is a larger proportion of charcoal saved, and the product is of better quality; there is also a large quantity of pyroligneous acid produced, which is of great value in the arts.

Charbon Roux (*i. e.* "red charcoal"), is charcoal obtained by subjecting wood to heated air or steam raised to the temperature of 572° F. By this process from 36 to 42 per cent. of charbon rouge is obtained, whereas not more than 25 per cent. of charcoal is obtained by the ordinary method. It has a dark-red color, and contains 75 per cent. of carbon. It is extensively used in Europe in the manufacture of gunpowder and iron blooms.

HENRY HARTSHORNE.

Charcoal Blacks are made both from animal and vegetable substances—*e. g.* burnt ivory, bones, vine-twigs, peach-stones, nut-shells, the smoke of oil or rosin condensed, etc. Those which are derived from vegetable substances when mixed with white are usually of a blue tint. (See LAMPBLACK.)

Chardin (Sir JOHN), a French traveller, born in Paris Nov. 26, 1643. As a dealer in jewels and gems he made a journey to India and Persia in 1664. Having passed many years in Persia, and studied its language, history and customs, he became a resident of London in 1681, and was knighted by Charles II., who sent him on a mission to Holland about 1682. He published "Travels in Persia and the East Indies" (3 vols., 1686–1711), a work of much merit. Died Jan. 26, 1713.

Char'don, a post-village and township, capital of Geauga co., O., on a ridge 14 miles from Lake Erie and 170 miles N. E. of Columbus, on the Painesville and Youngstown R. R., has a fine court-house and school building, 4 churches, and 1 weekly newspaper. Pop. of v. 885; of tp. 1772.

J. O. CONVERSE, ED. "GEAUGA REPUBLICAN."

Charente, a river of France, rises in Haute-Vienne, and flows in a very tortuous course westward through the departments of Charente and Charente-Inférieure, and enters the Atlantic opposite the Isle of Oléron. Total length, about 157 miles. It is navigable for steamboats from its mouth to Saintes, and by means of twenty-seven locks is navigable for 102 miles.

Charente, a department in the W. part of France, has an area of 2294 square miles. It is intersected by the rivers Charente and Vienne. The surface is undulating, and in some parts hilly; the soil is mostly calcareous and dry. Several deep limestone caverns occur here. Extensive forests of chestnut trees grow on the hills. Truffles are found in abundance. A large part of Charente is occupied by vineyards, the product of which is mostly converted into brandy. The chief article of export is Cognac and Jarnac brandy. Here are manufactures of iron, paper, and leather. Capital, Angoulême. Pop. 378,218.

Charente-Inférieure, a department in the W. part of France, is bounded on the W. by the Atlantic, and on the S. W. by the estuary of the Gironde, and is intersected by the river Charente. Area, 2635 square miles. The surface is nearly level; the soil is very fertile. The staple products are grain, wine (which is mostly converted into brandy), hemp, and flax. The salt-works on the sea-coast are the most valuable in France. It has manufactures of glass, earthenware, and leather. Capital, La Rochelle. Pop. 479,559.

Charenton, a town of France, department of Seine, on the right bank of the Marne, 5 miles S. E. of Paris. It has large chemical-works. A bridge across the river connects this town with Charenton St. Maurice, where is the large national asylum for lunatics. This bridge has been the scene of several conflicts between armies contending for the possession of Paris. Pop. 6190; of St. Maurice, 4931.

Cha'res [Χάρης], an Athenian general notorious for his corruption and incompetence, was chosen commander-in-chief in the Social war, which began in 358 B. C. This war was provoked by his extortions.

Chares, a Greek statuary, born at Lindus, was a pupil of Lysippus and the founder of the Rhodian school of sculpture. He lived about 300 B. C. Among his works was the Colossus at Rhodes, regarded as one of the Seven Wonders of the World. It was a bronze statue of Apollo, or rather of the sun-god, about 105 feet high, and was thrown down by an earthquake in 224 B. C.

Chares of Mytilene is mentioned by Plutarch in his Life of Alexander as holding the office of εἰσαγγελεύς (one who bears messages and introduces persons to the royal presence) to that monarch. His position gave him the opportunity of collecting many facts and anecdotes about Alexander, which he afterwards published in a work, of which the tenth book is quoted by Athenæus, and which is several times referred to as authority by Plutarch. (The fragments of his works are collected in MÜLLER'S "Scriptores de Rebus Alexandri," p. 114–120; "Alexandri Magni Historiarum Script.," ed. Geier, pp. 290–308.)

HENRY DRISLER.

Charge, in heraldry. The ordinaries and figures depicted on an escutcheon or shield are called charges, and a shield with such figures is said to be charged. The charges ought to be few and strongly marked. The shield belonging to the head of the house has fewer charges than the shields of collateral or junior members.

Charge, in law, a burden imposed on a thing; a duty or obligation imposed upon a person; sometimes merely a formal and distinct allegation. More specifically, it is used in the following connections: (1) A burden imposed upon land, particularly in a court of equity. It is a common course in a will to "charge" the devisor's estate with the general payment of debts or legacies, or with the payment of a particular debt or legacy. In such a case the land is burdened with the debt, so that it is a lien or encumbrance upon it; and this would follow it into the hands of a purchaser. A charge of this kind may be created by implication. Thus, if a testator should provide as follows, "*After* the payment of $1000 to A, I devise my mansion-house to B," that sum would be charged upon the land as owned by B, and would follow it in case of sale or other transfer. (2) A charge upon the person. A will or other instrument may be so drawn as to confer a benefit upon a person, and at the same time impose upon him an obligation. Should he accept the benefit, he will by implication take upon himself the burden or obligation, though it may outweigh the benefit. No person is bound to accept such a devise or provision, so that the charge in the case supposed is in truth created by the grantee's or devisee's own act, in conjunction with the grantor's or testator's direction. (3) Directions to a jury. In a jury trial, as the decision of questions of law appertains to a judge, and matters of fact belong to the jury, it is a common practice for the judge to instruct

or "charge" the jury upon the questions of law. These instructions the jury are legally bound to follow. The idea lying at the root of the word "charge" in this case would seem to be the obligation or duty of the jury to accept the version of the law propounded by the judge. In equity practice the words "charge and discharge" are found in connection with the taking of accounts in that court of moneys paid and received. The *charge* means the statement of debts due by the party against whom the account is rendered, and *discharge* means the items of credit presented by the latter. These might be so presented as to make counter-statements necessary. This practice, in its details, is disfigured by much technicality, and has been abandoned both in England and in some of the American States, and much simpler methods are now resorted to. In equity pleadings there is a statement made by the plaintiff, known as the charging part of the bill (or complaint), in which he sets forth certain facts, anticipatory of a defence which he supposes that the defendant will make. The word charge here means a distinct and formal affirmation, and the pleader sets forth the defendant's claim as a mere pretence on his part, and alleges on his own part the facts in opposition to it. T. W. Dwight.

Chargé d'Affaires, a French phrase used by many nations as the title of a diplomatic agent of lower grade than a minister. He is accredited, not to the sovereign, but to the department of foreign affairs. He sometimes acts as deputy or substitute of the ambassador in the absence of the latter.

Char'iot [Lat. *currus* or *biga*: Fr. *char* or *chariot*], a vehicle used by the ancients in war and in journeys of pleasure. The ancient chariot had only two wheels, which revolved on axles, and was generally drawn by two horses. It was closed in front and open behind. War-chariots were used by the ancient Greeks, Romans, Phœnicians, Britons, and other nations. The four-horse chariot in which Roman generals rode when they entered Rome in triumph was called a *quadriga*. (See Carriages, etc., by L. P. Brockett, M. D.)

Charis'ius, an Attic orator, a contemporary of Demochares, nephew of Demosthenes. He wrote, like Isocrates, orations for others, and in this, as Cicero says in his "Brutus," he imitated Lysias. His orations must have been extant in the time of Quintilian, for he speaks favorably of them. Three passages are quoted by Rutilius Lupus, in his work "De Figuris," in a Latin translation to illustrate certain rhetorical figures. Henry Deiglan.

Charisius (Aurelius Arcadius), a learned jurist who lived under Constantine and his sons, and filled the office of "magister libellorum." He wrote several works on legal subjects. Extracts from three of his writings are contained in the "Digest." Henry Deiglan.

Charisius (Flavius Sosipater), of Campania, a celebrated grammarian, whose date is uncertain, but who preceded Priscian, as the latter quotes from him, and he flourished in the latter part of the 5th century. He was a man of some distinction, and is styled "magister urbis" in the inscription of his work, which is a Latin grammar in five books, "Institutionum Grammaticarum libri quinque," written for the use of his son. Portions of the work have been lost; the remainder is given in the various collections of Latin grammarians, most recently by Lindemann and Keil. Henry Deiglan.

Char'itable Uses, property, either real or personal, held by a trustee to be devoted by him to charitable purposes. The word "charitable" in this connection is nearly synonymous with public. Trusts for charitable purposes would include funds in the hands of trustees devoted to the repair of highways or streets in cities, the support of paupers, the foundation of colleges, churches, and hospitals, etc. etc. (The subject will be more fully treated under Power, by J. N. Pomeroy, LL.D.)

Char'ites (sing. **Cha'ris**), [Gr. Χάριτες: Lat. *Gratiæ*], the Graces of classic mythology, who were said to be the daughters of Jupiter. They were patrons of poetry and art, and presided over festivals and social amusements. There were three Graces, whose respective names were Aglaia, Euphrosyne, and Thalia.

Char'iton, a river of the U. S., rises in the S. part of Iowa. Having crossed the boundary between Iowa and Missouri it flows southward through Scotland, Macon, and Chariton counties of the latter State, and enters the Missouri River 7 miles above Glasgow. Total length, about 200 miles.

Chariton, a county of Missouri. Area, 740 square miles. It is bounded on the S. W. by the Missouri or Big Grand River, and intersected by the Chariton River. The surface is undulating, and diversified in timber and fertile prairies. Grain, wool, tobacco, and livestock are extensively raised. Timber, coal, and limestone abound here. It is traversed by the St. Louis, Kansas City, and Northern R. R. Capital, Keytesville. Pop. 19,106.

Chariton, a post-village, capital of Lucas co., Ia., is on the Chariton River and on the Burlington and Missouri River R. R., 36 miles W. of Ottumwa. It has a national bank, six churches, a large public hall, and two newspaper-offices. Pop. 1728; of Chariton township, 2601.
Mosier & Folsom, Props. Chariton "Patriot."

Chariton, a township of Appanoose co., Ia. Pop. 888.

Chariton, a township and village of Chariton co., Mo. Pop. [illegible].

Chariton, a township of Howard co., Mo. Pop. 4743.

Chariton, a township of Macon co., Mo. Pop. 1269.

Chariton, a township of Randolph co., Mo. P. 1699.

Charito[illegible]n, a township of Schuyler co., Mo. Pop. 903.

Charitop[illegible], of Aphrodisias in Caria, is the probably assumed designation of the writer of a Greek romance. Neither his name nor his real country is known, and the position which he assigns himself, that of secretary to the orator Athenagoras assigns himself, that of secretary to the orator Athenagoras, cannot be true. His Syracuse mentioned in Thessalonica. Charicles and Callirhoë, which treats of the loves and adventures of the principals and given in eight books, and has often been to us almost entire. An [illegible] in Perizonius's "History of Fiction" of the contents is given with copious notes by D'Orville, etc." It has been edited by Reitzke, revised edition, Leipsic, 1[illegible] with a Latin translation.
Henry Deiglan.

Char'ity, Sisters of [Fr. *sœurs de la charité*, or *sœurs grises*, i. e. "Gray Sisters," on account of their dress], a name applied to several orders of allied female nurses in the Roman Catholic Church. The first congregation which bore this name was established at Chatillon, in France, in 1633, by Vincent de Paul in 1778. Confirmed by the pope, by 1807 this congregation greatly multiplied and its house of Rome, found in all parts of the world. Their order is to devote themselves to the care of the sick and the protection of friendless persons, to train children and aged persons, and hence to get to be regarded with more favor than almost any other [illegible] of nuns.

Mrs. Eliza Ann Seton of Maryland in 1809 founded a congregation of Sisters of Charity under a [illegible] rule, which is still followed to a considerable extent in the U. S., though many of its houses have united with the [illegible] order. Several congregations of Augustinian nuns and [illegible] other Roman Catholic writers are called sisters of Charity, and Sisters of Mercy, and have branches in the U. S. The Sisters of Charity have many claims to the gratitude [illegible] mankind, and, besides the direct good accomplished by them, their example has led many who do not profess piety to act, and who do not belong to their Church, to engage in acts and lives of benevolence.

Charlemagne [Lat. *Carolus Magnus*], king of the Franks and Roman emperor, born April 2, 742, probably at Aix-la-Chapelle, was a son of Pepin le Bref, and, on his father's death, in 768, he reigned over the Franks, jointly with his brother Carloman, until the death of the latter in 772. From that time sole ruler, during a reign of forty-three years he carried on incessant wars on all his borders, extending his dominion, and at the same time spreading Christianity, repressing rebellions, and building up the vast dominion over which he was crowned as a successor of the Roman cæsars by Pope Leo III. in 800. In 772 he began a thirty years' war against the determined Saxons, after the successful opening of which Charlemagne was called to the assistance of Pope Hadrian I. against Desiderius, king of the Lombards, who had demanded the banishing of Charlemagne and the coronation of the sons of Carloman. Desiderius had married his daughter to Charlemagne, but soon after put away the daughter of Desiderius on account of sterility, and taken the Swabian princess Hildegard to his bed. Charlemagne marched two armies over the Alps and conquered Lombardy in 774; received and beat the Saxons again; and dominated into Spain in 778 to help the Saracen rulers of that country against the Roman caliph of Bagdad. It was on this war that the epic of romance, Roland at Roncesvalles, fell in the pass of Roncesvalles. The successive invasion of Charlemagne was very successful except in Saracen Spain and Saxony. In all the Romans received against Pope Leo III., and were soon brought into subjection by Charlemagne, who in return, while he was praying at the steps of St. Peter's church, was crowned by Leo with the gold crown of the Western empire, successfully to him, as he proceeded on Christmas Day, 800. Charlemagne held the title and rule of his empire accordingly. He was supreme, energetic, and vigorous, as a ruler and commander alike. He watched over and fostered agriculture, trade, art, and letters with untiring zeal, clearing away forests, draining swamps,

manding monasteries and schools, building churches, and founding splendid palaces, as at Aix, Worms, and Ingelheim, and drawing to his court scholars and poets from all nations, as Alcuin, Paulus Diaconus, and Dungal. He was himself proficient in science as well as all manly accomplishments, speaking Latin and knowing Greek. But we find not even a moderately correct view of his character, simple in his life, "speaking all men of no class, by all alike feared and beloved, by all alike admired," as he was described by the historian Nithard. His name spread through all lands. He was about to become united by marriage with the Byzantine emperor Irene, but after he had the pope on friendly terms with her successor, Nicephorus. The caliph Haroun-al-Rashid sent an embassy to the court of Charlemagne, with gifts in return for gifts sent. He had three sons, Pepin, Charles, and Louis, among whom he intended to divide his empire, but Pepin and Charles died before their father. In 813 he associated his son, Louis le Débonnaire, with himself in the empire. He died at Aix-la-Chapelle Jan. 28, 814, and was succeeded by his son Louis. His descendants were called Carlovingians. (See Eginhard, "Charlemagne et ses Exploits," 1856; A. L. H. Lewis, "Life of Charlemagne," 1852; Bernhardi, "Ein Deutsch Nagel," 1857; Bunsen, "Karl der Grosse," 1853; Thiersch, "Pelagius als Charlemagne," 1859; Pertz, "Jahrbücher des Fränkischen Reiches unter Karl dem Grossen," Berlin, 1860.)

Charlemont, a post township and village of Franklin co., Mass. The village is on the Connecticut and Passumpsic R. R., 28 miles W. N. W. from Boston. Pop. 1855.

Charlemont, a township of Bedford co., Va. Pop. 2020.

Charleroi, a strongly fortified town of Belgium, in Hainaut, 14 m. by river Sambre and on the railway between Brussels and Namur, 37 miles S. of Brussels. This place was fortified by Vauban, and was held alternately by the French and Spaniards. It has important manufactures of military glass, bells, etc. In the vicinity are extensive coal-mines, and smelting furnaces which produce cast iron. Railways connecting it various directions connect it with Paris and other towns. Pop. 11,396.

Charles, a county in the S. of Maryland. Area, 400 square miles. It is bounded on the S. and W. by the Potomac River, which here navigable. The surface is level, and partly covered with forests of oak, oak, chestnut, etc. Tobacco, grain, and wool are staple products. Capital, Port Tobacco. Pop. 16,758.

Charles I., emperor. See Charlemagne.

Charles II., emperor. See Charles the Bald of France.

Charles III., surnamed the Fat (le Gros or Gras), emperor of the Franks, born in 832 A. D., was a younger son of Louis II., who at his death, in 876, divided the empire between his three sons, Carloman, Louis, and Charles. After the death of his brothers, which occurred before 884, Charles inherited their hereditaries, and was the nominal ruler of a large empire, but he was imbecile and had little real power. He was deposed by his nephew Arnulph in 887, and died in the same year.

Charles IV., emperor of Germany, born in 1316, was a son of John le Luxembourg, king of Bohemia. He was elected emperor in 1346 in the room of Louis V., whom the pope had deposed. He founded in 1348 the Carolina Bull, which for many years formed the fundamental law to regulate the election of German emperors. He died in 1378, and was succeeded by his son Wenceslaus.

Charles V., (or Charles I. of Spain, afterwards emperor of Germany), was the eldest son of the worthless Philip of Austria, and a grandson of the emperor Maximilian I. His mother was Joanna, the daughter and sole heiress of Ferdinand of Aragon and Isabella of Castile. He was born at Ghent, Feb. 24, 1500, and succeeded to Flanders, having as his preceptor Adrian of Utrecht. On the death of his father in 1506, Charles inherited the low countries and Franche-Comté, and in 1516 he succeeded Ferdinand as king of Spain, to which he returned his court in 1517. In 1519 he was elected emperor of Germany, defeating Francis I. of France, who was also a competitor for that dignity. He was crowned as emperor at Aix-la-Chapelle Oct. 23, 1520. Charles V. and Francis I. of France were then the most powerful sovereigns in the continent of Europe, and were rivals. Their ambitious designs against Italy led to hostilities, which commenced in 1521. In this war Henry VIII. of England was the ally of Charles V., whose army defeated France at the battle of Pavia (1525), and took the monarch. The war was suspended by the treaty of Madrid in 1526. Charles married in that year Isabella, a daughter of Emmanuel king of Portugal. The war was renewed in 1527 by Francis I. and Pope Clement VII., who had formed an alliance against the emperor. Under the constable of Bourbon the army of Charles assaulted Rome and took the pope prisoner in 1527. Peace was restored by the treaty of Cambrai in 1529. Charles employed his power to check the progress of the Protestant Reformation, for which purpose he assembled the Diet of Augsburg in 1530. This Diet ordained that severe penalties should be inflicted on the Protestants. In 1531 the German Protestant princes formed the league of Schmalkalden, and obtained some concessions from Charles, who, being then engaged in a war against the Turks, thought it expedient to temporize. In 1535 he undertook in person an expedition against Barbarossa, whom he defeated at Tunis. In 1536 he again invaded the south of France, but was not successful, and was soon forced to retreat. A truce of ten years was effected between Charles and Francis I. in 1538, but it was broken in 1542. The French gained a victory at Cerisole, in Italy, in 1544, soon after which the war was ended by a treaty of peace. Desirous to extirpate heresy among his subjects, he published in 1548 the Ina of the empire against the elector of Saxony and the landgrave of Hesse, who were chiefs of the Protestant party. They were soon defeated, and were imprisoned at Mühlberg in April, 1547. Their cause, however, found an able defender in Maurice of Saxony, who, at the head of a league, took arms against Charles early in 1552. Charles, surprised by his rapid and skilful movements, was compelled to flee, and hostilities were ended by the important treaty of Passau, July 22, 1552, which secured religious liberty to the German Protestants. In the autumn of 1552 he formally resigned to his son Philip the sovereignty of the low countries, Spain, and his other hereditary dominions. He also abdicated the imperial crown, and was succeeded as emperor by his brother Ferdinand. His motive for abdicating appears to have been partly ill-health. He retired to the monastery of Yuste, near Plasencia, in Spain, where he died Sept. 21, 1558. (See Robertson, "History of the Reign of Charles V.;" Prescott, "History of Philip II. of Spain," vol. i.; Lord Brougham, "Life of Charles V.," 1857; A. Porter, "Charles Quint," 1861; Stirling, "The Cloister Life of the Emperor Charles V.," 1853; Sandoval, "Historia de la Vida de Carlos V.," 1606; Kausler de Lettenhove, "Correspondance de Charles V.," Brussels, 1852.)

Charles VI., emperor of Germany, the second son of the emperor Leopold I., was born Oct. 1, 1685. He claimed the throne of Spain as a relative of Charles II., who died without issue in 1700, and was proclaimed Philip of Anjou as his heir. In the war of the Spanish succession, which ensued, the cause of Charles was supported by Austria, England, and a portion of the Spaniards. These allies were defeated at Almanza in 1707 by the army of Philip, who finally obtained the throne by the aid of Louis XIV. of France. On the death of his brother, Joseph I., in 1711, Charles was chosen emperor of Germany. Having no son, he wished to secure for his daughter, Maria Theresa, the succession to his hereditary dominions, and appointed her his heir by a Pragmatic sanction in 1724. Died Oct. 20, 1740. (See Schirach, "Biographie Kaiser Karls VI." 1775.)

Charles VII. (Charles Albert), emperor of Germany, a son of Maximilian Emanuel, elector of Bavaria, was born at Brussels in 1697. He married a daughter of the emperor Joseph I. in 1722, and became elector of Bavaria on the death of his father in 1726. When Charles VI. died, in 1740, the elector claimed part of the Austrian dominions. To obtain these he made alliance with France and Prussia, which war against Maria Theresa. He was elected emperor in 1742, but his reign was harassed by that of Maria Theresa. Died Jan. 20, 1745.

Charles I. (Charles Stuart), king of Great Britain, born at Dunfermline, Scotland, Nov. 19, 1600, was the third son of James I. and Anne of Denmark. He became heir-apparent to the throne on the death of his brother Henry in 1612. He inherited extreme notions in relation to royal prerogative from his father, which he manifested in May, 1626. He married Henrietta Maria, a daughter of Henry IV. of France, in the same year, and in disregard of public opinion chose for his prime minister and adviser the unpopular duke of Buckingham, who had been his father's favorite. The Parliament, animated by a growing spirit of liberty, was sparing in its grants of supplies, and was soon involved in a conflict with the court. Charles dismissed several Parliaments in the first few years of his reign, and had recourse to arbitrary methods of raising money. He governed for eleven years without a Parliament, and after the death of Buckingham supported Laud and the earl of Strafford in their measures. During this period the Puritans were severely persecuted, and the po-

triot Hampden was prosecuted because he refused to pay the illegal tax called ship-money. In 1638 the Scottish people, on whom he attempted to impose the Liturgy, rose in arms to assert their liberty, and subscribed the National Covenant. Charles, who had not power to enforce his policy in Scotland, summoned a Parliament, which met in April, 1640, but, as it was not subservient, it was dissolved in the next month. The Scottish insurgents invaded England in August, and defeated the royal army at Newburn-on-Tyne. This disaster and the want of money induced the king to call a new Parliament, which met in Nov., 1640, and was the famous Long Parliament. Both Houses were resolute in resistance to despotic power. They impeached the earl of Strafford, who was executed in 1641, and they imprisoned Laud. In Jan., 1642, the king made a rash and abortive attempt to arrest Pym, Hampden, and three other members of the House of Commons. Provoked by this outrage, the Parliament appealed to arms. The royalists at first gained several victories, but they were defeated at Marston Moor in 1644, and again in June, 1645, at the battle of Naseby, where Charles commanded in person and Cromwell led the right wing of the Roundhead army. He was here so completely beaten that he soon gave himself up to the Scottish army, which transferred him in 1647 to the custody of the English Parliament. Having been tried and convicted in a high court appointed for the occasion, he was beheaded Jan. 30, 1649. He was distinguished for his literary culture and good taste in the fine arts. He was regarded as a martyr by a large portion of his subjects. (See HUME, "History of England;" WILLIAM HARRIS, "Life of Charles I.," 1758; DISRAELI, "Life and Character of Charles I.," 1828.)

Charles II., king of Great Britain, son of Charles I., was born May 29, 1630. He went into exile in 1645, and joined his mother in Paris. In 1649 he assumed the title of king, and he was proclaimed king by the Scottish Parliament "on condition of his good behavior." He landed in Scotland in June, 1650, and was crowned at Scone early in 1651. The austere Covenanters required him to sign "articles of repentance," and subjected him to restraints which were very irksome to a man who was naturally fond of ease and pleasure. A Scottish army fighting for the king was defeated by Cromwell at Dunbar in Sept., 1650. Charles, having recruited his army, led it into England, hoping that many English royalists would rally to his support. He was pursued by Cromwell, who gained a decisive victory over the royal army at Worcester, Sept. 3, 1651. Charles then became a fugitive, and after several narrow escapes took refuge in France.

After the death of Cromwell, the royalist party, which was always the most numerous, and was now favored by the law of reaction, easily regained the ascendency. Charles was restored in 1660 to almost unlimited power. He appointed Lord Clarendon prime minister, and married in 1662 Catherine, a daughter of the king of Portugal. In 1665, without good reason, he declared war against the Dutch—a war which was contrary alike to the feelings and commercial interests of the English people. The Dutch admiral De Ruyter, by entering the Medway and burning some ships of war at Chatham, induced him to make peace in 1667. Lord Clarendon was removed from power in 1667, and was succeeded by a corrupt ministry called the CABAL (which see). These ministers abused their power to promote popery and absolute monarchy, and in their foreign policy were subservient to Louis XIV. Charles accepted a pension from the French court, that he might be enabled to reign without the aid or control of parliaments. He also became an ally of France in another war against the Dutch in 1672, but this war, which was unpopular, was ended in 1674. The king showed partiality to the Roman Catholic Church, of which he had secretly become a member. A rumor of a popish plot caused a violent excitement among the people in 1678. Charles dissolved Parliament in that year, and called another, which in 1679 passed the Habeas Corpus act in opposition to the will of the court. The prevalence of corruption and profligacy in politics and morals, together with the despotic policy of the court, rendered this reign one of the most disgraceful in English history. In 1683 the patriots Algernon Sidney and Lord Russell were put to death for their complicity in the Rye-House Plot. Charles died without lawful issue Feb. 6, 1685, and was succeeded by his brother, James II. Charles II. was indolent, unambitious, and depraved in morals. (See HUME, "History of England;" MACAULAY, "History of England," vol. i.; WILLIAM HARRIS, "Life of Charles II.," 1765; LORD HALIFAX, "Character of Charles II.," 1750.)

Charles I. of France. See CHARLEMAGNE.

Charles, surnamed THE BALD [Fr. *Le Chauve*], or **Charles II.,** king of France, the fourth son of Louis le Débonnaire, was born at Frankfort on the Main in 823 A. D. On the death of his father (840) he inherited all of France which is W. of the Rhone. He was unable to resist the Normans, who invaded France, and was compelled to pay them tribute in 845 and again in 861. Having invaded Italy with success, he was crowned as emperor by the pope in 875 A. D. He is styled Charles II. among the German emperors, as well as Charles II., king of France. He died in 877, and was succeeded by his son, Louis le Bègue.

Charles III. of France, called THE SIMPLE, a son of Louis le Bègue, was born in 879 A. D. Eudes, count of Paris, was elected king by the barons in 883. Charles assumed the title of king in 893, and after the death of Eudes, in 898, he reigned alone. He was a feeble prince, and failed to defend his kingdom from the Normans. In 923 the nobles elected Raoul (or Rodolph) of Burgundy to the throne. Charles died in 929, leaving a son, Louis Outremer.

Charles IV. of France, surnamed THE HANDSOME [Fr. *Le Bel*], the third son of Philippe le Bel, was born in 1294. He began to reign in 1322. He aided his sister Isabella to dethrone her husband, Edward II. of England. He died without male issue in 1328, and was succeeded by Philip of Valois.

Charles V., called THE WISE [Fr. *Le Sage*], king of France, born Jan. 21, 1337, was a son of John II. He acted as regent during the captivity of John, who was taken prisoner by the English in 1356. He became king on the death of his father, in 1364, at a time when France was invaded by English armies. He acted on the defensive and avoided a general battle. The French general Du Guesclin expelled the English from Poitou, Saintonge, etc. Charles founded the Royal Library of Paris. He died Sept. 16, 1380, leaving the throne to his son, Charles VI. (See MICHELET, "Histoire de France;" BARTHÉLÉMY DE BEAUREGARD, "Histoire de Charles V.," 1843.)

Charles VI., called THE BELOVED [Fr. *Le Bien-Aimé*], a son of Charles V., was born in Paris Dec. 3, 1368. He was the first prince who received the title of dauphin. He became insane in 1392, after which the kingdom was distracted by the rivalry between the dukes of Burgundy and Orleans. In 1407 a civil war broke out between the Burgundians and the Armagnacs. France was also invaded by Henry V. of England, who gained a great victory at Agincourt Oct. 21, 1415. Charles died in 1422.

Charles VII., surnamed THE VICTORIOUS, king of France, born Feb. 22, 1403, was a son of Charles VI., whom he succeeded in 1422. At that time Henry VI. of England was recognized as king of France by a faction which had possession of Paris, and France was partially occupied by the English, who besieged Orleans in 1428. From the ruinous state to which the country was reduced by intestine discord and foreign invasion, it was restored by the heroism of Joan of Arc and the prudent policy of Charles, who became master of Paris in 1436. He waged war with success against the English, and recovered Normandy in 1450. He died July 22, 1461, and was succeeded by his son, Louis XI. (See VALLET DE VIRIVILLE, "Histoire de Charles VII.," 3 vols., 1862–65.)

Charles VIII., surnamed THE AFFABLE, king of France, born at Amboise July 30, 1470, was a son of Louis XI., whom he succeeded in 1483. He married, in 1491, Anne, duchess of Brittany. He led an army into Italy in 1494, and conquered Naples early in 1495. Alarmed by his victorious progress, the king of Spain, the German emperor, and other powers formed a league against him. As Charles was marching homeward he encountered and repulsed the army of the allies at Fornovo, and then returned to France. He died without issue April 7, 1498, and was succeeded by Louis XII. (See PHILIPPE DE SÉGUR, "Histoire de Charles VIII.," 1835.)

Charles IX., king of France, the second son of Henry II. and Catherine de Médicis, was born at St. Germain-en-Laye June 27, 1550. He succeeded his brother, Francis II., in 1560. During his minority his mother had the chief control of the government. His reign was disturbed by civil or religious wars, which began in 1562, between the Catholics and Huguenots. The court generally cooperated with the Catholic party, but Catherine was jealous of the duke of Guise, the leader of the Catholics, and sometimes opposed him by her intrigues. The civil war was several times suspended by treaties, and renewed in consequence of the perfidy of the court. Charles married, in 1570, Elizabeth, a daughter of the emperor Maximilian II. He made overtures of peace to the Huguenots, and negotiated a marriage between his sister Margaret and Henry of Navarre. On the occasion of this wedding he invited Coligni and other Protestant leaders to court, and treated them with a simulated favor which lulled their suspicions. It appears that he and his mother were responsible for the massacre of the Protestants which commenced

Aug. 24, 1572 (St. Bartholomew's Day). Charles admitted that he had consented to this crime. He died without issue May 30, 1574. (See VARILLAS, "Histoire de Charles IX.," 1683; SISMONDI, "History of France.")

Charles X., king of France, born at Versailles Oct. 9, 1757, was a younger brother of Louis XVI. He was originally styled the count of Artois. In 1773 he married Maria Theresa, a daughter of the king of Sardinia. He emigrated in 1789, and instigated the French royalists to revolt in 1795, but he declined to land and put himself at their head, for which conduct he was accused of cowardice by some of his own party. He remained in exile until 1814, and when he returned to Paris exclaimed, "Friends, nothing is changed in France; there is only one Frenchman the more!" He began to reign on the death of Louis XVIII. in Sept., 1824, and his conduct soon confirmed the proverbial saying, that "the Bourbons learn nothing and forget nothing." His policy was reactionary, and his advisers were a conclave of fanatical priests. In Aug., 1829, he dismissed the ministers and formed an ultra-royalist ministry, the chief of which was the prince de Polignac. In Mar., 1830, 221 deputies, forming a majority of the Chamber, avowed their hostility to the ministry. The court then dissolved the Chamber, and ordered a new election, which resulted in the return of another Chamber that was opposed to the ministers. The king and his ministers then resorted to a *coup-d'état*. On the 25th of July, 1830, they issued ordinances which subverted the freedom of the press, and dissolved the new Chamber. The Parisians appealed to arms, barricaded the streets, and after a contest of three days were completely victorious. Charles abdicated in favor of his grandson, the duke of Bordeaux, and escaped to England. He died Nov. 6, 1836. (See LORIEUX, "Histoire du Règne de Charles X.," 1834; LAMARTINE, "History of the Restoration.")

Charles I. of Anjou, king of Naples, count of Anjou and Provence, born about 1220, was the youngest son of Louis VIII. of France, and a brother of St. Louis. He married Beatrice, a daughter of Raimond Berenger, count of Provence, and became his heir. At the instigation of the pope he attacked and defeated Manfred, king of Naples, in 1266, and usurped his throne. Provoked by his tyranny, the Sicilians revolted and massacred a multitude of Frenchmen on the 30th of Mar., 1282. This event was called "The Sicilian Vespers." Died in 1285.

Charles I. of Spain. See CHARLES V. (emperor).

Charles (or Carlos) II., king of Spain, born in Nov., 1661, was the son of Philip IV., who died in 1665. Anne of Austria became regent during the minority of Charles, who was her son. He married, in 1678, Louise, a niece of Louis XIV. of France. In 1689 he became an ally of England and other powers in a war against Louis XIV. He was an incapable ruler and a man of morbid condition of mind and body. As he was childless, he became in the latter part of his life anxious and irresolute about the choice of his successor. By his last will he appointed Philip, duke of Anjou, as his heir. Died in 1700.

Charles III., king of Spain, a son of Philip V., was born in 1716. He ascended the throne on the death of his brother, Ferdinand VI., in 1759, and was an ally of France in the war against England which began in 1762. He promoted education and reform, and expelled the Jesuits from Spain in 1767. In 1779, as an ally of France, he declared war against England. These allies besieged Gibraltar without success. He died in 1788, and was succeeded by his son, Charles IV.

Charles IV. of Spain, a son of Charles III., was born at Naples Nov. 12, 1748. He became king in 1788, before which he had married Maria Louisa Theresa of Parma. In 1792, through the evil influence of the queen, her depraved favorite Godoy was appointed prime minister. In 1793 war was declared by the French against the Spaniards, who were defeated in many battles. Charles sued for peace, and the war ended in July, 1795. As an ally of France he declared war against England in 1796. Charles abdicated in favor of his son Ferdinand in Mar., 1808, but Napoleon in the same year deposed him, and placed his own brother Joseph on the throne. Died Jan. 19, 1819.

Charles X. (or **Charles Gustavus**), king of Sweden, born at Nyköping in 1622, was a son of the prince of Deux-Ponts. His mother was a sister of King Gustavus Adolphus. He was the heir-apparent in the reign of Christina, and became king when she abdicated in June, 1654. He was an able and a warlike ruler. In 1655 he invaded Poland because the Polish king had not renounced his claim to the throne of Sweden. He took Warsaw, and speedily drove the king out of Poland. During his absence the Danes declared war against him. He defeated them and compelled them to cede Scania to Sweden (1658). He died in 1660, and left the throne to his son Charles. (See LUNDBLAD, "Konung Carl X. Gustaf's Historia," 2 vols., 1823-29.)

Charles XI., king of Sweden, the son of Charles X., was born in 1655. By a treaty with Poland in 1660, Esthonia and other provinces which Charles X. had conquered were ceded to Sweden. Charles XI. assumed the royal functions in 1672, and formed an alliance with Louis XIV. of France. He defeated the Danes, who invaded Sweden in 1677, but in 1679 he signed a treaty of peace and married a sister of the king of Denmark. His reign henceforth was pacific and prosperous. In 1682 he was invested by the states with absolute power, of which he made a good use. He died in 1697, and was succeeded by his son, Charles XII.

Charles XII. of Sweden, born at Stockholm June 27, 1682, was the eldest son of Charles XI. and Ulrica Eleonora of Denmark. He learned Latin, French, and German, and formed in his youth simple and frugal habits of living. He began to reign in April, 1697, and chose Count Piper as his chief minister and adviser. In 1700 a league was formed against Sweden by Peter I. of Russia and the kings of Denmark and Poland, who designed to aggrandize their dominions at his expense. At the head of a well-disciplined army Charles assumed the offensive in May, 1700. He marched first against Copenhagen, and compelled the Danish king to sue for peace, which was concluded in Aug., 1700. With prompt and rapid movement he then led about 8000 men against Peter the Great, who was besieging Narva with nearly 70,000 men. Charles gained a decisive victory at Narva in Nov., 1700, soon after which he invaded Poland. He defeated the Poles in several battles, and deposed Augustus, king of Poland, in 1704. Provoked by recent acts of hostility on the part of the czar Peter, he advanced towards Moscow in Sept., 1707, with an army of 43,000 men. The Russian army was not able to resist his impetuous progress, and he crossed the Beresina in June, 1708. Having arrived at Smolensko, he was induced by Mazeppa, hetman of the Cossacks, to march southward into the Ukraine. Here many of his men perished from cold and want of provisions, and his army remained inactive during the severe winter of 1708–09. At the beginning of the next campaign he had only 18,000 Swedes in his army. He besieged Poltava, to relieve which Peter advanced with an army of 70,000 men. The decisive battle of Poltava, July 8, 1709, resulted in the defeat of Charles, who lost about 9000 men killed and 6000 prisoners. He retreated into Turkey, and was kindly received by the sultan, who gave him a residence at Bender. He induced the sultan to declare war against Russia, but this war was soon ended by a treaty. Charles remained in Turkey several years, and at length was involved in a quarrel with the Turkish rulers, who treated him as a prisoner. He escaped in 1714, and travelling *incognito* through Hungary and Germany, reached Stralsund in November of that year. The Russians, Danes, and Prussians continued to wage war against the king of Sweden, and they took Stralsund in Dec., 1715, after a long siege. The energy and audacity of Charles remained unabated, notwithstanding his reverses, and while the allies threatened to invade Sweden, he invaded Norway. He was killed at the siege of Frederikshall Nov. 30, 1718, and left a great reputation as a military genius. He was never married, and his sister Ulrica Eleonora inherited the throne. (See VOLTAIRE, "Life of Charles XII.;" NORDBERG, "Karls XII. Historia," 1740; LUNDBLAD, "Konung Carls XII. Historia," 2 vols., 1830; POSSELT, "Geschichte Carl's XII.," 1804.)

Charles XIII., king of Sweden, born 7th Oct., 1748, was a son of King Adolphus Frederick and a nephew of Frederick the Great. He was before his accession an admiral of the Swedish navy, and gained a naval victory over the Russians in 1788. In 1792 he became regent during the minority of his nephew, Gustavus IV., and retained that office until 1796. The States-General deposed Gustavus in 1809, and elected Charles as his successor. Having no son, Charles, with the consent of the Swedish Diet, adopted Gen. Bernadotte as his son and heir in 1810. Died Feb. 5, 1818.

Charles XIV. of Sweden. See BERNADOTTE.

Charles (or Carl) XV. (LOUIS EUGÈNE), king of Sweden and Norway, was born May 3, 1826. He succeeded his father, Oscar I., in July, 1859. He married in 1850 a Dutch princess of Orange. Died in Sept., 1872, leaving a daughter, Louisa, crown-princess of Denmark. The crown descended to his brother, Oscar II., Frederick, duke of Ostrogothia.

Charles, archduke of Austria, an eminent general, born at Florence 5th Sept., 1771, was a son of the German emperor Leopold II. Having served several campaigns against the French, he obtained in 1796 the chief command

of the Austrian army of the Rhine, and defeated the French general Jourdan at Wurtzburg in September of that year. He also compelled Moreau to retire across the Rhine. He retired from active service on account of ill-health in 1800. In 1805 he commanded in Italy, and defeated Massena at Caldiero. He became general-in-chief of the Austrian armies in 1806. He could not prevent Napoleon from entering Vienna, but he encountered him with success at the great battle of Aspern in May, 1809. The archduke and Napoleon commanded the armies at Wagram July, 1809, where the French claimed the victory. He resigned the command soon after this event. He wrote an able work called "Principles of Strategy" (1814). He died 30th April, 1847, leaving a son, Albert.

Charles Albert, king of Sardinia, was born Oct. 2, 1798. He was a son of Prince Charles Emmanuel of Savoy-Carignan. He became king on the death of Charles Felix in 1831, and adopted a liberal policy. Co-operating with the movements of the popular party in the cause of the unity and liberation of Italy, he declared war against Austria in the spring of 1848. Having been defeated at Novara in Mar., 1849, he abdicated in favor of his son, Victor Emmanuel. Died July 28, 1849.

Charles (surnamed) **the Bold,** sometimes called **Charles the Rash** [Fr. *Charles le Téméraire*], duke of Burgundy, born at Dijon Nov. 10, 1435, was a son of Philip the Good. He was styled count de Charolais until he became duke in 1467. He married Margaret, a sister of Edward IV. of England, in 1468, and became one of the most powerful sovereigns of his time. His dominions included the Netherlands. He waged war against Louis XI. of France and other princes. In 1476 he was defeated by the Swiss at Morat. He afterwards invaded Lorraine, and was defeated and killed at Nancy Jan. 5, 1477. He was succeeded by his daughter Mary, who was married to the emperor Maximilian I. (See KIRK, "History of Charles the Bold," 1868; COMINES, "Mémoires.")

Charlesbourg, a flourishing post-village of Quebec co. (Canada), 4 miles from Quebec, has a heavy trade in lumber, and is the seat of a convent of the Sisters of the Good Shepherd. Pop. about 800.

Charles City, a county in the S. E. of Virginia. Area, 184 square miles. It is bounded on the N. and E. by the Chickahominy, and on the S. by the James River. The surface is undulating. Grain, wool, and tobacco are the chief products. Two Presidents of the U. S., Harrison and Tyler, were born in this county. Capital, Charles City Court-house. Pop. 4975.

Charles City, a post-village, capital of Floyd co., Ia., is on Cedar River and the Iowa division of the Illinois Central R. R. where it is crossed by the Milwaukee and St. Paul R. R., 139 miles W. N. W. of Dubuque. It has a national bank, a savings bank, a furniture factory, and various other industries, and two newspapers. Pop. 2166.
DYKE BROS., PUBS. "INTELLIGENCER."

Charles City Court-house, a post-village, capital of Charles City co., Va., is about 1 mile N. of the James River and 28 miles S. S. E. of Richmond.

Charles Edward, "the Young Pretender," or more fully **Charles Edward Louis Philip Casimir Stuart,** son of James Stuart, the first "Pretender," and of the Polish princess Clementina Sobieski, was born at Rome Dec. 31, 1720. Unlike his father and his grandfather James II., he had much native talent and firmness of purpose. He was well educated, and skilled in athletic exercises, as well as in music and the fine arts. In early youth he served with much honor in the Spanish army against Austria. War having broken out between France and England, and his father having abdicated his claim to the British throne, he in 1744 embarked with a powerful fleet and army for England, Marshal Saxe being in command; but the expedition was broken up by a great storm, which destroyed a large part of the fleet. In the following year (July 25) he landed with a few attendants at Moidart. He soon had a large following, mostly of Highlanders. With these he entered Edinburgh Sept. 17, destroyed Sir John Cope's army at Preston Pans Sept. 21, entered England, and could easily have taken London, but for the insubordination of the Highland chiefs, who compelled him to retreat to Scotland, repulsing the royal troops at Clifton. On Jan. 17, 1746, he defeated Hawley at Falkirk. The character of his forces soon compelled his retreat to the Highlands, whither he was followed by the duke of Cumberland. He fought the latter at Culloden Muir (April 16), and was there utterly overthrown; but though his army was inferior in numbers and worn out by exposure and hunger, he would doubtless have won a complete victory but for the jealousy of the clan MacDonald. As it was, the battle was totally lost, and with it the last reasonable hope of the Stuart line. After many months of suffering he escaped from the Western Islands by the aid of the famous Flora MacDonald. He lived upon various parts of the Continent under the title of count of Albany. His ill-fortune and the unfaithfulness of the countess (who was the mistress of Alfieri) led him to grossly intemperate habits. He died at Rome Jan. 30, 1788.

Charles (ELIZABETH RUNDLE), an English authoress, born about 1826. She was married to Andrew P. Charles, Esq., of London. Among her works, which are very popular, are "Chronicles of the Schönberg-Cotta Family" (1863) and "Diary of Mrs. Kitty Trevylyan" (1864).

Charles Emmanuel I., duke of Savoy, surnamed THE GREAT, was born in 1562. He succeeded his father, Philibert Emmanuel, in 1580, and married Catherine, a daughter of Philip II. of Spain. He was an ambitious prince, and waged war against Henry IV. of France and other powers. Died in 1630.

Charles Friederich August Wilhelm, duke of Brunswick, born Oct. 30, 1804, son of Friedrich Wilhelm, who perished at the battle of Quatre-Bras, had for his guardian George IV. of England. Assuming the reins of government in 1823, he ruled so capriciously and arbitrarily that he was deposed by the German Diet. He lived afterwards in Paris and London, and died in Aug., 1873, bequeathing his immense fortune to the city of Geneva.

Charles (JACQUES ALEXANDER CÉSAR), a French savant and aëronaut, born at Beaugency Nov. 12, 1746. He was a popular lecturer on physical science in Paris, and gained distinction by his experiments in electricity. He also made an improvement in the art of ballooning by substituting hydrogen gas for heated air. He and M. Robert were the first persons who ever ascended in a balloon. They ascended in 1783 to the height of 7000 feet. Died April 7, 1823.

Charles Martel, king of the Franks, born in 690 A. D., was a son of Pepin d'Héristal, duke of Austrasia. He succeeded his father as mayor of the palace in 714, and obtained royal power, while Chilperic was the nominal king. He gained near Poitiers in 732 a most important victory over a large army of Saracens who had invaded the kingdom. This is known as the battle of Tours, and is regarded as one of the decisive battles of the world's history. For this victory he was surnamed MARTEL (*i. e.* the "Hammer"). He died in 741 A. D., and was succeeded by his sons, Carloman and Pepin le Bref.

Charles Mix, a county in the S. E. of Dakota, is bounded on the S. W. by the Missouri River. Capital, Greenwood. Pop. 152.

Charles River, Mass., rises in Worcester co., and pursues a very tortuous course through Norfolk and Middlesex cos. It meets the tide-water at Boston, forming part of Boston harbor, and separating that city from Cambridge. Total length, about 75 miles.

Charleston, a county of South Carolina, bordering on the Atlantic. Area, 1900 square miles. It is bounded on the N. and N. E. by the Santee River, and drained by the Cooper River. The surface is level; the soil is mostly sandy, and is partly fertile. Cotton, rice, and corn are the chief crops. It is intersected by the North-eastern, the South Carolina, and the Savannah and Charleston R. Rs. Capital, Charleston. Pop. 88,863.

Charleston, a post-village, capital of Coles co., Ill., on the Indianapolis and St. Louis R. R., 45 miles W. of Terre Haute. It has two national banks and two newspaper-offices, and is the seat of a medical college and an infirmary. Pop. 2849; of Charleston township, 4472.

Charleston, a post-township of Lee co., Ia. P. 1241.

Charleston, a post-township of Penobscot co., Me. Pop. 1191.

Charleston, a township of Kalamazoo co., Mich. Pop. 1369.

Charleston, a post-village, capital of Tallahatchee co., Miss. It has one weekly newspaper.

Charleston, a post-village, capital of Mississippi co., Mo., on the St. Louis and Iron Mountain and the Cairo Arkansas and Texas R. Rs., 12 miles from Cairo. It has three churches, an academy, and one newspaper. P. 635.
WM. BURNS, ED. CHARLESTON "COURIER."

Charleston, a post-township of Montgomery co., N. Y. It has five churches, and manufactures of woollens, flour, sash and blinds, etc. Pop. 1601.

Charleston, a post-village, capital of Swain co., N. C., is about 50 miles S. S. E. of Knoxville, Tenn.

Charleston, a township of Chester co., Pa. Pop. 907.

Charleston, a post-township of Tioga co., Pa. Pop. 2014.

Charleston, the chief city of South Carolina and capital of Charleston county, is situated in lat. 32° 46′ N., lon. 79° 57′ W., about 7 miles from the Atlantic Ocean and 120 miles from Columbia, the capital of the State. The city stands upon a tongue of land between the Ashley and Cooper rivers. Northward stretches an extended plain occupied by fruit, floral, and vegetable farms; southward the two rivers unite, forming a spacious and beautiful harbor, one of the safest and most commodious on the Atlantic coast. The depth within the harbor is from 40 to 50 feet, but only 18 feet at the entrance; however, the work of deepening the latter is now progressing. The city covers 5¼ square miles, is triangular in form, has 53 3/5 miles of streets, and 9½ miles of water-front. The population in 1850 was 42,985; in 1860, 48,409; in 1870, 48,956. The proportion of the white to the colored population in 1870 was 22 to 26. Between 1860 and 1865 the population was greatly reduced by war-influences. Commerce by land and sea was totally destroyed. The railroads leading into the interior were torn up, the wharves decayed, the docks filled up, and the capital of the merchants was destroyed or rendered unavailable. Charleston was not made a port of entry for more than a year after the end of the war. As soon as it was, industry revived, and commerce has since steadily increased. The city is the seat of a large wholesale trade carried on with the interior, and is the port through which the large interior cities of the neighboring States draw their supplies of merchandise from the great commercial centres. There is also a growing trade in flour, bacon, grain, etc., carried on overland with St. Louis, Chicago, and the cities of the West and the North-west. Charleston is the first rice and fourth cotton port in the U. S. In 1873 the receipts of rice were 49,284 tierces, and of cotton 391,307 bales, being an increase over the year previous of respectively 5607 tierces and 109,221 bales. The principal exports are in cotton, rice, naval stores, lumber, and phosphate rock (a fertilizing substance of great value). The exports in 1873 were—

	Total.	Foreign.	Coastwise.
Cotton, bales	385,185	160,169	225,016
Rice, tierces	37,672	none.	37,672
Naval stores, barrels	215,413	70,476	144,973
Lumber, feet	20,769,280	2,148,110	18,621,170
Phosphate rock, tons	29,838	2,435	27,403

The exports of each article were larger than those of the year before, particularly the foreign exports of cotton and naval stores, which increased 50 per cent. A large quantity of vegetables grown upon the suburban farms is annually exported to New York and other Northern cities. In the spring of 1873, 18,178 barrels of Irish potatoes and 101,956 packages of other vegetables were shipped northward. The value of foreign exports for the year ending Dec. 24, 1873, was $14,746,697, of which $2,911,770 represented the exports for Dec., 1873. The bulk of coastwise imports cannot be ascertained, but it is very large; the foreign imports are small, but growing; their value for the year ending Dec. 24, 1873, was $891,083. The vessels owned in Charleston in 1873 were 15 ocean sailing-vessels, aggregating 1713 tons; river sailing-vessels 130, tons 2125; ocean steamers 6, tons 1031; river steamers 9, tons 1593.

Manufactures are carried on in iron, wood, and phosphate rock. The census of 1870 sets down the manufactories of all kinds at 224, employing $1,538,539 capital, 2579 hands, paying annually $616,962 in wages, consuming $1,264,731 in materials, and producing $2,431,763 in manufactured articles. Since then, however, considerable increase has occurred in manufactures. In 1873 the manufacture of phosphate rock alone employed $2,010,000 capital. In the same year 56,298 tons of manufactured fertilizers, worth $3,000,000, nearly all produced by this industry, were shipped into the surrounding country. The manufacture of locomotives was begun in the South Carolina R. R. machine-shops in 1873.

The U. S. census of 1870 fixes the valuation of all property in the city at $54,730,166, while by the State assessment for 1872 it was only $41,047,625, and by the city assessment for 1873, $28,178,991. Of the last amount, $9,204,271 represented the personal and $18,974,720 the real property. The municipal tax in 1873 was 19¼ mills on the dollar, yielding $542,445. By licensing all classes of business $89,182 additional were collected. The State tax in 1873 was 15 mills, 3 mills being for county purposes. The city debt is $5,127,208, contracted before the war in aid of railroads. The municipal expenditures of 1873 were $1,087,736.40, of which $189,829.52 were spent in reducing the debt. The banking capital is $3,000,000, divided between seven banks of discount, whose aggregate deposits are $1,600,000. In addition there are five savings banks, aggregate deposits $1,155,990. There is one local fire insurance company, capital $26,000. There are three daily, one tri-weekly, one semi-weekly, five weekly, one semi-monthly, two monthly, and one quarterly publication. A city court, sitting once a year, and presided over by a judge elected for life by the legislature, and the mayor's court, constitute the municipal tribunals. There is a county jail, and a house of correction which is in the suburbs. The inmates are made to cultivate a farm, which produces nearly enough to pay for supporting that institution and an adjoining asylum for the aged and infirm. Pauperism and crime characterized respectively one-third and one-fifth of 1 per cent. of the population.

The principal educational institutions are—Charleston College, founded in 1785, endowment over $200,000, income without tuition $14,000, cost of tuition $40 per annum, number of faculty 6, students 34, alumni since 1866, 50; and the Medical College of South Carolina, no endowment, number of faculty 12, of students 60, cost of course $60. The former has an excellent museum of natural history, and the latter one of the best pathological and anatomical museums in the U. S. There is one high school for boys, with 5 teachers and 100 pupils; cost of tuition $40, annual donation from city $2000. Number of public schools 4, teachers 72, pupils 3000. Teachers' salaries aggregate $36,000 per annum, and vary from $400 to $2000 each. One of these schools is a normal school for girls; it has two departments. In the higher girls are prepared to become teachers. The other schools are divided into primary, intermediate, and grammar departments, each of the two last being the field of promotion for the one below. Each school has a principal, and a sub-principal for each department. All of the schools are under the direction of a superintendent, who is subject to the control of a board of commissioners composed of one citizen from each ward, chosen every two years by the people. The Charleston Library is the principal institution of that kind. Established in 1748, it formerly contained 24,000 volumes, but lost about 8000 by the war. Many of its books are of great value. The society owns a building on Broad street. It has no endowment; its income is about $2000. The Apprentices' and Minors' Library Society had a building on Meeting street and 10,000 volumes, which were destroyed by fire in 1861. It was reorganized in 1873.

The churches number 39: Episcopal 11, Presbyterian 8, Catholic 5, Methodist 5, Baptist 4, Lutheran 3, Unitarian 1, Independent 1, Orphans' chapel 1; also two Jewish synagogues; average sittings 500 each. St. Michael's and St. Philip's, Episcopal, and the Central Presbyterian, are the finest church edifices. The benevolent institutions are the city orphan-house, endowment $190,000, annual cost $21,377, inmates 303, city donation $20,000 a year; the Catholic orphan asylum, inmates 109, annual city donation $6000; almshouse, inmates 75, besides outside pensioners, cost to the city $10,000 a year; asylum for aged and infirm, inmates 58, annual cost $3515; city hospital, patients treated 1223, annual expenses $20,977, cost to the city $7287. There is an asylum for colored orphans, supported by the State, cost $5000 a year. The Confederate Widows' Home, St. Philip's Church Home, Sailors' Home, Ladies' Mutual Aid Association, and Ladies' Fuel Society are among the private benevolences.

The most noted public buildings are the Arsenal and the Citadel, occupied by U. S. troops, the market, city hall, court-house, city orphan-house, Charleston Hotel, Mills House, Academy of Music, new custom-house, and the post-office. The Battery, a small park on the S. front of the city, is the chief public resort.

The city railroads are the City Railway, for passengers only, capital $200,000, miles of track 8, passengers carried annually 1,000,000; Enterprise Railroad, for freight and passengers, capital $250,000, miles of track 3, now building. Three steam railroads centre in the city, the principal of which is the South Carolina. There is a steam ferry to Sullivan's Island, a summer resort, carrying 200,000 passengers annually. The city is lighted by a private gas company. The paved streets are 9½ miles, planked 5½, shelled 1¾. The tidal sewerage is in vogue: miles of sewers, 5½, besides inclined drains.

Charleston was founded in 1680 by an English colony. During the first half century its growth was slow, but it attained commercial importance before the end of the second. It was taken by the British in 1780, after a gallant defence, and evacuated by them in 1782. It was the State capital until 1790, when the seat of government was removed to Columbia. It was the seat of the great Democratic convention of 1860, and later in the same year of the convention which passed the famous Ordinance of Secession. The reduction of Fort Sumter, its principal harbor defence, was the first conflict of the great civil war and the first triumph of the Confederate arms. In Dec., 1861, nearly half of the city was destroyed by fire. During the last two years of the war it sustained a protracted siege and bombardment, and was finally evacuated by the Confederates Feb. 19, 1865.

W. E. Simmons, Jr., late Ed. "News and Courier."

Charleston, a township of Orleans co., Vt. It has an academy, and manufactures of lumber, leather, starch, etc. Pop. 1278.

Charleston, or **Kanawha Court-house,** the capital of West Virginia and of Kanawha co., at the mouth of the Elk River, on the Kanawha River, 65 miles from its mouth and 150 miles S. S. W. of Wheeling. The Chesapeake and Ohio R. R. passes the city on the opposite side of the Kanawha. Steamboats navigate the Kanawha River up to this point. The city has one daily and three weekly newspapers, two national banks, two iron-foundries, and several large manufactories. A considerable trade in lumber, salt, and coal is carried on. There are ten salt furnaces, one of which makes 2000 bushels of salt per day. The seat of the State government was removed to Charleston in 1869. Pop. 3162; of township, 3857.

CHARLES B. WEBB, ED. "KANAWHA CHRONICLE."

Charleston, College of. In June, 1770, a meeting of the citizens of Charleston, S. C., was held to petition the general assembly for the establishment of a college. In Oct., 1775, an act was passed providing for three colleges, one of which was to be located in Charleston. In Mar., 1789, the Rev. Dr. Robert Smith was elected president. In Oct., 1794, the first commencement was celebrated. In 1805 Dr. George Buist was elected president, and served three years. Upon his death Mr. Mitchell King was elected to supply his place.

After a suspension of some years, in 1826 the Rev. Jasper Adams of Brown University was elected president, and in 1830 the new building (subsequently enlarged by the addition of wings) was erected. From 1826 to 1838 the chair was filled by Dr. Adams, with the exception of one or two intervals, in which Mr. King and the Rt. Rev. Dr. Bowen officiated temporarily. In 1838, Rev. Dr. Brantley was elected, and was succeeded in 1844 by W. P. Finley, LL.D., who served until 1857, when the present president, N. Russell Middleton, LL.D., was elected.

The plan upon which the college is now conducted repudiates all coercion; if the students are indolent or ill-behaved, they are dismissed, and the discipline of the college has decidedly improved under this method. The institution being intended chiefly for the use of the citizens, to keep their sons under parental influences and preserve their acclimation, has never been largely supplied with students, the number varying from 30 to 60.

N. R. MIDDLETON.

Charlestown, a post-village, capital of Clarke co., Ind., is 2½ miles from the Ohio River and 12 miles N. N. E. of Louisville, Ky. It has four or more churches and one newspaper. Pop. 2204; of Charlestown township, 3294.

Charlestown, a post-village of North-east township, Cecil co., Md., on the North-east River and on the Philadelphia Wilmington and Baltimore R. R., 7 miles E. by N. of Havre de Grace. It was settled in 1742, and burned by the British in 1813. Pop. 223.

Charlestown, a former city and seaport of Middlesex co., Mass., is a northern suburb of Boston, lat. 42° 2′ N., lon. 71° 3′ 33″ W. It is situated on a peninsula nearly enclosed by the Mystic and Charles rivers, and is connected with Boston and Chelsea by five bridges. The ground is uneven, and rises into two eminences, Breed's and Bunker Hills, which afford delightful situations for dwellings. The city is handsome and well built, with pleasantly shaded rather irregular streets. Three avenues, Main, Bunker Hill, and Medford streets, traverse the peninsula, and, converging at its neck, make the fine broad avenue Broadway, passing through Somerville and over Winter Hill. The city has thirteen churches, two national banks, three newspapers, public parks, horse-railways, a public library, and numerous charities. Here is also a State prison, after the plan of that at Auburn, N. Y., in which there are 600 convicts. There is an extensive U. S. navy-yard, occupying seventy to eighty acres, extending from the Charles to the Mystic rivers, in which are three large ship-houses, a ropewalk, the largest in the U. S., and machine-shops for the manufacture of copper-work, machinery, and ordnance, capable of employing 2000 men. A dry-dock connected with the navy-yard is built of granite and cost $670,000. There are $10,000,000 worth of government stores in the yard. Charlestown has manufactures of steam-engines, boilers, and machinery, chemicals, stone-ware, brass-ware, brushes, sugar, soap, leather, mechanics' tools, gas fixtures, whips, drain-pipes, New England rum, tobacco, oils, etc. To commemorate the battle of BUNKER HILL (which see) a granite shaft 220 feet high, 31 feet square at the base, and 15 at the top, was commenced in 1825 and finished in 1843. It is called the Bunker Hill Monument, and from its summit is afforded a magnificent view of the surrounding country. The corner-stone of this tower was laid by La Fayette, and at the celebration of its completion, June 17, 1843, the anniversary of the battle, was present a vast gathering of people, including the President and his Cabinet. Charlestown is supplied with water from Mystic Lake, 5 miles distant. The water-works were finished in 1864, at a cost of $1,461,259. In 1872 there was a balance over expenses of $144,576—a singular instance of water-works paying a balance over maintenance. The water flows from the lake one mile by gravitation, is then pumped by three engines to a reservoir on Tuft's Hill, from which it flows four miles, and supplies Charlestown and the neighboring towns; in all, a population of 100,000. Charlestown is memorable from its associations with the Revolution. It was burned by the British on the day of the battle of Bunker Hill. The city charter dates from 1847. The city of Charlestown, also the towns of West Roxbury and Brighton, were annexed to Boston Oct. 13, 1873, to become a part of that municipality Jan. 5, 1874. Pop. 28,323.

WM. H. DECOSTA, PUB. "ADVERTISER."

Charlestown, a post-village of Sullivan co., N. H., on the Connecticut River and the Vermont Central R. R., 50 miles W. of Concord. It has a national bank, a savings bank, four churches, and manufactures of lumber, boots and shoes, etc. Pop. of Charlestown township, 1741.

Charlestown, a post-township of Portage co., O. P. 675.

Charlestown, a post-township and village of Washington co., R. I. The village is on the Stonington and Providence R. R., 40 miles S. S. W. of Providence. Pop. 1119, including 115 Indians of the Narragansett tribe.

Charlestown, a post-village, capital of Jefferson co., West Va., on the Baltimore and Ohio and South Virginia R. Rs. It has four churches, a fine court-house, a jail, one newspaper, and a national bank. In this place John Brown was tried and executed Dec., 1859. On the 18th Oct., 1863, a Confederate force of 1200 or 1400 men, under Gen. Imboden, surrounded the place at daylight, and attacked the Union troops stationed there. Being surprised, they were panic-stricken, and, flying in confusion, were nearly all captured. The place was recaptured within an hour by a force of U. S. troops under Col. Geo. D. Wells, and the Confederates driven from the town. Pop. 1593.

W. W. B. GALLAHER, ED. "FREE PRESS."

Charlestown, a post-township of Calumet co., Wis. Pop. 1250.

Charleville, a town of France, in the department of Ardennes, on the river Meuse, which separates it from Mézières. It is well built and handsome, and has a college and a large public library; also manufactures of hardware, nails, copper, leather, etc. A suspension bridge crosses the river here. This place was formerly fortified. Pop. 11,244.

Charlevoix, a county of Canada, in the province of Quebec, bounded on the E. by the St. Lawrence. It abounds in limestone, and has saline and sulphur springs. Iron and plumbago have been found in this county. Capital, St. Paul's Bay. Pop. in 1871, 15,611.

Charlevoix, a county of the N. part of the S. peninsula of Michigan, bordering on Lake Michigan. Its surface is largely covered with timber, and it abounds in lakes. Potatoes, grain, and maple-sugar are the most important crops. Capital, Charlevoix. Pop. 1724.

Charlevoix, a post-village, capital of Charlevoix co., Mich. It has one newspaper. Pop. of township, 456.

Charlevoix, de (PIERRE FRANÇOIS XAVIER), a French Jesuit and historian, born at Saint-Quentin Oct. 29, 1682. He went as a missionary to Canada in 1720, and descended the Mississippi to its mouth. He wrote, besides other works, a "History of Canada" (3 vols., 1744). Died Feb. 1, 1761.

Charlotte, a county in the S. W. of New Brunswick, Canada, is bounded on the S. by the Bay of Fundy and Passamaquoddy Bay, and on the W. by the river St. Croix, which separates it from Maine. The soil is fertile. It is intersected by the New Brunswick and Canada R. R. Capital, St. Andrew's. Pop. in 1871, 25,882.

Charlotte, a county in S. S. E. Virginia. Area, 550 square miles. It is bounded on the S. W. by the Staunton River. The surface is uneven; the soil is productive. Tobacco and grain are the staple crops. It is intersected by the Richmond and Danville R. R. Capital, Marysville or Charlotte Court-house. Pop. 14,513.

Charlotte, a township of Livingston co., Ill. P. 746.

Charlotte, a post-township of Washington co., Me. Pop. 467.

Charlotte, a city, capital of Eaton co., Mich., on the Grand River Valley branch of the Michigan Central and the Peninsular R. Rs., 19 miles S. W. of Lansing. It has a national bank, a fire department, two newspapers, lumber, and other manufactories. Pop. 2353. ED. "REPUBLICAN."

Charlotte, a township of Bates co., Mo. Pop. 1289.

Charlotte, a township of Chautauqua co., N. Y. It has six churches, and manufactures of leather, cheese, lumber, etc. Pop. 1682.

Charlotte, a post-village of Monroe co., N. Y., on Lake Ontario, at the mouth of the Genesee River, 7 miles N. of Rochester, with which it is connected by railroad. Here is a custom-house and an iron foundry.

Charlotte, a post-village, capital of Dickson co., Tenn., 38 miles W. of Nashville. Pop. 276.

Charlotte, a post-township and village of Chittenden co., Vt., on the Rutland division of the Vermont Central R. R., 12 miles S. S. W. of Burlington. Pop. 1430.

Charlotte, a city, the capital of Mecklenburg co., N. C., on the Atlanta and Richmond R. R., and the terminus of the North Carolina division of the Richmond and Danville and the Charlotte Columbia and Augusta R. Rs. It has one national and two other banks, one daily and four other newspapers, three academies, and various manufactories. Gold-mines have been opened in the vicinity. There is a branch of the U. S. Mint in this city. Pop. 4473; of township, 2212. JOHNSTONE JONES, ED. "OBSERVER."

Charlotte Amalie, a town of the West Indies, capital of the island of St. Thomas. It stretches a mile along the shore, with white-walled, red-roofed houses, contrasting with the palms on the neighboring hills. It has a good harbor and an extensive trade, and is a station for the mail-packets which ply between Southampton and the West Indies and for the steamers from New York to Brazil. Pop. 12,560.

Charlotte Court-house, a post-village, capital of Charlotte co., Va.

Charlotte Hall, a post-township of St. Mary's co., Md. Pop. 1601.

Charlotte Harbor, an inlet on the W. coast of Florida, in Manatee county, is nearly 24 miles long, and is sheltered from the sea by several islands. It is shallow, its greatest depth being nearly ten feet. Good oysters and fish abound here. Cattle are exported to Key West.

Charlot'tenburg, a town of Prussia, in the province of Brandenburg, on the river Spree, 3 miles W. of Berlin, at the end of the Thiergarten park. It has a palace with a fine park and a famous palmery, and a mausoleum in which are statues of Frederick William III. and Queen Louisa, by Rauch. Here are manufactures of cotton and hosiery. Pop. in 1871, 19,518.

Char'lottesville, the capital of Albemarle co., Va., is on the Rivanna River and on the Chesapeake and Ohio R. R., 97 miles by railroad W. N. W. of Richmond; it is 61 miles N. N. E. of Lynchburg by the Orange Alexandria and Manassas R. R. One mile W. of this town is the University of Virginia, founded in 1819 by Thomas Jefferson, and endowed by the State. Here are two national and two other banks, a cloth, an agricultural implement, two tobacco, and other factories. The city has an academy and several other schools, seven churches, an insurance company, and two newspapers. Monticello, the residence of Jefferson, is three miles distant. Pop. 2838; of township, 7145. ED. "CHRONICLE."

Char'lottetown, the capital of Prince Edward Island and of Queen's county, is situated on the N. bank of East River, near the S. coast. It has an excellent harbor and a large export trade. The town is well laid out, and has a fine colonial building, post-office, and athenæum, a normal school and lunatic asylum, and is the seat of Prince of Wales, St. Dunstan's (Roman Catholic), and a Methodist college. It has excellent public schools. It is the see of a Roman Catholic bishop, has nine churches, and seven weekly, one semi-weekly, and one fortnightly periodical. Pop. in 1871, 8807.

Charl'ton, a county of Georgia, bordering on Florida. It is partly bounded on the E. by the Satilla and St. Mary's rivers. The surface is level; the soil is sandy. Pine timber abounds. Corn, rice, wool, and sweet potatoes are the chief products. Capital, Trader's Hill. Pop. 1897.

Charlton, a post-township and village of Worcester co., Mass., on the Boston and Albany R. R., 57 miles W. S. W. of Boston. Lumber and woollens are manufactured. P. 1878.

Charlton, a post-township and village of Saratoga co., N. Y. Pop. 1607.

Charlton (ROBERT M.), an American lawyer and author, born at Savannah, Ga., Jan. 19, 1807. He published a volume of poems in 1838, and became U. S. Senator in 1852. Died Jan. 18, 1854.

Char'mides [Χαρμίδης], an Athenian philosopher, born about 450 B. C., was an uncle of Plato and a pupil of Socrates. He was one of the tyrants who obtained power by the aid of Lysander the Spartan, and was killed in battle by the army of Thrasybulus about 404 B. C.

Char'nock (Rev. STEPHEN), an English nonconformist, born in London in 1628; died July 27, 1680. He is best known by his able treatise on "The Being and Attributes of God" (1682, folio). A second folio volume appeared in 1683. His whole works were published in nine volumes, 8vo, in 1815, and a new edition in 1866.

Cha'ron [Gr. Χάρων], in classic mythology, the ferryman who transported the souls of the dead across the rivers of the infernal regions. The poets feigned that he was the son of Erebus and Nox.

Charon'das [Χαρώνδας], an eminent Greek legislator, born at Catana, in Sicily, flourished about 650 B. C. He composed laws in verse, which were adopted by the Athenians and other nations.

Cha'ron of Lamp'sacus, son of Pythocles, one of the early writers of history preceding Herodotus, who are known under the name of "logographi." Little more is to be gathered of his life than the brief summary given by Suidas, who places him in the time of the Persian wars, Ol. 75 (*i. e.* B. C. 480). Plutarch refers to him as writing still after the death of Xerxes, which occurred B. C. 465. He composed a number of works on historical subjects, particularly an account of the Persians (Περσικά), and another of the Greeks (Ἑλληνικά). Suidas gives the titles of several other histories of separate countries, some of which, Creuzer and Müller think, may be but different names of the same work; some probably belong to other writers of this name. Suidas speaks of two others—one of Carthage, who wrote accounts of the tyrants of Europe and Asia; the other of Naucratis, who wrote the lives of Alexandrian and Egyptian priests, a history of kings, and an account of Naucratis. (The fragments of the works of Charon of Lampsacus are collected in CREUZER'S "Histor. Græc. Antiq. Frag.," and in MÜLLER'S "Histor. Græc. Frag.," vol. i., pp. 32–35.)

HENRY DRISLER.

Charost, de (ARMAND JOSEPH DE BÉTHUNE), DUC, a French philanthropist and economist, born at Versailles July 1, 1728, was a descendant of the renowned Sully. He founded hospitals and published treatises on agriculture. Died Oct. 27, 1800.

Charr, the *Salmo umbla*, one of the most beautiful and most delicious fishes of the salmon family, caught in the British Islands, Switzerland, and Sweden. It is not a game fish, though it will occasionally rise at the fly or take a

The Northern Charr.

minnow. It lives in the clear water of lakes and streams, and is so much hunted for market that it is believed to be rapidly becoming extinct. It seldom weighs much more than a pound, and is quite variable in color and marks.

Charrette, a township of Warren co., Mo. Pop. 2690.

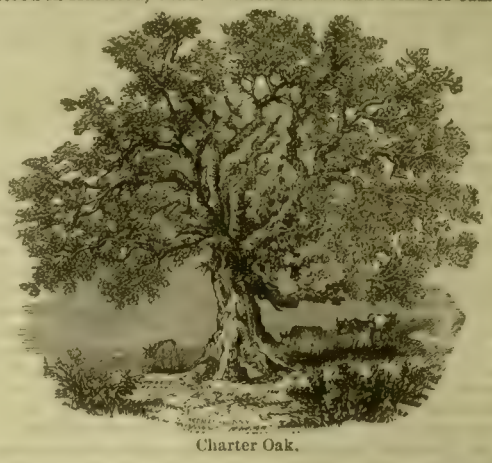
Charrières, de (MADAME SAINT HYACINTHE), a French authoress, born in Holland in 1740, married M. de Charrières, a Swiss gentleman, and lived in the neighborhood of Neufchâtel. She wrote several romances of Swiss life that were praised by Sainte-Beuve. The best known are "Lettres Neuchateloises" (1784) and "Caliste" (1786). She was intimate with Benjamin Constant while he was yet young, and their interesting correspondence has been published. Died Dec. 20, 1805.

Chart [from the Fr. *carte;* Lat. *charta*, "paper"], a hydrographic map for the use of navigators, is the projection of some portion of the sea or coast on a plane surface. Charts are generally constructed on the principle of Mercator's projection. In the English and U. S. services, after coasts have been surveyed by the government, charts are engraved and sold at prices below their cost, in order to encourage their general use. The navigating charts, showing the dangers of the coasts with sufficient clearness to enable mariners to avoid them, are usually on a uniform scale, and the U. S. charts are generally on the polyconic

projection. The preparation of charts is a part of the duty of the hydrographical department at the admiralty in England, and in the U. S. of the coast survey department.

Char'ta Epispas'tica [Lat. for "drawing" (or blistering) "paper"], the pharmaceutical name for blistering paper. It is prepared by applying to one surface of smooth bibulous paper a mixture of oil, wax, spermaceti, resin, Canada balsam, water, and powdered cantharides. When applied to the skin it adheres, and after a time raises a blister as perfectly as the blistering cerate does, while it is much cleaner and more easily applied.

Various *chartæ emplasticæ*, or adherent medicated papers (*papiers emplastiques*), are employed by many French physicians instead of the less neat and convenient plasters of ordinary pharmacy.



Charte [Fr.], the name applied in France (1) to the "Grand Charter" of John II., prepared by the States-General and agreed to by the king: this was the basis upon which the States-General asserted their liberties at the commencement of the Revolution; (2) that by which Louis XVIII. in 1814 acknowledged the rights of the people; (3) that of 1830, which was sworn to by Louis Philippe, recognizing the popular sovereignty.

Char'ter [Fr. *chartre* or *charte*, from the Lat. *charta*, "paper"], a formally written instrument given as evidence of a grant, contract, or other transaction between man and man; an instrument executed with form and solemnity bestowing rights and privileges. In public law the term is applied to those formal deeds or instruments by which sovereigns guarantee the rights and privileges of their subjects, or by which a sovereign state guarantees those of a colony. The founders of several of the British colonies, now States of the Union, obtained charters from the king of England for the same. In municipal law the word is principally used to designate a grant obtained from the king of franchises, privileges, or estates by letters patent under the great seal. A leading instance is found in the creation of corporations. In early times corporations were created principally in this manner. It has been doubted whether municipal corporations could at first be created in any other way than by royal charter. The better opinion is that there could be valid charters other than royal. It is now quite frequent to originate them by act of Parliament. The act of incorporation in that case has the force of a statute. There are certain special rules appertaining to royal charters, as distinguished from corporations created by act of Parliament. Thus, the king cannot limit the perpetuity of a corporation, while Parliament may. Accordingly, when the Bank of England was established by way of experiment, the aid of Parliament was called in to limit its duration. A general statute now confers that power upon the king to limit the time of corporate existence. So the Crown cannot force a new charter upon an already existing corporation. The king cannot derogate from his own grant. Parliament may abolish the institution or modify it at pleasure. Nor can the king remove corporators at discretion, as each corporator is supposed to have a freehold estate. So a charter cannot create exclusive right or prohibit trade, or in any way change the established law of the land. These propositions are of but little practical use in the U. S., as, since the Revolution, corporations are created by act of the legislature. There is a number of municipal and other charters in existence which were granted by the king prior to the Revolution, and which remain in force, notwithstanding the change in government. (As to general rules of law in which the rules concerning strict charters agree with corporations created by the legislature, see CORPORATION.)

T. W. DWIGHT.

Char'ter-House [a corruption of *Chartreuse* (see CARTHUSIANS)], a hospital and school in London, founded in 1611 by Sir Thomas Sutton, who endowed it with the revenues of more than twenty manors, lordships, and other estates. It was originally a Carthusian monastery, founded in 1371. It is an asylum for poor brethren, the number of whom is limited to eighty, and they must be bachelors, members of the Church of England, and fifty years old. Each brother receives, besides food and lodging, an allowance of £26 a year for his clothing, etc. The school is for the benefit of "the sons of poor gentlemen to whom the charge of education is too onerous." The number of scholars is limited to forty-four, but there are large numbers of day and boarding pupils who are not charity scholars. Among the eminent men educated here were Addison, John Wesley, George Grote, Bishop Thirlwall, and Thackeray. The reputation of the school is high. In 1873 the school was removed to Godalming.

Char'ter Oak, a tree famous in colonial history, once stood in Hartford, Conn. When Sir Edmund Andros came

Charter Oak.

to Hartford in 1687, by command of King James II., to resume the charter of the colony, the charter was concealed by Capt. James Wadsworth in a hollow of this oak. This historic tree was blown down by a gale in Aug., 1856.

Charter Oak, a township of Crawford co., Ia. P. 67.

Chart'er-Par'ty [Fr. *chartre-partie*, so called from such documents being at one time divided (in Fr. *parti*), and one-half given to each party concerned], the title given to a contract in which the owner or master of a ship, with consent of the owner, lets the vessel or a portion of her to a second party for the conveyance of goods from one port to another port; hence the vessel is said to be "chartered." It must specify the voyage to be performed, and the terms on which the cargo is to be carried. On the part of the ship it is covenanted that she shall be seaworthy, well found in rigging, furniture, and provisions, and that the crew be suitable in number and competency; that she shall be ready to receive the cargo on a given day, wait its complete delivery for a certain period, and sail for the stipulated port when laden if the weather for the time permits. The freighter's portion of the contract obliges him to load and unload at suitable periods under specified penalties, and to pay the freight as agreed on. The master must not take on board any contraband goods, or otherwise render the vessel liable to seizure. The owner is not responsible for losses caused by war, fire, or shipwreck, unless arising from negligence of the master or crew. A charter-party sometimes assumes another character, and is a mere lease of a ship, which is manned by the charterer, who then has the usual rights and incurs the liabilities growing out of possession.

Chartier (ALAIN), an eminent French poet, born in Normandy about 1385, was secretary to Charles VI. and to Charles VII. He wrote a prose work called "Le Curial," and popular poems, among which is "The Book of the Four Ladies" ("Le Livre des Quatre Dames"). He contributed to improve and refine the French language. Died about 1455.

Char'tiers, a township and post-village of Alleghany co., Pa. The village is 5 miles W. of Pittsburg, on the Pittsburg Cincinnati and St. Louis R. R. Total pop. 2269.

Chartiers, a township of Washington co., Pa. Pop. 1870.

Chart'ism [so called from "the people's charter," noticed below], a political movement in Great Britain between 1835 and 1850, in which attempts were made to secure universal male suffrage, equal representation, the vote by ballot, annual parliaments, the abolition of property qualification for office-holders, and the payment of salaries to members of Parliament. These changes were demanded in "the people's charter" of 1838. The movement was primarily caused by the sufferings of the working-classes; and as a whole, the demands of the Chartists were reasonable, moderate, and just; but they excited the greatest alarm in England, and the movement was opposed by force, some of their meetings being fired upon by the troops, prominent Chartists being imprisoned, and Parliament refusing to entertain their petitions. But various parliamentary reforms and the repeal of the corn laws in 1846 having in a measure relieved the distress of the working-classes, Chartism gradually declined.

Chartres (anc. *Autricum*), a city of France, capital of the department of Eure-et-Loir, is on the river Eure, and on

the railway which connects Paris with Le Mans, 49 miles S. W. of Paris. It is built at the base and on the declivity of a steep hill. The streets are narrow and crooked. Here is a Gothic cathedral of the eleventh century, said to be the most perfect in France; it is surmounted by two towers, one of them 382 feet high, with rich ornamentation, and the other exceedingly massive. Chartres has two other remarkable churches, an episcopal palace, and a public library of about 30,700 volumes; also manufactures of hosiery, hats, leather, etc. Here is a large weekly market for grain and flour. During the Middle Ages, Chartres was the capital of the district of *Chartrain*, made by Francis I. a duchy, and given as an appanage to the dukes of Orleans. Hence the title duke of Chartres was given to the eldest son of the duke of Orleans. More recently the same title was given to Prince Robert of Orleans, grandson of King Louis Philippe, and second son of Duke Ferdinand of Orleans. Pop. 19,442.

Chartreuse, La Grande, a large and famous monastery in the French Alps, 12 miles N. N. E. of Grenoble, in the midst of wild and impressive scenery, 3281 feet above the sea. The convent was founded by Saint Bruno in 1084, somewhat higher up the mountain than the present buildings. The name of the order, Carthusians, comes from this convent, and the English Charter-house is a corruption of its name. The buildings are extensive, but rudely built, and date from 1689. The monastery had been repeatedly burned before the present structure was built. The monks were stripped of their possessions, which were considerable, in the French Revolution, and abandoned the convent until 1826. They have never recovered their former wealth and dignity.

Char'tulary [Late Lat. *chartularia*] is, as its name implies, a collection of charters. So soon as any body, ecclesiastical or secular, came to be possessed of a considerable number of charters, considerations of convenience and safety would suggest having them classified and copied into a book or roll. Such book or roll has received the name of a chartulary. Mabillon traces chartularies in France as far back as the tenth century, but it was not until the twelfth or thirteenth century that they became common. They were kept not only by all kinds of religious and civil corporations, but even by private families. Many of them have been printed, and their contents are often of the greatest value in historical, archæological, and genealogical inquiries.

Charyb'dis [Gr. Χάρυβδις], now called **Galofaro,** is an incessant undulation, rather than a whirlpool, on the Sicilian side of the Strait of Messina, opposite the rock of Scylla. It is caused by the meeting of currents, and is seldom dangerous. It was anciently much dreaded by mariners. (See Rear-Admiral William Henry Smyth's monograph on the Mediterranean, p. 519, 8vo, 1854.)

In Greek mythology, Charybdis was a daughter of Poseidon, and was killed by Zeus with a thunderbolt and hurled into the sea, where she henceforth drew the approaching ships into the deep.

Chase [Fr. *chasse*], a pursuit, a hunting; the sport of hunting or pursuing game. In nautical language, chase is the pursuit of a hostile vessel and also the vessel pursued. The chase of a gun is the name of the greater portion of the length between the muzzle and the trunnions. In forestry, chase is a row or rank of trees or plants, especially hedge-plants; also an extent of waste or forest-land formerly appropriated in England for the breeding of deer and other game.

Chase [Fr. *châsse*], in printing, an iron frame in which the pages of type are wedged up to secure the letters from separating or dropping out in the process of printing. Chases are of different dimensions, according to the number of pages in a sheet and the size of the paper.

Chase, a county in E. Central Kansas. Area, 757 square miles. It is intersected by the Cottonwood River, and also drained by several creeks. The surface is undulating: the soil is fertile. Tobacco, grain, live-stock, and wool are produced. It is traversed by the Atchison Topeka and Santa Fé R. R. Capital, Cottonwood Falls. P. 1975.

Chase, a post-township of Lake co., Mich. Pop. 520.

Chase (Carlton), D. D., born at Hopkinton, N. H., Feb. 20, 1794, graduated at Dartmouth in 1817, was ordained deacon in 1818, and priest in 1820, and in 1844 was consecrated Protestant Episcopal bishop of New Hampshire. Died at Claremont, N. H., Jan. 18, 1870.

Chase (Dudley), born in Cornish, N. H., Dec. 30, 1771, an uncle of S. P. Chase, graduated at Dartmouth in 1794, was chief-justice of Vermont (1817–21), and U. S. Senator from 1813 to 1817, and again from 1825 to 1831. Died Feb. 23, 1846.

Chase (Irah), D. D., born at Stratton, Vt., Oct. 5, 1793, graduated at Middlebury College in 1814, studied at Andover Theological Seminary, and was ordained to the Baptist ministry in 1817. He labored as missionary in West Virginia, and was in 1818 appointed professor in the theological school at Philadelphia. From 1825 to 1845 professor at successive periods of biblical theology and ecclesiastical history in the Theological Institution (which he was largely instrumental in founding) at Newton Centre, Mass. He published several works, mainly controversial. Died at Newton Centre, Mass., Nov. 1, 1864.

Chase (Philander), D. D., an American Episcopal bishop, born in Cornish, N. H., Dec. 14, 1775, and graduated at Dartmouth in 1796. He went in 1817 as a missionary to Ohio, where he planted the Episcopal Church. He became bishop of Ohio in 1819, and bishop of Illinois in 1835. He founded Kenyon College, O., and Jubilee College, Ill. Published "Reminiscences" (2 vols. 8vo). Died Sept. 20, 1852.

Chase (Pliny Earle) was born at Worcester, Mass., Aug. 18, 1820, and graduated at Harvard College in 1839. While engaged for many years as a teacher in Philadelphia, and afterwards in mercantile life, he employed his leisure in metaphysical, philological, and physical studies, producing many able and learned papers, published in the "Proceedings of the American Philosophical Society," and in various scientific journals, several of which were copied in the London, Dublin, and Edinburgh "Philosophical Magazines" and other foreign journals. These articles have procured him wide distinction as a man of science. In 1871 he was appointed professor of physics in Haverford College. The Magellanic gold medal of the American Philosophical Society was awarded to him in 1864 for his paper on the "Numerical Relations of Gravity and Magnetism."

Chase (Salmon Portland), an American statesman and jurist, son of Ithamar Chase, a farmer of New Hampshire, and nephew of Dudley and Philander Chase, above noticed, was born at Cornish, N. H., Jan. 13, 1808. He was sixth in descent from Aquila Chase, who emigrated from England to Massachusetts in 1630. His mother was of Scotch descent. The stock to which he belonged was prolific in eminent men. His grandfather, Samuel Chase, had seven sons, five of whom received an education at Dartmouth College. During the war of 1812 Ithamar Chase engaged in the glass manufacture at Keene, N. H., but this business resulted unfortunately on the reintroduction of foreign manufactures. He died in 1817, leaving his family in straitened circumstances. Salmon's education, however, was not neglected. He was first sent to a school at Windsor, Vt., and when twelve years of age went to Ohio to live with his uncle, the bishop, who resided near Columbus. Here he divided his time between hard work on the bishop's farm and hard study in the bishop's academy, which was afterwards removed to Cincinnati. In 1823 he returned to New Hampshire, and the next year entered Dartmouth College, from which he graduated in 1826. He then repaired to Washington, and supported himself by teaching a school whilst studying law under the direction of William Wirt. Here he obtained his license to practise law in 1829, and in the spring of 1830 went to Cincinnati to pursue his profession. For a few years, like most young men without influential business connections, he had to struggle hard to maintain a professional existence, and his first efforts in court, as often happens to men of great talent, were failures. But all these difficulties were finally overcome. During the weary hours of waiting for business he occupied himself in preparing an edition of the "Statutes of Ohio," with notes and an historical introduction. This brought him into notice, and in 1834 he was appointed solicitor for the U. S. Bank in Cincinnati. From this period he never wanted employment.

He early engaged in the controversy respecting slavery and the slave-power in the U. S., and took the then unpopular anti-slavery side. He held slavery to be against natural law and right, and was for confining it within its narrowest limits of power and territory. In 1837 he appeared as counsel for Matilda, a colored woman claimed as a fugitive slave, and took the ground that Congress had no right to impose on State officers the duty of assisting to render up fugitive slaves, nor to legislate on the subject at all—that the States were, by the Constitution, solely responsible for the performance of that duty, and had a right to prescribe such proceedings as they saw fit to prevent unjust arrests and detentions. These views were enforced with great eloquence and power, though unsuccessful at that time. In a subsequent case he took the broad ground that slavery was a local institution, dependent upon State laws for its existence and continuance. His great maxim was, "Slavery is sectional, freedom is national." In 1842

he was employed to defend Van Zandt, the original of Van Tromp in "Uncle Tom's Cabin," who had been a Kentucky farmer, but from a conviction of the wrong of slavery had liberated his slaves and removed to Ohio, near Cincinnati. Here he was indicted, under the Fugitive Slave law of 1793, for harboring fugitive slaves and aiding them to escape. The cause was carried to the Supreme Court of the U. S., where it was ably argued by Mr. Chase and Hon. W. H. Seward in 1846, and became one of the *causes célèbres* of the country.

The subject had now become fully introduced into the politics of the country, and Mr. Chase was virtually the founder and leader of the Liberty party, which resulted in the formation of the Free-Soil party, and ultimately of the great Republican party, which became the means of prostrating the slave power and abolishing slavery in the U. S. A convention of this party, under the guidance of Mr. Chase, was held at Columbus, O., in Dec., 1841, after it became apparent that no hope was to be expected from President Tyler or the old Whig party in the direction of anti-slavery. Other conventions were held at Buffalo, Cincinnati, and Columbus in 1843, 1845, 1847, and 1848, resulting in the latter year in the nomination of Mr. Van Buren and Charles Francis Adams as the candidates of the Free-Soil party for President and Vice-President. Mr. Chase was the moving spirit in these conventions. He presided over the last, and drew up the platform of principles and policy which it adopted. Most absorbing and prominent among these, at this time, was that of preventing the extension of slavery into the new Territories.

Mr. Chase was originally a Whig, but in the pursuit of his great object of crushing slavery and the political forces which supported it, he allied himself to any party that, for the time being, would further his aims. On the 22d of Feb., 1849, he was elected to the Senate of the U. S. by the Democrats, including the Free-Soil section of the party. During his senatorial term, from 1849 to Mar., 1855, occurred those great debates in Congress upon the question of extending slavery into the new Territories, California, New Mexico, Kansas, and Nebraska, which resulted in the Compromise acts of 1850 and the repeal of the Missouri Compromise. These acts produced a state of feeling in the Northern States which resulted in the formation of the Republican party. It is needless to say that Mr. Chase took a leading part in the debates referred to, and he was always noted for the frankness with which he declared his sentiments on the questions at issue. They were the same which he had always maintained—that slavery was local and exceptional, sustained only by local laws, and that all new territory was free territory by the laws of nature and the principles of American government, and could only be made slave territory by usurpation and wrong; and that only the original States, who had entered into the constitutional compact, were bound to render up fugitive slaves, and then only after such proceedings had as they might deem just and reasonable for preventing illegal seizures and detentions. He failed to carry his measures in Congress, but the result in after years showed the sagacity with which he comprehended the entire situation. He lived to see the fulfilment of his predictions and the consummation of his most cherished hopes.

In Oct., 1855, he was elected governor of Ohio, and re-elected in 1857. In 1860 he was a prominent candidate for the presidency before the Republican convention which nominated Mr. Lincoln. In the following session of the Ohio legislature he was again chosen Senator of the U. S., but had scarcely taken his seat in Mar., 1861, when he was nominated by President Lincoln as secretary of the treasury, upon the duties of which position he immediately entered.

The period of civil war that ensued rendered his duties as financial minister of the government most important and arduous; and it is almost universally conceded that he discharged them with pre-eminent ability and success. He found the treasury empty and the government credit below par. But he inaugurated measures which met the pressing demands of a gigantic war, amounting to six or seven hundred millions per annum, and stimulated the industrial energies of the country. These measures cannot be examined in detail. They belong to the history of that struggle. A cardinal principle kept in view was, to issue a sufficient amount of such securities and notes as would furnish a currency that would enable the people to meet their engagements and avoid bankruptcy. This kept them in heart, and kept every branch of industry in constant activity. It obviated those commercial crises which are the usual consequences of such wars. This financial policy was largely due to the recommendations of Secretary Chase, although able financiers in Congress and out gave him wise and energetic co-operation.

One of the measures resorted to, which should be noticed as exciting a difference of opinion in the constitutional power of Congress, was the issue by the government, in Feb., 1862, of currency notes which were made a legal tender in the payment of debts. It is due to Secretary Chase to say that whilst he recommended the issue of the notes, the making them a tender originated in Congress, though acquiesced in by him. Another measure of permanent importance to the country was the establishment, in Feb., 1863, of a national banking system, by which all notes issued were to be based on funded bonds of the government of equal or greater amount. This system was entirely originated by Secretary Chase, and will probably be regarded as one of his greatest achievements for the benefit of his country. He hoped that it would effectually abolish a resort to State bank issues of paper currency, which, it is known, he latterly regarded as bills of credit within the meaning and prohibition of the Constitution.

Mr. Chase resigned the secretaryship of the Treasury in the last of June, 1864, and on the 6th of Dec. following he was appointed chief-justice of the Supreme Court of the U. S., in place of Chief-Justice Taney. The duties of his new office were no less important to the country than those which he resigned. Many of the momentous questions which arose out of the issues of the war had to be ultimately adjudicated by the high tribunal over which he was called to preside—questions affecting vast private interests and the future stability of the government. It was the singular fortune of Chief-Justice Chase that he bore a conspicuous and leading part not only in the great political movement which brought on the American civil war and abolished slavery, but in the successful conduct of that war, and in the final settlement of the constitutional issues and changes to which it gave rise. The status and reconstruction of the Southern States; the rights of their citizens, personal and political; the constitutionality of acts of Congress and of the executive in various matters during the impulses and excitements of the war; the construction of those important amendments to the Constitution which were necessitated by the event of the contest,—these were among the subjects upon which the Supreme Court was called to decide. As presiding officer of the court and as a constitutional judge, the chief-justice fully met the duties, responsibilities, and the dignity of his high position. But his long service in political life and absence from the bar induced him to lean largely upon the experience of the other members of the bench in matters of technical law. In every case of public consequence depending upon constitutional or fundamental principles he exhibited the same largeness of mind which characterized his entire career. His opinions on some questions have been criticised as exhibiting a leaning against the Federal government and its authority, in which as an executive officer he had taken so large a part. For example, on the question of the constitutionality of the legal-tender notes he changed his opinion, and held them unconstitutional. But it is fairly due to him to accept his own explanation, that he assented to the law as a pressing necessity when passed, but subsequent reflection convinced him that he was mistaken. His opinions are characterized by great clearness and chasteness of style, and may be cited as models of juridical composition. They ever betrayed the fine scholar and the practised writer.

In 1868 he was called upon, as chief-justice, to preside over the Senate pending the impeachment and trial of President Johnson—the only instance of such a trial in the history of the Federal government.

In June, 1870, he had a stroke of paralysis, from the effects of which he labored more or less till his death. He attended the regular terms of court commencing in Dec., 1871, and Dec., 1872, and whilst his mind still remained clear and his logical powers unimpaired, his powerful frame was much enfeebled, and his general appearance indicated that his tenure of life was by a slender thread. He died in the city of New York May 7, 1873, in the sixty-sixth year of his age.

JOSEPH P. BRADLEY, *U. S. Supreme Court.*

Chase (SAMUEL), an American judge, born in Somerset co., Md., April 17, 1741. He was a delegate in Congress from 1774 to 1778, and signed the Declaration of Independence. In 1796 he became an associate justice of the Supreme Court of the U. S. He was impeached in 1804 for misdemeanor in the conduct of several political trials, but was acquitted by the Senate. John Randolph was one of the instigators and managers of this impeachment. Judge Chase died June 19, 1811.

Chase (THOMAS), a brother of Pliny Earle Chase, noticed above, was born at Worcester June 16, 1827. He graduated at Harvard with high honors in 1848. He served as tutor and Latin professor at Harvard for three years. He visited Europe in 1853–55, and studied at the University of Berlin. On his return he was appointed (in

1855) professor of philology and of classic literature at Haverford College. He has published, besides other works, excellent editions of Virgil, Horace, and Livy, and a volume entitled "Hellas," a description of his personal observations in Greece in 1862.

Chase (William H.). See Appendix.

Chas'idim [Heb. for "saints"], a name applied among the ancient Jews to a sect of pietists who originally aimed at strict ceremonial purity under the Mosaic law, warmly espousing the cause of the Maccabees, and opposing the Hellenizing tendencies of some of their fellow-Israelites. Some writers believe that the Essenes, Pharisees, and other strict followers of the Law all sprang from the Chasidim, but that the name was finally taken by a moderate party, who received the traditions as of equal authority with the Law. In recent times the name is applied to a sect of Jews who sprang up in Poland in the eighteenth century, and who aim at a restoration of the ancient piety of their nation. Their ceremonial is extremely formal. Their peculiar mystical and cabalistic doctrines and customs are repudiated by the orthodox Jews. They are now chiefly found in Eastern Europe. (See Jewish Sects, by Prof. F. Adler.)

Cha'sing, or **Encha'sing,** the art of working raised figures in metal; the art of embossing or making metallic bas reliefs. Much chasing is done by filling the vessel to be chased with a composition of pitch, and then hammering with a point and chisel on the outside. Closely connected with chasing is the art of stamping with a punch from the inside, a very ancient art. Phidias and other ancient Greek artists practised the art of chasing on statues which were formed of ivory and gold. Cellini's chasing ranks with the best ever made. As an art it is chiefly practised in Europe and the East.

Chas'ka, a post-village, capital of Carver co., Minn., in a township of its own name, on the left bank of the Minnesota River, 32 miles W. S. W. of St. Paul, and on the Minneapolis and St. Louis and the Hastings and Dakota R. Rs. The St. Paul and Sioux City R. R. passes on the opposite side of the river. It has one weekly newspaper. Total pop. 847.

Chasles (Michel), a French geometer, born at Epernon Nov. 13, 1793. In a "Memoir on Two General Principles of the Sciences, Duality and Homography," he established the basis of a new theory of conic sections. He became in 1846 professor of the higher geometry in the Faculty of Sciences, Paris. He extended and simplified several important theories of pure geometry. Among his works is "History of Arithmetic" (1843), a "Treatise on Higher Geometry" (1852), and "Treatise on Conic Sections" (1865 *seq.*).

Chasles (Victor Euphémion Philarète), a French journalist and author, and professor of foreign literature at the College of France, born Oct. 8, 1799, was apprenticed to a printer by his father, a prominent democratic journalist of the Revolution. He went to England, where he assisted Valpy in his editions of the classics, and afterwards studied in Germany. He has contributed to the "Journal des Débats," the "Revue des Deux Mondes," and many other journals, and made admirable translations for the "Revue Britannique." Died Aug. 3, 1873.

Chasseloup-Laubat, a French statesman, born May 18, 1805, at Alessandria, in Italy, was maître de requêtes during the reign of Charles X., member of the Chamber of Deputies, and councillor of state under Louis Philippe. He became in 1849 member of the legislature, in 1851 minister of the navy, in 1859 minister of the colonies, in 1862 senator, and in 1869 president of the ministry which was to carry out the liberal promises of the imperial message of July 12, 1869. Died Mar. 29, 1873.

Chassepot, a breech-loading rifle musket, which takes its name from its inventor, Antoine Alphonse Chassepot, a French officer and inspector of arms, whose first model was brought out in 1863. It has been since repeatedly improved. This musket has attracted much attention in consequence of its use by the French in the recent war with Germany. The chassepot belongs to the same class with the German needle-gun, having in its cartridge a mass of fulminating material, which is exploded by means of a needle thrust into it along the axis of the bore. Military critics have objected to the chassepot that it is too light and fragile, too expensive, too easily fouled by the powder and the fulminate, and that it is difficult to clean it properly. The more recent forms of it are free from some of these objections.

Chasseur, a French word signifying a "hunter," a "sportsman," the name of certain light troops in the French army who are distinguished as good marksmen. There are chasseurs both among the infantry and cavalry. In the Austrian army are similar troops called *Jägers*. The light troops which fought under Garibaldi in 1859 and 1860 were called *Cacciatori dei Alpi—i. e.* "hunters of the Alps."

Chasseurs de Vincennes is one of the names given to a famous corps in the French army. About the year 1835, when certain improvements had been made in the French rifle, the duke of Orleans ordered the formation of a company of riflemen armed with the new rifle; they were garrisoned at Vincennes. They proved so efficient that in 1838 a whole battalion was organized, which was called indifferently the tirailleurs (sharpshooters) or chasseurs de Vincennes.

Chastellux, de (François Jean), Marquis, a French general and writer, born in Paris in 1734. He wrote an "Essay on Public Happiness" (1772), which was highly commended by Voltaire, and became in 1775 a member of the French Academy. As major-general under Rochambeau he fought for the U. S. (1780–82). He was a friend of Washington and Jefferson. Among his works is "Travels in North America" (2 vols., 1786). Died in 1788.

Chas'uble [Lat. *casubula* or *casula*], the uppermost garment worn by priests in the Roman Catholic Church when robed for the mass. It was called also "the vestment," and under that name seems occasionally to have been used in the English Church after the Reformation. Originally it covered the priest from head to foot, like a little house, whence some writers think it had its name of *casula*, and in this shape it is still worn in the Greek Church. It is made of velvet, is of an elliptical shape, with a hole in the middle for the head; it has no sleeves. It has two parts, one hanging down before; another, on which a cross is embroidered, hanging down behind.

Chat (*Saxicola*), a genus of small birds of the very numerous family Sylviadæ, distinguished by a bill slightly depressed and widened at the base. They have rather longer legs than most of the family. They are lively birds, flitting about with incessant and rapid motion in pursuit of the insects on which they chiefly feed. They are found

Whinchat.

in Europe, Asia, Africa, and Australia. Three species are British—the stonechat, whinchat, and wheatear. The yellow-breasted chat of the U. S. (*Icteria polyglotta*) is a larger bird, and belongs to the family Turdidæ.

Chateaubriand, de (François Auguste), Viscount, a celebrated French author and diplomatist, born of a noble family at Saint-Malo Sept. 14, 1769. He studied the ancient languages at Dol and Rennes, and was destined for the Church, but he preferred other pursuits. Impelled by a love of adventure, he visited the U. S. in 1791. Having traversed the primeval forests of the South, and studied the nature and life of the aborigines, he found there the inspiring source of a new and romantic literature. He returned in 1792 to France, where he married Mademoiselle de Lavigne. The same year he joined the royalist emigrants who had taken arms to fight against the dominant party; he was wounded at Thionville, and became an exile in England. He passed nearly eight years in England in extreme poverty, and during this period wrote several works. In 1800 he returned to France, and began to write for the "Mercure de France." He published in 1801 "Atala," a romance, the scene of which is laid among the American aborigines. It excited much admiration. His "Genius of Christianity" (1802) promoted the revival of a religious spirit in French society, then recoiling from the skeptical theories

of the Revolution. In 1806 and 1807 he travelled in Greece, Asia Minor, and Palestine. He published in 1809 a prose epic entitled "The Martyrs, or the Triumph of the Christian Religion," and in 1811 his "Itinerary from Paris to Jerusalem." He was admitted into the French Academy in 1811. In 1814 he expressed his implacable enmity to Napoleon in an eloquent pamphlet entitled "Bonaparte and the Bourbons." After the restoration of 1815 he acted with the royalists, became a peer of France, and was sent as ambassador to Berlin in 1820. In 1822 he was transferred to the court of St. James. He was appointed minister of foreign affairs in 1823, but was removed by the agency of Villèle in June, 1824. He afterwards acted with the liberal opposition, and wrote articles against the Villèle ministry, which were inserted in the "Journal des Débats." In 1828 he was sent as ambassador to Rome by Martignac, but he resigned when Polignac became prime minister in 1829. His sympathy for the Bourbons was so strong that he refused to swear allegiance to Louis Philippe in 1830. In the latter part of his life he lived in retirement, and associated intimately with the accomplished Madame Récamier. Among his works is an interesting autobiography called "Mémoires d'Outre-Tombe" (1849–50, 12 vols.). He died July 4, 1848. He had a poetical imagination, and a superior talent for describing natural scenery. (See VILLEMAIN, "Châteaubriand, sa Vie, ses Écrits et son Influence," 1858; COUNT DE MARCELLUS, "Châteaubriand et son Temps," 1859; SCIPION MARIN, "Histoire de la Vie et des Ouvrages de Châteaubriand," 1833; SAINTE-BEUVE, "Causeries du lundi," tome i. and ii.)

Châteaudun, a handsome town of France, department of Eure-et-Loir, is on the river Loir, 28 miles S. S. W. of Chartres. It has an old castle of the tenth century, a communal college, a public library, and manufactures of blankets. Oct. 18, 1870, the town was stormed and almost entirely destroyed by the Germans. Pop. 6781.

Châteaugay, a county of Quebec (Dominion of Canada), bordering on New York. It is bounded on the N. W. by the Chateaugay River. Capital, Sainte-Martine. Pop. 16,166.

Chateaugay, a post-village of Franklin co., N. Y., on the Chateaugay River and on the western division of the Vermont Central R. R., 73 miles E. by N. from Ogdensburg. It has a newspaper, and manufactures of lumber, starch, butter, cheese, etc. Pop. of Chateaugay township, 2971. A. N. MERCHANT, PROP. "STAR."

Château-Gontier, a town of France, department of Mayenne, on the river Mayenne, here crossed by a stone bridge, 18 miles S. of Laval. It has manufactures of linen and woollen fabrics. Pop. 7364.

Château-Renard, a town of France, department of Bouches-du-Rhône, near the Durance, 17 miles N. E. of Arles. Pop. 5409.

Châteauroux, a town of France, capital of the department of Indre, is in an extensive plain on the river Indre, 62 miles S. E. of Tours. It has a castle built in the tenth century, a chamber of commerce, and a society of arts; also manufactures of wool, cotton, cutlery, paper, hats, and hosiery. Nearly 2000 persons are employed here in the manufacture of strong woollen fabrics. Good iron is found in the vicinity. Pop. 17,161.

Château-Thierry, a town of France, department of Aisne, on the river Marne, here crossed by a bridge, about 60 miles by railway E. N. E. of Paris. It is on the slope of a hill crowned by the ruins of a vast castle built by Charles Martel for Thierry IV. It was the native place of the great poet Lafontaine, to whom a marble monument has been here erected. Pop. 6519.

Chatel (FERDINAND FRANÇOIS), a French priest, was born in 1795 at Gannat, became a priest in 1818, renounced the communion of Rome in 1830, and founded in 1831 the "French Unitarian Church," the fundamental principle of which was to recognize nothing but the law of nature. The church of Chatel in Paris was closed by the police in 1842, revived in 1848, and again closed in 1852. Died in 1857.

Châtellerault, a town of France, department of Vienne, on the river Vienne, 18 miles N. N. E. of Poitiers. It is near the railway from Tours to Bordeaux. It has a handsome stone bridge, an old castle, a theatre, an exchange, and hospital; also important manufactures of cutlery, and a large trade in millstones, wines, etc. Here is a national manufactory of swords and bayonets. The Scottish dukes of Hamilton derive from this place the title of duke of Châtelherault, which was given by King Henry II. to James Hamilton in 1549. Pop. 14,278.

Chat'field, a post-village of Fillmore co., Minn., near Root River, about 35 miles W. S. W. of Winona. It has an academy and one newspaper-office. Pop. of Chatfield township, 1661.

Chatfield, a post-township of Crawford co., O. P. 1247.

Chat'ham, a fortified town, river-port, and naval arsenal of England, in the county of Kent, on the right bank of the Medway, and 30 miles E. S. E. of London. The river here begins to expand into an estuary. Chatham is defended by several forts or castles crowning the adjacent heights, by which it is flanked on the S. and E. It derives its importance from its naval and military establishments, which are separated from the town and the country by a line of fortifications which are considered the best in England, except those of Portsmouth. Here are a military hospital, barracks for infantry, marines, artillery, and engineers, and magazines, storehouses, and dépôts on a large scale. Chatham has also one of the largest royal shipbuilding establishments in the kingdom. The dockyard is nearly a mile long, and contains several building slips and wet-docks, sufficiently capacious for the largest ships. Connected with it are extensive saw-mills, forges, and a metal-mill which produces copper sheets, copper bolts, etc. In 1667 the Dutch admiral De Ruyter sailed up the Medway and burned some shipping at Chatham. Pop. in 1871, 44,135.

Chatham, a county of Georgia, bordering on the Atlantic. Area, 358 square miles. It is bounded on the N. E. by the Savannah River, and on the S. W. by the Ogeechee. The surface is level; the soil is sandy and partly sterile, but that which is near the rivers is fertile. Corn and rice are the staple crops. It is intersected by the Central R. R., the Savannah and Charleston R. R., and the Atlantic and Gulf R. R. Capital, Savannah. Pop. 41,279.

Chatham, a county in Central North Carolina. Area, 700 square miles. It is drained by the Haw and Deep rivers, which in the S. E. part unite to form the Cape Fear River. The surface is diversified; the soil is fertile. Grain, wool, live-stock, cotton, and tobacco are raised. Iron ores abound. Coal-mines have been opened near Deep River. It is intersected by the Western R. R. of North Carolina and the Raleigh and Augusta R. R. Capital, Pittsborough. Pop. 19,723.

Chatham, a port of entry of Northumberland co., New Brunswick, on the right bank of the Miramichi, 6 miles below Newcastle, has a heavy trade in lumber and salmon, several steam-mills and foundries, is lighted with gas, and is the seat of a Roman Catholic bishop. It has one weekly paper. Pop. of census sub-district in 1871, 4203.

Chatham, a post-town of Ontario (Dominion of Canada), capital of Kent co., on the river Thames, and on the Great Western R. R., 45 miles E. of Detroit, Mich., and 11 miles N. of Lake Erie. It has a court-house, five churches, two weekly papers, an extensive trade in lumber, wood, potash, tobacco, soap, and pork, and has extensive manufactures of iron castings, machinery, and woollen goods. Pop. in 1871, 5873.

Chatham, a post-village and township of Middlesex co., Conn., on the E. side of the Connecticut River, about 25 miles N. E. of New Haven. Here are cobalt-mines and manufactures of sleigh-bells, etc. Total pop. 2771.

Chatham, a township and post-village of Sangamon co., Ill. The village is on the St. Louis Alton and Chicago R. R., 10 miles S. of Springfield. Pop. 1460.

Chatham, a township and post-village of Barnstable co., Mass., on the ocean, at the S. E. extremity of Cape Cod, about 80 miles S. E. of Boston. It has a fair harbor, and is resorted to as a summer residence. There are four churches, good public schools, and one newspaper. It has two lighthouses, lat. 41° 40′ 15″ N., lon. 69° 56′ 30″ W. Pop. of township, 2411.

B. D. GIFFORD, ED. CHATHAM "MONITOR."

Chatham, a post-township of Wright co., Minn. Pop. 161.

Chatham, a township of Carroll co., N. H. Pop. 445.

Chatham, a post-village of Morris co., N. J., near the Passaic River and on the Morris and Essex R. R., 26 miles W. of New York. On the Passaic River there are several mills. The township of Chatham has an academy, and contains the important village of Madison. Pop. of township, 3715.

Chatham, a post-township of Columbia co., N. Y., contains villages called CHATHAM CENTRE and CHATHAM VILLAGE (which see). Chatham post-office and station is on the Harlem Extension R. R., 132 miles N. of New York. Pop. of township, 4372.

Chatham, a township of Medina co., O. Pop. 980.

Chatham, a township of Tioga co., Pa. Pop. 1575.

Chatham, a township of Pittsylvania co., Va. Pop. 4262.

Chatham (WILLIAM **Pitt**), EARL OF, one of the most distinguished of English statesmen, born Nov. 15, 1708, and educated at Eton and Oxford, was the son of Robert Pitt, a country gentleman, and grandson of a colonial governor. After travelling on the Continent he entered the army as a cornet in the Blues, and soon after, in 1735, was returned to Parliament from Old Sarum, a family borough. He had shown remarkable promise in his studies, and in the House of Commons he soon became prominent, engaging in the fierce opposition to the Walpole government headed by the prince of Wales, and embittered by a quarrel between the prince and the king. Upon the fall of the Walpole administration, the king, notwithstanding a strong personal dislike, saw best to give Pitt an office, and in 1746 he was made treasurer of Ireland, and then paymaster-general, and in 1755, upon the breaking out of the Seven Years' war, after the resignation of Fox, he became the head of the government, with the nominal title of secretary of state. His measures for the reorganization of the army and navy were opposed by the king, but upon his resignation he was recalled, and pursued his plans against the French vigorously, aiding Frederick the Great, capturing Canada through Wolfe, and improving the navy to such an extent that the French were driven from the seas. After the accession of George III. in 1761, Pitt's energetic military measures were opposed by the growing influence of the Tories, and a peace was negotiated unwillingly by Pitt, whose ministry soon afterwards went out. Pitt remained in the opposition until 1766. His health was become feeble; he nevertheless combated zealously the more obnoxious acts of Bute's government, and upon its defeat in 1766 was desired to form a cabinet, in which he chose for himself the unimportant office of privy seal, with a seat in the House of Lords. The new ministry was weak and inefficient, and after it went out in 1768, Lord Chatham never again held office. When the war for American independence began, he, though sinking under the infirmities of age, called back all his great powers of eloquence to oppose the cruel and oppressive measures which were put in practice against the colonies; but when, in 1778, the timid policy of the duke of Richmond was gaining ground in the legislature, which favored peace with France and a recognition of the American States, Pitt, feeble, pale, and dying, arose in the House of Lords and summoned his fleeting powers to denounce this course of weakness and shame so eloquently that the measure was defeated. He sank back in a swoon at the close of his appeal, and four days afterwards, April 11, 1778, he died.

Lord Chatham's character was above reproach, and throughout his life his actions were impelled by deep patriotic feelings. The effects of his extraordinary eloquence were enhanced by his tall and stately form and dignified bearing. His speeches, which were composed in a vigorous, eloquent, idiomatic English style, have only been partially preserved in the "Chatham Papers," 4 vols., 1838–40. (See F. THACKERAY, "Life of Chatham," 2 vols., 1827.)

J. THOMAS.

Chatham Centre, a post-village of Columbia co., N. Y., on the Boston and Albany R. R., 20 miles S. S. E. of Albany.

Chatham Four-Corners. See CHATHAM VILLAGE.

Chatham Islands, a group in the South Pacific Ocean, discovered by Broughton in 1791, about 400 miles E. of the Middle Island of New Zealand. They are about lat. 44° S., and between lon. 177° and 179° W. Chatham Island, the largest of the group, is nearly 90 miles in circumference, and contains a large lake. Area, 425 square miles. The others are for the greater part mere rocks. The soil and climate are good; besides the natives there are a few British colonists. Pop. 600.

Chatham Village, or **Chatham Four-Corners,** a post-village of Columbia co., N. Y., on the Boston and Albany R. R. and terminus of the Hudson and Chatham, the Harlem, and the Harlem Extension R. Rs., 22 miles S. E. of Albany. The name of the post-office is Chatham Village. It has one newspaper-office, a blast furnace, academy, foundry, machine-shops, cotton-mill, and two paper-mills. Pop. 1387. C. B. CANFIELD, PROP. "COURIER."

Chatoyant [from the Fr. *chat*, a "cat"], a French word used in mineralogy to denote the changeable or floating internal light which is reflected by certain minerals, and resembles the light reflected from the eye of a cat. Among the minerals which are chatoyant are adularia and CAT'S EYE (which see).

Châtre, La, a fine old town of France, department of Indre, on the river Indre, 22 miles S. E. of Châteauroux. It has a fine church, a ruined castle, a considerable chestnut market, and manufactures of woollen and leather. P. 5167.

Chats'worth, the mansion of the duke of Devonshire, one of the most splendid private residences in England, is situated in Derbyshire, on the river Derwent, 3 miles N. E. of Bakewell. It is surrounded by a beautiful park about ten miles in circumference. This domain was given by William the Conqueror to his natural son, William Peveril. It was purchased by Sir William Cavendish, who built here in 1570 a mansion in which Mary queen of Scots was confined for thirteen years. The present mansion was built in 1706 by the first duke of Devonshire. It is nearly a quadrangle with an interior court, and is ornamented with balustrades and Ionic pillars. The façade is 720 feet long. Chatsworth contains rich collections of paintings, statuary, bas-reliefs, and books. Here is a conservatory which covers nearly an acre, is 65 feet high, and has 70,000 square feet of glass.

Chatsworth, a township and post-village of Livingston co., Ill. The village is on the Toledo Peoria and Warsaw R. R., 70 miles E. of Peoria. It has one weekly newspaper. Pop. 999. Pop. of township, 1622.

Chattahoo'chee, a river of Georgia, rises in the Blue Ridge in the N. E. part of the State. It flows south-westward, through the gold-region of Georgia, to West Point, below which it flows southward and forms the boundary between Georgia and Alabama. At the S. W. extremity of Georgia it unites with the Flint River to form the Appalachicola. Its length is estimated at 550 miles. Small steamboats can ascend it to Columbus, which is about 325 miles from the Gulf of Mexico.

Chattahoochee, a county in the W. of Georgia. Area, 250 square miles. It is bounded on the W. by the Chattahoochee River, and on the N. W. by Upatoy Creek. The soil is productive. Corn and cotton are the principal crops. Capital, Cusseta. Pop. 6059.

Chattahoochee, a post-village of Gadsden co., Fla., near the junction of the Flint and Chattahoochee rivers, and on the Jacksonville Pensacola and Mobile R. R., 40 miles N. W. of Tallahassee. It has a State penitentiary.

Chattanoo'ga, a city of Tennessee, capital of Hamilton co., pleasantly situated on the left bank of the Tennessee River, about 200 miles by water below Knoxville, and 150 miles S. E. of Nashville by the Nashville and Chattanooga R. R. It is a terminus of the Western and Atlantic R. R., which connects it with Atlanta, Ga., and is the north-eastern terminus of the Alabama and Chattanooga R. R., which extends south-westward 295 miles to Meridian. It is also a terminus of the East Tennessee Virginia and Georgia, the Cincinnati Southern, and the Memphis and Charleston R. Rs. The river is navigable for steamboats above and below this point. This is the largest town of East Tennessee. It has three national banks, two rolling-mills, a furnace, machine-shops and foundries, a cotton-factory, water-works, a street railroad, and fine academies and schools. Two daily and two weekly papers are issued here. Coal and iron are found in the adjacent hills. After the retreat of Rosecrans to Chattanooga from the battle-field of Chickamauga, Sept., 1863, the Confederates under Bragg at once seized the passes which covered his line of supplies from Bridgeport, and, sending a cavalry force across the Tennessee above Chattanooga, struck various points on the railroad, making the supplying of the army difficult and hazardous. Gen. Grant relieved Gen. Rosecrans in October, and assumed general command of the departments of the Tennessee, Cumberland, and Ohio. Gen. Thomas was placed in immediate command of the department of the Cumberland, and Gen. Sherman, who had been telegraphed to bring his corps up at once from Mississippi, was assigned to the department of the Tennessee. The supply of the army at Chattanooga being of the first importance, Gen. Grant ordered Hooker with the Eleventh and Twelfth corps, which had been sent from the Army of the Potomac, to cross at Bridgeport and menace Bragg with a flank attack, while a force under W. F. Smith was to be thrown across the river at Brown's Ferry, a few miles below Chattanooga, and secure the points of Lookout Mountain commanding the river. These operations were successfully carried out on the 27th, 28th, and 29th of October, and communication restored with the dépôt of supplies. The loss in these operations for reopening communication on the S. side of the Tennessee, on the side of the U. S., had been about 450, while the Confederate loss is estimated as high as 1500.

Gen. Sherman's army was now coming up, and on the 23d of November the movement against the Confederates was commenced. Gen. Thomas's troops attacked the Confederate left at 2 P. M., and carried the first line of rifle-pits, which was held during the night. The battle was renewed on the 24th along the whole line. Sherman carried the end of Missionary Ridge nearly up to the railroad tunnel; Thomas had strengthened himself in his advanced position, and repelled every attempt on the part of the

Confederates to recover their lost position at the centre; while Hooker had been fighting desperately, and had partially carried Lookout Mountain, and intrenched himself in a strong position, the Confederates abandoning the mountain entirely during the night. Fighting was resumed at early dawn of the 25th, continuing until dark. Missionary Ridge, Lookout Mountain top, and all the rifle-pits in Chattanooga valley were now in possession of the U. S. troops, having been carried after a most desperate struggle. The Confederate army was routed, and pursued by Sherman and Hooker back to Georgia. A severe fight occurred at Taylor's Ridge, near Ringgold, Ga., Nov. 27, resulting in dislodging the Confederates, after which their retreat continued. Forty cannon and thousands of small-arms were captured. The loss on the part of the U. S. forces amounted to between 6000 and 7000 in killed, wounded, and missing. The Confederate loss in killed and wounded is estimated at 2500; in prisoners, 6000. The result of this battle cut off Bragg from communication with Longstreet, and forced the latter to abandon the siege of Knoxville and retreat to Virginia.

This battle must be regarded as one of the most remarkable of the war, owing to the apparently impregnable position held by the Confederate army upon lofty mountains. Pop. 6093. Ed. Chattanooga "Times."

Chat'tel [remotely from the Lat. *capitalis*, a man's "capital" or property], in law. This is a word of comprehensive meaning, and, with certain exceptions, includes all property of a personal or movable nature. The common law distinguishes between hereditaments on the one hand and chattels on the other. Though this distinction is in the main founded on a difference in the nature of things, the one being in general immovable and the other movable, yet it is in part arbitrary, since there are some things which are in their nature chattels, and yet in law, in a particular case or for some special purposes, within the rules governing interests in land. No one could deny that pigeons are in general movables or chattels, yet they might become so connected with the land by their abode in a pigeon-house as to descend as land to an heir. The same remark might be made of a key of a house, which, though in its owner's pocket, might be regarded in law as part of the house or land. Mr. Austin expresses the same idea in the following words: "Things which are physically movable may be immovable by institution." So in some cases an owner's intention may impress upon a movable thing the legal qualities of an immovable, as where money is directed by a testator to be laid out in land, it is for legal purposes deemed to be land. These same doctrines may be regarded from an opposite point of view, and that which is really land may become in contemplation of law a chattel, as where land is directed by a testator to be sold and converted into money. Certain temporary interests in land are in law treated as chattels of a peculiar nature (chattels real), such as leases for a definite number of years. There is here no completeness of classification, and much time must be spent by a legal practitioner in acquiring arbitrary distinctions, and particularly in determining when chattels attached to the land are to be deemed a part of it. The addition of machinery, buildings, trees, and shrubs to land, either by the owner or some stranger, has given rise to an important class of questions usually treated under the term "fixtures."

Chattels personal are usually sub-divided by text-writers into two principal classes: such as are in possession and in action. The first term needs no special explanation. It would include the common case of a movable thing, like a watch or a domestic animal, in the possession or under the control of its owner. A so-called thing in action, or chose in action, is intangible. It is a mere right, and can only be made available or reduced into possession by a legal proceeding. An instance is a note or bond, or, according to some authorities, a right to recover damages for a wrong committed. This classification is imperfect, as it is plain that there are some rights which cannot be brought within it; such as patents or copyrights, which, though derived from the state and in the nature of monopolies, are considered as chattels. Some writers would discard this common-law distinction, and divide property of a movable nature into corporeal and incorporeal. This is not satisfactory, for, though such a distinction is prevalent in the law of real estate, it is well shown by Mr. Austin to be unphilosophical. He advocates a classification which philosophically seems to be correct between those rights which can be affirmed against all persons, and those which can only be asserted against particular persons and those who represent them. The former case is equivalent to complete ownership, such as that of a field or watch; the latter is illustrated by the rights growing out of a contract, or even a wrong, as no one could claim these except a party to the contract or one injured by the wrong. While the comprehension of these distinctions is of service to the student in tending to give him clear conceptions of his subject, the old classification cannot be disregarded by the practising lawyer, who is so bound by precedent that he cannot ask a court to dismiss from its view elementary propositions concerning things in possession and things in action. We would adopt the words of Mr. Maine, who says: "The lawyers of all systems have spared no pains in striving to refer these classifications to some intelligible principle, but the reasons of the severance must ever be vainly sought for in the philosophy of law. They belong not to its philosophy, but to its history." They must be accepted as historical facts. They can only be reduced to symmetry, if at all, by legislation. (See, for further distinctions, Property, Ownership, and Title.) (Consult Austin, "On Jurisprudence," 3d ed.; Williams, "On Personal Property;" Schouler on the same; Kent's "Commentaries.")

T. W. Dwight.

Chat'terer, a significant popular name often given to birds of the family Ampelidæ, which belongs to the order Insessores and tribe Dentirostres. The chatterers have depressed bills like those of flycatchers, but rather shorter and broader in proportion. They feed chiefly on insects and their larvæ. Many of them have richly-colored plumage, and some of them have excellent powers of song.

Chat'terton (Thomas), an English poet, born at Bristol Nov. 20, 1752. He was a precocious youth, fond of antiquities, and was educated at the parish school. He began to write verses at the age of twelve, and was apprenticed to an attorney of Bristol in 1767. Soon after this date he exhibited to his friends manuscript copies of poems which he said were composed by Rowley, a monk of the fifteenth century, and produced other ingenious fabrications. Disgusted with the drudgery of legal studies and business, he removed to London in April, 1770, and adopted the profession of author. He produced with great rapidity songs, satiric poems, letters in the style of Junius, and other works, some of which were inserted in the public journals, but brought him little remuneration. He was reduced to extreme destitution, and was found dead in his lodging-room in Aug., 1770. Among his poems are "The Tragedy of Ella," "The Battle of Hastings," and the "Tournament." (See John Dix, "Life of T. Chatterton," 1837; "Edinburgh Review" for April, 1804 (by Sir Walter Scott); T. Campbell, "Specimens of the British Poets.")

Chattoo'ga, a county in the N. W. of Georgia. Area, 360 square miles. It is drained by the Chattooga River and several creeks. The surface is diversified by mountains or high ridges and fertile valleys. Cotton, tobacco, and grain are raised. Limestone, marble, iron, and lead are found here. Capital, Summerville. Pop. 6902.

Chattooga, a township of Oconee co., S. C. Pop. 596.

Chau'cer (Geoffrey) was born before 1346, and died in 1400. He was a son of John Chaucer, vintner of London. Of the year and place of his birth nothing is known, though much has been surmised or asserted. He deposed in Oct., 1386, that he was of the "age of forty and upwards," and had been armed twenty-seven years. A Geoffrey Chaucer was in the service of Lionel, third son of Edward III., in 1357, not improbably in the condition of page. The poet himself has told us that he was in the army which invaded France in the autumn of 1359, and that this was his first military service. It appears from public records that he was a valet of the king's chamber—a place always filled by gentlemen—in 1367, and that in June of the same year the king granted him a salary for life, or till he was otherwise provided for, in consideration of services past and to be rendered. Before this time he had married Philippa, possibly a daughter of Sir Payne Rouet and sister of the third wife of John of Gaunt, certainly a lady in the household of the queen. At various times from 1370 to 1380 Chaucer was employed on royal missions in Italy, France, and Flanders, and for somewhat more than ten years from 1374 he held offices in the customs. He was elected to Parliament for Kent in the year 1386, but towards the end of that year was dismissed, for reasons unknown, from his place in the customs; and although he received other public appointments in 1389, he lost them again, and remained in comparative poverty until the accession of Henry IV., whose favor he immediately received, but lived only a year to enjoy.

Chaucer left behind him neither property nor descendants. His wife died in 1387, and a son, Lewis, to whom he dedicated a treatise on the astrolabe in 1391, is not heard of after that. Thomas Chaucer, a person of great wealth and consideration, has generally been assumed to be a son of the poet, but upon insufficient evidence.

The chief work of Chaucer, and one which has secured him an immortal and still brightening fame, is "The Canterbury Tales," a series of about twenty stories narrated by pilgrims to the shrine of Saint Thomas. The persons and

characters of the pilgrims are sketched with marvellous spirit in an introductory Prologue, and both here and in the tales there is displayed a dramatic power of the comic sort second only, and scarcely second, to Shakspeare's. "Troilus and Cressida," "The House of Fame," and "The Legend of Good Women" are also admirable poems. "The Canterbury Tales" were excellently edited by Thomas Tyrwhitt in 1773, and his edition has not been superseded. The best edition of the other poems is by Robert Bell. A society was formed in 1868 for the purpose of printing a selection of the best texts of Chaucer's poems, and has accomplished the larger part of its work. F. J. Child.

Chaudet (Antoine Denis), an eminent French sculptor and painter, born in Paris in 1763. He studied in Rome, worked in Paris, and was chosen a member of the Institute about 1805. Among his best works are "Paul and Virginia," "Cincinnatus," and a bas-relief of "Joseph Sold by his Brethren." Died in 1810.

Chaudière, a river of the Dominion of Canada, rises in the S. part of the province of Quebec, flows northward, and enters the St. Lawrence about 7 miles above Quebec. Length, 120 miles. Two and a half miles from its mouth is a remarkable cataract, called the Falls of the Chaudière, which is about 100 feet high.

Chaudière, a lake of Canada, about 15 miles W. of the city of Ottawa, is an expansion of the Ottawa River.

Chaudordy, de (Emile), Comte, a French statesman, was after 1855 employed in the French ministry of foreign affairs. He retained his position under Jules Favre, and went as the representative of Favre with the delegation of the provisional government in Sept., 1870, to Tours, and in Jan., 1871, to Bordeaux.

Chaud'war', an ancient and ruined city of Hindostan, in Orissa, near Cuttack. The ruins extend many miles, and include the remains of several temples and reservoirs. Scarcely any parts of the temples are visible except the foundations.

Chaumonot (Pierre Marie Joseph), a French Jesuit and missionary to the North American Indians. He was born in France in 1611, went to Canada in 1639, and after many labors and hardships died near Quebec in 1693. He wrote a grammar of the Huron language, which was published in 1835.

Chaumont, a fortified town of France, capital of the department of Haute-Marne, is on an eminence near the river Marne, about 141 miles E. S. E. of Paris. It is connected by railways with Paris, Troyes, and Vesoul. It has a triumphal arch commenced by Napoleon, and a public library of 35,000 volumes; also manufactures of drugget, hosiery, cotton yarn, and gloves. On Mar. 1, 1814, the allied powers here concluded a treaty against Napoleon. Pop. 8285.

Chaumont, a post-village of Lyme township, Jefferson co., N. Y., situated on Chaumont Bay, an inlet of Lake Ontario, at the mouth of Chaumont River. It has extensive fisheries and large quarries of excellent limestone. Pop. 370.

Chauncey, a post-village of Dover township, Athens co., O. Pop. 201.

Chaun'cey (Charles), B. D., second president of Harvard University, was born in England in 1592, and educated at Cambridge, where he was a professor of Greek and Hebrew. He came to New England in 1638, became president of Harvard in 1654, and died Feb. 19, 1672.

Chauncey (Charles), LL.D., an American lawyer, born at New Haven, Conn., Aug. 17, 1777, graduated at Yale in 1792. He removed to Philadelphia about 1798, and practised there with much distinction. Died Aug. 30, 1849. —His father, Charles Chauncey, LL.D. (1747–1823), was an eminent jurist of Connecticut.

Chauncey (Isaac), a commodore in the U. S. navy, born at Black Rock, Fairfield co., Conn., Feb. 20, 1772. At an early age he manifested a love for the sea, and entered the merchant service about 1785, displaying such energy and ability that he obtained command of a ship when he was only nineteen years old. During one of his voyages between Charleston and New York the entire crew and all the officers were stricken down with yellow fever, and Chauncey, alone and unaided, brought the vessel safely to New York. On the organization of the navy in 1798, Chauncey was appointed a lieutenant, was promoted to be commandant in 1802, and captain in 1806. He served with distinction in the war with Tripoli, and for his services there received the thanks of Congress, which body also voted him a sword, but the resolution was never carried into effect. He was in command of the navy-yard at Brooklyn, N. Y., from 1808 till the outbreak of the war with Great Britain, when he was placed in the command of the lakes. He reached Sackett's Harbor Oct., 1812, and at once entered upon the important and arduous duties on shore of supervising the construction of a fleet, while at the same time he was obliged to maintain a sharp lookout for the enemy on the lakes, naval superiority on those waters being of the greatest importance to both nations. Chauncey retained this important command till the close of the war, and won for himself the highest honors for gallantry and skill as a naval commander. He subsequently commanded the Mediterranean squadron (1816–18), was in command of the navy-yard at Brooklyn, and was president of the navy commission at the time of his death, which occured in Washington Jan. 27, 1840. No officer of the navy ever served his country more faithfully, or better acquitted himself of the high trusts reposed in him.

Chauncey (John S.). See Appendix.

Chauny, a town of France, department of Aisne, at the commencement of the canal of St.-Quentin, and on a railway, 18 miles W. of Laon. It is partly built on an island in the Oise, here navigable. It has an active trade, and manufactures of hosiery, chemicals, etc. Pop. 9080.

Chausses, shŏss, a French word signifying "hose," stockings, or breeches. In the armor of the Middle Ages it was the name of defence-pieces for the legs. Some of them were made of chain-mail, some of riveted plates, and others of padded and quilted cloth.

Chautau'qua, the most western county of New York. Area, 1099 square miles. It is bounded on the N. W. by Lake Erie, and is drained by Conewango Creek. Among its features is Chautauqua Lake (which see). The surface is partly undulating; the soil is fertile. Grain, hay, fruit, and dairy products are extensively raised. The manufacturing interests are increasing; they include carriages, lumber, leather and leather goods, flour, cooperage, metallic wares, etc. There is a spring of inflammable gas at Fredonia, used to illuminate the houses. This county is intersected by the Erie R. R., the Atlantic and Great Western R. R., the Buffalo Corry and Pittsburg R. R., and the Lake Shore R. R. Capital, Mayville. Pop. 59,327.

Chautauqua, a township of Chautauqua co., N. Y. It contains Mayville, the capital of the county. Pop. 3064.

Chautauqua Lake, in Chautauqua co., N. Y., is a beautiful sheet of water about 18 miles long and from 1 to 3 miles wide. It is 726 feet higher than Lake Erie, and is said to be the highest navigable water in the U. S. The surplus water flows through an outlet into Conewango Creek. Steamboats ply between the outlet and Mayville, which is at the N. W. end of the lake. Near the S. E. end is the large village of Jamestown.

Chauvenet (William), LL.D., a mathematician, born in Pennsylvania in 1820, graduated at Yale in 1840. He was professor of mathematics and astronomy at the U. S. Naval Academy at Annapolis, Md. (1845–59), and the author of several works on those sciences. Died in 1870.

Chauve-Souris. See Bat.

Chauvinisme, a French term derived from Chauvin, a character in a popular comedy which was performed at the time of the restoration of the Bourbons, 1815. Chauvin was a bragging veteran of Napoleon's army, who talked much of Austerlitz and Jena, and vowed to take revenge for the battle of Waterloo. A Chauvinist may be defined as one who has exaggerated and ridiculous sentiments of patriotism, and is excessively warlike or quarrelsome.

Chaux-de-Fonds, a town of Switzerland, in the canton of Neufchâtel, is situated in a narrow gorge of the Jura Mountains, 9 miles N. W. of Neufchâtel. It is 3070 feet above the level of the sea. It has extensive manufactures of clocks and watches. Above 160,000 watches are manufactured annually. Nearly every house of this town is surrounded by a garden. Pop. in 1870, 19,930.

Cha'ves (anc. *Aquæ Flaviæ*), a town of Portugal, province of Villa Real, on the river Tamega, 52 miles W. of Braganza. It was once fortified, and has a Roman bridge of eighteen arches over the river. Here are hot saline springs, and baths which are well frequented. Pop. 6382.

Chay-Root, Choya, or **Indian Madder** (*Oldenlandia umbellata*), an herb of the order Rubiaceæ, a native both of India and of Mexico, cultivated in India for its roots, the bark of which affords a beautiful red dye. The quality is improved by keeping. The coloring-matter is used to paint the red figures on chintz. Several plants of this genus abound in the U. S.

Cha'zy, a post-village of Clinton co., N. Y., in Chazy township, about 13 miles N. of Plattsburg. Chazy township is bounded on the E. by Lake Champlain. The village is on the Montreal and Plattsburg R. R. Pop. of township, 3206.

Chazy Limestone, a member of the lower Silurian formation, derives its name from Chazy in Clinton co., N. Y. According to Dana, the Trenton period of geology is divided into two epochs, one of which is called the Chazy epoch.

Chea'dle, a neat town of England, in the county of Stafford, in a pleasant valley, 180½ miles by rail N. W. of London. It has a fine Gothic fifteenth-century church, and manufactures of cotton tape; also copper- and brass-works. Pop. 3191; of parish, 4803.

Cheat, in law. This topic may be considered under two principal divisions: 1, at common law; 2, by statute, then termed "false pretences."

1. The common law regarded a "cheat" as a crime when one person defrauded another not by mere words, but by some outward and visible means, such as a false token or sign. A mere lie was not in this sense a cheat, though in a civil sense and as a basis for a civil action it may amount to a fraud. Thus, the act of marking false brands upon articles sold, calculated to deceive and defraud persons in general, would come within the scope of the criminal offence. This view led to fine-spun and artificial distinctions. For example, if a man in purchasing goods gave his own check on a bank in which he knew that he had no funds, it would be a mere lie reduced to writing, and thus not a cheat; while if he gave another man's check under the same circumstances, the act would be cheating, as the paper was then a token or symbol. Under these rules false personation may be a common-law cheat, particularly where the personator by dress or tokens represents himself to be another person, and thus causes injury to others. Some have even maintained that the defrauder might himself be a symbol or token, as where, knowing that he held a relation (such as apprenticeship) which prevented him from entering into a public engagement (enlisting as a soldier), he professed to be able to, and did in fact, enter into it.

The crime of forgery, though usually, from its magnitude as an offence, discussed separately from the various classes of cheats, is, in reality, comprised within the same category. The "false token or sign" necessary to constitute cheating at common law must be of such a nature that its tendency in general would be to deceive, though in fact it may be used only to injure particular individuals; as, *e. g.*, the use of false dice in games of chance. Moreover, it is essential that any injury sustained be properly attributable to some confidence or belief which the use of the token, etc. inspired. If other considerations than the device influence a person's action, there is merely an attempt to cheat. This is, however, also indictable. Cheating belongs to the lower grade of criminal offences, termed "misdemeanors."

2. *False Pretences* constitute a very reprehensible mode of fraudulent deception. The failure of the common law to provide a remedy where no symbol was employed made statutory provisions necessary for wrongs thus occasioned. Reference can here be made only to such regulations as the various States have generally agreed in establishing. False pretences may be defined as false representations, with intent to defraud, by words or acts concerning past or present facts and events. Statements of a promissory nature in regard to any future transaction, and perhaps all representations as to the future, are insufficient to afford a ground for prosecution. The false representation may be made by acts without words, as if one purports by his peculiar dress to belong to a particular institution of learning, such as Cambridge University. A false sample may also be referred to. Mere expressions of opinion, however, or mere exaggerations of language, by which no reasonable man would be influenced, cannot be considered false pretences within the statutes. It is a further rule that the deception practised must be the efficient operative cause of the injury sustained. The criterion always is, Whether, if there had been no such deceit practised, the transaction between the parties would have been consummated? There has been much discussion upon the point whether the representation must be calculated to deceive a person of ordinary prudence, or whether it will be sufficient, though the party was weak, that he was actually defrauded. The question is still open. The false pretence may be made by an agent in such a way as to make his principal criminally liable.

Property acquired under false pretences is held by the wrongful possessor under a voidable title as regards the true owner, but if transferred to an honest purchaser, who acts in good faith, without knowledge of the fraud, the latter's claim is indefeasible. On the other hand, when goods are stolen the thief can, with but few exceptions, give no better title than he himself possesses. The reason for the difference is, that in the one case the wrong-doer acts with the owner's consent, even though it be procured fraudulently, while in the other his will is in no way exerted. According to general principles, this offence would be a misdemeanor, though the statutes of some of the States make it a felony. T. W. Dwight.

Cheat'ham, a county of the N. part of Middle Tennessee. Area, 375 square miles. It is intersected by the Cumberland River and the Harpeth. The surface is undulating. Tobacco, corn, wheat, and oats are the staple crops. Lumber is an important product. It is traversed by the Nashville and North-western R. R. Capital, Ashland City. Pop. 6678.

Cheatham (B. F.), a general in the Confederate army, born in Tennessee, served during the war with Mexico as captain of Tennessee volunteers and as colonel Third Tennessee Voltigeurs to July, 1848. During the recent civil war he espoused the Confederate cause, was appointed major-general, and bore a conspicuous part at Chickamauga, Missionary Ridge, Franklin, Nashville, etc.

Cheat River, of West Virginia, is formed by the junction of several branches which rise among the Alleghanies in Randolph county, and unite in Tucker county. It flows nearly northward, and enters the Monongahela in Fayette co., Pa. Its length without the branches is about 75 miles. It takes its name from the extremely variable volume of its waters; for while it is sometimes a large stream, it often becomes in a few hours quite insignificant.

Chebanse, a post-village of Iroquois and Kankakee cos., Ill., on the Central R. R., 65 miles S. S. W. of Chicago. It has one newspaper, and has a very extensive trade in grain. Pop. of township, 2530. Ed. "Herald."

Cheboy'gan, a county of Michigan, at the N. extremity of the Lower Peninsula, is bounded on the N. by Lake Huron and traversed by the Cheboygan River. Lumber, potatoes, and maple-sugar are the chief products. Capital, Cheboygan. Pop. 2196.

Cheboygan, a post-village, capital of Cheboygan co., Mich. It has one weekly newspaper.

Check [Fr. *échec* and *cheque*], a hindrance or obstruction, a curb or restraint; a repulse; a mark put against names in going over a list; a token which is given to a passenger on a railroad or steamboat, and is a duplicate of a token fastened on his baggage in order to identify it. Also a term used in the game of Chess (which see).

Check is also the name of a variegated cloth, the pattern of which consists of quadrangles or rectangular spaces like a chessboard. It is made of cotton, linen, or wool.

Check, or **Cheque,** a bill of exchange drawn upon a bank or banker, or person holding a position similar to that of a banker. It has some peculiarities which distinguish it from an ordinary bill of exchange, particularly when it is payable without any specific mention of time. It is then, in point of law, payable on demand and without days of grace. If payable a fixed number of days after date, it varies but slightly from a bill of exchange, and will follow the ordinary rules as to days of grace. It is usually said in the law-books that a check is not accepted as a bill is. Acceptance, however, as will be seen hereafter, has recently become quite common, and is perfectly lawful. A check may be considered under the following heads: 1, Its form and requisites; 2, The duty of the holder as to demand of payment (*a*) towards the drawer, (*b*) towards the endorser, and herein of crossed checks; 3, The effect of the check upon the banker, and, under this, of acceptance; 4, A check considered as payment of a debt or as cash; 5, The civil and criminal liability of drawers having no funds.

1. A check in its ordinary form is simply an order addressed to the banker to pay a person named or his order or bearer, or the equivalent of a bearer (such as a mere numeral), a sum of money. A check may preserve this form and be post-dated. This class of checks is not used in England, owing to the provisions of the stamp acts. It is quite common at the present time to make a check payable to order, as the endorsement of the name of the payee operates as a receipt. In some instances a note may amount to a check. Thus, if a customer makes a note payable at his bank, he implicitly requests its payment in the same general manner as if he had drawn his check. In filling up a check care should be taken to so draw it that additional words, which might increase its amount, cannot be inserted in blank spaces. Thus, if the drawer had written the words "fifty dollars," and had left sufficient space between the word "fifty" and that which preceded it to insert "one hundred and," and such words had been fraudulently inserted, and the bank had paid the check in good faith, supposing it to be drawn for one hundred and fifty dollars, the drawer would be the loser. When, on the other hand, due caution has been exercised, the loss from forgeries will fall on the bank, rather than on the drawer, though the former may in some instances

recover from the holder. The drawer may simply sign his name to a blank printed form of check, or even to a blank sheet of paper, at the same time authorizing it to be subsequently filled up by some person acting in his behalf. If so filled he will be bound. Even should the agent acting fraudulently fill it up for a larger sum than was directed, the drawer would still be bound to a person who took the check in good faith. This would not be strictly a case of forgery, but that of an agent defrauding his principal, and yet acting within his apparent authority.

2. *The Duty of the Holder as to Demand and Notice:* (*a*) *As to the Drawer.*—The drawer has a right to expect that the holder will demand payment with promptitude, as, if the banker fails to pay, recourse may be had to him. Presentment should be made, in general, as early as the next day, and if payment is not made, due notice given. However, a failure to present is not necessarily fatal to the holder's claim. Whether it is or not depends on the fact whether an injury is caused to the drawer. If, for example, he had no funds in the bank, want of presentment is unimportant, as it is plain that he sustains no harm; so, if after giving the check, he withdraws his funds. If, however, the banker should become insolvent with sufficient funds of the drawer in his possession, want of presentment would be a sufficient defence. (*b*) *Demand as to Endorsers.*—Endorsements upon checks are common. An endorsement is necessary when the instrument is payable to order: it is admissible when payable to bearer. The legal effect of endorsement, as in the case of a bill of exchange, is to make the endorser liable, provided that the steps necessary to charge him are taken. These are substantially the same as in bills of exchange. There are cases in which no presentment is necessary to bind the endorser, as where he endorses and puts in circulation a void or forged check, even though he does this innocently. In some cases custom enlarges the time for presentment. Thus, if there be a custom to pay checks through the "clearing-house" (see CLEARING-HOUSE), the time required for them to pass through the system of exchanges there adopted will be allowed. In England a practice of *crossing* checks is resorted to. A check is said to be "crossed" when it is marked by the drawer in such a way that, instead of being presented through an ordinary holder, it must come to the paying bank through a banker. This practice has given rise to a number of perplexing questions recently settled by statute (21 and 22 Vict. ch. 79). The additional time necessary to present the check in this manner must of course be allowed there to the holder. It is believed that crossing checks is not practised in this country. A practice has grown up in some of our large cities to pay drafts drawn on bankers by checks drawn by such bankers, in turn, upon some regularly organized bank, instead of cash. This practice has an important effect upon the subject of demand. Though the check is not payment of the draft, yet it must be presented on the *same day* that it is received, or the drawers of the draft may be discharged. The holder of the draft might have insisted on the money instead of taking the check, and if not paid might have protested the draft.

3. *Effect of the Check on the Banker on whom it is Drawn, and herein of Acceptance.*—According to the better opinion, a check gives no right of action to the holder against the banker. Of course the latter should, in general, pay it, but the holder has no means of enforcing this obligation if the banker refuses to perform it. This rule grows out of the nature of a deposit in a bank, in respect to which there is much popular misconception. This fact is perhaps partly due to the ambiguity lurking in the word "deposit." This is sometimes and properly used to mean the act of entrusting a specific chattel to a person, who is bound to return the identical thing delivered to him. That, however, is not the nature of an ordinary bank account against which checks are drawn. The banker is not bound to render the specific money delivered, but only engages to pay an equivalent amount. The relation of *debtor* and *creditor* is created by the transaction. Although the banker is bound to pay checks when he is in funds, it is a duty between him and the depositor or creditor. It cannot be enforced by the payee of the check, who is no party to the contract. Nor can the check be treated as an assignment by the depositor of so much money as it represents. These rules have led to a very important practice of certifying checks. An officer of a bank—*e. g.* a teller or cashier—has by custom acquired an authority to mark such checks as are presented to him as good. This act is treated in law as an acceptance, and the bank becomes liable. The practice is attended with danger, as it practically gives to a teller power to establish without limit fictitious claims against the bank, as he may certify checks for persons who have overdrawn their accounts, or even who have closed their accounts, or have had no dealings with the bank, which will still be binding upon it on general principles of law. (See AGENT, ESTOPPEL, and BILL OF EXCHANGE.) A cashier or teller, however, cannot, where he has no funds, validly certify his own check. On the other hand, certification of a check is attended with some hazard to the holder, as he may thereby release the drawer should the bank fail even on the same day and between the time of certification and of presentment for payment. (*National Bank of Jersey City agt. Leach*, N. Y. Court of Appeals, 1873.) In the financial crisis of 1873 in New York certified bank-checks by general consent played an important part in monetary transactions, and became for a considerable time, through the association of a number of national banks, a substitute for currency. It may be added that banks sometimes pay checks for customers who have no balance due them. These are called "overdrafts." The bank in such a case has a claim upon the dealer for the sum overdrawn.

4. *A Check Considered as Payment or as Cash.*—The general presumption of law is that a check is issued by a drawer to a payee in payment of debt, and not as a means of making a loan. The intention, however, may be shown by affirmative proof. Considered as payment, it is not in general absolute. It is rather a means of obtaining payment, whether it be the debtor's own check or that of a third person. Accordingly, if the check is not paid, the creditor may resort to his original claim, though if there be an agreement to receive the check as full payment, it must be followed. In other words, a check is not money, but a means of obtaining money, and debts cannot be paid in anything but money, unless there be an agreement for some substitute. The gift of one's own check, unless it be certified, is a mere naked promise, and may be countermanded at any time before payment. The death of a drawer in such a case before payment would be a revocation of the authority. It is common for a bank to receive on deposit not only cash, but checks drawn either on itself or on some other bank, payable to the depositor. Such a deposit is not to be treated as cash in case the check is drawn on another bank. It is rather received conditionally, in case it turns out to be good, and the depositor will be liable on his endorsement, which is usually required. Where, however, the check is given by another dealer, the receiving bank is absolutely bound by the credit which it gives the depositor as if it had paid the check.

5. *Civil and Criminal Liability of Drawers of Checks having no Funds with the Bank:* (*a*) *Civil Liability.*—It is a general rule that a man who draws a check with knowledge that he has no funds commits a fraud towards the payee. If he should purchase goods under such circumstances, the seller could rescind the sale as fraudulent. It will not be enough to sustain the sale that he has reasonable grounds to expect funds, but they must be *actually on hand* to pay the check. This view proceeds upon the theory that a check is in the nature of a representation that the money is immediately available; and where a drawer has notice to the contrary he makes a representation known to be false which avoids the contract as between him and the seller, though it would be otherwise should the rights of innocent purchasers intervene. (See SALES.) (*Loughran agt. Barry*, 6 Irish Com. Pleas, 457, A. D. 1872.) (*b*) *Criminal Liability.*—It was not a crime at common law to give one's own check for goods bought with knowledge that it was worthless, since this was only an affirmation or a base lie reduced to writing, and there was no token or symbol of falsehood on which the common law lays stress. It might accordingly be a criminal cheat (see CHEAT) knowingly to pass off the worthless check of another. Under the statutory offence of false pretences it is criminal to give one's own check on such a sale, knowing that the drawer had no funds nor any reasonable grounds of expecting them. There might be cases, such as that of *Loughran against Barry*, above cited, where the contract would be rescinded on account of a representation known to be false, and yet the drawer would not be guilty of crime, by reason of the absence of a true criminal intent. (See farther SHAW "On the Law of Bankers' Checks," London, 1871; also PARSONS "On Bills and Notes;" and other text-writers on same subject, as CHITTY, BYLES, STORY, etc.)

T. W. DWIGHT.

Checkers. See DRAUGHTS.

Chedu'ba, an East Indian island, in the Bay of Bengal, near Aracan, has an area of about 250 square miles. It is about lat. 18° 50′ N. and lon. 93° 40′ E. The soil is fertile, and produces cotton, sugar, rice, indigo, etc. This island was captured from the Burmese by the British in 1824.

Cheek's Creek, a township of Montgomery co., N. C. Pop. 960.

Cheese [Lat. *caseus*; Ger. *Käse*], the coagulated, pressed, and dried casein of milk, containing also a large percentage of water, with some salt, oil (butter), etc. It is extensively prepared for food, chiefly from the milk of

cows, but that of goats, sheep, asses, and other animals is used to some extent in various countries. In China the caseine of peas is pressed and dried into cakes, which resemble cheese in taste as well as chemical composition. Cheese often contains various coloring-matters, generally anatto, which is added for its rich golden color, or herbs, which are employed to give it a green or mottled appearance. Coagulation is usually produced by the addition of rennet, which is usually prepared from the stomach of young calves, and which, from the pepsin and other active principles derived from the gastric juice, is believed to give to cheese a stomachic or eupeptic property, so that its use is recommended in some cases of dyspepsia. Various plants, such as the yellow bedstraw of Europe (*Galium verum*) and the *Pinguicula vulgaris*, or butterwort, are in some places employed instead of rennet. Hydrochloric acid is used in Holland. The process of making cheese varies in different places. Generally, the milk is heated to a temperature of from 100° to 112° F., the rennet added, and the whole stands from half an hour to an hour, when the curd is chopped, salted, drained, and pressed, so as to consolidate the curd and expel the whey or serum of the milk. The cheese-press is of various forms, and the pressure to which cheese is subjected is in most cases very great. Skimmed milk makes an inferior quality of cheese, though some fine kinds, like the celebrated Parmesan cheese, are made from it. In the U. S. cheese is manufactured on a larger scale in factories, which are often owned by a large number of farmers in common; the result being, on the whole, a decided improvement in the quality of the product, with a large diminution of the cost of manufacture. Great quantities of cheese are exported from the U. S. to Great Britain and the West Indies.

Among the remarkable varieties of cheese may be mentioned those made at Stilton, Huntingdonshire, Cottenham, Cambridgeshire, and the Vale of Cheddar, Gloucestershire, England; the Scotch Dunlop cheese; the Highland cheese, flavored with lovage leaves; the Swiss Gruyère and the Schabzeiger, known as "sap-sago," which is made green with leaves of the melilot; other varieties of green cheese, in which sage or grass is used; the globular and conical cheeses, of which the Westphalian are celebrated. Among the Dutch cheeses, that of Gouda is called the best. It excels in keeping qualities. In parts of Germany boiled potatoes are mashed and mixed with the curd. France and Italy produce much excellent cheese. The English cream and slip-coat cheese, and the German *Schmirkäse*, are soft curds, often from sour milk, mixed with cream, and sometimes flavored with pepper, etc. Some of the stronger sorts of cheese are rasped fine and used as a condiment. The cheese of Limburg is partly putrefied before it is ready to be eaten. The French *Roquefort* cheese is made of sheep's and goats' milk, and ripened with much care in caverns. *Brie* (French), *Vaschrein* (German), and *Neufchâtel* (Swiss) cheese are made of pure cream. They are successfully imitated in the U. S., as are all the more famous European cheeses. The better qualities of the Laplander's reindeer cheese are highly commended by travellers. Cheese is made in Europe and Asia from the milk of the buffalo. In Arabia and the East buttermilk curds are dried into a cheese which is powdered before eating. It is a villainous product, not much relished even by the natives.

CHARLES W. GREENE.

Cheese-maggot, the larva of *Piophila casei*, a black dipterous fly of the family Muscidæ, to which the house-fly belongs. The perfect insect is three-twentieths of an inch long. It is a pest of dairies, laying its eggs in cracks of cheese, the destined food of its larvæ. To preserve cheeses from this pest it is of advantage to brush or rub them frequently, and to remove all injured cheeses, besides keeping them dry and in a well-aired place. The same rules are applicable to their preservation from the other insects by which they are sometimes infested. Among these may be mentioned the cheese-mite, *Tyroglyphus siro*, of the family Acaridæ. Those cheeses of the Netherlands which are prepared with hydrochloric acid, instead of rennet, are reported to be uninjured by insects, but are rather hard.

Cheese-mite.

Chee'tah, or **Hunting Leopard,** the *Gueparda jubata* or *Cynailurus jubatus*, a carnivorous mammal of the cat family, having longer legs than any of the true cats, and approaching the Canidæ in its almost non-retractile claws, its manner of hunting, as well as in temper and disposition when tamed. It is found throughout Africa, and in Asia nearly as far N. as Siberia. It is generally spotted like the leopard, but, like that animal, is sometimes entirely black. In India and Persia it is trained for the chase of antelopes and deer. The cheetah is kept leashed and hooded until the game is found near, when it is let loose, and drawing stealthily near its victim, it rushes suddenly upon it, and can with difficulty be made to let go its hold. This animal is readily domesticated. In Ceylon, the true leopard is called *cheetah*.

Chee'ver (EZEKIEL), an eminent school-teacher, born in London Jan. 25, 1615, emigrated to America in 1637. He was one of the founders of the colony of New Haven, where he taught for twelve years. He removed to Charlestown, Mass., in 1661, and he taught in the Latin School in Boston for thirty-eight years. Died Aug. 21, 1708.

Cheever (GEORGE BARRELL), D.D., an American divine, born at Hallowell, Me., April 17, 1807, graduated at Bowdoin College in 1825. In 1833 he became minister of a Congregational church in Salem, Mass. He published, in 1835, a satirical allegory called "Deacon Giles's Distillery," for which he was prosecuted by a certain distiller, and was condemned to imprisonment for thirty days. He was distinguished as a zealous advocate of temperance and as an opponent of slavery. In 1839 he removed to New York City, and from 1846 to 1867 was pastor of the Church of the Puritans in that city. Among his works are "Studies in Poetry" (1830), "Lectures on Pilgrim's Progress" (1843), and "Wanderings of a Pilgrim in the Shadow of Mont Blanc" (1846).

Cheever (Rev. HENRY THEODORE), a younger brother of the above, author of "Island World of the Pacific" (1851) and other works, was born at Hallowell, Me., in 1814, and graduated at Bowdoin in 1834.

Cheha'lis, a river of Washington Territory, rises in Lewis co. on the E. side of the Coast Range, flows in a W. N. W. direction through Chehalis co., and enters Gray's Harbor. It is navigable for steamboats. Total length, about 125 miles.

Chehalis, a county of Washington Territory, bordering on the Pacific Ocean. Area, 1600 square miles. It is intersected by the Chehalis River, and also drained by the Satsop, Hoquium, and other small rivers. The surface is hilly and undulating; the soil of the valleys is fertile. It is mostly covered with dense forests of fir, cedar, spruce, maple, and ash. Oats, wheat, wool, and potatoes are raised. Coal is found. Capital, Montesano. Pop. 401.

Cheirol'epis [from the Gr. χείρ, a "hand," and λεπίς, a "scale"], a genus of fossil lepido-ganoid fishes peculiar to the Devonian measures. Eight species have been found. They had large heads, the spine rudimentary and the body covered with small lozenge-shaped ganoid scales. The first ray of each fin was converted into a strong spine. The pectorals and ventrals were largely developed, the dorsal small and farther back than the anal fin. The generic name was given in allusion to the scaly pectoral fins.

Cheironec'tes [from the Gr. χείρ, the "hand," and νήχω, to "swim"], a genus of marsupial quadrupeds, differing from the opossums in having webbed feet and

Cheironectes.

aquatic habits. The only species, *Cheironectes palmatus*, or the yapock, is common in Brazil and Guiana. It has a soft woolly fur; the color of the upper parts of the body is gray, with large patches of black and a dorsal black line; the breast and belly are white; the tail is long, thick at the base, tapering, and covered with scales. The cheek-pouches are very large. Fishes, insects, and crustaceans are the chief food of this animal, which is a marsupial representative of the otter. (See also CHIRONECTES.)

Cheke (Sir JOHN), an English scholar and Hellenist, born at Cambridge June 14, 1514. He became in 1540 first professor of Greek in the university of that place, and distinguished himself as a reviver of classical learning. In 1544 he was appointed Latin tutor to Prince Edward. He

was secretary of state in 1553, but on the accession of Queen Mary he was deprived of his office because he was a Protestant, and he went into exile. He was seized in Flanders in 1556 by the agents of Philip II. of Spain, and taken to England. Compelled to choose between death by fire and a profession of the Catholic religion, he accepted the latter. Died Sept. 13, 1557. Of his numerous writings, "The Hurt of Sedition" (1549) and the translation of the Gospel of Matthew are especially noteworthy. (See STRYPE, "Life of Cheke," 1705.)

Che-Kiang, a maritime province of China, area, 39,150 square miles, is intersected by the Grand Canal. The soil is very fertile. Silk is the chief article of export. It has manufactures of silk, crape, paper, etc. The chief towns are Hang-Chow-Foo and Ningpo. Pop. 26,256,784.

Chelidonius. See SCHWALBER.

Chelms'ford, a town of England, capital of the county of Essex, at the confluence of the Chelmer and Cann rivers, on the Eastern Union Railway, 29 miles N. E. of London. Two fine bridges cross the river here. The town is well built, has an old church, a handsome county hall, a theatre, and assembly-rooms. Pop. 5513.

Chelmsford, a post-township of Middlesex co., Mass., on the S. side of the Merrimack River. It contains the village of North Chelmsford, on the Boston Lowell and Nashua R. R., 3 miles W. of Lowell; also South Chelmsford and West Chelmsford. The town is traversed by the Framingham and Lowell and the Stony Brook R. Rs. It has granite-quarries and important manufactures. Pop. 2374.

Chelmsford (Sir FREDERICK THESIGER), LORD, an English lawyer and judge, born in London in 1794. He became solicitor-general in 1844 and attorney-general in 1845, but he resigned in 1846. He was reappointed in 1852. On the formation of a conservative ministry in 1858, he was appointed lord chancellor and received the title of Lord Chelmsford. He resigned with his colleagues in June, 1859, and was again lord chancellor from July, 1866, to Feb., 1868.

Chelo'nia [from the Gr. χελώνη, a "tortoise"], or **Testudina'ta,** one of the three great orders of true reptiles, characterized by the possession of a carapace or horny dorsal shell composed of several united pieces; a ventral shell, plastron, or sternum; a horny, bill-like mouth, without teeth; eyes with three lids; and external ear-openings. The carapace represents the blended ribs and vertebræ, the plastron the sternum of other animals, these elements being intimately blended with the proper dermal elements. The spinal column is entirely immovable, for the vertebræ are thoroughly ankylosed with the shell and with each other. The genus *Emysaura* forms a transition from this order to the saurians through the alligators and crocodiles, having its carapace much contracted, while the neck, tail, and limbs are greatly elongated. The lung-sacs of the Chelonia have their cavities subdivided by imperfect partitions. They are very capacious, and the large quantity of air they contain materially aids in buoying up the heavy body as the animal swims in the water. Since the ribs and sides are fixed, the chelonians breathe by gulping down air through the nostrils, thus filling the lung-cavities for a time, the air being occasionally renewed. The order is divided into two sub-orders—the Chelonii, true or sea-turtles, which have the fore feet, or more frequently both fore and hind feet, transformed into paddles; and the Amydæ, or land-tortoises. The sea-turtles comprise the largest living species, one of which, the *Sphargis coriacea* of the Atlantic and Mediterranean, has been found to weigh nearly 2000 pounds; but the fossil shell of *Colossochelys atlas,* a land-tortoise of East Indian deposits, is sometimes twenty feet long, and it must have weighed much more than the *Sphargis.* The sea-turtles are of two families—Sphargidæ and Chelonoidæ, or loggerheads. The land-tortoises are much more numerous in genera and species, and are divided into seven or more families. They are peculiarly abundant in North and South America, but are found in nearly all warm and temperate regions.

There are several edible species both of land and sea chelonians. The flesh of some others is disagreeable or even injurious. The best known is the green turtle (*Chelonia midas*), found throughout a large part of the Atlantic, but having its head-quarters about the Bahamas, and notably at Ascension Island in the South Atlantic. Another famous edible species is the great *Testudo Indica,* a land-tortoise of the coasts of the Pacific and Indian oceans, of which the head-quarters are at the Galapagos Islands. Some species are valuable for their oil; others for that of their eggs; and one at least, the *Eretmochelys imbricata* of tropical seas, the inedible hawksbill turtle, affords the valuable tortoise-shell of commerce.

Tracks ascribed to chelonians have been found in triassic rocks, but their remains are first observed in the upper oolite. In the more recent formations their remains are abundant in both hemispheres.

CHELONIA is also the name of a genus of sea-turtles, to which the green turtle belongs.

Chel'sea, a populous south-western suburb of London, in Middlesex, on the left (N.) bank of the Thames, 4½ miles W. S. W. of St. Paul's. The river is here crossed by a fine iron bridge. Many of the nobility and gentry formerly resided at Chelsea. The principal public edifice is the noble hospital for superannuated soldiers. (See CHELSEA HOSPITAL.) Chelsea has waterworks for the supply of London, a chain pier, and manufactures of floor cloth; also a training college for male teachers, and one for female teachers. Here is a place of public amusement called Cremorne House Gardens. Pop. in 1871, 71,086.

Chelsea, a post-village of Hull township, Ottawa co., Quebec, Canada, on the Gatineau River, 8 miles from Ottawa. It has a postal savings' bank and a large lumber-trade. Pop. about 400.

Chelsea, a post-township of Butler co., Kan. Pop. 277.

Chelsea, a township of Kennebec co., Me., 3 miles E. of Augusta. It contains the Togus mineral springs and the U. S. military asylum. Pop. 1238.

Chelsea, a city of Suffolk co., Mass., is a north-eastern suburb of Boston, and is 3 or 4 miles N. E. of Boston Common. It is separated from Charlestown by the Mystic River, which is here crossed by the Chelsea Bridge. It is bounded on the S. and S. E. by an inlet of the sea called Chelsea Creek, which separates it from East Boston. Chelsea has a U. S. marine hospital and a U. S. naval powder-magazine, eleven or more churches, an academy, two newspapers, benevolent societies, a national and a savings bank, and a large elastic rubber factory; also manufactures of sewing-machines, brass-ware, linseed oil, iron safes, woollens, brushes, machinery, tools, etc. It is connected with Boston by the Eastern R. R. and by a ferry 1¼ miles across. Pop. 18,547. ED. "TELEGRAPH AND PIONEER."

Chelsea, a post-village of Sylvan township, Washtenaw co., Mich., on the Michigan Central R. R., 55 miles from Detroit. It has one weekly paper. Pop. 1013.

Chelsea, a post-village, capital of Orange co., Vt., 22 miles S. by E. from Montpelier. It has a national bank, an academy, and manufactures of leather, lumber, and woollen goods. Pop. including Chelsea township, 1526.

Chelsea Hospital, at Chelsea, England, is an asylum for disabled or superannuated soldiers. Founded as a college in 1610, it was made a hospital in 1682. It has accommodations for about 660 persons, and is governed by a board of commissioners, comprising, *ex-officio,* the lord president of the council and the first lord of the treasury. It supports about 500 in-pensioners and nearly 70,000 out-pensioners. The former receive, besides board, lodging, and clothing, a small sum of money, varying from eight pence a week for a private soldier to three shillings six pence for a color-sergeant. The out-pensioners receive daily a sum of money varying from four pence to two shillings six pence for life.

Cheltenham, chĕlt'năm, a town and fashionable watering-place of England, in the county of Gloucester, and on the Bristol and Birmingham Railway, 96 miles by the road or 121 by railway W. N. W. of London. It is pleasantly situated in a picturesque valley on the Chelt, a small tributary of the Severn, and is sheltered on the E. and S. E. by a semicircle of the Cotswold Hills. It derives its prosperity and importance from its mineral springs, which contain sulphates of soda and magnesia, with iodine, iron, and carbonic acid. It has elegant squares, terraces, and crescents, and numerous villas, interspersed with gardens and shrubberies. The public promenades are among the finest in England. It has ten or more churches, besides chapels of dissenters, a general hospital, a theatre, a zoological garden, and a well-endowed grammar-school founded in 1574. Cheltenham is famous for its colleges and schools, among which is the proprietary college for the sons of gentlemen. This has usually about 600 pupils. Pop. in 1871, 44,519.

Cheltenham, a post-township of Montgomery co., Pa. Pop. 2462.

Chemical Affinity. See AFFINITY.

Chemical Analysis is the identification and separation of the elements of chemical compounds or mixtures of any sort. When conducted simply with reference to determining what elements exist in any substance it is termed *qualitative analysis.* When the absolute or relative quantities of the elements are ascertained it is *quantitative analysis.* The theory of qualitative chemical analysis is to put the substance to be analyzed under such conditions and associations as shall cause all its various elements, one after another, to present certain characteristic phenomena or to

enter into certain recognizable combinations, and is based on the grand truth that each chemical element has constant and absolute peculiarities which it carries into its compounds. Thus, the fact that silver and mercury are the only elements whose compounds with chlorine are insoluble in dilute nitric acid, is taken advantage of to separate these two metals from all others. Any nitric solution of metals which is not made milky or turbid on the addition of hydrochloric acid does not, and cannot, contain silver or sub-salts of mercury. Again, any nitric solution wherein hydrochloric acid produces a white milkiness or a white curdy separation, or a fine dazzling white powder, which neither dilute hydrochloric acid, dilute nitric acid, nor hot water will clear up, must contain either silver or mercury, or both. In case such a white separation—or "precipitate," as the chemist technically terms it—is formed by hydrochloric acid in a solution of metals, the liquid, together with the suspended precipitate, is poured upon a filter (a conical cup folded from a circle of paper specially prepared for the purpose) sustained in a glass funnel. The liquid, which retains all the other elements in solution, passes the pores of the paper, but the precipitate of silver chloride and mercurous chloride remains upon it. The filter is next repeatedly filled with water until the acid liquid has been washed out from the precipitate and the pores of the paper, and we have then all the silver and all the mercury that existed in the form of sub-salts in the filter, and all the other elements in the "filtrate," as the liquid which has passed through is designated.

The substances which are employed to bring about those chemical changes which serve the purposes of chemical analysis are called *reagents*, and the chemical processes themselves are termed *reactions*, for the reason that at least two substances must always be involved in chemical transformations, and that both act and are reacted upon. Thus the hydrochloric acid employed in our separation of silver and mercury from all other metals is a reagent, and the precipitation is the evidence of a reaction.

Chemical reactions have been known and employed to identify certain bodies from the earliest times. Pliny described the use of paper dyed in nutgalls for detecting iron sulphate when mixed with verdigris as an adulteration. The reaction is a blackening of the paper (formation of ink). In many cases it is easy to recognize a substance by simply applying in this manner a single reagent, which is then called a test. Thus, copper in its solutions is tested by a bit of clean iron wire, which precipitates it as a red powder. A clean piece of copper is a test for mercury in solution, the latter metal forming a silvery coating on the former. Lime-water is a test for carbonic acid gas, making with it a white precipitate of carbonate of lime. Hydrochloric acid is a test for ammonia, as the vapors of the two, when brought together, produce a white cloud. But there are circumstances under which such simple tests fail to give unequivocal answers to the chemical inquirer, and it is needful to frame a system of operations which takes account of all possible contingencies, and which enables the analyst not only to prove with certainty that such and such elements exist in any substance he analyzes, but also gives him equal assurance that nothing else is present in it—a system, in short, which can lead him to a complete knowledge of the composition of any body. Such systems of procedure, more or less satisfactory, have been devised out of the collective experience of chemists, and their details are found in our treatises on qualitative chemical analysis. In respect to the elements and compounds of mineral or inorganic chemistry a very perfect plan has been elaborated, which has received in all essential points the sanction of universal usage.

This system of analysis applies to all the metals and their oxides, and to all their compounds with mineral elements or acids. It supposes that the elements, etc. are in a state of solution either in water or an appropriate acid, and gives directions for obtaining such solutions. The substance is first subjected to a "preliminary examination," which often leads to the detection of some of its ingredients, or demonstrates the absence of certain elements, and furnishes useful hints as to the mode of solution and subsequent procedure. The actual examination begins with the application of four "general reagents," which serve to dissect the substance into six "groups" as regards its bases or metallic oxides.

The solution being in nitric acid, the first reagent is hydrochloric acid, which precipitates the first group—viz., silver and mercury (the latter from mercurous salts). The acid filtrate from these chlorides is submitted to a stream of sulphuretted hydrogen gas, which precipitates the second and third groups, consisting of twelve metals together, as sulphides. These are collected and washed upon a filter, and upon them is poured sulphide of ammonium. This dissolves and carries through the filter the sulphides of the second group—viz., arsenic, antimony, tin, gold, platinum, molybdenum, and tungsten, while the sulphides of mercury (from mercuric salts), lead, bismuth, copper, and cadmium, constituting the third group, remain undissolved.

The filtrate from the precipitate by sulphuretted hydrogen is next taken in hand, made alkaline by ammonia, and sulphide of ammonium is added to it. This throws down, as hydroxides or phosphates, aluminium, chromium, glucinum, and the cerium metals; as phosphates, calcium, barium, strontium, and magnesium; and as sulphides, nickel, cobalt, manganese, zinc, iron, uranium, thallium, and indium —making a fourth group.

To the ammoniacal liquid, separated by a filter from the last precipitate, is added carbonate of ammonium, whereby the fifth group—viz., barium, calcium, and strontium—are precipitated as carbonates.

Lastly, the liquid filtered from the above carbonates may contain the alkalies and magnesium.

The resolution of these groups is accomplished by further application of appropriate reagents. Each group is treated after a certain order which experience has taught. To illustrate: the white precipitate obtained by hydrochloric acid, already described, may contain silver chloride or mercurous chloride, or both. To complete its examination we employ the deportment of these chlorides towards ammonia-water, which easily dissolves silver chloride to a clear liquid, but converts white mercurous chloride into a black substance that remains undissolved. It is only needful then to pour dilute ammonia upon the white content of the filter; and if it blacken, the presence of mercury is demonstrated. The ammonia-water that passes the filter is dropped into excess of dilute nitric acid; the separation of a white curdy substance is evidence of silver.

After thus isolating the two metals we may apply further confirmatory tests. Thus, the black mercury compound remaining in the filter may be mixed with carbonate of sodium, dried, introduced into a small glass flask, and heated to redness, when metallic mercury will distil off and gather on the cold part of the vessel in brilliant globules. So, too, the white curds of silver chloride separated by nitric acid from the ammoniacal solution may be gathered and washed on a filter, the latter burned, the precipitate and ashes mixed with moist carbonate of sodium into a pellet, and heated strongly on charcoal by aid of a jeweller's blowpipe. The silver is thus reduced to the metallic state, and may be found, even when present in extremely minute quantity, by cutting out the charcoal to a little depth around the spot where the pellet was placed, grinding it in a smooth mortar of porcelain or agate, and carefully washing away the coal-powder by a gentle flow of water. The flattened silver particles will reveal themselves by their lustre.

The detection of acids is accomplished in another portion of the substance by the use of other reagents, after the same general plan.

In quantitative chemical analysis it is needful to convert each element of a substance into some form or compound which will admit of complete separation from all the others, and also of accurate weighing or measuring. In many cases an element must be separated in one form, and converted into another for weighing. Silver may be both separated and weighed as chloride or as metal, whilst zinc must be separated as carbonate or sulphide, but can only be weighed accurately as oxide. Many of the reactions employed in qualitative analysis also serve in quantitative estimations; the latter branch of analysis has, however, a multitude of processes peculiar to itself.

In most cases the determination of the quantity of an element or ingredient consists in the collection of a precipitate on a filter, washing, drying, burning away the paper at a red heat, and weighing the ignited residue. This requires a delicate balance, accurate weights, vessels of glass, porcelain, and platinum, which are unalterable by acids and by heat, and great nicety of manipulation. It also requires a perfect knowledge of the deportment of the precipitate towards all the reagents and solvents with which it must have contact, and a certainty that it can be obtained of perfectly definite and known chemical composition. Our present stock of this kind of knowledge is the fruit of a multitude of the most painstaking experiments, and every day the labor of skilled investigators is adding to its variety and extent.

To certain branches or general modes of analysis technical names are applied. Thus "blowpipe analysis" designates a system of operations carried on mainly by aid of the blowpipe, which serves for identifying a large share of the elements, and even for quantitatively estimating the precious metals, as well as lead, copper, nickel, and some others. "Spectral analysis," which furnishes the most sensitive tests for the presence of the alkali metals, is based on the fact that the light proceeding from a flame in which

the vapor of any substance is intensely heated, manifests, when viewed there by a prism, lines or bands of color whose position and number are characteristic. "Volumetric analysis" is a branch of quantitative analysis, in which measured volumes of solutions of determined strength are employed in reactions whose completion is indicated by some change of color or other marked phenomenon. "Organic analysis" is either ultimate or proximate. The former signifies the estimation of carbon, hydrogen, nitrogen, and the other elements of organic compounds. Proximate organic analysis is the separation of organic compounds from each other, as is done, for example, in determining the proportions of water, oil, starch, etc. in seeds. "Assaying" is the term usually applied to the estimation of the valuable metals, or ingredients of an ore or other commercial article.

Some of the most striking discoveries of science have been steps in the development of chemical analysis. The recognition of oxygen, chlorine, baryta, and manganese were results of Scheele's analysis of the mineral "wad" or pyrolusite. Among the first fruits of quantitative analysis was the discovery of the laws of definite and multiple combining proportions. Those philosophers who, like Bergmann and Dalton, were the first to announce, and those who, like Berzelius, Dumas, and Stas, have done most to establish, these laws, have been eminent for their skill in analytical chemistry.

The utility of chemical analysis manifests itself in a multitude of directions. By it the values of bullion, coinage, and plate are established; ores of all the metals are worked and sold on the chemist's report of their analysis. The same is true of a host of commercial articles, such as various alkalies, acids, salts, medicines, dyestuffs, fertilizers, etc. Chemical analysis furnishes the consumers of these and many other articles a protection against the dishonesty or ignorance of producers or dealers. The physician often gathers decisive diagnostic hints from the analysis of urine; the advocate relies upon chemical analysis for the detection of poisons which can be employed in the perpetration of murder.

There are indeed limits to the application of chemical analysis. It is not difficult to make mixtures some of whose constituents no chemist can identify with the knowledge now at his disposal. The composition of a large number of drugs, such as vegetable extracts, is nearly or quite unknown; and if a professional chemist certifies that he has analyzed a "compound syrup" of sarsaparilla, yellow dock, and buchu, or a "bitters" containing the virtues of a dozen of the best vegetable remedies, and has found it to be a pure and efficacious medicine, the simple fact is, he has not done it, and cannot do it, and there is a fraud involved in the assertion.

The successful pursuit of analytical chemistry requires a long course of the most patient and conscientious experimental work; it is therefore an admirable disciplinary study, and is recognized as such in the higher schools of Europe and this country.

(The best extended treatises on chemical analysis are Rose's "Handbuch der Analytischen Chemie;" Fresenius, "Qualitative Analysis," and the same author's "Quantitative Analysis;" Bunsen's "Gasometric Methods;" Hoppe-Seyler's "Handbuch der Physiologisch- und Pathologisch-Chemischen Analyse;" and Gorup-Besanez, "Zoochemischen Analyse." The "Zeitschrift für Analytische Chemie," edited by Fresenius, and now (1872) in its eleventh volume, is a complete repertory of all that is currently published on the subject.) S. W. Johnson.

Chemical Equivalents. See Chemistry.

Chemillé, a town of France, in the department of Maine-et-Loire, in the arrondissement of Cholet, on a railway, 20 miles S. S. E. of Angers, and on a small stream called the Hyronne. It has manufactures of linen handkerchiefs, woollen cloths, flannels, blankets, etc. Here is also a trade in cattle and agricultural products. The neighboring country produces considerable quantities of grain and white wine. Pop. 4414.

Chemistry [etymology uncertain*]. The present condition of chemical science has been reached by a gradual process of evolution. More than at any previous time, the individual characteristics which it exhibits represent the results of the united labors of all the workers in its domain from the dim ages of alchemy to the present day. A rapid historical sketch of its development, therefore, cannot but form an appropriate introduction to a consideration of its present condition.

History.—The alchemists had no science in any proper sense. Most of the valuable facts they have handed down to us were collected in the search for the philosopher's stone, the universal solvent, or the elixir vitæ. Here and there, it is true, there were those who speculated upon the facts which had been observed, and who strove to evolve from them some general principles. But so unsatisfactory were the results that, although the word "chemistry"—signifying, however, the art of making gold and silver—came into use early in the fourth century, it was not until near the close of the seventeenth century that chemistry proper had any existence. For our present purpose it is sufficient to extend our investigation only to the progress of the conception of the constitution of matter. The four elements of Aristotle (B. C. 384–322), earth, air, fire, and water, held undisputed sway until the eighth century. Then the Arabian alchemist Geber introduced the theory that the metals were made of mercury and sulphur, and suggested, for the first time, the idea that differences of properties were due to differences of composition. In the thirteenth century Albertus Magnus united these two conceptions into one, by asserting that the physical properties of bodies depended upon the elements of Aristotle, and their chemical properties upon those of Geber. In the fifteenth century Basil Valentine, the last of the alchemists, added "salt" to Geber's elements, and refined the idea involved in them by asserting that by sulphur was meant the inflammable principle, by mercury the volatile principle, and by salt the fixed principle. Paracelsus (1493–1541) appeared mainly as the reformer of medicine. Accepting Basil Valentine's views of matter, he maintained that the health of the human body depended upon the presence in it of a just proportion of the three principles. The first book upon chemistry was written by Libavius in 1595; he defined it as the art of producing remedies. The period of Iatro chemistry closes with Lemery (1645–1715), who sought again to introduce the ideas of Aristotle by uniting two of his elements, water and earth, to those of Basil Valentine. A new and more hopeful era opens with the English chemist Boyle (1627–91). He opposed the views thus far held upon the constitution of matter, and argued that the true elements were the bodies—themselves undecomposable—which were obtained by the decomposition of other substances, and which could be used to form these substances again. The differences observed in the elements themselves he accounted for by supposing that their smallest particles differed either in size or form. Stahl (1660–1734) accepted the theory that chemical properties depended upon the presence of certain definite constituents, and sought to demonstrate it experimentally. By a closely-knit argument, founded on observed facts, he succeeded in giving to his theory of combustion —called the "phlogistic theory," because it assumed the presence of phlogiston in all combustible bodies, which phlogiston passed off in burning—a solidity which enabled it to maintain itself for nearly two hundred years. In the steady progress of the science, however, the materials for the overthrow of the phlogistic theory were being prepared. Black (1728–99), when a medical student in Edinburgh, wrote, on his graduation in 1754, a thesis entitled "De Humore acido a cibis orto, et Magnesia alba." Appended to it was a series of chemical experiments upon the mild and caustic alkalies, which were afterwards extended and published separately in 1756. In this paper he shows that the mild alkalies differ from the caustic in the fact that they contain a large amount of "fixed air," which, when a mild alkali is treated with an acid, escapes with effervescence. A mild alkali is therefore a caustic alkali, plus fixed air. Now between the current theories of phlogiston and of causticity there is a close analogy. As by the former combustible bodies were compounds of phlogiston, so by the latter caustic alkalies were compounds of the caustic principle. And as, in burning, the combustible gave up its phlogiston and became a calx, so a mild alkali in the fire took up the fiery caustic principle and became itself caustic. Black, however, proved that this explanation of causticity was false; he showed that in burning the mild alkali did not gain but lost something, this loss being the "fixed air;" and that it was this loss of fixed air which made a caustic alkali. This research of Black made the framing

* Perhaps the most probable etymology is that which derives the term from *Khem*, one of the ancient names of Egypt; signifying also "black" or "dark," in allusion perhaps to the dark and mysterious character of the art of alchemy, or else to the fact that Egypt was especially distinguished for its knowledge of secret and rare arts. The derivation from the Greek χυμός, "juice," seems highly improbable, principally because the original spelling of the word as seen in *alchemy* (whence the modern *chemistry* is derived) had not the first syllable in *chy*, as it should have had coming from the Greek χυ; for the Greek term itself was χημεια (not χυμεια); though many modern writers, misled by this supposed etymology from χυμός, write *alchymy* (or *alchymic*), as well as *chymist* and *chymistry*. And though the interchange of one vowel or diphthong for another is very common in Greek, as α for η, ει for ι, we believe no instance can be pointed out in which υ interchanges with η. There seems, moreover, no reason to suppose that the mixture or preparation of "juices" of any kind was the chief occupation of the alchemists, their great problem having been the transmutation of baser metals into gold; and, from what we know of the experiments, their chief agent was fire.

of an argument against phlogiston easy. It is not surprising, therefore, that not long afterwards Lavoisier (1743–94), furnished with abundant material by the remarkable discoveries of Priestley (1733–1804), Cavendish (1731–1810), and Scheele (1742–86), undertook a crusade against the Stahlian hypothesis. As Black had shown that the loss of causticity depended upon the assumption of a gaseous matter—fixed air—by the alkali, so was it not clear that the loss of combustibility depended upon the assumption of another kind of gaseous matter—vital air—by the combustible? As the conversion of a mild into a caustic alkali did not consist of the taking up of "causticum," but in the evolution of fixed air, so the production of a metal from its calx did not consist in the taking up of "phlogiston," but in the evolution of oxygen. His conclusive experiment with mercury established the analogy, and gave phlogiston its deathblow.

Meanwhile, numerical relations had begun to take their place in the science. Though Homberg (1652–1715) had attempted to fix the quantity of a base required to saturate several different acids, yet it was not until 1777 that Wenzel (1740–93) succeeded in establishing the true idea of definite chemical combination. His analyses were surprisingly accurate. He proved, for example, that 123 parts of lime, or 222 parts of potash, neutralized 240 parts of nitric or 181.5 parts of sulphuric acid. Hence, 123 parts of lime are the equivalent, in neutralizing power, of 222 parts of potash; and so of the quantities of the acids, as given. Richter (1762–1807) extended these experiments, and drew up the first tables of equivalents. He showed that the quantity of the bases A and B which combined with an acid C would also combine with the acids D, E, and F, and hence, that the composition of many salts could be calculated from the known composition of other salts; thus laying the foundation of Stoichiometry. Richter also pointed out that the ratio between the amount of an acid required to saturate certain bases, and the amount of oxygen contained in those bases, was definite. Thus early was the law of definite proportions established. It was soon followed by another of not less importance. In 1804, Dalton (1766–1844), in a research upon olefiant and marsh gases, observed that the latter contained, to the same weight of carbon, twice as much hydrogen as the former. Extending this observation to other bodies, he was at once led to the law of multiple proportions, which asserts that when one body combines with another in more than one proportion, the quantities uniting in the second and subsequent cases are simple multiples of the first. It was in pondering upon the cause of so remarkable a law that Dalton devised the atomic theory. It seemed clear to him that the definite weights with which bodies enter into combination represent definite quantities of matter, indivisible by chemical means. These definite quantities of matter he proposed to call atoms; they were of the same size, but their weights were proportional to the combining weights in each case. These atoms combined with each other, forming compounds; hence the quantities combining must be definite in weight; they might be multiples in one case of the quantities in another, and the weight of the compound must be the sum of the weights of its constituents. These atomic weights being relative, Dalton chose the smallest of them, that of hydrogen, as a standard, calling it unity. In 1808 he published a table of atomic weights, in which that of nitrogen is 5, of carbon 5, of oxygen 7, of sulphur 13, of iron 38, of zinc 56, of silver 100, of mercury 167, etc. Some of Dalton's contemporaries accepted his views in full, others only in part. Among the latter was Wollaston (1766–1828), who accepted Dalton's numbers, but preferred to call them equivalents, on the ground that an equivalent was a fact, an atomic weight only a hypothesis. Davy (1778–1829) also rejected the hypothesis of atoms, but proposed "proportional numbers" for Dalton's atomic weights. Nevertheless, the atomic theory stimulated investigation, and chemists set themselves at work to revise, and if possible to make more accurate, these numbers of Dalton.

Contemporaneously with this progress in the determination of the combining weights of the elements was an advance in ascertaining their combining volumes. Gay-Lussac (1778–1850), in connection with Humboldt, proved in 1805 that water was formed by the union of one volume of oxygen with two volumes of hydrogen. Continuing his researches, he showed in 1809 that the combination of any two gases always took place in simple volume-ratios, and that the volume of the product always bore a simple ratio to that of its constituents. This discovery was not only an important confirmation of the law of definite proportions, but it furnished a means by which an atomic weight could with certainty be determined. For, since, according to Dalton, bodies combine in proportions represented by the weight of their atoms, and, according to Gay-Lussac, the simple gases also combine by volume in a simple ratio, it is evident that the relative weights of these volumes ought to represent the atomic weights. But the relative weight of a given volume is the density; hence the atomic weights of simple gases are proportional to their densities. Singularly enough, Dalton—who, more than any other, should have welcomed this new confirmation of his views—refused to accept it, and attacked the accuracy of the results. Berzelius (1779–1848), however, warmly espoused the new theory of volumes, and constructed his tables of atomic weights in accordance with it. By the improvements in methods of analysis which he devised, he was able, in 1815, to give a wonderfully accurate table of this kind, in which—following Wollaston—he took oxygen as the standard and called it 100. Hydrogen he gave as 6.24. The influence of Gay-Lussac's law is here clearly apparent. For, since by Wollaston's equivalents the ratio of the hydrogen in water to the oxygen is as 1 to 8, and by Gay-Lussac's law the volumes are as 2 to 1, it is clear that the ratio of the weights of these volumes is as 2 to 16, or as 6.24 to 100, as Berzelius gave it. Moreover, he substituted for the arbitrary notation of Dalton—which consisted of circles—a system of symbols, in which each atom was represented by the first letter of its Latin name. A bar drawn through a symbol signified a double atom, and a dot over it indicated an atom of oxygen. Water was written H_2O, or, abbreviated, $\dot{H}$; nitric acid, N_2O_5, or $\dot{N}$. In order to bring his atomic weights into accordance with the equivalents of Wollaston and Davy, Berzelius had recourse to an unfortunate hypothesis. He admitted the existence among the elements of double atoms, inseparable in combination, which were represented by his barred symbols. These double atoms of Berzelius were equal in weight to the equivalents of Wollaston.

Two parties were now in the field. On the one side was Dalton with his atomic theory, maintaining that when but a single combination between elements took place it always took place atom to atom, and considering the atomic weight to be the quantity of a substance which united with one atom of hydrogen; and Wollaston and Davy, rejecting the theory of atoms, and asserting that an equivalent of any element was the quantity of it by weight which combined with 10 parts of oxygen. On the other was Berzelius—already more than a match for any of his contemporaries—accepting the theory of Dalton, and contending that the atomic weights were proportional to the gaseous volumes, being the relative weights of these volumes when equal, but conceding the existence of inseparable double atoms. Dalton confounded the idea of atomic weight with that of equivalent; Wollaston and Davy retained the idea of equivalent, but carried it out inconsistently; Berzelius conceived the true idea of an atom, and sharply distinguished it from that of an equivalent. In the case of non-volatile bodies, as the metals, however, he too considered an atomic weight to be the quantity which combined with 100 of oxygen to form the first degree of oxidation, though, for special reasons, he varied this rule in some cases. The great weight of his authority bore down all opposition, and for twenty years his views were the absolute basis of chemical science. His theory, nevertheless, had its weak points; and in 1848 Gmelin (1788–1853) in the fourth edition of his "Lehrbuch der Chemie," attacked the chief of these, the theory of double atoms. "There is no compound," he says, "containing but one atom of hydrogen, nitrogen, etc., as small as that adopted by Berzelius. Hence two atoms of these bodies are the *equivalent* of one atom of oxygen. If the atoms be supposed twice as great, the idea of an atom will coincide with that of an equivalent, and all confusion will be avoided." He therefore proposed that the formulas of water, hydrochloric acid, and ammonia, which Berzelius had written H_2O, H_2Cl_2, and H_6N_2, should be written HO, HCl, and H_3N. This argument of Gmelin, strengthened by the old idea of Wollaston that atoms were purely hypothetical and equivalents were actual, succeeded in leading chemists to ignore the positive results obtained by Gay-Lussac, and to sink back into the old equivalent system of notation. The view of chemical equivalency thus adopted, however, based as it was on negative statements mainly, was full of inconsistencies. Adopting, as less cumbrous, the hydrogen scale of equivalents, and therefore assuming that an equivalent of any substance was the quantity of it which united with one atom of hydrogen, the chemists who advocated it gave 14 as the equivalent of nitrogen, although it was certain that this quantity combined, not with one, but with three atoms of hydrogen. In the case of salts, a class of bodies termed ternary by Berzelius, and formulated on the dualistic or electro-chemical view, the same is true. Wenzel, Richter, and even Berzelius, had studied the neutralization of acids by bases, and had formed tables of equivalencies between them. It was impossible to assert that all bases were equivalent to each other. One equivalent of alumina, for example, sat-

urated three times as much sulphuric acid as one equivalent of potash; and phosphoric acid, equivalent for equivalent, required three times as much base as nitric. In general, polyacid bases and polybasic acids could not be brought into accordance with the theory except by strained hypothesis or arbitrary assumption. Consistency required the adoption of formulas which were at variance with fact. The need of a reform was apparent, and it was soon begun. The reformer was Gerhardt (1816–56). He was struck with the fact that on the existing notation, whenever any organic reaction gave rise to the formation of water or of carbonic gas, the quantity of these bodies evolved never corresponded to a single equivalent, but always to two or a multiple of two. Moreover, he observed that if the equivalents of carbon, hydrogen, and oxygen were taken at 6, 1, and 8, respectively, then that all organic formulas contained an even number of carbon and of oxygen atoms. If, he reasoned, C_2O_4 (in which $C_2 = 12$ and $O_4 = 32$) be the smallest quantity of carbonic gas which can be set free in any reaction, is it not a complete molecule? and is it not better to write the formula CO_2, in which $C = 12$ and $O_2 = 32$? So, if H_2O_2 be a molecule of water, is it not better to double the weight of the oxygen atom and write it H_2O? Thus did Gerhardt sharply define the ideas of molecule and atom, and thus did he construct his tables of atomic weights, which, while closely accordant with those of Berzelius, avoided his hypothesis of double atoms. In accordance with the law of Gay-Lussac, and with the law of Avogadro and Ampère—that equal volumes of all gases contained the same number of molecules—Gerhardt defined a molecule to be that quantity of any substance which in the gaseous state occupied two volumes, the standard volume being that occupied by an atom of hydrogen. As Berzelius had written many of his formulas in accordance with his dualistic ideas—nitric acid, for example, being $N_2O_5H_2O$ or $H_2N_2O_6$—which formulas corresponded to 4 volumes of vapor, Gerhardt at once halved them, writing nitric acid HNO_3, and so brought them to the 2-volume standard. He regarded molecules as units, whence the name "unitary" given to his system. He maintained that the determination of the arrangement of the atoms within the molecule was impossible, and hence opposed the use of rational formulas. He rejected the compound radical theory of Lavoisier and Berzelius, and accepted, with curious inconsistency, Laurent's theory of "residues," essentially similar.

Gerhardt's early death prevented the full development of his views. His atomic weights were never fully accepted until after they had become modified by the influence of two physical laws discovered some time before. In 1819 two French chemists, Dulong (1735–1838) and Petit (1791–1820), showed that the specific heats of simple bodies were inversely proportional to their atomic weights; or, what is the same thing, that the atoms of all simple bodies have the same specific heat. Although Berzelius had regarded this law in fixing certain of his atomic weights, yet it was not until re-investigated by Regnault in 1849 that it was generally used. He called attention to the fact that to make the equivalent weights then in use accord with the law of specific heats, it was necessary only to halve the equivalents of hydrogen, nitrogen, chlorine, bromine, iodine, phosphorus, arsenic, potassium, sodium, and silver. But this, in all but the last three cases, was to return to the atomic weights of Berzelius. Gerhardt, however, in doing this, had arbitrarily assigned to the protoxides the formula R_2O, while the law of specific heats allowed this formula only in the cases of potassium, sodium, and silver. For all other metals, therefore, the protoxides were RO, and the atomic weights of Berzelius were more accurate than those of Gerhardt. The second law which influenced atomic weight was the law of isomorphism, discovered in 1819 by Mitscherlich (1794–1863). He proved that bodies similarly constituted crystallize similarly; and hence that bodies really isomorphous—*i. e.*, having crystalline forms nearly or quite identical—ought to be represented by analogous formulas. For example, cuprous sulphide is isomorphous with silver sulphide; its formula should therefore be Cu_2S, analogous to Ag_2S, and not CuS, as Gerhardt wrote it. Thus, in due time, all the considerations which bear upon the question of atomic weights appear to have been regarded, and these weights established to the satisfaction of all.

Another of the most prolific of modern chemical theories must be briefly glanced at in this place. This theory, called the theory of types, was first proposed in 1839 by Dumas, upon his discovery of trichloracetic acid. He stated it thus: When equivalent substitution of any of the elements of a compound takes place, the compound itself retains its original chemical type, the replacing element playing the same part as that which is replaced. Ten years later Wurtz discovered the amines, and in his paper on the subject compared them either to ether, in which oxygen was replaced by amidogen (NH_2), or to ammonia, in which one atom of hydrogen was replaced by an alcoholic radical. The investigation of these "compound ammonias" was continued by Hofmann, who accepted the latter view, and has since given it a most remarkable development. In 1851, Williamson extended the idea of types by his beautiful researches upon etherification, and especially by the discovery of mixed ethers. The water-type had been suggested already by Laurent (1807–53), who had formulated caustic and anhydrous potash upon it; it had been extended by Sterry Hunt. But Williamson went farther: he showed conclusively that if an alcohol molecule contained the ethyl group once, that of ether contained it twice—that if alcohol be represented by replacing half the hydrogen in water by ethyl, $\left.\begin{matrix}C_2H_5\\H\end{matrix}\right\}O$, then ether ought to be represented by replacing the whole, $\left.\begin{matrix}C_2H_5\\C_2H_5\end{matrix}\right\}O$. By a rapid generalization of this view he showed that the acids, bases, and salts, not only of mineral, but also of organic chemistry, were readily referable to the water-type. Two types were now established, the water and the ammonia types. Gerhardt increased the number by proposing the type hydrogen (HH), not only for free elements, like chlorine and potassium, but for the hydrides, aldehydes, ketones, and radicals of the carbon series; and the type hydrochloric acid (HCl) as the type of the haloid salts and ethers. In the same year Williamson suggested the idea of "condensed types" for the polybasic acids and the polyacid bases. On the water-type twice condensed, $\left.\begin{matrix}H_2\\H_2\end{matrix}\right\}O_2$, he formulated sulphuric acid, by replacing half the hydrogen by the radical (SO_2), $\left.\begin{matrix}(SO_2)\\H_2\end{matrix}\right\}O_2$. Odling showed that phosphoric acid was derived from the water-type trebly condensed, $\left.\begin{matrix}(PO)'''\\H_3\end{matrix}\right\}O_3$; the replacing power of a radical being indicated by dashes $(PO)'''$. In 1854 he introduced the conception of "mixed types," arguing that if a poly-equivalent radical could replace the hydrogen atoms in several similar molecules, either wholly or partially, it could also thus unite several dissimilar molecules.

Two distinct ideas are involved in the theory of types: one is the idea of the replacing body or radical; the other is that of the body in which the replacement takes place, or the type itself. The first of these involves clearly the conception of replacing power; those substances being first formulated upon the theory of types whose radicals replaced but a single atom of hydrogen. The brilliant research of Wurtz upon the glycols, made in 1856, proved that ethylene replaced two atoms of hydrogen. And, starting from this, Cannizzaro in 1858 established the analogy for several of the metals, and thus originated the principle of classifying the elements according to their replacing power. The same year Kekulé gave a vigorous impulse to this idea of elemental replacing power by establishing, in a paper on the chemical nature of carbon, the fact that this element had a replacing power of four. Gradually, the names atomicity, quantivalence, and equivalence came into use to express this replacing power—an atom being a monad, dyad, triad, or tetrad, or a univalent, bivalent, trivalent, or quadrivalent radical, according as its replacing power is equal to one, two, three, or four atoms of hydrogen. Wurtz, however, prefers to use the terms monatomic, diatomic, triatomic, etc. for the same purpose. But this combining or replacing power is not invariable. A given element, according to the law of multiple proportions, may form a series of compounds with another element, and in each of these its equivalence must be different. It was early observed, however, that this variation in equivalence always took place by twos; so that an atom might replace 1, 3, 5, or 7, or 2, 4, 6, or 8 hydrogen atoms. The equivalence never changes from even to odd, or the reverse. Odling therefore divided the elements into two groups, calling the group of even equivalence artiads, and the group of odd equivalence perissads. If an atom is a perissad in one of its compounds, it is so in all; and so if it is an artiad. Out of this classification of the elements according to their equivalence, involving as it does the predetermination of their compounds, there grew, insensibly and almost inevitably, the idea of molecular arrangement. Though isomerism had necessitated the supposition that differences of arrangement must exist, yet hitherto the precise character of this difference could not be determined. To express the idea, three sorts of graphic formulas were devised. The first, by Kekulé, consisted of ovoids, longer or shorter according to the equivalence:  ; the second, by Foster, consisted simply of lines, thus:  ; and the third, by Crum Brown, was composed of circles with radiating lines:  . The latter notation—using symbols in

place of circles—is in general use. If oxygen be a dyad, and hydrogen a monad, the graphic formula of water must be H—O—H: the oxygen must link the two H atoms together; there is no other arrangement possible.

The second part of the theory of types is involved in the idea of the body in which the replacement is effected; *i. e.*, the type itself. Four of these were fixed by Gerhardt—namely, HH, HCl, H_2O, and H_3N; to which Odling subsequently added H_4C. HH and HCl were soon after united; and indeed it was soon shown that all the others were easily derived from the hydrogen type. Upon examination of these types, it is evident that the atoms united to the hydrogen successively increase in equivalence, the Cl being a monad, the O a dyad, etc. The reason, therefore, why these substances are really typical is obvious: it is because they represent the combinations of monads, dyads, triads, tetrads, etc. with other elements; *i. e.*, all possible compounds. In this light the type theory appears as only a special case of the broader theory of equivalence, into which, by the labors of Kekulé, Wurtz, Hofmann, Boutlerow, and others, it has already been completely merged.

Theoretical Chemistry.—Modern science regards matter as divisible into masses, molecules, and atoms. A mass of matter is any portion recognizable by the senses. A molecule of matter is the smallest quantity of any substance which can exist by itself, and which can enter into or leave a chemical change. An atom is the smallest particle of matter which can exist in combination. A molecule is made up of atoms, and a mass is made up of molecules. These divisions of matter are held together by attractions, called, respectively, mass, molecular, and atomic attraction. Mass attraction is called gravitation; molecular attraction is called cohesion; and atomic attraction is called chemism. Differences in molecular composition produce differences in the physical properties of bodies; differences in atomic composition produce differences in their chemical properties. The only differences possible in atomic composition are: (1) a difference in the kind of atoms in the molecule; (2) a difference in the number of these; and (3) a difference in their arrangement. Hence, upon these three all the chemical differences observed in matter must depend. Water differs from salt because a molecule of the former, made up of oxygen and hydrogen, differs from a molecule of the latter, made up of chlorine and sodium, in the *kind* of atoms which it contains. Litharge differs from red lead because their molecules, while containing in both cases lead and oxygen atoms, differ in the *number* of these present in each; cane-sugar and milk-sugar are different, because the kind and number of atoms composing their molecules being alike, the *arrangement* of them is different. Chemistry, therefore, may be defined as the science which treats of the atomic composition of bodies, and of those changes in matter which result from an alteration in the kind, number, or relative position of the atoms which compose the molecule.

Chemistry, then, is the science of atoms. It takes cognizance only of those facts which depend upon differences of atomic constitution. Hence, no substance is chemically understood until the kind, the relative and absolute number, and the arrangement of the atoms within its molecule, are known. To determine the first of these, the kind of atoms, is the business of qualitative analysis; it affirms that a water-molecule contains only oxygen and hydrogen atoms, and a salt-molecule only atoms of chlorine and of sodium. The relative number of atoms contained in a molecule of any substance is ascertained by quantitative analysis, being obtained by dividing the percentage of each constituent by its atomic weight, and clearing the quotients of fractions. The absolute number of atoms in any molecule is fixed from the molecular weight, which is obtained generally from physical data. Knowing the weight of the molecule, it is easy to distribute this weight among the constituent atoms in the proportions given by analysis; then, dividing the quantity of each substance present by its atomic weight, the absolute number of atoms is obtained. The arrangement of the atoms within the molecule is ascertained either directly, being deduced necessarily from the law of equivalence, or indirectly, by experiment. Since the strength of the atomic attraction varies in the different parts of a molecule by reason either of distance or position, it is possible to break up the molecule so as to obtain certain groups existing in it in other and recognizable forms. Hence, by breaking up a molecule by suitable means, and studying its derivatives, the character of its groupings, and consequently the arrangement of the atoms within it, may be accurately determined.

Molecular constitution is the basis of chemical classification. In the first place, all substances are divided into two classes, according as their molecules are made up of like or of unlike atoms. A substance like sulphur, carbon, or iron is made up of molecules containing like atoms, and is called a simple or elementary substance; a substance like salt, water, or sugar is made up of molecules containing unlike atoms, and is called a compound substance. These two kinds of molecules are easily distinguished by the fact that upon rearranging the atoms between two contiguous molecules the former yields no new substance, while from the latter some different form of matter is obtained. If, for instance, two molecules of simple matter be represented by AA and AA, it is evident that rearrangement would only produce AA and AA again, exactly like the others; but if rearrangement be effected between two compound molecules, AB and AB, then the product would be AA and BB, two new forms of simple matter. It should be mentioned that if the agent employed was not powerful enough to produce the rearrangement, the result would be, apparently, that first given, even if the substance were compound; it may be, therefore, that some of the bodies now considered elementary will be proved compound upon the discovery of some new and more energetic rearranging force. Thus far, however, sixty-three substances have resisted all attempts to decompose them and to evolve from them other forms of matter. These substances, therefore, are regarded as elementary. Since each molecule is made up of like atoms, and these are peculiar to itself, it follows that the number of known kinds of atoms is sixty-three also. The number of atoms contained in a simple molecule is called its atomicity. It is obtained by dividing the weight of the whole molecule by the weight of a single atom. The molecular weight is generally obtained by means of the law of Avogadro or Ampère, which asserts that equal volumes of all gases contain the same number of molecules. Whence it follows (1) that the molecules of all bodies in the gaseous state must be of the same size; and (2) that the molecular weights must be as the weights of equal volumes. Taking, for example, the weight of one liter of hydrogen (.0896 gram) as unity, the weight of one liter of oxygen (1.43 grams) is 16, the weight of a liter of arsenic vapor (13.41 grams) is 150, and the weight of a liter of mercury vapor (8.96 grams) is 100. Hence, a molecule of oxygen is 16, a molecule of arsenic is 150, and a molecule of mercury is 100, times as heavy as a molecule of hydrogen. But the weight of a molecule of hydrogen, containing two atoms, is 2; hence the molecular weight of oxygen is 32, of arsenic is 300, and of mercury 200. Since the atomic weight of oxygen is 16, that of arsenic is 75, and that of mercury is 200, it is evident that the molecule of oxygen is diatomic, that of arsenic tetratomic, and that of mercury monatomic. Most of the elementary molecules are diatomic.

Atoms differ from each other (1) in weight, (2) in the quality of their combining power, and (3) in the quantity of this power. An atomic weight is the weight of an atom, referred to that of hydrogen as unity. Since an atom is the smallest quantity of an element which can enter into the composition of a molecule, it is evident that by analyzing the molecules of several different compounds of a given element, and by comparing together the quantity of this element contained in each, the atomic weight may readily be fixed. Thus, it is found that the quantity of bromine contained in a molecule of its hydrogen compound is 80; of its mercury compound is 160; of its boron compound is 240; and of its silicon compound is 320. Its atomic weight is therefore 80, because it is the smallest quantity by weight in which bromine enters into combination. According to the quality of their combining power, atoms are divided into two classes, called positive or negative, according as, in electrolysis, they go to the negative or positive pole. To the former or positive class belong the metals in general; to the latter or negative class, the non-metals. This distinction is a purely relative one, since an atom may be positive when associated with one atom and negative with another. This property of atoms affects the quality of the molecule into which they enter; the hydrates of positive atoms, for example, being bases, and the hydrates of negative being acids. Besides the differences now noticed, atoms differ also in their equivalence, or their power of entering into combination with other atoms. Taking the atom of

hydrogen as the standard, it is found that other atoms have combining powers two, three, four, five, and even six, times as great. Such atoms are called, therefore, monads, dyads, triads, tetrads, pentads, and hexads. The combining power of a hexad atom being six times as great as that of a hydrogen atom, and that of a dyad atom being three times as great, a complete molecule formed by their union must be composed of one hexad and three dyad atoms. But atomic equivalence is variable; a monad may act as a triad or even as a pentad. This variation, however, always takes place by twos; so that atoms of even equivalence (called artiads) remain even, and atoms of odd equivalence (called perissads) remain odd.

Compound molecules are built up by the union of dissimilar atoms. But since atoms do not exist free and uncombined, a direct union of these is impossible. Hence the union must take place by way of exchange. If, for instance, the two simple molecules AA and BB be brought together, the attraction of unlike atoms for each other being stronger than that of like, rearrangement will take place, and AB and AB, two compound molecules, will result. The number of atoms which a compound molecule may contain is apparently unlimited. Two classes of compound molecules are distinguished: in one the characteristic constituent atoms are united directly together; in the other they are linked together by the intervention of a third atom. The former are called binary compounds, because, whatever the absolute number of atoms present, they can never be of more than two kinds. The latter are called ternary, because there must always be present at least three atoms. Salt, for example, is a binary compound, because made up of molecules containing sodium and chlorine atoms; nitric acid is a ternary compound, because made up of molecules consisting of hydrogen, nitrogen, and oxygen atoms, the two first being linked together by the last. It is evident that only a poly-equivalent atom can link others together; and, in fact, the dyad oxygen and the triad nitrogen perform by far the largest part of this work. Hence, ternary molecules may be divided into two groups, according as oxygen or nitrogen performs in them the linking function. Moreover, the quality of the chemism of atoms here comes in, and each of these groups may be subdivided into three classes, according as the dominant atom united to hydrogen is positive or negative, or as the molecule contains both thus united. The classification of simple and compound molecules above given may be conveniently presented in a tabular form, thus:

- Molecules
  - Like atoms ..... Element.
  - Unlike atoms
    - United directly ..... Binary.
    - United indirectly
      - By a dyad
        - $\overline{R}$ and H Acid.
        - $\overline{\overline{R}}$ and H Base.
        - $\overline{R}$ and $\overline{\overline{R}}$ Salt.
      - By a triad
        - $\overline{R}$ and H Amide.
        - $\overline{\overline{R}}$ and H Amine.
        - $\overline{R}$ and $\overline{\overline{R}}$ Alkalamide.

The principle upon which compound substances are named is essentially that proposed by Lavoisier. Every molecule must contain at least two atoms, one of which is positive to the other, which is negative. In the case of binary molecules the rule is: Place the name of the positive first, and then that of the negative, changing the termination of this into *ide*. A substance composed of potassium and sulphur would therefore be called potassium sulphide. If the positive atom varies its equivalence, this fact is indicated by giving it, for the higher of two stages, the termination *ic*, and for the lower the termination *ous*, as mercuric and mercurous oxides. Should a third stage be developed below the *ous*-compound, the prefix *hypo* is given, as hyposulphurous oxide; or if above the *ic*-body, the prefix *per*, as perchloric oxide. Ternary molecules are similarly named, except that the negative terminations are *ate* and *ite*, instead of *ide*. Sodium and iodine united directly form sodium iodide, a binary, but if united by oxygen they form sodium iodate, a ternary. So hydrogen and phosphorus united by oxygen form hydrogen phosphate; potassium and hydrogen thus united form potassium hydrate. Besides these systematic names the acids have more common ones, which are formed from the name of the characteristic atom by adding *ic* or *ous* as in the case of binaries, *ic* corresponding to *ate*, and *ous* to *ite*. Thus, hydrogen sulphate is sulphuric acid, and hydrogen nitrite is nitrous acid.

The system of chemical notation now in use is also old, being essentially that devised by Berzelius. The atomic symbols are the first letters of their Latin names, or, when two have the same letter, the first and some other distinctive letter. The symbol of sodium—Latin, *natrium*—being Na, and that of chlorine being Cl, a molecule of sodium chloride, or salt, is represented by placing them together, thus: NaCl, the positive coming first. If more than one atom of any constituent be present, the number is indicated by a numeral placed below and to the right of the symbol; thus, water is written H_2O. In the case of ternary molecules especially it is necessary to express not only the kind and the number of atoms the molecule contains, but also their arrangement. The formula HNO_3, for example, indicates only that a molecule of nitric acid contains one atom of hydrogen, one of nitrogen, and three of oxygen. But since several bodies might be represented by such a formula, it is necessary to go farther and to fix the constitution of the molecule. This may be done by the use of graphic or of rational formulas. The graphic formula of nitric acid is

$$H-O-\overset{\overset{O}{\|}}{\underset{\underset{O}{\|}}{N}}$$

; the rational formula is $NO_2(OH)$. Both express the fact that two of the oxygen atoms act simply to saturate the nitrogen, while the third links the hydrogen to it. Moreover, this question is one of practical importance, since the basicity or salt-forming power of the acid is directly as the number of hydrogen atoms, thus linked, which it contains. Nitric acid, as above, contains one such atom, and is monobasic; sulphuric acid,

$$H-O-\overset{\overset{O}{\|}}{\underset{\underset{O}{\|}}{S}}-O-H,$$

or $SO_2(OH)_2$, is dibasic; phosphoric acid

$$H-O-\overset{\overset{O}{\|}}{\underset{\underset{H}{|}}{\underset{\underset{O}{\|}}{P}}}-O-H,$$

or $PO(OH)_3$, is tribasic. By exchanging its hydrogen for a metal, an acid forms a salt; KNO_3, potassium nitrate, is formed by replacing the hydrogen in HNO_3 by potassium. When an acid and a base are brought together, a salt and water are the products. Thus hydrogen nitrate $NO_2(OH)$ and potassium hydrate K(OH) act to produce potassium nitrate $NO_2(OK)$ and H(OH), or H_2O. Water, acting upon a positive oxide, yields a base; upon a negative oxide, an acid; while a positive oxide acting upon a negative oxide yields a salt.

Chemical changes are called reactions—the substances producing them, reagents. Reactions are represented by equations, in which the symbols of the factors, or substances acting, form one member, and the symbols of the products, or the substances which result, form the other. Reactions are of three kinds—analytical, in which a complex molecule is broken up into simpler ones; synthetical, where two or more simpler molecules unite to form a more complex one; and metathetical, in which a simple transposition of atoms takes place between molecules. Since every symbol represents an atom, and hence an atomic weight, the quantities of matter entering or leaving any chemical reaction are expressed in the equation. Whence, knowing the factors, it is easy to calculate the weight of the product, or to ascertain what quantity of the factors is required to yield a given weight of the product. Chemical calculations, founded on atomic weights, constitute the department of Stoichiometry.

General Chemistry.—This branch of chemical science is essentially descriptive. It takes up the elements, grouped according to their several analogies, and discusses their history, their occurrence, their methods of preparation, their properties, and their compounds with each other. It is obvious that such a treatment must be an extended one,

covering the entire sixty-three simple substances and their innumerable compounds. We must refer those interested, therefore, to any of the larger treatises upon chemistry for these details, and content ourselves with giving the annexed tabular statement of the names, equivalences, symbols, and atomic weights of the elements at present known:

Perissads.		Symbol.	At. wt.
Monads:			
Hydrogen,	.....	H	1
Fluorine,	.....	F	19
Chlorine,	I, III, V, VII.	Cl	35.5
Bromine,	I, III, V, VII.	Br	80
Iodine,	I, III, V, VII.	I	127
Lithium,	.....	Li	7
Sodium,	I, III.	Na (*Natrium*)	23
Potassium,	I, III, V.	K (*Kalium*)	39
Rubidium,	.....	Rb	85
Cæsium,	.....	Cs	133
Silver,	I, III.	Ag (*Argentum*)	108
Thallium,	I, III.	Tl	204
Triads:			
Nitrogen,	I, III, V.	N	14
Phosphorus,	I, III, V.	P	31
Arsenic,	I, III, V.	As	75
Antimony,	III, V.	Sb (*Stibium*)	122
Bismuth,	III, V.	Bi	210
Boron,	.....	B	11
Gold	I, III.	Au (*Aurum*)	196
Pentads:

G. F. Barker.

Chem'mis [Gr. Χέμμις], the name given by Diodorus Siculus to the Egyptian king who built the great pyramid; the same as Cheops (which see).

Chemnitz, a town of Germany, in Saxony, on the Chemnitz River, and at the base of the mountain called Erzberge, about 44 miles W. S. W. of Dresden. It is on the railway from Riesa to Zwickau. It is the principal manufacturing town of Saxony, and has extensive manufactures of cotton, linen, wool, hosiery, machinery, etc. Nearly 20,000 looms are employed in this vicinity in the production of stockings, mitts, etc., which are partly exported to the U. S. Chemnitz has also works for printing calico. The factory laborers own cottages and gardens in which they work when the looms are still, and their condition is superior to that of their class in most other cities. For four centuries it was a free imperial city. It was formerly fortified, but the walls have been converted into promenades. It has a castle, a gymnasium, a school of commerce, several technical schools, and an exchange. Pop. in 1871, 68,229.

Chem'nitz [Lat. *Chemnitius*], (Martin), an eminent German Lutheran theologian, was born at Treuenbrietzen, in Brandenburg, Nov. 9, 1522. He was educated at Wittenberg, and became minister of a church at Brunswick in 1554. In a work called "Examen Concilii Tridentini" (1565) he ably refuted the doctrines approved by the Council of Trent. Chemnitz and Mörlin were the authors of the "Corpus Doctrinæ Pruthenicæ" ("Body of Prussian Doctrine," 1566), which was a standard work among the Protestants. He was appointed superintendent at Brunswick in 1567. He was one of the authors of the "Formula Concordiæ" (1579). Among his works is "Loci Theologici" ("Theological Topics," 1591), which excels most similar books in learning and method. Died April 8, 1586.

Chemung, she-müng', a river of New York, formed in Steuben county by the union of the Conhocton and Tioga rivers. It flows in an E. S. E. direction through Chemung county, and enters the North Branch of the Susquehanna about 1 mile below Athens, in Bradford co., Pa.

Chemung, a county of New York, bordering on Pennsylvania. Area, 406 square miles. It is intersected by Chemung River and Cayuta Creek. The surface is diversified by hills and alluvial river-bottoms; the soil is fertile. Tobacco, grain, lumber, wool, dairy products, and cattle are the staples. The manufactures include lumber, leather, flour, furniture, metallic wares, cooperage, carriages, etc. It is traversed by the Erie R. R. and the Northern Central R. R. Capital, Elmira. Pop. 35,281.

Chemung, a post-township of McHenry co., Ill. Pop. 2222. Chemung Station is on the Chicago and Northwestern R. R., 66 miles N. W. of Chicago.

Chemung, a township and post-village of Chemung co., N. Y. The village is on the Erie R. R., 24 miles W. S. W. of Owego. Pop. of township, 1907.

Chenan'go, a county in S. E. Central New York. Area, 898 square miles. It is partly bounded on the E. by the Unadilla River, and drained by the Chenango, Susquehanna, and Otselic rivers. The surface is partly hilly; the soil is generally fertile. It is an agricultural county; dairy products, hops, grain, and wool are the chief crops. The manufactures include lumber, flour, cheese, carriages, furniture, etc. It is intersected by the New York and Oswego Midland R. R., the Utica Chenango and Susquehanna R. R., and the Albany and Susquehanna R. R. Capital, Norwich. Pop. 40,564.

Chenango, a township and village of Broome co., N. Y. The village is at the junction of the Syracuse Binghamton and New York and the Utica Chenango and Susquehanna R. Rs., 73 miles S. S. E. of Syracuse. Pop. of township, 1680.

Chenango River rises in Oneida co., N. Y., flows S. S. W. through Madison and Chenango counties, and enters the Susquehanna at Binghamton. Length, 90 miles.

Cheney (Charles Edward), D. D., was born at Canandaigua, Ontario co., N. Y., Feb. 12, 1836. He graduated at Hobart College, Geneva, N. Y., in 1857, and studied at the Theological Seminary of Virginia. Nov. 21, 1858, he was ordained deacon, and became assistant rector of St. Luke's church, Rochester, N. Y. Subsequently he took charge of St. Paul's church at Havana, N. Y., and in Mar., 1860, he was ordained a presbyter, and took charge of Christ's church in Chicago. He was in Dec., 1873, elected assistant bishop of the Reformed Episcopal Church.

Che'ney's Grove, a twp. of McLean co., Ill. Pop. 1164.

Chengwata'na, a post-village, capital of Pine co., Minn., on Snake River, about 70 miles N. of St. Paul. Pop. of township, 99.

Chénier, de (André), an excellent French poet, a brother of the following, was born at Constantinople in 1762. He was educated in Paris, and was sent to London in 1787 as secretary of legation. He returned to Paris in 1790, and became a moderate supporter of the popular cause. He produced beautiful elegies and eclogues, in which the influence of Greek poetry was predominant, and which gave a new direction to the poetry of France. Having in some of his writings censured the acts of the Jacobins, he was committed to prison. He there wrote an admir-

able poem entitled "The Young Captive." He was executed in July, 1794, and left unfinished poems called "America" and "Hermes." (See H. DE LATOUCHE, "Notice sur André Chénier;" SAINTE-BEUVE, "Causeries du Lundi," tome iv.)

Chénier, de (MARIE JOSEPH), a French poet of the Revolution, born Aug. 28, 1764, at Constantinople, where his father was consul. His tragedies "Gracchus," "Fénélon," "Timoléon," and others were inspired by an intense love of freedom, and composed in a noble style. He wrote likewise patriotic songs; among them "Le Chant du Départ." Died Jan. 10, 1811.

Cheno'a, a post-village of McLean co., Ill., on the Toledo Peoria and Warsaw R. R., where it is crossed by the Chicago and Alton R. R., 48 miles E. of Peoria. It has one newspaper-office. Pop. of Chenoa township, 2351.

Chenopodia'ceæ [from *Chenopodium*, one of the genera], a natural order of exogenous plants, chiefly herbaceous. They are destitute of stipules, have small inconspicuous flowers, and a persistent calyx. The stamens are never more numerous than the segments of the calyx. They are found in most parts of the world. The order comprises the beet and spinach, and many species which have a weed-like appearance and grow in waste places.

Chenopo'dium [from the Gr. χήν, a "goose," and ποῦς, ποδός, a "foot"], a genus of herbaceous plants of the order Chenopodiaceæ, natives of America, Europe, and Asia. They are weeds, growing in gardens and waste places, and often covered with a white mealiness. Several species are naturalized in the U. S., and are known by the names of goosefoot, pigweed, and lamb's quarter. The *Chenopodium anthelminticum* (wormseed) is a native of the U. S. The seeds of this plant are administered as a remedy for worms. Among the more important plants of this genus is QUINOA (which see).

Cheo'ah, a township of Cherokee co., N. C. Pop. 1427.

Che'ops [Gr. Χέοψ], the name given by Herodotus to the despotic builder of the great pyramid in Egypt, now identified with Suphis I. (or Shufu) of the monuments. He was the second king of the fourth dynasty, which was established at Memphis about 2500 B. C., according to the more sober English Egyptologists. Professor C. Piazzi Smyth (1867) tries to fix the date of the great pyramid, on astronomical grounds, at 2170 B. C. Bunsen's date is 3280 B. C.

Chepach'et, a post-village of Glocester township, Providence co., R. I. It is on the Chepachet River, and has extensive manufactures.

Chep'stow, a town and river-port of England, in the county of Monmouth, on the river Wye, 2½ miles from its entrance into the estuary of the Severn, and 141 miles by rail W. of London. It is surrounded by grand and beautiful scenery, a good view of which is obtained from a rock called Windcliff, 970 feet high. At Chepstow occurs the highest tidal bore in Europe, rising suddenly often fifty feet, and sometimes more than sixty-five. Large vessels can ascend the river to this port. A railway bridge built by Brunel here crosses the Wye. Pop. 3364.

Che'quest, a township of Van Buren co., Ia. Pop. 967.

Cher, a river of Central France, rises in the department of Creuse, flows in a general north-west direction through the departments of Allier, Cher, and Loir-et-Cher, and enters the river Loire immediately below Tours. Its total length is 207 miles. Destructive floods sometimes occur. It is navigable in the last 47 miles of its course.

Cher, a central department of France, has an area of 2853 square miles. It is bounded on the E. by the river Loire, and intersected by the Cher. The surface is nearly level, and extensively covered with forests; the soil is variable; the staple products wine, hemp, flax, and wool. It has mines of coal and iron, and manufactures of woollen fabrics. Capital, Bourges. Pop. 336,613.

Cheraw, a post-village of Chesterfield co., S. C., on Pedee River, at the head of navigation, 140 miles N. of Charleston, the terminus of the Cheraw and Darlington R. R. It has seven churches, two academies, several other schools, a public library, and one newspaper. During the late civil war this place was captured, Mar. 3, 1865, by the Federal forces under Gen. Sherman. It had been a dépôt of supplies for the Confederates, and twenty-five cannon, thousands of small-arms, tons of gunpowder, and immense commissary stores fell into the hands of the Federals. Pop. 960; of township, 2258. T. LITTLE, ED. "DEMOCRAT."

Cherbourg [Lat. *Caroburgus*], a fortified seaport-town and important naval station of France, department of Manche, on the English Channel, and at the N. end of the peninsula of Cotentin, 229¾ miles by rail W. N. W. of Paris; lat. 49° 38′ N., lon. 1° 37′ W. Its climate is mild. The streets are narrow. It contains a communal college, a public library, a museum, and a theatre; also manufactures of hosiery, chemicals, lace, and leather, but the industry of the inhabitants is chiefly employed in the arsenal and dockyards. Vast sums of money have been expended here in fortifications and in public works for the improvement of the harbor. The latter is sheltered by land on three sides, but is open to heavy seas and storms on the N. To protect it from these a breakwater, or *digue*, was commenced in the reign of Louis XIV. and completed under Napoleon III. Cherbourg breakwater is the most gigantic work constructed for such a purpose in ancient or modern times, and is a noble monument of the skill and perseverance of the French engineers. (See BREAKWATER.) At the apex of the angle formed by the meeting of the two branches of the breakwater there is a central fort or battery measuring 509 feet on the inner line of the parapet, which forms a flat semi-ellipse. Besides the batteries on the mole (*digue*), Cherbourg is defended by twenty-four regular forts and redoubts. On the land side it is defended and commanded by La Roule and Fort d'Octeville, which occupy two adjacent heights. The naval port consists of an outer harbor 776 feet long by 663 wide, its minimum depth being 58 feet, and the entrance to it is 206 feet wide. The harbor communicates by means of a lock with a wet-dock 957 feet long by 712 wide. In Aug., 1858, the government completed an inner wet-dock, which is cut out of the solid rock, and is about 930 yards long by 437 wide. Cherbourg was besieged by the English in 1378, 1418, and 1450. William the Conqueror founded a hospital here. Pop. 37,215.

Cherbuliez (ANTOINE ELYSÉE), a prominent writer on political economy, born in 1797 at Geneva, became professor of law and political economy, first at Geneva, and subsequently at the Polytechnicum at Zurich. He wrote against the Socialists, and especially against Proudhon. His chief work is "Outline of the Science of Political Economy" (2 vols., 1862). Died at Zurich Mar. 14, 1869.

Cherbuliez (VICTOR), nephew of the preceding and son of André Cherbuliez, professor of Hebrew at Geneva, born about 1832, has become known as a clever novelist. His "A propos d'un Cheval," a revery on ancient art, appeared in 1860, and was followed by the romances "Comte Kostia" (1863), "Paule Meré," "Le Roman d'une honnête femme" (1866), "Le grand œuvre" (1867), and others.

Cher'ibon, or **Sher'ibon,** a seaport-town of Java, capital of a division on its northern coast, 128 miles E. S. E. of Batavia. It is the residence of a Dutch governor, is defended by a fort, and has a considerable trade in coffee, indigo, teakwood, etc. Pop. about 11,000.

Cherimoy'er, or **Chirimoy'a** (*Anona Cherimolia*), a fruit of South and Central America, now common in the East Indies and other tropical countries. It is sometimes described as the finest of all fruits, and sometimes as inferior to the mangosteen only. Both flowers and fruit emit a pleasant fragrance, but when the tree is covered with blossoms the odor is almost overpowering. The fruit varies from the size of an orange to sixteen pounds or more in weight. It is roundish or heart-shaped, greenish, and covered with small knobs and scales. Internally, the fruit is snow-white and juicy, and contains a number of small brown seeds. The eatable part is soft like a custard, and forms almost the entire mass of fruit. The cherimoyer attains excellence only in particular situations, and some varieties are much finer than others. It is of the order Anonaceæ.

Cher'okee, a county of Alabama, bordering on Georgia. Area, 550 square miles. It is traversed by the Coosa River. The surface is diversified by high ridges; the soil is mostly fertile. Cotton, grain, wool, and tobacco are raised. It is intersected by the Selma Rome and Dalton R. R. Capital, Centre. Pop. 11,132.

Cherokee, a county in the N. W. of Georgia. Area, 475 square miles. It is intersected by the Etowah River, and also drained by several creeks. The surface is partly hilly and partly undulating; the soil is generally fertile. Cotton, tobacco, wool, and grain are raised. It contains mines of gold and quarries of statuary marble. Capital, Canton. Pop. 10,399.

Cherokee, a county in the W. N. W. of Iowa. Area, 576 square miles. It is intersected by the Little Sioux River. The surface is undulating; the soil is productive. Wheat, corn, and cattle are raised. It is traversed by the Dubuque and Sioux City R. R. Capital, Cherokee. Pop. 1967.

Cherokee, a county in the S. E. corner of Kansas. Area, 604 square miles. It is intersected by Spring River, an affluent of the Neosho, which runs through the S. W.

part of the county. The soil is fertile. Cattle, corn, tobacco, and wool are raised. It is traversed by the Missouri River Fort Scott and Gulf R. R. Capital, Columbus. Pop. 11,038.

Cherokee, a county which forms the W. extremity of North Carolina. Area, 625 square miles. It is intersected by the Hiawassee River. The surface is partly mountainous, and the Unaka or Smoky Mountain extends along the N. W. border. The soil of the valleys is fertile. Corn, wool, and tobacco are raised. Gold, zinc, lead, and excellent white marble abound. Capital, Murphy. Pop. 8080.

Cherokee, a county of the E. of Texas. Area, 1144 square miles. The surface is somewhat hilly; the soil is excellent, producing fine crops of corn, wheat, cotton, and fruit. Wool-growing and stock-raising are also carried on. Timber and the best iron ores abound. Lumber is manufactured, and also iron to some extent. It is intersected by the International R. R. Capital, Rusk. Pop. 11,079.

Cherokee, a post-village in the township of same name, capital of Cherokee co., Ia., on the Little Sioux River and on the Iowa division of the Illinois Central R. R., 59 miles E. N. E. of Sioux City. It has two weekly newspapers. Pop. including the township, 719.

Cherokee, a township of Cherokee co., Kan. P. 370.

Cherokee, a township of Spartanburg co., S. C. Pop. 1675.

Cherokee, a township of York co., S. C. Pop. 1895.

Cher'okees', a tribe of North American aborigines who were formerly numerous and powerful. They occupied the southern portion of the Appalachian Mountains and large tracts in Georgia and Alabama. They have been considered the most civilized of the Indians in the U. S. In 1838 all the Cherokees living in Georgia were removed to the Indian Territory beyond the Mississippi, in which a large tract of land was appropriated to them. Many of them cultivate the soil and are industrious in their habits. They have a written language, written laws, and an organized government. Their syllabic alphabet, which was invented by George Guess or Sequoyah, a half-breed Cherokee, consists of eighty-five characters. Their present territory embraces 9,776,000 acres, with a population in 1872 of 18,000, besides several hundred in North Carolina.

Cher'ry, the name of numerous trees and their fruit belonging to the genus *Prunus* and order Rosaceæ, but placed by some in a separate genus or sub-genus (*Cerasus*), distinguished by having the stone or pit of the fruit round, while the plums of the genus *Prunus* proper have flattened pits; but with several species the distinction does not hold good. There is therefore no such genus or sub-genus as *Cerasus*. But those cherries which have their flowers and fruit in racemes (clusters), called bird cherries, are properly placed in a sub-genus, *Padus;* and the evergreen species, called cherry-laurels, are placed in a sub-genus, *Lauro-cerasus*.

Cultivated cherries are of many varieties, and belong to two distinct species—*Prunus avium* and *vulgaris*—both Old World species, the former comprising the "dukes," "oxhearts," "bigarreaus," etc., and the latter the "morellos," "guignes," and sour cherries. The former in Europe yields valuable timber. They are useful as dessert fruit and for preserving, and are employed in the manufacture of various liqueurs (Maraschino, Kirschwasser, cherry-brandy, etc.). There are numerous wild species of cherry in both continents. Those best known in the U. S. are the choke-cherry and the black cherry (*Prunus Virginiana* and *serotina*); the bark of both species is very useful in medicine; the latter is a large tree yielding a very useful timber.

Cherry, a township of Montgomery co., Kan. P. 802.

Cherry, a township of Butler co., Pa. Pop. 903.

Cherry, a township of Sullivan co., Pa. Pop. 1710.

Cher'ry Creek, a township and village of Chautauqua co., N. Y. The village is 18 miles S. E. of Dunkirk. It has three churches, a State bank, and some manufactures. Pop. of township, 1359.

Cher'ryfield, a township and village of Washington co., Me. The village is 30 miles W. of Machias. It is on the Narraguagus River. Shipbuilding is carried on, and the manufacture of lumber, leather, doors, sash, blinds, etc. Pop. of township, 1760.

Cher'ry Grove, a township and village of Carroll co., Ill. The village is about 15 miles S. W. of Freeport. Pop. of township, 1154.

Cherry Grove, a township of Goodhue co., Minn. Pop. 884.

Cherry Grove, a township of Warren co., Pa. P. 61.

Cherry Hill, a township of Indiana co., Pa. P. 1976.

Cherry Lane, a post-township of Alleghany co., N. C. Pop. 309.

Cher'ry Lau'rel, a name given to the evergreen cherry trees, such as the bay laurel, *Prunus Laurocerasus*, a native of Asia; the Portugal laurel, *Prunus Lusitanica*, a native of Southern Europe; and the "mock orange" of the Southern U. S., *Prunus Caroliniana*. They are all prized as ornamental shrubs or trees, and all abound in poisonous hydrocyanic acid, especially in the kernels and leaves. They have also an essential oil, resembling that of bitter almonds. The leaves of the first-mentioned species are used in flavoring sauces, etc., and in preparing cherry-laurel water, sometimes used in medicine as a sedative; but its strength is variable, and it should not be used.

Cher'ry Ridge, a post-township of Wayne co., Pa. Pop. 1101.

Cher'rytree, a borough of Indiana co., Pa. Pop. 360.

Cherrytree, a post-township of Venango co., Pa. Pop. 2326.

Cher'ry Val'ley, a township and post-village of Winnebago co., Ill. The village is on the Chicago and Northwestern R. R., 84 miles W. N. W. of Chicago. Pop. of township, 1421.

Cherry Valley, a post-village of Otsego co., N. Y., on a branch of the Albany and Susquehanna R. R., 68 miles W. of Albany. It has an academy, a national bank, and one weekly newspaper. Cherry Valley was the scene of a dreadful massacre by the Tories and Indians in the British service Oct. 11, 1778. Thirty-two inhabitants, nearly all women and children, were murdered, besides sixteen soldiers of the Continental army. The rest of the citizens were made prisoners and taken away, and all the buildings were burned. Pop. 930; of Cherry Valley township, 2337.

Cherry Valley, a post-township of Ashtabula co., O. Pop. 726.

Cher'ryville, a township and post-village of Gaston co., N. C. The village is on the Wilmington Charlotte and Rutherford R. R., 43 miles N. W. of Charlotte. Pop. of township, 2003.

Cher'siphron [Gr. Χερσίφρων), an eminent Cretan architect who flourished about 600 B. C. He designed the temple of Diana at Ephesus, one of the Seven Wonders of the World, but he died before it was finished. It was adorned with 127 Ionic columns of marble sixty feet high, and was 425 Roman feet in length.

Cher'so (anc. *Crepsa*), an island of Illyria, in the Adriatic, 12 miles S. S. W. of Fiume. Area, with Osero, 95 square miles. The products are oil and wine. There are large anchovy-fisheries. Capital, Cherso. Pop. 17,500.

Cherso, a town of Illyria, in the Austrian province of Trieste, situated on the above island, 25 miles S. of Fiume. It has a fair harbor, and trades in fish, wine, and lumber. Pop. 8095.

Chersone'sus [Gr. Χερσόνησος], the ancient name of several peninsulas of Europe and Asia, as Chersonesus Aurea (Malacca), Chersonesus Cimbrica (Jutland), Chersonesus Thracia (Gallipoli), and Chersonesus Taurica (Crimea).

Chert, or **Hornstone,** a silicious mineral, a variety of quartz with many of the characters of flint, but differing from it in being of a tougher nature, and breaking with a splintery instead of a conchoidal fracture. It is always massive, and is of various colors—white, red, yellow, gray, and brown. It is common in the mountain limestone, oolite, and greensand formations; it sometimes forms rocks, and often contains petrifactions. The term chert is often applied to the silicious concretions which occur as nodules in limestone rocks. The limestone is said to be "cherty" when it contains so much of these concretions as to render it unfit for building and conversion into lime.

Cher'ub (plu. **Cher'ubim** or **Cherubs**), [etymology doubtful, though, according to a somewhat popular view, the cherubim are angels who excel in knowledge as the seraphim are conceived to excel in love; and in this view the name has been supposed to be related to the Hebrew *kârah*, to "grasp," and hence to "know"], the name of a winged being mentioned in the Scriptures. A cherub guarded Paradise and prevented the return of fallen man. Figures of cherubim were placed over the mercy-seat in the Holy of Holies, and were wrought into the hangings of the temple. In the book of Ezekiel cherubim with four wings and many eyes, with forms partly human and partly bestial, are described. They appear as four-winged beings of a generally human form in Christian art. Most writers regard them as angels, but many critics believe that they are symbols, rather than real existences.

Cherubi'ni (Maria Luigi Carlo Zenobi Salvador), an eminent Italian composer, born at Florence Sept. 8, 1760,

was a pupil of Felici and Sarti. He visited London in 1784. After 1786 he passed the most of his time in Paris, where his opera "Lodoiska" was performed with success in 1791. He composed, besides other works, operas entitled "Iphigenia in Aulide" (1788), "Elisa" (1794), "Medea" (1797), and "Anacreon." He acquired a European reputation as a composer of sacred music. Among his works in this department is a grand requiem. He was a professor in the Conservatory of Paris, and a member of the Royal Academy. Died Mar. 15, 1842. (See L. DE LOMÉNIE, "M. Cherubini, par un homme de rien," 1841; RAOUL-ROCHETTE, "Notice sur la Vie et les Ouvrages de Cherubini.")

Cherus'ci, an ancient and celebrated German tribe mentioned by Cæsar, inhabited a country on the north side of the Silva Bacenis (Hartz Forest). The famous Hermann (Arminius) was a chief of the Cherusci. Having formed a league with other German tribes, he defeated the Roman general Varus near the Lippe in 9 A. D. According to Tacitus, the Cherusci were conquered by the Catti or Chatti after the death of Arminius.

Cher'vil [Fr. *cerfeuil*, from the Lat. *cerefolium*], an umbelliferous plant which is cultivated in Europe as a pot-herb and used in soups. The leaves have a peculiar, somewhat sweetish and aromatic smell and taste. It is a native of Europe and naturalized in the U. S. Its systematic name is *Chærophyllum sativum*. Other species are cultivated; one or more have roots of some value, which somewhat resemble those of the carrot.

Chesaning', a post-village of Saginaw co., Mich., on the Shiawassee River and the Jackson Lansing and Saginaw R. R., 43 miles N. E. of Lansing. It has one weekly newspaper. Pop. 721; of Chesaning township, 1507.

Chesapeake, a township of Elizabeth City co., Va. Pop. 2703.

Chesapeake, a township of Matthews co., Va. P. 1700.

Chesapeake Bay [from an Indian word meaning "mother of waters"], a large inlet of the Atlantic, extends from Capes Charles and Henry northward through Maryland and Virginia to the mouth of the Susquehanna River. It is about 200 miles long, and varies in width from 4 to 40 miles. The distance from Cape Charles to Cape Henry is nearly twelve miles. The coasts on each side are deeply indented by numerous inlets and estuaries, which are navigable. The Chesapeake is so deep that the largest ships can ascend from the ocean nearly to the northern extremity. It contains numerous islands. The largest rivers which flow into it are the Susquehanna, the Potomac, and the James River.

Chesapeake City, a post-village of Cecil co., Md., at the western terminus of the Chesapeake and Delaware Canal, 84 miles N. E. of Annapolis. Pop. 1008; of Chesapeake City township, 2683.

Chesebro (CAROLINE), an American writer, born at Canandaigua, N. Y. She contributed largely to periodical literature, and was the author of several novels, among which are "Dreamland by Daylight," "Isa, a Pilgrimage," "The Foe in the Household," etc. Died Feb. 16, 1873.

Ches'elden (WILLIAM), F. R. S., an English anatomist and surgeon, born in Leicestershire in 1688. He began to lecture on anatomy in London about 1711, and published in 1713 "The Anatomy of the Human Body," which was long used as a text-book. He was afterward chief surgeon of St. Thomas's and Westminster Hospitals, and acquired a high reputation as an operator. Among his works is "The Anatomy of the Bones" (1733). Died in 1752.

Cheshire, England. See CHESTER.

Cheshire, chĕsh'ir, a county which forms the S. W. extremity of New Hampshire. Area, 770 square miles. It is bounded on the W. by the Connecticut River, and drained by the Ashuelot. The surface is hilly, and partly occupied by mountains, among which is the Grand Monadnock. The soil of the valleys is fertile. Tobacco, grain, wool, and dairy products are largely raised. The manufactures are extensive, and comprise lumber, furniture, woodenware, leather, cotton and woollen goods, etc. It is intersected by the Cheshire R. R., the Ashuelot R. R., and the Monadnock R. R. Capital, Keene. Pop. 27,265.

Cheshire, a township and post-village of New Haven co., Conn. The village is on the New Haven and Northampton R. R., 15 miles N. of New Haven. Pop. of township, 2344.

Cheshire, a township and post-village of Berkshire co., Mass. The village is on the North Adams branch of the Boston and Albany R. R., 9 miles N. of Pittsfield. The town has valuable beds of glass sand, and important manufactures. Pop. of township, 1758.

Cheshire, a post-twp. of Allegan co., Mich. Pop. 1443.

Cheshire, a post-township of Gallia co., O. Pop. 1895.

Ches'ney (FRANCIS RAWDON), an officer noted as an explorer, was born in Ireland in 1789. Aided by the British government, he explored a route from Europe to India by way of the Red Sea, and in 1836 descended the Euphrates in a steamer from Beer (Bîr) to its mouth. He published "The Expedition for the Survey of the Euphrates and Tigris" (4 vols., 1850). In 1855 he obtained the rank of major-general. Died Jan. 30, 1872.

Chess [Fr. *échecs*; Ger. *Schach*; from Persian, *shah*, a "king"*]. The origin of this game is undoubtedly Oriental, but its date is lost in antiquity. Terms connected with it are found in the Sanscrit, as well as in some other Asiatic languages. It was probably introduced into Europe by the Arabians as early as the eighth century. Some slight modifications have been made in it in modern times, but the game appears to have been, in its most essential characters, the same for two or three thousand years. No other game approaches it in the scope afforded, by the number and variety of powers of the pieces, for skill and foresight, involving the faculties of memory and conception especially to a large degree. Dr. Benjamin Franklin admired it greatly, and wrote upon the advantages obtainable by it in the cultivation of the mind and character; particularly in promoting the habit of circumspection. With Napoleon I. it was a favorite recreation, and many other men of superior intelligence (as, for instance, J. J. Rousseau) have greatly enjoyed it. Yet capacity for eminent skill in it has often been possessed by men who have not otherwise displayed remarkable ability.

The *chess-board* is divided into sixty-four squares, alternately white and black. A white square should always be at the corner next to the right hand of each of the two players. The pieces used are as follows, upon each side, of different colors, commonly white and red:

A *King*, placed at the beginning of the game near the middle of the back line or row of squares. This is the most important piece on the board. It can move but a single square in any direction; it can *take* any piece belonging to the adversary which is upon an adjoining square, except the king—although the piece near it may be *protected* by some other piece being in a position to take in return. The king can never be taken; when so placed that if it were any other piece it might be captured by the adversary, the king is *in check*; and it is always necessary for the king in such a case, at the next move, to be placed where he is not in check. If this cannot be done, it is *checkmate*, and the game is ended. *Stalemate* occurs when, there being few pieces on the board, none of them, including the king, can be moved without placing the king in check.

A *Queen*, the most valuable *active* piece on the board, placed, on commencing, next to the king in the back row, on that square nearest the middle which has *her own color*—*i. e.* white queen on white square, black or red queen on black square. The queen can move and take any piece of the adversary (except the king, as above said) at any distance in a straight line upon the board, either in the direction of the squares or diagonally; always provided that it cannot leap over intervening pieces. The queen can be taken by any other piece.

Two *Rooks* or *Castles*—one placed in the beginning of the game at each end of the back row of squares. The rook can move or take only in the direction of the lines of squares (*i. e.* not diagonally), but at any distance when not obstructed by other pieces. It ranks in value next to the queen.

Two *Bishops*, one of which stands at the side of the king, and the other at the side of the queen, on the back row. One is thus upon a black square, and one upon a white one; and as they move or take only *diagonally* across the board, each keeps upon the same color throughout the game.

Two *Knights*, whose station is, at the opening, one at the side of each of the bishops, being thus next to the castles or rooks, and completing the back row. The movement of the knight is peculiar—one square diagonally, and then one forward or backward; or the converse, one square forward or backward, and then one diagonally. It can, moreover, *leap over* any intervening pieces to occupy an empty square or to take an adversary's piece. The knight and the bishop rank as about equal in value; probably in the early part of the game the knight is worth rather the most, and the bishop somewhat more when but few pieces are left upon the board.

Eight *Pawns*, arranged at first in the row of squares next to the more important pieces just described. The pawn *moves* only forward, but *takes* only diagonally. In either case it can go but a single square, except that, when a pawn first moves from its place in the second row, it may, at the option of the player, move two squares. If, how-

* Checkmate is *shah mat*—*i. e.* "king confounded or overcome."

ever, an adversary's pawn is at that time so placed as to take the pawn moved if it were moved but one square, the moving pawn may be taken, as it is called, *en passant*. When a pawn can be advanced so far as to reach the adversary's back row, it becomes a queen or any other piece the player chooses, except a king. It is possible, therefore (as the game is conducted by many, though not all, players), to have more than two queens upon the board at a time. Pawns are the least valuable of all the pieces. Yet skill in their use is important towards winning the game; so much so that in the famous treatise of Philidor ("L'Analyse du Jeu des Échecs," London, 1749) the theory was maintained that "the pawns are the soul of chess."

Castling is a change of position allowed on either side, by which the king and a castle or rook are made to pass each other, each moving two squares if the change be made upon the king's side, and the castle three squares and the king two if it be upon the side of the queen. Castling can only be effected, however, when no pieces intervene, when neither the king nor the castle has yet been moved, and when the king is not in check, and will not have to move, in castling, over a square exposed to check from any piece belonging to the antagonist.

The squares are commonly named after the principal pieces. Thus, that upon which the king stands is the king's square; next to it, the queen's square; then, on one side, king's bishop's square, king's knight's and king's rook's squares; on the other side, queen's bishop's square, queen's knight's and queen's rook's squares; in front of these the king's pawn, queen's pawn, king's bishop's pawn, queen's bishop's pawn, king's knight's pawn, queen's knight's pawn, king's rook's pawn, and queen's rook's pawn.

A *gambit* is a mode of opening the game in which a strong attack is gained by the sacrifice of a pawn. There are several kinds of gambit in use. A curiosity of the chess-board is the "knight's problem"—viz. to place a knight alone upon any square, and then move it, in its usual manner, over every square of the board successively until it returns to the place from which it started. This was thought worthy of resolution by a mathematical process by the celebrated Euler, but many persons have resolved it experimentally.

The *rules* of chess are, with slight variations among individual players, absolute. The most important are the following:

1. If a piece be touched it must (if possible) be moved somewhere.

2. When a move has been made, and the hand has been withdrawn from it, the move cannot be retracted.

3. If you touch one of the adversary's pieces which can be taken, it must be taken, unless this be omitted with the consent of the adversary.

4. On giving check to the adversary's king, notice must be given by saying "check;" otherwise he is not bound to pay any attention to it.

5. When all the pieces on both sides have been removed in the course of a game, except just enough for one player to checkmate the other (as, king and rook, or two bishops, or bishop and knight, against king), the checkmate must be accomplished within fifty moves or it is counted a drawn game.

Among the most famous chess-players have been Danican-Philidor, Kermay de Légal, La Bourdonnais, Deschapelles, Lewis, McDonnell, Paulsen, and Paul Morphy. The last named, a native of the U. S., now living, is the most extraordinary chess-genius ever known. In 1858 he visited Europe, and conquered in turn all the most distinguished living players. His most astonishing feat has been playing, *blindfold*, six games at once with as many different players, and winning them all.

The *automaton* chess-player of MM. Kempelen and Maelzel, exhibited in Europe and America many years ago, was a very ingenious contrivance by which many persons were induced to believe (what is impossible) that the game was actually played by machinery wound up for the purpose. After the death of Maelzel, this automaton, having been taken to pieces, was purchased at Philadelphia by several gentlemen, and about 1842 the late Dr. J. K. Mitchell solved the riddle of its construction and operation, and put it together again for the amusement of his friends. A skilful player was, when it was exhibited, concealed within the table at which the "automaton" figure sat, the game being played upon a board on that table, and made known to the hidden operator by the rising and falling of magnetic "keepers" under the influence of the pieces, each of which contained a small portion of iron. (See "The Chess-player's Hand-book," by Howard Staunton, London, 1847; "Chess and Chess-players," by George Walker, London, 1850; and "Life of Philidor," by George Allen, Greek professor in the University of Pennsylvania, Philadelphia, 1863.)

H. Hartshorne.

Chess, or **Cheat,** a common name of *Bromus secalinus*, a plant of the order Graminaceæ. It is a troublesome weed which often infests wheat-fields. Many farmers believe (incorrectly) that wheat is liable to be transmuted into chess.

Chest [Lat. *pectus;* Fr. *poitrine*], or **Tho'rax,** is the part of the body between the neck and the abdomen. The chest is rather conical in form, the lower end of the cone being shut in by the diaphragm, a large muscular partition which projects upward from the lower ribs, convex towards the chest and concave towards the abdomen. The combination of bone, cartilage, muscle, and tendon in the chest is such as to permit of an expansive movement, and yet to guard against over-expansion, which would be fatal to the delicate textures within. The bones of the chest are an effectual protection against injury from without.

The parts which constitute the chest walls are—1. The spinal column, divided into twenty-four vertebræ, twelve of which, called the dorsal vertebræ, form the thoracic portion. 2. Twelve ribs, attached to the transverse processes of the dorsal vertebræ, and ending in front in the costal cartilages, by which most of the ribs are connected with 3. The sternum or breast-bone, occupying the middle line in front. 4. The diaphragm. The chief contents of the chest are the heart, the great blood-vessels, the lungs, the trachea or windpipe, the bronchi or branches of the trachea, the œsophagus, and the thoracic duct, by which most of the chyle and lymph are discharged into the blood. The importance of these parts and their liability to deranged action render the chest the seat of a large number of diseases which may end in death. Of the three organs which Bichat called the "tripod of life"—viz. the brain, heart, and lungs—the chest contains two; hence its condition in many diseases is an object of solicitude to the physician.

Chest diseases depend in some cases on alterations in form by disorders affecting the bones in early childhood, such as rhachitis (rickets). The lungs and air-passages are subject to many diseases, among which are consumption or phthisis pulmonalis, pneumonia, pleurisy, and bronchitis. The heart is subject to pericarditis, endocarditis, and chronic organic disease of the valves, as well as to enlargement (hypertrophy), dilatation, and degeneration of its muscular texture, besides many functional derangements. The aorta may be affected with degeneration of its walls, and with consequent aneurism. The great veins are liable to over-distension, and to obstruction by tumors or by coagulation of the blood. The exploration of the chest by physicians is now conducted not only by investigation of the symptoms of the disease, but by a minute and elaborate examination into the physical conditions of the contained organs by means of auscultation, percussion, measurement, etc. Revised by Willard Parker.

Chest, a post-township of Clearfield co., Pa. P. 1178.

Chest, a township of Cambria co., Pa. Pop. 870.

Ches'ter, or **Chesh'ire,** a maritime county of England, is bounded on the N. by Lancashire, on the S. and W. by Shropshire and Wales, on the E. by Stafford and Derby. It has a coast on the Irish Sea and the estuaries of the Dee and Mersey. Area, 1105 square miles. The surface is mostly level and well wooded; the soil is a fertile clayey or sandy loam adapted to grazing and dairy-farming. The surface-rock is new red sandstone. The chief rivers, besides the Mersey, are the Dee and Weaver. Coal, copper, and lead are found in the county. Here are many extensive dairies which produce good cheese; the quantity of cheese made annually is estimated at 12,000 tons or more. Chester has a good system of canals, and is traversed by several railways. Capital, Chester. The other chief towns are Macclesfield, Stockport, and Birkenhead. In 828 A. D. Egbert annexed Chester to his kingdom. William the Conqueror erected it into a county palatine. Pop. in 1871, 561,131.

Ches'ter, an episcopal city of England, capital of the county palatine of Chester, is on the right bank of the Dee, 22 miles from the sea and 16 miles S. S. E. of Liverpool. Six important railways converge to this point, and connect it with Liverpool, Manchester, London, Holyhead, and other towns. It stands on a rocky eminence, is mostly enclosed by ancient and massive walls, and is one of the most picturesque cities of England. The two main streets were cut out of the rock by the Romans five feet or more below the level of the houses. These streets are lined with shops, over which are piazzas or "rows" for foot-passengers. It has an old and massive sandstone cathedral 375 feet long, with a tower 127 feet high. Among its other edifices are a castle and St. John's church, the latter supposed to have been founded in 698 A. D., and now partially in ruins. Here is a stone bridge across the Dee with a single arch 200 feet in span. Chester has a public library,

a museum, and a theatre. It returns two members to Parliament. Cheese, coal, copper, and cast iron are exported from this port by the river, which is navigable for small vessels. Chester occupies the site of an important Roman station called *Deva* (or *Devana*) *Castra*. Pop. in 1871 of the municipal borough, 35,701.

Chester, a county in the S. E. of Pennsylvania. Area, 738 square miles. It is bounded on the N. E. by the Schuylkill River, and also drained by the Brandywine and Octorara creeks. The surface is pleasantly diversified. Among its remarkable features is a long narrow valley called Chester Valley, which extends across the county from the Schuylkill to Octorara Creek. The soil is very fertile. Cattle, fruit, grain, and garden and dairy products are extensively raised. Iron, paper, woollen goods, machinery, etc. are largely manufactured. Fine white marble is quarried in the valley. Among the minerals found in this county are copper, lead, zinc, kaolin, zircon, titanium, sapphire, corundum, amethyst, etc. It is intersected by the Pennsylvania R. R., the Philadelphia and Baltimore Central R. R., the Wilmington and Reading R. R., the Chester Valley R. R., and the West Chester and Philadelphia R. R. Capital, West Chester. Pop. 77,805.

Chester, a county of South Carolina. Area, 570 square miles. It is bounded on the E. by the Catawba River and on the W. by Broad River. The surface is moderately hilly; the soil is productive. Corn, cotton, and wool are the chief products. It is intersected by the Charlotte Columbia and Augusta R. R. Capital, Chester or Chester Court-house. Pop. 18,805.

Chester, a beautiful port of entry, post-village, and township of Lunenburg co., Nova Scotia, 45 miles W. by S. of Halifax, is on Chester Basin, which is studded with numerous islands. Its manufactures and fisheries are important. The village of Chester Basin, 5 miles distant, is also celebrated for its beauty.

Chester, a township of Dallas co., Ark. Pop. 510.

Chester, a post-township of Desha co., Ark. P. 260.

Chester, a township and post-village of Middlesex co., Conn. The village is on the Connecticut Valley R. R., 32½ miles S. S. E. of Hartford. Pop. of township, 1094.

Chester, a township of Logan co., Ill. Pop. 1062.

Chester, a city, capital of Randolph co., Ill., on the Mississippi River, 76 miles below St. Louis, and on the Iron Mountain Chester and Eastern R. R. It is the shipping-point for the Chester coal-fields. It has eight churches, two newspapers, a bank, rolling-mills, foundries, flour-mills, an elevator, and three coal-dumps. Pop. 1615.

CHARLES L. SPENCER, PUB. "VALLEY CLARION."

Chester, a township of Wabash co., Ind. Pop. 3143.

Chester, a township of Wells co., Ind. Pop. 1212.

Chester, a township and post-village of Howard co., Ia. Pop. 324.

Chester, a township of Poweshiek co., Ia. Pop. 568.

Chester, a post-township of Penobscot co., Me. P. 350.

Chester, a township and post-village of Hampden co., Mass. The village is on the Boston and Albany R. R., 82 miles W. N. W. of Worcester. There are important emery-mines in the township, and several factories. Pop. of township, 1253.

Chester, a township and post-village of Eaton co., Mich. The village is on the Grand River Valley R. R., 54 miles S. E. of Grand Rapids. Pop. of township, 1117.

Chester, a township of Ottawa co., Mich. Pop. 1405.

Chester, a township of Wabashaw co., Minn. P. 835.

Chester, a township and post-village of Rockingham co., N. H. It has manufactures of boots, shoes, barrels, tubs, etc. Pop. 1153.

Chester, a township of Burlington co., N. J. P. 2586.

Chester, a township and post-village of Morris co., N. J. The village is on the Chester R. R., a branch of the Morris and Essex R. R., 40 miles W. of New York City. It is a place of summer resort, and has an institute for young ladies. Pop. of township, 1743.

Chester, a post-village of Orange co., N. Y., on the Erie R. R., 55 miles N. by W. from New York. It has a national bank, an academy, and three churches. Pop. 666; of Chester township, 2113.

Chester, a township of Warren co., N. Y. The post-village of Chestertown contains an academy. Pop. of township, 2329.

Chester, a township of Clinton co., O. Pop. 1173.

Chester, a township of Geauga co., O. Pop. 727.

Chester, a township and post-village of Meigs co., O. Pop. 1656. The village is about 18 miles S. E. of Athens.

Chester, a township of Morrow co., O. Pop. 1073.

Chester, a township of Wayne co., O. Pop. 1921.

Chester, a city of Delaware co., Pa., on the Delaware River and the Philadelphia Wilmington and Baltimore R. R., 15 miles W. S. W. of Philadelphia. It was settled by the Swedes in 1643, and is the oldest town in the State. In Chester are large shipyards, in one of which 1300 men are employed. There are also manufactures of woollen and cotton goods, metals, etc. It has numerous churches and public schools, two national and one private bank, and one daily and five weekly papers. There is an academy in the city, and in the neighborhood is the Crozer Theological Seminary (Baptist). Chester has increased rapidly in the last decade. It was incorporated a city in 1866. Adjacent are the boroughs of Upland and South Chester, which have considerable manufactories. Pop. 9485; of township, exclusive of city, 1452.

WM. ORR, ED. DELAWARE CO. "DEMOCRAT."

Chester, a post-village, capital of Chester co., S. C., on the Charlotte Columbia and Augusta R. R., and the terminus of the King's Mountain R. R., 65 miles N. N. W. of Columbia. It has a national bank and one newspaper. P. of township, 944. E. C. MCLURE, ED. "REPORTER."

Chester, a township and post-village of Windsor co., Vt., on the Vermont Central R. R., 39 miles S. E. of Rutland. Here are manufactures of furniture, leather, lumber, carriages, boots and shoes, sash and blinds, etc. It is the seat of an academy. Pop. of township, 2052.

Chester, a township and post-village of Chesterfield co., Va. The village is on the Richmond Fredericksburg and Potomac R. R., 13 miles S. of Richmond. Pop. of township, 2313.

Chester, a township and village of Dodge co., Wis. The village is 17 miles S. W. of Fond du Lac. Pop. 1876.

Chester (COLBY M.), U. S. N., born in 1845 in Massachusetts, graduated at the Naval Academy as ensign in 1863, became a master in 1866, a lieutenant in 1867, and a lieutenant-commander in 1868. He served in the steamer Richmond at the battle of Mobile Bay Aug. 5, 1864, and was commended "for coolness and courage" by the commanding officer of that vessel, Capt. Thornton A. Jenkins, in his official report to Rear-Admiral Farragut of the part taken by the Richmond in the battle.

FOXHALL A. PARKER, U. S. N.

Chester (JOSEPH LEMUEL), a distinguished American antiquary, born in Norwich, Conn., in 1821. He has published "Greenwood Cemetery, and other Poems" (1843), a treatise on "The Law of Repulsion" (1853), "Educational Laws of Virginia," etc. (1854), and other works. He has since been engaged in the publication of all the marriage, burial, and baptismal registers of Westminster Abbey, with annotations.

Chester Court-house, S. C. See CHESTER.

Ches'terfield, a town of England, in Derbyshire, 24 miles by railway N. N. E. of Derby. It has a church built in the thirteenth century, with a remarkable twisted spire 230 feet high. Here are manufactures of silk and cotton stuffs, laces, hosiery, earthenware, and machinery. Mines of coal, lead, and iron are worked in the vicinity. Pop. in 1871, 11,426.

Chesterfield, a county in the N. E. of South Carolina. Area, 868 square miles. It is bounded on the E. by the Great Pedee River and on the W. by Lynche's Creek. The surface is hilly; the soil in some parts is fertile. It produces corn, cotton, and some tobacco and rice. It is intersected by the Cheraw and Darlington R. R. Capital, Chesterfield Court-house. Pop. 10,584.

Chesterfield, a county in the S. E. of Virginia. Area, 300 square miles. It is bounded on the N. and N. E. by the James River, and on the S. by the Appomattox. The southern suburbs of Richmond are in this county. The surface is uneven. Tobacco, corn, and wheat are the chief crops. Coal is found here. It is intersected by the Richmond and Danville R. R. and the Richmond Fredericksburg and Potomac R. R. Capital, Chesterfield Court-house. Pop. 18,470.

Chesterfield, a post-township of Hampshire co., Mass. Pop. 811.

Chesterfield, a township of Macomb co., Mich. Pop. 2175.

Chesterfield, a township and post-village of Cheshire co., N. H., 8 miles S. W. of Keene. It has manufactures of leather, lumber, augers, etc. Pop. of township, 1289.

Chesterfield, a township of Burlington co., N. J. Pop. 1748.

Chesterfield, a township of Essex co., N. Y. Pop. 2795.

Chesterfield, a township of Nash co., N. C. Pop. 863.

Chesterfield, a township of Fulton co., O. Pop. 926.

Chesterfield Court-house, a post-village, capital of Chesterfield co., S. C., is about 90 miles N. E. of Columbia.

Chesterfield Court-house, the capital of Chesterfield co., Va., is about 12 miles S. S. W. of Richmond.

Chesterfield Inlet, a long and narrow inlet of British America, extends westward from the N. part of Hudson's Bay. It is about 250 miles long, and 25 miles wide at the broadest part. It encloses many islands.

Chesterfield, Earls of (1628), Barons Stanhope (1616, England).—George Philip Stanhope, eighth earl, born Nov. 29, 1822, succeeded his kinsman Nov. 30, 1871. Died Dec. 1, 1872.

Chesterfield (Philip Dormer **Stanhope**), fourth earl of, an English author and courtier distinguished for his wit and politeness, was born in London Sept. 22, 1694. He was the eldest son of Philip the third earl and Elizabeth Saville, who was a daughter of the marquis of Halifax. He studied at Cambridge, made a tour on the Continent in 1714, and was elected a member of Parliament in 1715. In 1726 he inherited the earldom and passed into the House of Lords. He became an eloquent debater, and gained distinction by his graceful manners and fine taste. In 1733 he married Melusina Schulemburg, countess of Walsingham. He was a strenuous opponent of Sir Robert Walpole about 1734–40, was appointed lord lieutenant of Ireland in 1745, and one of the principal secretaries of state in 1746. He resigned office in 1748. He was intimate with Pope, Swift, Voltaire, and Bolingbroke. His reputation as a writer is founded chiefly on his "Letters to his Son" (1774), the style of which is much admired. "Take out the immorality," said Dr. Johnson, "and it should be put into the hands of every gentleman." Died Mar. 24, 1773.

Ches'ter Hill, a post-village of Marion township, Morgan co., O. Pop. 354.

Ches'terton, a post-village of Porter co., Ind.

Ches'tertown, a seaport, the capital of Kent co., Md., on the right (W.) bank of Chester River, about 30 miles in a direct line E. of Baltimore. It is the seat of Washington College, and has a national bank and three newspapers. Pop. 1071; of township, 3639.

Plummer & Usilton, Pubs. "Kent News."

Ches'terville, a township and post-village of Franklin co., Me., 22 miles N. W. of Augusta. It has manufactures of furniture, spools, doors, etc. Pop. 1011.

Chesterville, a village of Westerlo township, Albany co., N. Y. Pop. 247.

Chesterville, a post-village of Chester township, Morrow co., O. Pop. 282.

Chest, Military [Fr. *caisse militaire*], is a technical name for the money and negotiable securities carried with an army, and intended to defray its current expenses. In the British military system this department is managed by the commissariat; in the U. S., by the paymaster-general.

Chest'nut [Lat. *castanea*; Fr. *châtaigne*], a forest tree of the natural order Cupuliferæ. The genus *Castanea* is distinguished by having sterile flowers interruptedly clustered in long and naked cylindrical catkins, and coriaceous and farinaceous ovoid nuts enclosed in a hard and prickly 4-valved involucre. The *Castanea vesca* is a large tree growing wild in Europe and the Northern U. S. It has oblong-lanceolate and pointed leaves, serrate with coarse pointed teeth, and smooth and green on both sides. Each involucre (called the bur) contains from one to three edible nuts, often compressed and flattened on one or both sides. The wood is light and coarse-grained, but durable, is a valuable material for fences, and is much prized for finishing rooms. The chestnut is an ornamental and stately tree, and in Europe attains a great age. A chestnut tree on Mount Etna is celebrated for its longevity, and is said to have measured 200 feet in circumference. The fruit of the Spanish chestnut (which some botanists call *Castanea vulgaris*) is larger than that which grows in the U. S. This tree prefers a dry, light soil, and usually grows in hilly districts. Chestnuts form an important article of food in France and other countries of Southern Europe, where they are cultivated, and used either roasted or boiled. The best variety of French chestnuts are called *marrons*. Among the other species of *Castanea* is the silvery chestnut of Java (*Castanea argentea*), the fruit of which is edible, and the chinquapin (*Castanea pumila*), a small tree indigenous in the Southern U. S. The nuts of the chinquapin are good to eat, but are not so large as chestnuts. California has another species of chinquapin. At Totworth, in England, there is a chestnut tree which was a boundary-mark in the reign of King John (1199–1216).

Chestnut, a township of Knox co., Ill. Pop. 1144.

Chest'nut Creek, a post-village, capital of Baker co., Ala., about 35 miles N. N. W. of Montgomery.

Chest'nut Hill, a township and village of Ashe co., N. C. The village is 5 miles N. E. of Jefferson. Pop. 1412.

Chestnut Hill, a township of Monroe co., Pa. Pop. 1419.

Chestnut Hill, a northern suburb of Philadelphia, is on the Wissahickon Creek, about 10 miles N. N. W. of the State-house. It is finely situated on high ground, and is surrounded by beautiful scenery. Here are numerous elegant country-seats.

Chest Springs, a post-borough of Cambria co., Pa. Pop. 269.

Chesun'cook Lake, in Piscataquis co., Me., is about 24 miles long and from 2 to 4 miles wide. It is an expansion of the Penobscot River.

Chetimach'es Lake, or **Grand Lake,** is in the S. part of Louisiana, between the parishes of St. Mary's and St. Martin's. It is about 40 miles long, and is too shallow for navigation. It is an expansion of the Atchafalaya Bayou.

Cheto'pa, or **Cheto'pah,** a city of Labette co., Kan., on the Indian Territory line, on the Neosho River and on the Missouri Kansas and Texas R. R., 72 miles S. S. W. of Fort Scott. It has one newspaper-office, planing-mills, two banks, flour-mills, a foundry, and large stock-yards. There are four churches, and a school building costing $25,000. Pop. 960. Cavaness & Van Landigham, Pubs. "Southern Kansas Advance."

Chetopah, a township of Neosho co., Kan. Pop. 821.

Chetopah, a township of Wilson co., Kan. Pop. 580.

Chet'wynd, Viscounts and Barons Rathdowne (Ireland, 1717).—Richard Walter Chetwynd, sixth viscount, born Dec. 13, 1800, succeeded his father Feb. 27, 1821.

Chevalier (Michel), a French political economist, born at Limoges Jan. 13, 1806. He was sent to the U. S. in 1832 to examine the American railroads, and published in 1836 "Letters on North America." Among his important works is one entitled "On the Material Interests of France" (1838). He became an advocate of free trade. In 1840 he was appointed professor of political economy in the College of France, and in 1841 chief engineer of mines. He was deprived of these places by the republicans in 1848, but was reinstated by Napoleon in 1852. In 1851 he was admitted into the Institute. He is the author of "History and Description of the Ways of Communication in the United States" (2 vols., 1840–42), "Mexico, Ancient and Modern" (1863), and other works.

Chevaux-de-Frise, a French military term, used also in English, and applied to large and strong pieces of timber from which wooden or iron spikes project in various directions. They are employed to impede the advance of cavalry or of a storming-party in a fortified place. The cheval-de-frise is variously constructed of wood or iron. Sometimes it consists of an iron barrel or cylinder about six feet long, having twelve holes to receive as many spears, which can be packed away in the barrel when not in use.

Cheverie, a seaport of Kempt township, Hants co., Nova Scotia, on the Basin of Minas, exports annually some 30,000 tons of gypsum to the U. S.

Cheverus (Jean Louis Anne Madeleine Lefebvre), D. D., a French cardinal and philanthropist, born at Mayenne Jan. 28, 1768. He was appointed bishop of Boston, Mass., in 1808, archbishop of Bordeaux in 1826, and a cardinal in 1835. Died July 19, 1836. (See Huen-Dubourg, "Vie de Cheverus.")

Cheves (Langdon), LL.D., an American statesman and lawyer, born in Abbeville district, S. C., Sept. 17, 1776. He was a member of Congress from 1811 to 1816, and was Speaker of the House of Representatives during one session (1814–15). In this position he voted against the bill to recharter the U. S. Bank, but he was afterwards president of that bank (1819–22). Died June 25, 1857.

Chev'iot Hills, a mountain-range extending along the border between England and Scotland. The range is about 35 miles long. Its direction is nearly N. E. and S. W. The highest point is Cheviot Peak, which rises 2684 feet above the level of the sea. The rocks of which the range is formed are porphyry, trap, and mountain limestone. Grouse abound on these hills, which afford good pasture, and are grazed by sheep of a superior breed, called Cheviots. They have been the scene of many conflicts between the English and Scotch.

Chevreau (Henry), a French politician and devoted

partisan of Louis Napoleon, born Oct. 23, 1823, at Belleville, near Paris, was appointed at the age of only twenty-six years prefect of the department of Ardèche, and, after being employed for a short time in the ministry of the interior, in succession prefect of Loire-Inférieure, of the Rhône, and of the Seine. From Aug. 9 to Sept. 4, 1870, he was minister of the interior in the last Bonapartist ministry.

Chevreul (Michel Eugène), a French chemist, born at Angers Aug. 30, 1786. He published in 1823 "Chemical Researches on Fat Substances of Animal Origin," and became director of the dyeworks at Gobelin in 1824. He succeeded Vauquelin as professor of applied chemistry in the Museum of Natural History in 1829. He published in 1839 an important work "On the Law of the Simultaneous Contrast of Colors and the Distribution of Colored Objects." Among his other works is "Lectures on Chemistry Applied to the Art of Dyeing" (1831).

Chev'ron [Fr. *chevron*, signifying "rafter"], an ornament and badge of rank of gold or silver lace, or of braid, worn on the sleeve, deriving its name from its resemblance in form to a pair of rafters. It is of French origin, and has been used to denote periods of service in the ranks (*chevrons d'ancienneté*) or the rank of non-commissioned officers. The corporals and the various grades of sergeant have from one to four chevrons, of different colors in different branches of the service.

Chevron, or Zigzag Moulding, in architecture, a moulding in the form of a succession of chevrons. In general it is characteristic of Norman architecture, but is also found during the transition period from Norman to Early English.

Chev'y Chase, one of the most famous of British ballads. In its present form the piece does not seem to be older than the beginning of the seventeenth century. But more ancient versions existed; and Bishop Percy has published a poem of the sixteenth century which obviously suggested passages in the more recent composition. It is impossible to reconcile its incidents with history, but the event commemorated appears to have been the battle at Otterburn (1388) between the Scotch and English.

Chew (Richard S.), U. S. N., born Sept. 7, 1843, in the District of Columbia, graduated at the Naval Academy in 1861, became an ensign in 1862, a lieutenant in 1864, and a lieutenant-commander in 1866. He served in the frigate Minnesota when she was attacked by the iron-clad Merrimack, Mar. 8 and 9, 1862, and was attached to the West Gulf blockading squadron during 1863 and 1864, and participated in the battle of Mobile Bay. D. Apr. 9, 1875.

Foxhall A. Parker, U. S. N.

Chew (Samuel), M. D. See Appendix.

Chewink', Ground Finch, or **Tow'hee Bun'ting** (*Pipilo erythrophthalma*), a very common passerine bird of the U. S. and Canada, represented in the far West by several other species of the genus. It lives in thickets, scratching among leaves for the insects and seeds which are its food. It is variegated with brown, white and red, and is seven and a half inches long. It nests on the ground, and flies with a peculiar jerking motion.

Chewink.

Cheyenne, a county in the western part of Nebraska. It contains much excellent pasturage and some timber. It is intersected by the Union Pacific R. R. Capital, Sidney. Pop. 190.

Cheyenne City, the capital of Wyoming Territory and of Laramie county, is on the Union Pacific R. R., at the northern terminus of the Denver Pacific R. R., 106 miles N. of Denver and 516 miles W. of Omaha. Elevation, 5931 feet. It has an extensive round-house and shops of the Union Pacific R. R., several churches, one national bank, waterworks, a park, an artificial lake, a public library, and iron and soap manufactories. The railroad was opened to this place in 1867, since which it has increased rapidly. One daily and two weekly newspapers are published here.

H. Glafcke, Ed. "Leader."

Cheyenne Indians, a tribe of savages dwelling in the U. S. Territories E. of the Rocky Mountains. Most authorities refer them to the Algonquin stock, but others as confidently to the Dakota group. They are associated with the Arapahoes, but are much more roving in their habits than the latter. They are a tall, courageous race, and are fine horsemen, often at war with their neighbors. They probably do not number more than 3000 persons, and are divided into three bands.

Chiabre'ra (Gabriello), an eminent Italian lyric poet, born at Savona June 8, 1552. He was an admirer and imitator of Pindar, and the founder of a new school of poetry. He composed canzoni and odes remarkable for their sublimity, and in some of his verses rivalled the graceful style and genial spirit of Anacreon. He wrote numerous poems in many varieties of verse. In his mature life he resided at Florence, Genoa, and Savona. Died Oct. 14, 1637. "He borrowed from Pindar," says Hallam, "that grandeur of sound, that pomp of epithets, that rich swell of imagery, that unvarying majesty of conception which distinguish the odes of both poets." (See "Vita di G. Chiabrera," written by himself, Milan, 8vo, 1821; Henry Stebbing, "Lives of the Italian Poets," 1831.)

Chia'pas, a state in the S. E. part of the Mexican confederation, has an area of 16,771 square miles. It is bounded on the N. by Tabasco, on the E. by Guatemala, and on the W. by Tehuantepec. It exports cocoa and vanilla. Extensive and remarkable ruins of an ancient city are visible at Palenque in this state. Capital, San Cristóbal. Pop. in 1871, 193,978.

Chiaramon'te, a town of Sicily, in the province of Noto, situated on a hill about 30 miles W. S. W. of Syracuse, commands a beautiful prospect. Wine of good quality is produced in this vicinity. Pop. 7108.

Chia'ri, a town of Italy, in the province of Brescia, on the railway from Milan to Brescia, 11 miles W. of the latter, was formerly fortified. It has several churches, and manufactures of silk fabrics. Pop. 5297.

Chiaroscu'ro [It., "clear dark;" Fr. *clair-obscur*], the distribution of light and shadow in art. The reproduction of the effects of light and shade is one of the greatest difficulties an artist has to deal with. The conditions of its treatment are: (1) The natural separation of the lights and darks, the play of light in the shadow and of shade in the light, as is seen in nature; the softening of the lights and the transparency of the shadows. In connection with chiaroscuro must be taken into consideration the choice of colors and the preservation of the color-effects. (2) In composition chiaroscuro consists in the massing of lights and shades in different regions of a painting, and the juxtaposition and balancing of these masses, so as to duly heighten or modify the effect of each, and to render the effect of the whole simple and harmonious instead of patchy and confused. The greatest masters of chiaroscuro were Rembrandt, Titian, and Correggio.

Chiasma. See Decussation.

Chia'vari, a town of Italy, in the province of Genoa, on the Gulf of Rapallo, at the mouth of the Sturla, 21 miles E. S. E. of Genoa. The streets are bordered with arcades and well-built houses. The town is enclosed by cultivated hills, and has many handsome villas in the environs. Here are several picturesque old towers and three churches; also manufactures of silk, lace, and furniture. Chiavari has a valuable anchovy-fishery and a slate-quarry. Pop. 6995.

Chibouque, a smoking-pipe used in Turkey and

Egypt. It has a mouthpiece of amber or glass, a rather long wooden stem, and a bowl of clay.

Chica, chee'kȧ, a resinous dyestuff, used to give an orange-red color to cotton. It is obtained by boiling the leaves of the *Bignonia Chica*, a plant which grows on the banks of the Orinoco. This plant is a climber with bipinnate leaves, heart-shaped leaflets, and flowers in drooping clusters.

Chica, or Pito, is a fermented liquor made from Indian corn in some parts of South America, and similar to ordinary beer; but the Indians sometimes prepare it by chewing the grains, and that which is so prepared is most highly esteemed. To make this liquor particularly strong and well flavored, they pour it into an earthen jar which contains beef; and having made the jar airtight, they bury it in the ground, where it is left for years. On the birth of a child it is their custom thus to bury a jar of chica, to be drunk at the same child's marriage. Chica has an agreeable flavor, and is very intoxicating.

Chica'go, cap. of Cook co., Ill., the largest city on the great lakes. The court-house square is in lat. 41° 52′ 20″, lon. 87° 35′ W. of Greenwich. The city is 18 miles N. of the S. end of Lake Michigan. Its site was determined by the Chicago River, up the S. branch of which, ages before the white man set foot upon the American continent, the Indian paddled his canoe, and thence on, through Mud Lake, down the Des Plaines and the Illinois to the Mississippi. Upon the spot marked out by nature modern commerce has built up a great city within the lifetime of some of its present inhabitants. It is situated on a low flat prairie from 10 to 18 feet above the lake, and yet, as will hereafter appear, skilful engineering and the energy of its people have made it a perfectly dry and very healthy city. This is due largely to the fact that it is upon the summit or dividing ridge between the St. Lawrence and the Mississippi. Since the upper level of the canal was cut down only 8 feet, the pure water from Lake Michigan flows directly through the city into the Des Plaines, and down the Illinois River and Mississippi to the Gulf of Mexico. Its position makes it the commercial centre of the upper valleys of the two greatest rivers of the continent, the St. Lawrence and the Mississippi. The N. and the S. branch of the Chicago River, with no current whatever except after severe storms, unite half a mile or more from the lake. Hence through them and the main stream lake-craft have free access to a very considerable portion of the city. Dock-room along their shores extends some 15 miles, and it may be increased indefinitely by slips cut at right angles from both branches.

History.—Marquette, the Jesuit missionary, was the first white man who (in 1673) set foot upon the site of Chicago. Subsequently, he, La Salle, Joliet, and Hennepin—some of them several times—passed from the lakes by the S. branch of the Chicago River and the route above indicated to the Mississippi. Fort Dearborn was built by the government near the mouth of the river in 1804, and maintained with a small garrison till 1812, when the soldiers and several of the few inhabitants then here were massacred by the Indians. James Thompson, by direction of the canal commissioners, commenced surveying the plat for the town in 1829. His first map bore date Aug. 4, 1830. The residents of the town were then John Kinzie and family, Dr. Wolcott, his son-in-law, Indian agent, John Miller, who kept a "log tavern," John B. Beaubien, and some three or four Indian traders. To these must be added the garrison and its officers. In spite of the Black Hawk war in 1832, a very considerable addition was made in that year. On Aug. 10, 1833, the people having previously by a vote of 12 to 1 voted to become incorporated, five trustees were appointed, the total number of votes being then 28. Of the voters, two, Philo Carpenter and Stephen F. Gale, are alive (1877). The same year, on Sept. 26, the Pottawattomie Indians, 7000 being present, made a treaty by which they ceded all their lands in Wisconsin and Northern Illinois to the government; and on Oct. 1 they started for their new home W. of the Missouri in charge of Col. J. B. F. Russell. The first newspaper was issued by the late John Calhoun Nov. 26, 1833, and the second number Dec. 3. Of the advertisers in that issue, S. B. Cobb, Walter Kimball, Philo Carpenter, and John Bates, Jr., are still residents of the city. So late as 1834, Chicago had but one mail per week, and that was from Niles, Mich., on horseback. The schooner Illinois was the first vessel to enter the harbor, July 11 of the same year. On Aug. 16 the first lawyer's bill, of $5, was paid by the town to the late James H. Collins, and the next, of $75, was paid to Hon. J. D. Caton, for many years chief-justice of the State, on Oct. 7, 1835, for services rendered in 1833–34. On Oct. 6, 1833, a large black bear was killed within the limits of the town, and the writer of this article saw a wolf run by his house on Michigan Avenue, near the corner of Van Buren street, in 1850. In 1836–37 the town increased rapidly, but suffered severely from the financial crash of 1837. A city charter was obtained from the legislature Mar. 4, 1837, and on the first Tuesday in May the city government was organized by the election of officers. Only 703 votes were cast. The first three mayors—William B. Ogden 1837, Buckner S. Morris 1838, and B. W. Raymond 1839—are still living. The census, taken July 1, 1837, showed that there were then

Males and females, 21 and over	2645
" " over 5 and under 21	831
" " under 5	513
Total white	3989
Black	77
Sailors belonging to vessels owned in Chicago	104
Total population	4170

The census also showed 4 warehouses, 398 dwellings, 29 dry-goods stores, 5 hardware stores, 3 drug stores, 19 grocery and provision stores, 10 taverns, 26 groceries, 17 lawyers' offices, 5 churches.

Population.—From the facts above given the gradual increase of the population from a few families in 1831 may be inferred, up to the time when the first census was taken in 1835. The following table shows the result of city, county, and State government enumerations:

1835	3,265	1853	60,652
1836	3,820	1854	65,872
1837	4,170	1855	80,028
1840	4,479	1856	84,113
1841	5,755	1860	112.172
1842	6,248	1862	138,835
1843	7,580	1864	169,353
1845	12,088	1866	200,418
1846	14,169	1868	252,054
1847	16,859	1869	273,043
1848	20,023	1870	298,977
1849	23,047	1872	364,377
1850	28,269	1874	395,408
1851	34,437	1876*	450,000
1852	38,733		

It should be stated that some tables include the omitted years, but they are mere estimates.

City Finances.—The following table, taken from the latest comptroller's report, shows the gradual but rapid growth of the city as distinctly as any of the others which follow:

Year.	Value of real estate.	Value of personal property.	Total valuation.	Tax levy.
1837	$236,842.00	.....	$236,842.00	$5,905.15
1840	94,437.00	.....	94,437.00	4,721.85
1843	962,221.00	$479,093.00	1,441,314.00	8,647 89
1845	2,273,171.00	791,851.00	3,065,022.00	11,077.58
1846	3,667,425.00	857,231.00	4,521,656.00	15,825.80
1847	4,995,446.00	853,704.00	5,849,170.00	18,159.01
1848	4,998,266.00	1,302,174.00	6,300,440.00	22,051.54
1849	5,181,637.00	1,495,047.00	6,676,684.00	30,045.09
1850	5,685,965.00	1,534,284.00	7,220,249.00	25,270.87
1853	13,130,677.00	3,711,154 00	16,841,831.00	135,662.68
1855	21,637,500.00	5,355,393.00	26,992,893.00	206,209 03
1856	25,892,308.00	5,843,776.00	31,736,084.00	396,652.39
1860	31,198,135.00	5,855,377.00	37,053,512.00	373,315.29
1862	31,587,545.00	5,552,300.00	37,139,845.00	564,038.08
1864	37,148,023.00	11,584,759.00	48,732,782.00	974,655.64
1865	44,065,499.00	20,644,678.00	64,709,177.00	1,294,183 50
1866	66,495,116.00	29,458,134.00	85,953,250.00	1,719,064.05
1868	174,490,660 00	55,756,340.00	230,247,000.00	3,223,457.80
1869	211,371,240.00	54,653,640.00	266,024,380 00	3,990,373.25
1870	223,643,600.00	52,342,950.00	275,986,550.00	4,139,798.70
1871	236,898,650.00	52,847,820.00	289,746,470 00	2,897,464.75
1872	239,154,890.00	45,042,540.00	284,197,430 00	4,262,961 41
1873	262,969,820.00	49,103,175.00	312,072,995.00	5,617,313.92
1874	258,549,310.00	45,155,830.00	303,705,140.00	5,466,692.54
1875—Appropriations	.....	.....	.....	5,123,905.29

The funded debt of the city, as shown by the same report, Jan. 28, 1876, was $13,457,000; floating debt, $5,075,934.13.

Manufactures.—It would be simply impossible to give in this article an extended statement of the manufactures of the city. A brief synopsis of a few of the more important branches will be attempted. The facts that Chicago is the best point from which to supply the constantly-increasing demand of the North-west, that raw materials in most cases are abundant and cheap, and that food and homes for operatives are also cheaper than anywhere else, sufficiently explain the cause of the rapid growth of our manufacturing industries. The decline in wages paid for the past three years must be charged directly to the stringency of the times, labor suffering, as all else, from its effects:

Iron.

	No.	Capital.	Workers.	Product.
Totals for 1876	173	$14,800,000	9178	$27,226,000
Totals for 1875	178	14,855,000	9625	29,573,000
Totals for 1874	159	14,264,600	9244	28,727,200
Totals for 1873	127	13,545,800	9620	32,103,000

The aggregate annual wages paid is $4,267,770, against $5,650,837 in 1875, $5,311,520 in 1874, and $7,294,680 in 1873. Of these 173 establishments, only 26 were in existence previous to 1860.

* Estimated.

Wood.

	No.	Capital.	Workers.	Product.
Totals for 1876.....	227	$7,701,600	9298	$18,957,000
Totals for 1875.....	228	8,268,000	9370	20,114,290

The aggregate annual wages paid is $4,013,570, against $5,790,660 in 1875, $5,577,830 in 1874, and $6,004,400 in 1873.

Wood and Iron combined.

	No.	Capital.	Workers.	Product.
Totals for 1876.....	67	$10,850,000	8796	$18,897,910
Totals for 1875.....	70	8,865,000	3816	12,348,000
Totals for 1874.....	77	9,980,000	3854	15,912,800
Totals for 1873.....	58	8,112,500	4816	17,419,500

The aggregate annual wages paid is $2,647,710, against $2,512,139 in 1875 and $2,050,000 in 1874. In this department agricultural machinery forms a very large item.

Other Metals than Iron.

	No.	Capital.	Workers.	Product.
Totals for 1876.....	61	$2,262,000	1273	$3,274,000
Totals for 1875.....	62	2,878,000	1358	3,512,300

The aggregate amount of wages paid is $956,000, against $970,000 in 1876, $1,085,930 in 1874, and $1,361,000 in 1873. Of these establishments, only 6 were in existence previous to 1860. It will be observed that the proportion of capital to annual production in this department is exceptionally large.

Brick and Stone.

	No.	Capital.	Workers.	Product.
Brick-yards.....	35	$700,000	3000	$1,000,000
Stone-cutters.....	19	1,000,000	2100	4,960,000

Totals for 1876.....	1098	58,464	$8,129,007
Totals for 1875.....	975	55,479	9,778,080
Totals for 1874.....	757	33,065	5,785,541
Total, three years.	2830	147,008	$23,692,628

Leather.

	No.	Capital.	Workers.	Product.
Tanneries.....	16	$2,000,000	597	$3,150,000
Boot and shoe manufrs.	23	2,000,000	1710	5,333,000
Saddle and harness manufactories.....	13	50,000	140	302,000
Trunk manufactories..	18	250,000	255	568,750
Blank-book manufrs...	8	400,000	267	800,000
Leather-belt manufrs...	1	100,000	30	150,000
Whip manufactories...	3	3,000	21	20,000
Totals for 1876.....	82	$4,803,000	3020	$10,324,050
Totals for 1875.....	79	$4,253,500	2910	$8,796,000

The aggregate wages paid is $1,510,000, against $1,448,795 in 1875, $803,330 in 1874, and $903,000 in 1873. Of these 82 establishments, only 15 were in existence previous to 1860.

Brewing and Distilling.

	No.	Capital.	Workers.	Product.
Breweries.....	12	$3,000,000	400	$3,200,000
Distillers and rectifiers.	59	1,000,000	238	6,000,000
Malt-houses.....	8	800,000	84	1,260,860
Totals for 1876.....	79	$4,800,000	722	$10,460,860
Totals for 1875.....	90	5,200,000	763	9,045,520

The aggregate wages paid is $430,700, against $457,800 in 1875, $345,000 in 1874, and $615,714 in 1873.

Chemicals, etc.

	No.	Capital.	Workers.	Product.
Chemical works.....	6	$280,000	150	$900,000
White-lead works.....	4	800,000	400	1,384,782
Varnish works.....	3	184,000	36	[illegible]

Medicine manufac'rs....	2	400,000	54	165,000
Vinegar works.....	18	50,000	37	104,500
Soda and mineral water.	9	230,000	[illegible]	640,000
Pickle manufactories...	4	205,000	237	470,000
Soap works.....	14	550,000	298	2,739,000
Oil works.....	3	100,000	87	975,000
Totals for 1876.....	76	$3,199,000	2019	$9,528,282
Totals for 1875.....	70	3,284,000	1981	9,648,000
Totals for 1874.....	65	3,195,000	[illegible]	7,753,000
Totals for 1873.....	52	2,903,000	1927	7,550,000

The aggregate annual wages paid, $1,000,000, against $1,010,000 in 1875, $917,380 in 1874, and $925,000 in 1873. The wages scale was in this department a shade lower.

Commercial Statistics.—In constructing the following table of the grain-trade the figures in periods of five years are deemed sufficient, except where the export of corn begins in 1847, barley in 1849, and rye in 1852. No tables for receipts are found previous to 1852:

Year.	Flour received, barrels.	Flour shipped, barrels.	Wheat received, bushels.	Wheat shipped, bushels.	Corn received, bushels.	Corn shipped, bushels.	Oats received, bushels.	Oats shipped, bushels.	Rye received, bushels.	Rye shipped, bushels.	Barley received, bushels.	Barley shipped, bushels.	Total receipts of grain, flour reduced to bushels.	Total shipments of grain, flour reduced to bushels.

Live-Stock.—Chicago leads all the other cities of the country in handling live-stock. The business began to assume considerable proportions soon after her railways were opened. The following table shows the increase of the cattle-trade in periods of five years:

Year.	Received.	Shipped.	Year.	Received.	Shipped.
1857	48,524	25,502	1870	532,964	391,709
1860	117,101	97,474	1875	920,843	695,334
1865	330,391	301,037	1876	1,089,654	793,604

Receipts and Shipments of Hogs.—It will be seen from the following table that the handling of swine has reached very large figures:

Year.	Received.			Shipped.		
	Live.	Dressed.	Total.	Live.	Dressed.	Total.
1857	208,902	35,433	244,345	110,070	13,498	123,568
1860	285,149	107,115	392,864	191,931	35,283	227,164
1865	757,072	92,239	849,311	575,511	69,034	644,545
1870	1,693,158	260,214	1,953,372	924,483	171,188	1,095,671
1875	3,912,110	173,012	4,085,122	1,582,643	153,523	1,736,166
1876	4,206,010	136,521	4,342,531	1,129,799	76,046	1,205,845

Beef and Pork Packing.—The following table exhibits the growth of the packing business. As it is done in the fall and winter, the totals for the business season of 1876–77 are not given:

Season.	Number of cattle packed.	Number of hogs packed.	Season.	Number of cattle packed.	Number of hogs packed.
1851–52	21,806	22,036	1869–70	11,963	688,140
1854–55	23,413	52,849	1874–75	41,192	1,781,896
1859–60	51,606	151,339	1876	75,000	3,054,671
1864–65	92,459	760,514			

The packing of beef is gradually concentrating in towns and cities W. of Chicago, but the product is largely controlled by capitalists residing here.

Provisions.—The provision-trade of the entire Northwest, and in fact of the whole country, has largely concentrated in this city. Buyers not only from this, but from the other side of the Atlantic, find it for their advantage to purchase in this market. The following figures show the receipts and shipments for the last three years:

Receipts of Provisions and Dressed Hogs.

	1876.	1875.	1874.
Beef, barrels and tierces.....	36,162	26,949	36,670
Pork, barrels.....	43,911	49,205	39,695
Meats, tons.....	16,574	27,223	25,815
Lard, tons.....	15,975	10,991	12,073
Tallow, tons.....	5,305	2,815	3,874
Dressed hogs, number.....	136,521	173,012	213,038

* The shipments of rye for 1876 were greater than the receipts, for the reason that there was a large amount in store at the beginning of the year.

Shipments of Provisions and Dressed Hogs.

	1876.	1875.	1874.
Beef, barrels and tierces	72,004	60,454	72,562
Pork, barrels	315,448	313,713	231,350
Meats, tons	232,702	181,071	131,466
Lard, tons	68,536	57,808	41,105
Tallow, tons	6,209	3,988	4,051
Dressed hogs, number	76,046	153,523	197,747

The large difference in the receipts and shipments must be credited to the packing done here. The cut meats, after being cured by piling them up in layers of salt, are packed in boxes, and generally shipped on through bills of lading direct to Europe.

Lumber.—The immense pine forests of Michigan, Wisconsin, and Western Canada, easily accessible by lake-vessels, and the vast fertile country tributary to Chicago and dependent upon this market for lumber, have for many years made the figures in this department of trade almost fabulous. The following will show what, in spite of the hard times, they have been for the past three years:

Receipts.

	1876.	1875.	1874.
Lumber, feet	1,027,311,000	1,147,193,000	1,060,088,000
Shingles	544,987,000	635,708,000	619,279,000

Shipments.

Lumber, feet	450,092,000	628,485,000	580,694,000
Shingles	211,169,000	209,427,000	370,197,000

The above figures show that large quantities of lumber are yearly absorbed in the buildings of the city. Doors, sash, and blinds are manufactured here in vast quantities, and shipped by the car-load to all the towns E. of the Rocky Mountains way around to the Gulf of Mexico and the Atlantic seaboard.

Vessels Wintering here.

Statement showing the class, number, and tonnage of vessels laid up in Chicago harbor for winter of 1876–77:

Class.	No.	Tonnage.
Steamers	3	998
Propellers	41	33,948
Barks	6	2,157
Brigs	3	841
Schooners	342	109,286
Tugs	45	1,430
Steam canal-boats	4	358
Total	444	149,018
Foreign.		
Propeller	1	543
Schooner	1	284
Total	2	827

Vessels Owned here.

Statement showing the class, number, and tonnage of vessels owned in Chicago Dec. 31, 1876:

Class.	No.	Tonnage.
Steamers	3	88
Propellers	14	5,005
Steam canal-boats	24	2,196
Tugs	58	1,766
Barks	10	3,373
Brigs	3	1,015
Schooners	275	60,411
Total	387	73,854

Banking and Insurance.—To do the business of the city there are 15 national banks; capital, according to recent statement, $7,050,000; surplus, $5,232,500; total, $12,282,500; circulation, $1,662,840; loans and discounts, $23,409,054. Besides these, 2 Canadian banks, with a capital of $7,900,000, have branches here. There are 21 private and State-chartered banks, some of which have a large capital and do a very extensive business. Of savings banks there are 12. The clearing-house exhibit for the last five years is:

1872	$993,060,503.47
1873	1,047,027,828.33
1874	1,101,347,918.41
1875	1,212,817,207.54
1876	1,110,093,624.37
Credit balances 1876	$101,429,342.62

Since the great fire of 1871, which broke all our insurance companies, only 1 leading company and perhaps 2 or 3 others have been organized.

Packing and Warehouses.—The stock-yards, a little S. of the city limits, with the packing-houses in the vicinity, form a little city of themselves. There are 43 firms engaged in the packing business. The total capacity of the establishments is the slaughter of 51,350 hogs per day. Some 40,000 is about the highest number ever actually reached. One establishment can dispose of 16,000 per day, and from that others range all the way down to a few score. To do the work 4900 men are constantly employed. To handle the grain there are 19 warehouses, having a storage capacity of 15,750,000 bushels. Several cars are run in on each side; the grain is shovelled rapidly into hoppers, whence it is elevated to the top of the building and distributed into bins, to await reshipment. This is done through spouts from the bottom of the bins. A railway-train or a large lake-vessel can be loaded in an incredibly short time, all the work going on in a very quiet but rapid manner.

Commercial Facilities.—The lakes and the St. Lawrence River and canals, and the Erie Canal, furnish the most extensive water-transit to the ocean. The Canadian government is enlarging the Welland Canal, so that within three, or five years at most, vessels of 800 to 1000 tons will pass freely between Chicago and Europe. The Illinois and Michigan Canal connects the lakes by the Illinois with the Mississippi River and its branches. Eastward, the Grand Trunk (Canada), the Michigan Central, the Michigan Southern, the Pittsburg and Fort Wayne, and the Baltimore and Ohio, all great roads, furnish the most ample facilities for freight and passenger transit to the Atlantic seaboard. The immense fertile country to the westward is penetrated by railways in all directions. Several lines reach to Lake Superior, to the Rocky Mountains, and to the Gulf of Mexico, and one to the Pacific Ocean at San Francisco. In some cases, trunk-lines unite a few miles from the city and come in on the same track. The names of these trunk-roads are—the Chicago and North-western (Milwaukee division), Chicago Milwaukee and St. Paul, Chicago and North-western (Wisconsin division), Chicago and North-western (Freeport division), Chicago and Pacific, Chicago and North-western (Omaha division), Chicago Burlington and Quincy, Chicago Rock Island and Pacific, Illinois Central, and Chicago and Danville, making, with the five great Eastern roads, fifteen trunk-lines leading into the city. A hundred miles or more from Chicago they branch off in all directions, giving access by rail to all the cities and towns of any considerable size in the whole country.

Waterworks (see TUNNEL, CHICAGO).

Sewerage, Paving, Horse Railways, etc.—Nearly all the city is now thoroughly sewered. The sewers are of brick, and constructed in the best possible manner. Many of the streets have been raised several feet, and the city is now as dry as any other in the country. Most of the sewers have their outlet in the Chicago River, but since the lowering of the summit-level of the canal the pure water from the lake flows directly through the city, and dissolves and carries off all impurities. The city has about 265 miles of sewers, at a cost of $4,620,000. There are 102 miles of wooden-block paved streets, and 23 miles dressed with broken stone, macadam, gravel, and cinders. Horse railways reach all sections of the city. The river and branches are generally crossed by pivot bridges; that is, they turn on a pier in the centre of the river. There is one tunnel under the S. branch, connecting the W. and S. sides, at Washington street, and another under the main river at Lasalle street, connecting the S. and N. sides. They furnish communication with all parts of the city if the bridges happen to be out of order. Cost, about $1,000,000. Gas was not introduced into the city till Sept., 1850; now the pipes extend to all parts of the city.

Public Buildings and Parks.—The great fire of 1871, while it was thought to have ruined the city, swept away all the old rookeries, and their place has been supplied by splendid structures. The U. S. government is building a very large post-office. The city and county are erecting an immense court-house upon the site of that destroyed by the fire. The public parks and boulevards of Chicago are laid out on the most extensive scale. In most cases the land has all been purchased, and enough has been done to render them already very attractive. Lincoln Park, on the N. side, is a favorite resort for all classes. From Lincoln Park a fine boulevard is to be extended to Humboldt Park, nearly due W. Thence another is already partly completed S. to Central Park, and thence still another runs S. to Douglas Park. Thence a grand boulevard is partly finished, some 4 miles S., to Gage Park, at the corner of Fifty-fifth street. Thence a splendid boulevard joins Gage with the North Park, the two S. parks. This park has been greatly improved. The Botanical Garden attached to this park is a great success, specimens of trees, plants, and shrubs, and thousands of varieties of seeds, having been received and successfully cultivated from all parts of the world. Still another park, lying on the lake-shore S. and E. of the one last named, has been beautifully laid out, and during the coming season will afford new attractions to the people. These parks are connected by a plaisance 600 feet wide. These two parks embrace over 1300 acres. Lincoln Park and the three on the W. side, with others, together contain more space than the two S. parks, and all together, with the boulevards connecting them, will make a continuous and splendid driveway of 25 or 30 miles. Besides these, there are a number of smaller parks: Lake Park, directly in front of the city; Union Park, on the W. side; and Jefferson and Washington parks.

Educational.—There are in and near the city 3 universities—the Chicago University in the S. part of the city; the North-western, at Evanston; and Lake Forest, at Lake Forest. The two first are large and successful institutions; Lake Forest has just started its collegiate department, its academical institutions having for some years been in successful operation. Besides these, the Roman Catholics have St. Ignatius's College, a successful institution, founded in 1870. Each school in medicine has one or more colleges, and the Congregationalists, Lutherans, Baptists, Methodists, and Presbyterians each have theological seminaries. There is also a very successful law school connected with the Chicago University under a corps of professors drawn from the best legal talent in the city. There are 24 public-school buildings, nearly all of them large and commodious, and with every improvement. A position in the high school is secured by superior scholarship and behavior in the grammar schools. The sources of revenue were—

Rents and interest on school lots and funds..	$108,371.67
Appropriations.....	120,580.78
City taxes.....	620,842.52
Total.....	$849,794.97

There are 39 male teachers and 723 female teachers, who received in 1876 for salaries $821,308.50. The last census gave 110,184 children and youth in the city between the ages of six and twenty-one years. School enrollment, 51,128; average daily attendance, 38,081.

The Public Library was established under a general law of the State in 1872. It is maintained by a tax on the whole city. There have thus far been expended upon it $123,483. It has now 49,024 volumes, of which 10,251 were added during the year 1876. Under the law a yearly tax is levied for its benefit.

Newspapers.—There are 12 dailies, 53 weeklies, and 25 monthlies. Some of the dailies circulate an average of more than 40,000 copies, and some of the weeklies and monthlies reach 100,000.

Churches, Benevolent Institutions, etc.—The following is a synopsis of those given in the last city directory: Baptist 26, mission churches 5, Christian 4, Congregational 16, Dutch Reformed 2, Episcopal 19, Reformed Episcopal 8, Evangelical Association 8, Evangelical United 4, Independent 2, Jewish 10, Lutheran 25, Methodist Episcopal 39, Presbyterian 27, Roman Catholic 33, Swedenborgian 4, Unitarian 4, Universalist 3, miscellaneous 11. Some of these churches are rich, their edifices are large and costly.

Of benevolent and charitable institutions Chicago has a very large number. There are hospitals, homes for the friendless and the erring, refuges, dispensaries, societies for the relief of indigent persons of the States and of foreign nationalities. All the churches have Sunday-schools, and Bible classes for the more advanced pupils. There are theatres, concerts, operas in the season.

The Great Fire.—The great fire of Oct. 9, 1871, will ever be memorable in history, both on account of its extent and the value of the property destroyed. It commenced about 11 o'clock on the night of the 8th, at the corner of De Koven and Jefferson streets, and did not cease its ravages till the afternoon of the 9th. The city had been sweltering under the scorching rays of the sun for six weeks, scarcely rain enough falling to lay the dust or moisten a roof. With few exceptions, the interiors of all the buildings were constructed of wood, and a very large proportion of them entirely of that material. Of course, the whole city was really a tinder-box, and it burned with a fury never before witnessed. A furious wind was blowing from the S. W., which, under the stimulus of the fire, soon became a gale. When once the fire got fairly started, no fire department could stand before it. It would leap over one or more blocks at a single bound. The whole atmosphere in front of it seemed to be on fire itself. The blazing current swept on, for most of the way not more than two or three blocks wide, reaching Lincoln Park, nearly 4 miles, long before daylight. But in all great rivers there are eddies, and it was by these that the fire worked westward to the Chicago River and eastward to Michigan Avenue, as far S. as Congress street, thus keeping up its ravages till the afternoon. Its effects in some places can only be compared to those of the oxyhydrogen blowpipe, for iron safes, three or four feet of iron pillars twenty inches square, and parts of car-wheels were all burned up, no residuum whatever remaining to show where they stood. Some 2100 acres were burned over in a few hours; 100,000 people were homeless; and about $200,000,000 of property was destroyed. The business portion of the city was all gone. This terrible calamity was followed at once by the most unbounded liberality and the most spontaneous sympathy the world has ever witnessed. Every part of our own country, all civilized nations, seemed to vie with each other in sending liberal contributions and in cordial expressions of regard. The total amount received by the Chicago Relief and Aid Society, managed by a directory of our very best business-men, was $4,996,782.74. Of this magnificent sum, nearly $600,000 remained over, the interest of which, and whatever of the principal was actually needed, have been distributed among the poor during the winters that have followed. The fires were not out before busy hands and brave hearts were at work clearing away the rubbish and putting up buildings. In two years the traces of the fire had mainly disappeared, and the city was virtually reconstructed in three.

WILLIAM BROSS.

Chicago, a post-township of Douglas co., Neb. P. 260.

Chichen', a town of Central America, in Yucatan, 18 miles S. W. of Valladolid. Here are the remains of an ancient town, comprising a vast ruined building 450 feet long, a pyramid the base of which is 550 feet square, and a remarkable domed edifice.

Chich'ester (anc. *Regnum*), an episcopal city of England, capital of Sussex, on the South Coast Railway, 17 miles E. N. E. of Portsmouth. It stands on a plain between an arm of the sea and the South Downs. It is well built, and has clean wide streets. Here is a cathedral built in 1199, which is 410 feet long by 227 wide. The town is connected by a canal with the sea, which is two miles distant. It sends two members to the House of Commons. It was formerly the capital of the kingdom of Sussex. Pop. in 1871, 7850.

Chichester, a post-township and village of Merrimack co., N. H., 8 miles E. N. E. of Concord, on the Suncook Valley R. R. It has manufactures of leather, lumber, etc. Pop. 871.

Chichester, EARLS OF (United Kingdom, 1801), Barons Pelham (England, 1762), and baronets (1611).—HENRY THOMAS PELHAM, third earl, first church estate commissioner, born Aug. 25, 1804, succeeded his father in 1826.

Chick'adee [a name derived from its note], the popular name of the black cap titmouse (*Parus atricapillus*) and other American passerine birds of the same genus and of nearly related genera. The common chickadee is frequent all the year round throughout a great part of North America, and is one of the bravest and most cheerful of our winter birds. It shares with several others the name snowbird, and its familiar cry and sprightly manners render it a great favorite with children. It nests in a hollow tree, and feeds on insects in their season, and on seeds in winter.

Chickadee.

Chickahom'iny, a river in the E. part of Virginia, rises about 20 miles N. W. of Richmond, flows south-eastward, and after a course of about 75 miles enters the James River. It forms the boundary between Henrico and Charles City counties on the right, and Hanover, New Kent, and James City on the left. Along the margins of the Chickahominy is found the theatre of operations of Gen. McClellan operating against Richmond during May and June, 1862. In close proximity to this river occurred the battles of Seven Pines and Fair Oaks, May 31–June 1, 1862, Mechanicsville, June 26, Gaines's Mill, June 27, Savage's Station, June 29, White Oak Swamp, June 30, 1862, and Cold Harbor, June 3, 1864. (See CONFEDERATE STATES, by HON. HORACE GREELEY, LL.D.)

Chickahominy, a township of Charles City co., Va. Pop. 1372.

Chicka'lah, a post-township of Yell co., Ark. P. 175.

Chickamau'ga, a creek which rises in Walker co., Ga., flows north-eastward and northward, and enters the Tennessee River about 6 miles above Chattanooga.

Chickamauga, a post-village of Hamilton co., Tenn., on the Chickamauga Creek and the Western and Atlantic R. R., 12 miles E. of Chattanooga. (See CHICKAMAUGA, BATTLE OF.)

Chickamauga, Battle of. The battle of Chickamauga, fought between the forces of the U. S., under command of Gen. W. S. Rosecrans, and those of the Confederates, under Gen. Braxton Bragg, commenced on the morning of Sept. 19, 1863, about 9 o'clock. Of Rosecrans' army Gen. McCook commanded the right wing, Thomas the left, and Crittenden the centre, while Gen. Polk held chief command of the Confederate right and Hood of the left. The Confederates first attacked the extreme left of the U. S. army with heavy masses, the endeavor being to turn it, and thus gain possession of the roads to Chattanooga. A desperate conflict was continued during the day, but Thomas maintained his position. On the right the conflict had been severe at times, but on the whole the day closed with the advantage on the Union side. During the night Thomas was reinforced from the other wings of the army, and had strengthened his position by hastily thrown up breastworks. The attack was renewed by the Confederates on the morning of the 20th against the left and centre, and the tide of battle here ebbed and flowed throughout the day, with heavy losses on both sides, but without material advantage to either; but Bragg was unable to turn Thomas's flank and occupy the coveted passage to Chattanooga. The fight along the left centre had been equally desperate, bloody, and indecisive. But on the right a fearful disaster had fallen. In answer to Thomas' call for aid, Rosecrans had despatched Negley's and Van Cleve's divisions from the right and centre. Wood was directed to close up on Reynolds on the right centre, and Davis to close on Wood. According to Rosecrans' report, Wood overlooked this direction, but supposed that he was to *support* Reynolds, and attempted to do so by withdrawing from the line and passing in the rear of Brannan, thus opening a gap in the line of battle, which being quickly perceived by Longstreet, a decisive charge was made, striking Davis in flank and rear, and throwing the whole division into confusion. Pouring in through this gap, the Confederates cut off the Federal right and centre, and attacking Sheridan's division, which was advancing to the support of the left, compelled it, after a gallant struggle, to give way. It was afterwards rallied, however, and by a circuitous route joined Thomas, who was now left to breast the tide of battle against the whole army of Bragg. The right and part of the centre had been broken and sent flying in disorder towards Chattanooga, with terrible loss. Rosecrans, McCook, and numerous subordinate commanders were carried along in the whirl. Sheridan and Davis rallied and re-formed their decimated and scattered commands on the way, and halted at Rossville. Rosecrans, being unable to join Thomas, hastened to Chattanooga to prepare that place for defence in case of a total rout of his army, which now seemed imminent. But Gen. Thomas still remained immovable in his position. His line had now assumed a crescent shape, with its flanks supported by the lower spurs of the mountain; and here he repulsed the furious onsets of the Confederates. About 3½ P. M. the Confederates discovered a gap in the hills in rear of his right flank, through which Longstreet poured his massive columns. At this critical moment Gen. Gordon Granger, who had been posted with his reserves to cover the left and rear, arrived on the field. He had heard the sound of the cannon, and marched his force there without orders. Gen. Thomas pointed out to him the gap through which the Confederates were debouching, and he at once threw in Steedman's brigade of cavalry. The conflict was terrible, but the gap was taken. Two divisions of Longstreet's corps repeatedly assaulted the position, but a battery of six guns placed in the gorge repelled them with fearful slaughter. About sunset they made their last charge, when they were met and driven back at the point of the bayonet, and returned no more. In the mean time, Thomas had repulsed the repeated attacks on his left and front, and at nightfall the Confederate army retired beyond range of his artillery, leaving Thomas in possession of his hard-fought field. Considering the extreme labor of his troops, the scarcity of ammunition, food, and water, Gen. Thomas determined to retire on Rossville, where they arrived and took post before morning of the 21st, receiving supplies from Chattanooga, and offering battle during the day, but the attack was not seriously renewed. On the night of the 21st he withdrew within the defences of Chattanooga.

The result of the battle was a nominal victory to the Confederates on the field, though Chattanooga and the possession of East Tennessee, the prize for which the battle was fought, still remained in possession of the Union forces. The Union loss is reported at 16,000, killed, wounded, and missing; the Confederate loss, 18,000; they captured 36 guns, 8500 small-arms, and large quantities of accoutrements.

Chick'aming, a post-township of Berrien co., Mich. Pop. 992.

Chickasa'ba, a township of Mississippi co., Ark. Pop. 448.

Chick'asaw, a county in the N. E. of Iowa. Area, 540 square miles. It is intersected by the Wapsipinicon River. The Red Cedar River passes through the S. W. part of it. The surface is undulating; the soil is fertile. Cattle, wool, grain, and tobacco are raised. It is traversed by a branch of the Milwaukee and St. Paul R. R. The Cedar Falls and Minnesota branch of the Illinois Central R. R. crosses the S. E. corner of the county. Capital, New Hampton. Pop. 10,180.

Chick'asaw, a county in the N. E. of Mississippi. Area, 700 square miles. It is drained by the Yallobusha River, which rises in it, and by the Oktibbeha. The surface is nearly level; the soil is fertile. Corn and tobacco are the staple crops, but wool, cattle, and cotton are also raised. The Mobile and Ohio R. R. crosses the N. E. corner of the county. Capital, Houston. Pop. 19,899.

Chickasaw, a township of Chickasaw co., Ia. Pop. 1076.

Chickasaw Bluffs, Battle of, before Vicksburg, Miss. The U. S. forces under Gen. W. T. Sherman assaulted this strongly fortified position Dec. 29, 1862, but, though the head of the assaulting column reached the works, the severe fire from the rifle-pits and batteries caused them to fall back to the point of starting, leaving many dead, wounded, and prisoners on the field. The Confederate loss was but light.

Chick'asaw In'dians, a warlike tribe which formerly occupied the northern parts of Alabama and Mississippi. They were visited by De Soto in 1540. They waged war against the French in 1736. Having ceded their lands to the U. S. for a large sum of money, they removed beyond the Mississippi River to the Indian Territory in 1837–38, and formed a political connection with their kindred tribe, the Choctaws. The united tribes numbered in 1872 some 22,000 souls, the Choctaws being the more numerous.

Chick'atuck, a post-township and village of Nansemond co., Va., 8 miles S. E. of Smithfield. Pop. 2709.

Chick'en-pox, a contagious febrile disease, chiefly of children, and bearing some resemblance to a very mild form of smallpox. Chicken-pox is distinguished by an eruption of vesicles or blebs, which rarely become pustular or yellow, and leave only a very slight incrustation, which falls off in a few days, without any permanent mark or pit as in smallpox. It is a disease of little or no danger, the fever being often hardly perceptible, and never lasting long. It usually occurs but once in any one patient.

Chick'ering (JONAS), an American philanthropist, born in New Ipswich, N. H., April 5, 1798. He became distinguished as a pianoforte-maker, having begun that business for himself in 1823. He acquired great wealth, which he used freely, but not ostentatiously, in various charities. Died Dec. 8, 1853.

Chickering (THOMAS E.), a son of Jonas Chickering, was born at Boston, Mass., Oct. 22, 1824. He succeeded his father as the head of a large pianomaking business, and was colonel of the Forty-first Massachusetts Infantry in the civil war, serving chiefly in Louisiana. Died at Boston Feb. 14, 1871.

Chick's Springs, a post-township and village of Greenville co., S. C., about 9 miles N. E. of Greenville. Here are two mineral springs—one alterative and slightly sulphurous, the other a tonic iron spring. Pop. 1226.

Chick-pea (*Cicer*), a genus of plants of the order Leguminosæ, having pinnate leaves and 2-seeded pods, inflated like bladders. The common chick-pea (*Cicer arietinum*) grows wild in the countries around the Mediterranean. It is an annual, of a stiff upright habit. The seeds abound in farina, and have a slightly bitterish taste. They are about the size of common peas, and curiously wrinkled. They are used as food, either boiled or roasted, and are the common pulse of the East. They are an important article in French and Spanish cookery. They have been in general use from the earliest times, and the plant is extensively cultivated in Egypt, Syria, India, Europe, Mexico, etc. The herbage affords nutritious food for cattle. Drops exude from this plant, which, on drying, leave crystals of almost pure oxalic acid. In France, in India, and in Mexico the free use of the chick-pea as food is said sometimes to lead to paralysis.

Chicla'na, a town of Spain, in the province of Cadiz, 12 miles S. E. of Cadiz. The houses are built of white stone. It has a fine hospital, and manufactures of linen, earthenware, and brandy. Here are mineral springs which are much frequented. Pop. 9097.

Chi'co, chee'co, a post-village of Butte co., Cal., in a township of the same name, on Chico Creek and on the

Oregon division of the Central Pacific R. R., 96 miles N. of Sacramento. It is in a rich farming district, and has a steamboat connection with Sacramento. It has one weekly newspaper. Pop. including township, 3714.

Chico'a, a township of Pitt co., N. C. Pop. 1683.

Chic'opee, a river of Massachusetts, rises in Worcester county, flows nearly westward, and enters the Connecticut 4 miles above Springfield. It affords abundant water-power.

Chic'opee, a post-village of Hampden co., Mass., on the Connecticut River, at the mouth of the Chicopee, 4 miles N. of Springfield. It was formerly called CABOTVILLE. It has a national bank, a newspaper-office, and several cotton-mills of the Dwight Company (which employs a capital of $1,500,000 or more); also manufactures of swords, cutlery, machinery, and brass cannon. The Ames Company have here the largest manufactory of swords in the U. S. Pop. of Chicopee township, including Chicopee and Chicopee Falls, 9607.

Chicopee Falls, a post-village of Chicopee township, Hampden co., Mass., on the Chicopee River, 5 miles N. of Springfield and 1½ miles E. of Chicopee Centre, with which it is connected by a branch railroad. It has extensive water-power, four large cotton-mills, a bleachery, and manufactures of knitting machines, agricultural tools, Maynard rifles, guns, pistols, levels, planes, and plumbers' goods. It has four churches. Pop. about 3000. A. W. PAGE, P. M.

Chic'ory, or **Suc'cory,** an herb of the order Compositæ, sub-order Ligulifloræ. The common chicory or succory (*Cichorium Intybus*) is a perennial plant, found wild in most parts of Europe and naturalized in the U. S., growing in waysides, borders of fields, etc. It has a long, carrot-like root of a dirty or brownish-yellow color, and white within. The stem rises two to five feet, the leaves resembling those of the dandelion; the flowers rather large, beautiful, and generally blue. Chicory is extensively cultivated in Europe for its roots and for feeding cattle with its leaves. The blanched leaves are sometimes used as a salad. To this genus belongs also the endive. Chicory is much used with coffee. The roots are dried and roasted in heated iron cylinders, which are kept revolving as in coffee-roasting. During roasting the addition of two pounds of lard or butter for every hundredweight of chicory communicates to it the general appearance of coffee. Chicory contains sugar, but otherwise does not supply the animal economy with any useful ingredient. Some dislike the taste of chicory, and when largely used it has a tendency to produce diarrhœa; but many people prefer to use coffee mixed with chicory.

Chicot, shee'ko, a county which forms the S. E. extremity of Arkansas. Area, 800 square miles. It is bounded on the E. by the Mississippi River. The surface is level, and is drained by magnificent bayous. The soil is fertile. Cotton, tobacco, and corn are the chief crops. Capital, Lake Village. Pop. 7214.

Chicot, a post-village of Chicot co., Ark., on the Mississippi River, is the terminus of two railroads. It has two churches, two schools, machine-shops, and a newspaper. ED. OF "TIMES."

Chicoutimi, a county of the Dominion of Canada, in Quebec, is intersected by the river Saguenay, and borders on a large lake called St. John's. Lumber is exported from it. Capital, Chicoutimi. Pop. in 1871, 17,493.

Chicoutimi, a post-village, capital of Chicoutimi co., Quebec (Canada), on the S. side of the river Saguenay, 75 miles from its mouth. It has a court-house, jail, a convent of the Good Shepherd, and an important trade in lumber, which is shipped direct to England and other regions.

Chictawau'ga, a township of Erie co., N. Y. Pop. 2465.

Chief-Justice, the title of the highest in rank of the judges of a court. The chief-justice of the U. S. is an officer who presides over the Supreme Court, controlling its docket, regulating the order of business, and assigning to the associate justices the cases in which they are to prepare opinions. He reads decisions in practice cases; administers the oath to the President and Vice-President at their inauguration; presides when the President is on trial after impeachment; and nominates persons to be appointed registers in bankruptcy by the district judges. Like his associates, he is required to attend at least one term of the circuit court in his circuit during each period of two years. He ranks next to the President in official dignity. His salary is $10,500.

Chiem See, a lake of Bavaria, 42 miles S. E. of Munich, is at an elevation of 1726 feet above the sea. It is 12 miles long, about 7 miles wide, and 458 feet deep. It contains many fish. The surplus water is discharged through the Alz into the river Inn.

Chie'ri (anc. *Carrea Potentia*), a town of Italy, in the province of Turin, on the slope of a hill 8 miles S. E. of Turin. It had manufactures of fustians, etc. in 1422. Here is the church of St. Domenico, built in 1260, and the church of Santa Maria della Scala, which was founded in 1405, the largest Gothic structure in Piedmont. Chieri has manufactures of silk, cotton, and linen fabrics. Pop. 10,036.

Chie'ti, formerly **Abruzzo Citeriore,** a province of Central Italy, is a mountainous region. The chief products are corn, oil, fruits, rice, and wine. Area, 1277 miles. Pop. in 1871, 339,961.

Chieti (anc. *Teate*), a fortified episcopal city of Italy, capital of the province of Chieti or Abruzzo Citeriore, is situated on a hill near the Pescara, 40 miles E. of Aquila, 115 miles N. of Naples, and 6 miles from the Adriatic. It is the see of an archbishop, and has a cathedral, a college, and a fine theatre. Here are some manufactures of silk and woollen goods. Chieti occupies the site of the ancient *Teate*, a large and important city, the remains of which are still visible. Among these are the ruins of a theatre and several temples. Pop. in 1872, 23,607.

Chignec'to Bay, an inlet in British North America, is the northern part of the Bay of Fundy, and extends between New Brunswick and Nova Scotia. It is about 30 miles long.

Chi'goe, or **Jig'ger** (*Sarcopsylla penetrans*), a species of flea, much smaller than the common flea, found in the West Indies and North and South America, attacking any exposed part of the human body, effecting a lodgment between the skin and flesh, often under the nails of the toes, and also infesting dogs and mice. At first its presence is indicated by a slight itching, but ulceration is likely to result, which is not only painful, but even dangerous when the female chigoe is allowed to remain and deposit her eggs, about sixty in number. Before these are deposited her abdomen becomes distended to the size of a pea. The ulcer speedily contains a great colony of chigoes. The natives are very expert in extracting the chigoe, which is also removed by washing with tobacco juice. Rubbing with tobacco leaves is a preventive of its attacks, but cleanliness and the wearing of shoes is still better. Death has followed neglect to remove the chigoe.

Chi- (or **She-**) **Hoang-Ti,** called also **Tsin-Chi-Hoang-Ti,** and sometimes **Ching-Wang,** one of the greatest emperors of China, ruled that country from 246 to 210 B. C. The country now called China was then divided into eight feudatory kingdoms or principalities. He formed the design of subjugating them all and consolidating them into one great empire. This he at length accomplished, and by expelling some barbarous nations extended the empire to nearly its present limits. He also built the Great Wall of China, employing upon it several millions of men for ten years, of whom it is said half a million perished before the work was finished. He is also said to have been the first Chinese sovereign who caused a statistical survey of the whole empire, with a valuation of lands, products, etc., in order that the tributes might be justly apportioned. But his memory is stained by his attempted destruction of the ancient books of the country. This attempt he made in order to weaken or destroy the authority of the learned class, who were his enemies, and also to obliterate the national reverence for antiquity, which formed the chief support of the authority of that class. He appears to have been the first ruler of China (if we except those of a very remote antiquity) who assumed the title of *hoang* or "emperor," his predecessors having been called by the more modest title of *wang* or "king." Chi-Hoang-Ti has been compared to Napoleon, whom he certainly resembled in the force of his will, as well as in the extent of his power.

Chihua'hua, a state of Mexico, bordering on Texas, has an area of 105,299 square miles. It is bounded on the N. E. by the Rio Grande del Norte, and is drained by the Conchos. The W. part is occupied by a long mountain-chain called Sierra Madre. The surface E. of this chain is mostly a high table-land; the soil is generally arid and sterile. The state is rich in minerals, including gold, silver, copper, lead, tin, and cinnabar. The silver-mines, which are in the Sierra Madre, were formerly very productive. The chief wealth of the inhabitants consists in herds of cattle, horses, and mules. This state is infested by Apaches, who greatly retard its prosperity. Capital, Chihuahua. Pop. of the state in 1871, 179,971.

Chihuahua, a town of Mexico, the capital of the above state, is about 310 miles N. N. W. of Durango; lat. 28° 50′ N., lon. 105° 33′ W. It has a fine stone cathedral which cost about $800,000, a state prison, a state-house, and a mint. It is supplied with water by a good stone aqueduct

three miles long. Silver-mines have been opened in the vicinity. Chihuahua has an active trade with San Antonio in Texas. Pop. 12,000.

Chil'blain [Lat. *pernio*], one of the secondary effects of cold and moisture upon the human system, principally affecting the feet, hands, nose, ears, etc. Chilblains are frequently chronic in their character. Mild cases are marked by swelling and redness of the affected part, accompanied by intolerable itching. The more severe forms assume an ulcerated, and sometimes even a gangrenous, character. Those troubled with chilblains should carefully protect the feet and hands from cold, should wash the feet frequently and dry them very thoroughly, and avoid going near a fire when they are very cold. Benzoated oxide-of-zinc ointment, citrine ointment, borax and sugar of lead in oil or glycerine, tincture of iodine, sulphurous acid solution, and various stimulant applications are all useful, some being suited to the condition of certain patients, while others may require different applications. The severer forms may need surgical treatment.

Child (Francis J.), Ph. D., born in Boston Feb. 1, 1825, graduated at Harvard in 1846. After taking his degree he was for some time tutor in mathematics at Harvard, and subsequently in rhetoric and history. In 1849 he visited Europe, where he spent about two years. In 1851 he succeeded Prof. E. T. Channing as Boylston professor of rhetoric and oratory. Prof. Child is especially distinguished for his thorough acquaintance with early English literature. As a Chaucer scholar he has perhaps no superior in America or Europe. He has contributed to this "Cyclopædia" the admirable article on Ballad Poetry.

Child (Lydia Maria), an American writer, born at Medford, Mass., Feb. 11, 1802. Her maiden name was Francis. She was married in 1828 to David Lee Child, a lawyer, and became editor of the "National Anti-Slavery Standard" in 1841. She published, besides other works, "The History of Women" (1832), "Letters from New York" (2 vols., 1844), "The Oasis," "Fact and Fiction," "Philothea, a Grecian Romance," and "The Progress of Religious Ideas" (3 vols., 1855).

Childbirth. See Obstetrics.

Childe (John), an American officer and engineer, born Aug. 30, 1802, at West Boylston, Mass., graduated at West Point in 1827. He served, while lieutenant of artillery, on ordnance duty 1828–34; garrison and engineer duty at Newport Harbor, R. I., 1834–35. Resigned Dec. 31, 1835, and assumed the profession of civil engineer, in which he became eminent, particularly in the construction of railroads and bridges and improvements of rivers and harbors. His official reports are models of logical force and accuracy, and his inventive talent for mechanical improvements was remarkable. Died Feb. 2, 1858, at Springfield, Mass., aged fifty-five. George W. Cullum, *U. S. Army.*

Chil'dermas [from *child* and *mass*], or **Holy Innocents' Day** (Dec. 28th, or in the East the 29th), is observed by the Roman, Anglican, Greek, and various Eastern churches as a festival in honor of the children killed by Herod. It was considered unlucky to marry or to begin any work on this day. The learned John Gregory says: "It hath been a custom, and yet is elsewhere, to whip up the children upon Innocents' Day morning, that the memory of Herod's murder might stick the closer, and in a moderate proportion to act over the crueltie again in kinde." Throughout the day, however, the children might exercise a certain authority over the rest of the household.

Chil'dersburg, a township and post-village of Talladega co., Ala., on the Selma Rome and Dalton R. R., 90 miles N. E. of Selma. Pop. 1112.

Chil'dren (John George), F. R. S., an English electrician, born at Tunbridge in 1777. He constructed a galvanic battery with plates about four feet long and two wide, by which he demonstrated that the quantity of electricity is in proportion to the size of the plates, and its intensity depends on their number. Died in 1852.

Childs (George W.), an American journalist and publisher, born in 1829 at Baltimore, Md. He became a resident of Philadelphia in his youth, and in 1849 became a partner in a publishing-house. He purchased in 1864 the "Public Ledger," a daily newspaper of Philadelphia, which he made very successful. He is also distinguished for liberality.

Childs (Henry Halsey), M. D., a son of Timothy Childs (see below), was born in Pittsfield, Mass., June 7, 1783, and graduated at Williams in 1802. He was for many years president of the Berkshire Medical College, and was lieutenant-governor of Massachusetts in 1843. He was distinguished for his benevolence, integrity, and professional enthusiasm. Died Mar. 22, 1868.

Childs (Linus), born in 1803 at Southbridge, Mass., graduated at Yale in 1824, became a lawyer of Boston, Mass., and was for some time agent of a manufactory at Lowell. He was active in State politics, and was a prominent member of the prudential committee of the American board of commissioners for foreign missions, and of the trustees of Andover Theological Seminary and Phillips Academy. Died Aug. 26, 1870.

Childs (Orville W), an able civil engineer, was chief engineer of the New York State works (1840–47), aided in constructing the Champlain Canal, and in the survey of the Nicaragua ship-canal route. He contributed much to professional literature. Died at Philadelphia Sept. 6, 1870.

Childs (Thomas), an American officer, born in Pittsfield, Mass., in 1796, graduated at West Point in 1814 in the artillery. He served with distinction in the war of 1812–15 at the battle of Niagara, and at Fort Erie in 1814; he was engaged in the Florida war against the hostile Indians from 1836 to 1842, and in the war with Mexico, at Palo Alto, Resaca de la Palma, Monterey, Vera Cruz, and Cerro Gordo. For his distinguished conduct in the Florida war he was brevetted major, lieutenant-colonel, and colonel, and in the Mexican war brevetted brigadier-general. Died Oct. 8, 1853.

Childs (Timothy), M. D., born in Deerfield, Mass., in 1748, was a distinguished patriot and an army-surgeon in the Revolutionary war. At the end of the war he successfully resumed his medical practice at Pittsfield. Died Feb. 25, 1821.

Chilhow'ie, a post-township of Johnson co., Mo. Pop. 1362.

Chi'li [Sp. *Chile*], a republic of South America, is a long and narrow tract bounded on the E. by the Andes and on the W. by the Pacific Ocean. It extends from lat 24° to 43° 20′ S., and from lon. 70° to 74° W. It is about 1200 miles long, and varies in width from 90 to 130 miles. Area, estimated at 132,616 square miles. The dispute with Bolivia concerning the northern frontier was settled by the treaty of 1866, which gave to Bolivia possession of the Bay of Mejillones, but secured to Chili an equal share of the guano of the disputed territory.

Physical Features.—The surface is mountainous, and belongs entirely to the western slope of the great Cordillera of the Andes, which here attains a very great height. The mean elevation of the Chilian Andes is nearly 14,000 feet above the level of the sea. Among the peaks of the Chilian Andes is the porphyritic Nevado of Aconcagua, which rises 22,422 feet, and was once said to be the highest peak in South America. The volcano of Antuco near the eastern border of Concepcion is 8917 feet high. Other active volcanoes occur on the border of Chili. Besides the central chain of the Cordillera, Chili is traversed by lateral ridges separated by deep valleys, some of which are fertile. The richest soil and most luxuriant vegetation are found in the southern and central parts. The country N. of Valparaiso is mostly arid and sterile. The coast of Chili is bold and rocky, with deep water close to the shore. This region is subject to earthquakes, one of which in 1822 destroyed several cities, and raised the coast four feet above its former level. This change of level was permanent and very extensive.

Geology and Minerals.—The predominant rocks of Chili are granite, porphyry, basalt, quartz, clay-slate, limestone, etc. A long and narrow belt of palæozoic and fossiliferous strata extends along the coast S. of Santiago. Many silver-mines have been opened in the N. part of Chili, but the desert nature of the country and the scarcity of water render the mining operations difficult and expensive. Gold, copper, lead, iron, bismuth, antimony, cobalt, and quicksilver are also found here, the mines of copper being especially important. Extensive beds of bituminous coal have been opened near Talcahuano.

Climate, Productions, etc.—The climate of this region is remarkably healthy. Rain falls only between June and September, but the northern desert is subject to long droughts which continue for years. In the central parts of Chili storms of hail and terrific thunder are frequent in the winter. The hottest months of the year are January and February, during which the mercury sometimes rises to 95° F. in the shade. The southern part is covered with dense forests. The laurel, myrtle, cypress, and other evergreens attain here a gigantic size. In the middle portions the soil is adapted to grazing and the cultivation of grain. The staple productions are wheat, barley, maize, hemp, and potatoes. Apples, pears, plums, peaches, oranges, and other fruits are abundant. The chief articles of export are silver, copper, wheat, hides, and wool.

Rivers, Lakes, and Harbors.—Chili has no large rivers or large lakes. The streams are mostly mere mountain-

torrents, and are not navigable. The Biobio, which is one of the principal streams, is nearly 200 miles long. Many small lakes occur among the mountains. The best ports and harbors are at Valdivia, Valparaiso, Concepcion, and Coquimbo.

Political Divisions, Government, etc.—Chili is divided into fifteen provinces, named Chiloe, Llanquihue, Valdivia, Arauco, Concepcion, Nuble, Maule, Talca, Curico, Colchiagua, Santiago, Valparaiso, Aconcagua, Coquimbo, and Atacama, to which must be added the colony of Magallanes. The chief cities are Santiago, the capital, Valparaiso, Talca, and Concepcion. The executive power is exercised by a president elected for a term of five years. The legislature consists of two houses—the chamber of deputies, who are elected for three years, and the senate, the members of which are chosen for a term of nine years. The established religion is Roman Catholic. A large proportion of the population are of Spanish descent, and the other inhabitants are mostly Indians or aborigines. The public revenue in the budget of 1871 was estimated at 11,550,000 pesos (1 peso = 93 cents), and the expenditure at 12,542,493 pesos. The public debt in 1870 was 39,924,833 pesos. The value of the exports in 1869 amounted to $27,720,000, and that of the imports to $27,230,000. In 1871, Chili had 472 miles of railroad in operation. Pop. in 1865, 2,166,000. The number of vessels arriving in the ports of Chili in 1869 was 4009. The army embraces 5018 men of the line and 54,992 national guards. The fleet consists of 12 steamers.

History.—Chili was a part of the dominions of the incas of Peru when the latter was conquered by Pizarro. Almagro invaded Chili in 1535, soon after which the conquest of the country, except Araucania, was completed by Valdivia, who founded Santiago in 1541. He was defeated and killed in 1553 by the Araucanians, whom the Spaniards were never able to conquer. In 1810 the Chilians revolted against the king of Spain, and a junta which had met at Santiago elected the marquis de la Plata, a native of Chili, president of the republic. On Feb. 12, 1817, the Spaniards suffered a decisive defeat at Chacabuco; on Jan. 1, 1818, the independence of Chili was formally proclaimed by Bernardo O'Higgins, the commander-in-chief of the Chilian patriots; and on May 5 of the same year it was fully secured by the great victory of the Chilians on the river Maypu. The last stronghold of the Spaniards, the island of Chiloe, was captured in Jan., 1826. The first constitution was adopted in 1824, and a second in 1828. From May, 1837, to Mar., 1839, a war was carried on with Peru. On April 25, 1844, a treaty was concluded with Spain which recognized the independence of Chili. During the administrations of President Bulnes (1841–51) and of President Manuel Montt (1851–61) Chili remained free from the troubles which agitated most of the other South American republics. Two insurrections during the administration of the latter were easily suppressed. Agriculture, mining industry, and navigation steadily advanced, and a considerable immigration from Europe took place. During the two administrative terms of President Perez (1861–71) Chili, in union with Peru, Bolivia, and Ecuador, was involved in a war with Spain, which began in 1865. A Spanish fleet on Mar. 31, 1866, bombarded Valparaiso, but had to raise the blockade on April 14, owing to the remonstrances of the European powers. Actual hostilities soon after ceased, but a formal truce was not concluded until July, 1869, through the mediation of the government of the U. S. On Sept. 18, 1871, F. Errazuriz was elected president for the term 1871 to 1876. The new president, as well as his two immediate predecessors, supported the interests of the conservative and Church parties. The liberal party of Chili contends in particular for the introduction of universal suffrage and religious toleration. From 1859 to 1873 the republic was entirely free from intestine commotions, but it had often to suppress the insurrections of the Araucanians. (See Asta Buruaga, "Diccionario jeografico de la Republica de Chili," 1868; Valenzuela, "Historia jeneral de la Republica de Chili," 4 vols., 1866–68; Hunter, "A Sketch of Chili," 1866.)

A. J. Schem.

Chili, a township and post-village of Hancock co., Ill., on the Keokuk branch of the Toledo Wabash and Western R. R., 15 miles S. S. E. of Carthage. Pop. 1601.

Chili, a post-township and village of Monroe co., N. Y., on the New York Central R. R., 58 miles E. N. E. of Buffalo. Pop. 2367.

Chil'iad [Gr. χιλιάς, from χίλιοι, a "thousand"], an assemblage of things grouped or ranged by thousands. The word is chiefly used by the early computers of logarithmic tables, who expressed the extent of the table by saying it contained the logarithms of so many *chiliads* of absolute numbers.

Chiliasts. See Millennarians.

Chillicoth'e, a post-village of Peoria co., Ill., on the Illinois River and on the Peoria branch of the Chicago Rock Island and Pacific R. R., 18 miles N. N. E. of Peoria. It is a large grain dépôt, and possesses various manufacturing industries. A daily packet-boat runs to Peoria. It has one weekly newspaper. Pop. of township, 1486.

S. Stowell, for Ed. of "Democratic Union."

Chillicothe, capital of Livingston co., Mo., on the Hannibal and St. Joseph R. R. and on the Omaha branch of the St. Louis Kansas City and Northern R. R.; also the terminus of the Chillicothe and Des Moines City R. R., 76 miles E. of St. Joseph. It is the principal town in the Grand River Valley. It contains ten churches, two newspapers, two banks, three flouring-mills, two planing-mills, one foundry and machine-shop, fifty-seven stores, one academy, and graded free schools. Plenty of timber and water. Coal in abundance in the vicinity. Pop. 3978; of township, 2118.

Marsh & Desha, Props. of "Tribune."

Chil'licoth'e, or **Chilicoth'e,** a beautiful city, the capital of Ross co., O., is finely situated on the Scioto River, and in a plain enclosed on several sides by verdant hills nearly 500 feet high. It is on the Marietta and Cincinnati R. R., and on the Ohio and Erie Canal, about 48 miles S. of Columbus and 99 miles E. by N. from Cincinnati. The streets are wide, straight, and lighted with gas. It has a stone-front court-house, which cost about $100,000, thirteen or more churches, five newspaper-offices, three national banks, and four commodious brick union schoolhouses; also manufactures of steam-engines and farming-implements, flour-mills and other manufactories, and the Marietta and Cincinnati R. R. shops. Chillicothe was the capital of Ohio from 1800 to 1810. Pop. 8030.

J. R. S. Bond & Son, Pubs. "Scioto Gazette."

Chil'lingworth (Rev. William), an eminent English divine and controversialist, born at Oxford in Oct., 1602. In 1618 he became a scholar, and in 1628 a fellow of Trinity College, Oxford. In 1630, through the influence of John Fisher, the famous Jesuit, he became a Roman Catholic, and entered the Jesuit College in Douay, France. In 1631 he was persuaded by his godfather, Laud, then bishop of London, to reconsider the question and return to Oxford. In 1637 he put forth his great work, "The Religion of Protestants a Safe Way to Salvation," a work of singular acuteness and ability. He became chancellor of Salisbury and prebendary of Brixworth. In theology he was a latitudinarian, and in politics a royalist. Died at Chichester Jan. 31, 1644. His collected works appeared in 1742. (See Des Maizeaux, "Life of Chillingworth," 1725; August Neander, "Erinnerung an den evangelischen Gottesgelehrten W. Chillingworth," 1832.)

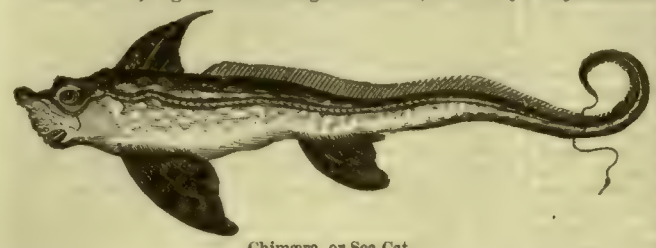
Chillisqua'que, a township and post-village of Northumberland co., Pa., about 55 miles N. of Harrisburg. Pop. 1597.

Chillon, commonly pronounced shil'lọn [Fr. pron. she'yôN'], a castle and fortress of Switzerland, in the canton of Vaud, 6 miles S. E. of Vevay. It is at the E. end of the Lake of Geneva, on an isolated rock, almost surrounded by deep water. It was built by Amadeus IV. of Savoy in 1238, and was long used as a state prison. Bonnivard was confined here from 1530 to 1536 for his efforts to liberate the Genevese. This place is the scene of Byron's poem, "The Prisoner of Chillon."

Chil'mark, a post-township of Dukes co., Mass., on the island of Martha's Vineyard. Pop. 476.

Chi'lo, or **Chi'lon** [Gr. Χίλων or Χείλων], a Spartan who is enumerated among the Seven Wise Men of Greece. He became one of the ephori of Sparta in 556 B. C. Among the maxims ascribed to him is "Know thyself." He is said to have died of joy when his son gained a victory at the Olympic games.

Chil'oe, an island of South America, in the Pacific Ocean, forms (with many small isles) a province of the republic of Chili. Area, 2398 square miles. It is separated from the mainland by a strait about a mile wide. Length from N. to S., about 110 miles; average width, nearly 40 miles. It is mountainous and covered with magnificent forests. The western shores are rocky, and rise abruptly to the height of 1500 feet or more. The climate is extremely moist. The soil is fertile, and produces wheat, barley, potatoes, etc. Capital, San Carlos. Pop. in 1869, 61,607.



Chil'tern Hund'reds, The Stew'ardship of, in England, a nominal office which a member of Parliament, desiring to withdraw, receives and immediately resigns; since a member cannot resign unless disqualified, and an appointment by the Crown works such disqualification. In old times the steward's duties were to protect from the robbers who lurked in the forests of the Chiltern Hills. When this office is occupied the stewardship of the manors of East

Hendred, Northshead, and Hempholme is made to serve the same purpose.

Chil'ton, a post-village, capital of Calumet co., Wis., on the Manitowoc River, 24 miles N. E. of Fond du Lac. It has a newspaper-office. Pop. of Chilton township, 1517.

Chimæ'ra [Gr. Χίμαιρα], a monster of classic mythology, was described by Homer as having the head of a lion, the body of a goat, and the tail of a dragon. It was supposed to exhale flames of fire. In modern languages the the term chimera is applied to any wild or incongruous fancy.

Chimæ'ra, a genus of cartilaginous fishes, ranked by

Chimæra, or Sea Cat.

Cuvier with the sturgeons (Sturionidæ), but now generally regarded as the type of a distinct family, of which only two or three species are known. The gills have a single wide opening, as in the sturgeons; but the gill-lid or operculum is merely rudimental and concealed in the skin, while there is an approach to sharks in the structure of the gills. The only known species of chimæra is *Chimæra monstrosa*, occasionally found in the British seas, and more common in more northern latitudes. It is sometimes called the "king of the herrings." It pursues the shoals of herrings, and is consequently sometimes taken in the herring-nets. It is seldom more than three feet long. Its general color is silvery white, the upper parts mottled with brown. It produces very large leathery eggs.

Chima'ra, or **Chimari** (anc. *Ceraunii Montes, i. e.* "thunder mountains"), a mountain-range of Albania, between lat. 40° and 41° N., and near lon. 19° E., terminating in Cape Linguetta, called by the ancients *Acroceraunia*.

Chimbora'zo, a conical mountain-peak of South America, is the culminating point of the Colombian Andes, and is 90 miles S. by W. from Quito. Its height, according to Humboldt, who ascended to within 1663 feet of its summit, is 21,422 feet. It rises only 12,000 feet above the adjacent table-land. It was formerly supposed to be the highest mountain in the world, but it is exceeded by Aconcagua, Parinacota, and Sahama of the Andes, and several of the Himalayas. No person has ever reached the summit of Chimborazo, which presents a magnificent spectacle from the Pacific Ocean at a distance of 100 miles or more.

Chime [Fr. *carillon*], the consonant or harmonic sounds of several instruments; correspondence of sound; music performed on a set of bells in a church tower. The term is sometimes used to denote a set of bells which chime or ring in harmony.

Chimere [Fr. *chimère*, from the Sp. *zamarro*, a "sheep skin"], the upper robe worn by a bishop, to which the lawn sleeves are now generally attached. Since the time of Queen Elizabeth it has been of black satin, but previously it was of a scarlet color, like that now worn by bishops assembled in convocation and when the sovereign attends Parliament.

Chim'ney [Fr. *cheminée*], a flue or cluster of flues for carrying off smoke or sustaining a draft in fires maintained in buildings for economical or other purposes. There are no remains of chimneys in the ruins of ancient cities, and no evidence from literature that such chimneys existed. Fires were either of charcoal in open braziers, or the smoke of a wood-fire was allowed to escape through a hole in the roof. The earliest remains of chimneys in Europe are somewhat doubtfully referred to the twelfth century. An earthquake in Venice in 1347 destroyed many chimneys. The year 1368 is assigned for the building of the first chimney in Rome. Early in the seventeenth century many houses of well-to-do yeomen in England had no chimneys. Their general use in France was of even later date. The earliest chimneys were cylindrical and very high. Many-flued chimneys are much later. Of late the construction of tall chimneys for manufacturing purposes is very common, some exceeding in height the tallest spires. They are built from the inside.

The principle of the draught of chimneys is, that a column of heated air is lighter than a column of cool air of the same height, and the greater the height of the heated column, the greater the difference of weight between the column of air within and without the flue. This is one reason why the chimneys of furnaces and mills are made so high, since a powerful draft can thus be easily maintained. It is also important to have the flue vertical, so as to prevent the friction of the air and the loss of heat which a long passage causes. If all the draft passes through the fire, so that the rising air becomes well heated, there is but little danger of downward currents causing a smoky chimney. The throat of the chimney of an open fireplace should be well contracted, and be directly over the fire, thus causing an intensity of draft at the throat, which will tend to overcome any downward currents which may exist in the chimney.

In towns especially chimneys are liable to be overtopped by neighboring buildings, and such chimneys are liable to become smoky during high winds, because the lofty walls deflect the wind and cause it to blow down the chimney. Various revolving and other cowls and chimney-tops have been devised to remedy this trouble. One of the best of these is Espy's ventilator, which does not rotate, and which is always effective, whatever be the direction of the wind. Another cause of smoky chimneys is insufficient ventilation. If air cannot enter a room rapidly enough to supply the draught of the chimney, it is obvious that the draft will be diminished. The most complete investigations in the matter of curing smoky chimneys are those of Count Rumford.

Chimney Rock, a post-village and township of Rutherford co., N. C., about 72 miles W. N. W. of Charlotte. Pop. 1024.

Chimpan'zee, the *Troglodytes niger*, an anthropoid or tailless ape of tropical Africa, noteworthy as one of the species of mammals which most closely approach the form and anatomical structure of man. It is about five feet high, covered with dark hair, is gregarious, and arms itself for defence with clubs and stones. It can be tamed and taught to walk, sit in a chair, and eat like a human being. Its arms are much longer than a man's, it has thirteen dorsal vertebræ and pairs of ribs instead of twelve, and the structure of its hand is far less delicate and complete than man's.

China. See Chinese Empire.

China, kī'na, a name of cinchona bark often to be met in books, and in common use on the continent of Europe. It is especially used by homœopathic practitioners. The name is derived, not from the empire of China, but from *kina* or *quina*, the Peruvian name of cinchona.

China, or **China-ware.** See Pottery and Porcelain Manufacture, by Prof. C. F. Chandler, Ph. D., LL.D.

China, a township of Lee co., Ill. Pop. 2351.

China, a post-township of Kennebec co., Me. P. 2118.

China, a post-township of St. Clair co., Mich. P. 1637.

China'bee, a township of Talladega co., Ala. P. 810.

China Clay. See Kaolin.

China Grass, or **Chinese Grass,** a vegetable fibre which the Chinese manufacture into a beautiful fabric called "grass cloth." It is also manufactured in Europe to some extent. It is obtained mostly from the *Bœhmeria nivea*, a plant of the order Urticaceæ. (See Ramie.) Grass cloth has a glossy appearance and a silky lustre. The plant yielding this excellent fibre flourishes in the southern parts of the U. S. under proper cultivation.

China, Great Wall of, the most remarkable fortification ever erected by human hands, was constructed by order of the celebrated emperor Chi- (or Tchi-) Hoang-Ti, for the purpose of protecting the northern and north-western frontier of the empire from the hordes of barbarians who were then swarming in that part of Asia. To accomplish this great object, several millions of men, it is said, were occupied for the space of ten years, during which time half a million of those employed on the work perished. It was completed in 211 B. C. The entire length of the wall is about 1250 miles, the height being from twenty to twenty-five feet, with towers about 100 yards apart and forty feet high. The wall is much thicker at the base than at the summit, which, however, is sufficiently broad to admit of six horsemen riding abreast. Each face of the wall was built of hewn stone or brick, with earth filled in between. No inconsiderable part of this great fortification is now in a ruinous condition, and some travellers whose attention has been directed chiefly to such portions—which, being constructed principally of earth, do not after a lapse of nearly twenty-one centuries present a very imposing ruin—have been led to speak disparagingly of the whole work. But those Europeans who have examined the work more carefully speak of it in a very different tone, and assert

that the portions which are faced with stone exhibit masonry of a very superior kind, the stones being admirably fitted together, and that the arches, in particular, are exceedingly well constructed. To give an idea of the quantity of material used in the erection of this great wall, it may be stated that a careful calculation has shown that it would be more than sufficient to construct a wall six feet high and two feet thick twice round the world. (See W. H. SEWARD'S "Travels around the World," 1873.)

China Grove, a township and post-village of Pike co., Ala., 32 miles S. E. of Montgomery. Pop. 1080.

Chinande'ga, a town of Central America, in Nicaragua, is in a fertile plain about 10 miles from the Pacific Ocean and 18 miles N. W. of Leon. The houses are built of adobes, and are only one story high. Cotton and sugar are produced in the vicinity. Pop. 8000.

China, Pride of (*Melia Azedarach*), a small and beautiful tree of the order Meliaceæ, a native of Southern and Western Asia, naturalized in the Southern U. S. It is often called "pride of India," "China tree," and "bead tree." The bark of its root is used as a vermifuge, and constitutes the drug azedarach. It has a sweetish fruit about the size of a cherry, often eaten by children without harm, though considered poisonous. Its wood is hard and beautiful. This tree is naturalized in the south of Europe. An allied species, the *Melia Azedarachta*, the margosa or neem tree of India, yields a febrifugal bark, and a sap (toddy) used as a beverage, while the pulp of its fruit, like the olive, affords a useful oil.

China Root, the rhizome of *Smilax China*, a climbing shrubby plant allied to sarsaparilla, a native of China, Cochin-China, and Japan. The stem is round and prickly, the leaves thin and roundish oblong; the rhizome tuberous and large, sub-astringent and diaphoretic. It is occasionally used in medicine in Europe, but it is also employed in the East as an article of food, for it abounds in starch.

China Sea [Fr. *Mer Orientale;* Chinese, *Toony Hai*] is that portion of the Pacific Ocean which extends between China and Siam on the W., the Philippine Islands on the E., and Borneo on the S. The chief ports on this sea are Canton, Manila, and Singapore.

China Wax, a substance resembling beeswax, produced by an insect (*coccus*) which lives on the *Fraxinus Chinensis*, an ash tree of China. The wax is scraped from the branches, melted, and strained. China also exports Japan wax, obtained from the fruit of *Rhus succedanea*, a sort of sumach tree.

Chin'cha Isl'ands, three small islands in the Pacific Ocean, about 14 miles from Peru, to which they belong; lat. 13° 39′ S., lon. 76° 28′ W. Here are large deposits of guano, and here multitudes of penguins and other oceanic birds build nests and breed. Neither of these islands is more than a mile in extent. They present cliffs 300 feet high and perpendicular, with numerous caves into which the sea dashes. The entire supply has been recently exhausted. (See GUANO.) The exportation of this manure from Peru in the years 1871–72 was 1,187,327 tons.

Chinch-bug, the *Rhyparochromus leucopterus* of Say, a hemipterous insect of the family Lygæidæ, which is a subdivision of Latreille's great family Corisiæ. The chinch is a great pest to the wheat crops of the U. S., attacking also Indian corn, grass, and the various kinds of grain and garden vegetables, destroying, in some years, much property. The female lays her eggs, some 500 in number, in the ground, and there are often two broods of larvæ in a single year—the first attacking the wheat sometimes as early as the middle of June, and not always disappearing until the middle of August. The next brood comes in autumn. The bug is $\frac{1}{10}$ of an inch long, and has white fore wings, each having a black spot on the middle of its edge; the body is mainly black, but the wingless young are at first red, with a white band on the back. The chinch-bug attacks the tender parts of plants, sucking the juices, and apparently poisoning the part which is bitten. The insect is not uncommon in the E. and N. E. of the U. S., but there its ravages are not conspicuous, and little attention is paid to it. The valley of the Mississippi has in some years suffered terribly from this cause. Thus, in 1864 one-half the corn (maize) and three-fourths of the wheat were destroyed by this pest throughout large districts, and the total damage to crops was estimated at $100,000,000 in U. S. currency. In 1865 a seemingly providential epidemic attacked the larvæ of the chinch-bug, and most effectually checked the destructive process, so that for some years it was not easy for entomologists to find specimens; but since that time the species has so multiplied that in some districts great destruction of grain has ensued. The false chinch-bug is often mistaken for the foregoing.

Chinchil'la [Sp. pron. chin-cheel'yä], (*Chinchilla*), a South American quadruped of the order Rodentia, and of a family, Jerboidæ, allied to the rabbits. There are several genera of Jerboidæ, distinguished in part by the toes, the true *Chinchilla* having four, with the rudiment of a fifth, on the fore feet, and four on the hind feet. All the family are gregarious, feed on roots, and live either in holes in rocky districts or in burrows. They are valued for their fur, particularly the chinchilla of the Andes (*Chinchilla lanigera*), of which the fur constitutes an important article of commerce. Their numbers are decreasing in consequence of the demand for the fur. The ancient Peruvians were accustomed to employ this fur as wool for the manufacture of fine fabrics. It might profitably be kept in a domesticated state. Chinchilla wool is variable in quality, and is perhaps the product of several species. The chinchilla is about the size of the common rat.

Chinchi'lla (anc. *Salaria*), a city of Spain, in the province of Albacete, on a hill 10 miles S. E. of the city of Albacete. It was formerly fortified, and is still enclosed by old walls. It has a fine church, and manufactures of cloth, linen, glass, earthenware, etc. Pop. 6044.

Chinese Architecture. In China the rise of the arts seems to have been constantly repressed by the state of mechanical drudgery and servitude in which the people are kept. In their painting, for example, the most exact imitation of plants, fruits, and trees is thought indispensable. Every matter relating to building is the subject of regulation by the police, which, rather than theory, governs its architecture. The laws of the empire detail and enforce with the greatest precision the mode of constructing a lou or palace for a prince of the first, second, or third rank, of a grandee, of a mandarin, etc. According to the ancient law of the kingdom, the number and height of the apartments, the length and height of a building, are all regulated with precision, from the plain citizen to the mandarin, and from the latter up to the emperor himself. This alone is sufficient to account for the poverty and want of invention in Chinese art.

In speaking of the principles of Chinese architecture, the word is not applicable in the same way as when we speak of classical architecture, but is meant to apply to those primitive causes which gave birth to it. Character and taste in every species of architecture are the necessary results of these elements. There can be no doubt that the tent is the real model of all Chinese buildings. One of the strongest proofs of this fact is the form of the Chinese roof. Nothing but a tent or pavilion could have given the idea of it. Again, there is nothing like the appearance of a member of wood, similar to the architrave, destined to lie on the tops of the columns, and receive and support the remainder of the carpentry. The Chinese roofs, on the contrary, jut out beyond the columns, whose upper extremity is hidden by the eaves; hence the omission of the use of capitals. It is easy to perceive that extreme lightness must result from this imitation.

Lightness, in fact, is the essential character of Chinese architecture, but there is another characteristic quality, both of the model and the copy, that is observable in the edifices of China; and this is its gay appearance. In this respect scarcely any style presents a more pleasing effect. Its roofs, single and double, brilliantly painted, its gayly-diapered porticoes, the gloss over the whole surface, the harmony of this species of decoration with the light and flowing forms of the buildings themselves, so please the eye when it is accustomed to see them that our cold and monotonous mode of decoration may well appear uninviting in contrast. REVISED BY CLARENCE COOK.

Chinese Camp, a post-township of Tuolumne co., Cal. Pop. 2220.

Chinese Empire, a vast territory of Eastern and Central Asia, occupying nearly a third of that continent. It lies between lat. 18° 20′ and 56° N., and lon. 70° and 143° 30′ E. It is bounded on the N. by Russian Asia, on the W. by Independent Tartary, S. by Hindostan and Farther India, and E. by the Pacific Ocean. The area is about 4,098,823 square miles; the population is variously estimated at from 446,500,000 to 550,000,000. The empire, besides China proper, contains Corea, which is nearly independent, also Manchooria, Mongolia, Thibet, and the Loo Choo (Lieu-Khieu) Islands. These regions, together, are nearly equal to a tenth part of the habitable globe.

CHINA PROPER [called in the Chinese language *Choong-Kwoy*, "central kingdom"*] occupies about one-third of the

* According to Pauthier, the Chinese did not, as is commonly supposed, give the name of Central Kingdom to their country because they considered it in the centre of the world, but because in the time of Confucius the country was divided into many petty kingdoms, the central one of which, having the chief power, gave name to the empire.

area of the empire. It extends in latitude from 21° to 41° N., and in longitude from 98° to 123° E. It is separated from the dependency of Mongolia on the N. by the Great Wall of China, by far the most extensive fortification ever undertaken by man. This wall is about 1250 miles in length, and is from twenty to twenty-five feet high. (See CHINA, GREAT WALL OF.) On the W. of China lies Thibet, on the S., Burmah, Anam, and the China Sea, and on the E., the Pacific Ocean. The important islands of Formosa and Hainan also belong to China proper. The capital of the empire is Peking.

China has a coast-line of more than 2500 miles, with an area of about 1,279,072 square miles, and a population variously estimated at from 420,000,000 to 536,909,300.

China is divided into eighteen provinces, viz.:

Provinces.	Area in sq. miles.	Population in 1852.	Capitals.
Pe-Chee-Lee	59,934	46,313,360	Pao-Ting-Foo.
Shan-Tong	65,100	41,700,621	Tsee-Nan-Foo.
Shan-See	55,278	20,166,072	Tie-Yuen-Foo.
Ho-Nan	65,100	33,173,526	Kai-Foong-Foo.
Kiang-Soo	44,500	54,494,644	Nan-King.
Ngan-Hwi	48,461	49,201,992	Ngan-King-Foo.
Kiang-See	72,180	43,814,866	Nang-Chang-Foo.
Che-Kiang	44,470	26,256,784	Han-Chow-Foo.
Fo-Kien	39,183	14,779,158	Foo-Chow-Foo.
Hoo-Pee	70,460	27,370,098	Woo-Chang-Foo.
Hu-Nan	74,325	18,652,507	Chang-Sha-Foo.
Shen-See	67,400	10,207,256	Si-Ngan-Foo.
Kan-Soo	86,608	15,354,875	Lan-Choo-Foo.
Se-Chuen	166,832	21,435,678	Ching-Too-Foo.
Quang-Tong	79,451	19,174,030	Canton.
Quang-See	78,260	7,313,895	Kwei-Lin-Foo.
Kwei-Chu	64,547	5,228,219	Kwei-Yang-Foo.
Yun-Nan	107,983	5,561,320	Yun-Nan-Foo.
Total.	1,279,072	536,909,300	Peking.

Geology.—The geology of China is not well known, but it is certain that the azoic rocks are very extensive in the S. and W. The Devonian and cretaceous strata are also extensive. Evidences of glacial action have also been observed. Coal and petroleum are found, the former abundantly. The anthracite coal seems to be especially important, but the coal of China is probably not of the carboniferous age. Silver is mined very extensively in the S. W. Gold, copper, lead, mercury, zinc, and especially iron, are abundant. Kaolin and the fictile clays are excellent in quality, and industrially very important. The engineering of mines is not well understood in China. Salt is produced in very great quantities, and yields the government a large revenue.

Physical Geography.—China is divided into three great valleys, each with its great river. These valleys are separated by two principal mountain-chains. The most northern of these chains (the Thsin-Ling, or Blue Mountains) extends in an irregular manner from W. to E., separating, to some extent, the valley of the Hoang-Ho on the N. from that of the Yang-Tse-Kiang on the S. South of the valley of the latter river is the great Yan-Ling chain, which extends north-eastwardly from the Himalayas to the Pacific. This range is said to have but few passes, and to have peaks 12,000 or more feet high. The valley of the Choo-Kiang, or Canton River, lies S. of this range. It is much the smallest of the three great basins, but is very populous, and commercially important. The eastern parts of the two former valleys constitute the Great Plain of China, a fertile and populous district. In the N. E. is a fourth basin, that of the Pei-Ho. The Yang-Tse-Kiang, the largest river of China, is a magnificent stream, which is of great importance to the internal commerce of the empire. It has a course of 2900 miles. The Hoang-Ho is about 2000 miles in length, but is so rapid as to be unsuited to Chinese navigation; but at present both these mighty streams are successfully navigated by American and European steamers, built expressly for the purpose. The two rivers are connected with each other and with Peking by the Grand Canal, which is said to be the largest and formerly the most important in the world. It is 650 miles long. A recent alteration in the course of the Hoang-Ho has, it is said, greatly diminished the usefulness of this famous canal.* The waters of China abound in fish, which furnish immense supplies of food.

Productions, etc.—China is the principal source of the commercial supply of tea for the whole world, Japan and Assam being the only other countries where its production is at all important. It also produces great quantities of silk, cotton, camphor, varnish, indigo, rhubarb, rice, maize, barley, wheat, tobacco, and fruits of many kinds. The population of China is so great that it has become necessary to carry on agriculture with great care in order to produce sufficient food. Every year the emperor of China, accompanied by the great dignitaries of the state, repairs to the Sacred Field and ploughs a furrow, by way of example to the nation. The steepest hillsides, it is said, are terraced, to increase the surface of the soil, rocks are covered with earth, the lakes have numerous floating gardens, and the bottoms of streams are planted with aquatic vegetables whose seeds or roots are used as food. The greatest economy is practised in the saving of manures. The wealthy Chinese have a strong liking for ornamental horticulture, and many of the most beautiful of our cultivated flowers have been developed in their gardens.

The production of food is not sufficient for the home-supply, great quantities of rice being imported from Siam and the Malay islands. This trade is carried on in small vessels, called *droghers*, which are often commanded by Englishmen or Americans.

The botany of the empire is very rich, from the extreme range of its latitudes and its great variations in altitude. In general, the flora may be said to resemble that of America more than that of Europe. The bamboo is one of the characteristic plants of China, and is largely used in building and for a great variety of purposes. It is said to be next to the rice-crop, commercially the most valuable production of the country. Among the native trees of China may be mentioned the curious gingko tree, well known in our parks and private grounds.

The zoology of China has not been thoroughly explored. The elephant, rhinoceros, antelope, and deer of several species are known, and bears, tigers, and other carnivorous animals are said to exist. Wild camels have been found in the western dependencies. Among the native insects is the silkworm. The ichthyology of this empire is very rich, though little studied by Europeans. The domestic animals of China are generally inferior to those of the Western nations. In addition to the kinds kept by us, they make use of the camel in the northern provinces. Domestic fowls are kept in great numbers, including several beautiful pheasants of kinds not known in Europe.

Inhabitants.—The Chinese are generally spoken of as a Mongolian race, but their language and physiognomy connect them with the races of Farther India rather than with the Mongols proper. Their language is of the so-called monosyllabic family, and has resemblances to the Burmese and other similar languages. (See CHINESE LANGUAGE AND LITERATURE.) Their coarse black hair, tawny skin, and oblique eyes give them a highly characteristic expression. They are generally a peaceable, industrious, and thrifty people, but they are said to be sensual, cruel, dishonest, and deceitful. It is probable that there are many persons of superior character among the better classes, and that the sweeping statements so often made against their character as a people are gross exaggerations.

Though the Chinese are skilled in imitative workmanship, they seem at present to be singularly destitute of inventive genius. Anciently, however, it must have been otherwise, for the mariner's compass, gunpowder, printing, and the manufacture of porcelain, paper, silk, and clocks, all were certainly first invented in China. Though not without taste in ornamental work, their skill in this direction must be considered good artisanship rather than really art in the best sense of the latter term. Their knowledge of astronomy is considerable, though wrong in theory.† Of physical and natural science they are profoundly ignorant. Their system of medicine is extremely unphilosophical and puerile.

Government.—The government is regarded as a patriarchal one. The emperor, though theoretically absolute, is really limited in his power by a carefully-digested code of laws, which, however, he can modify by his edicts. At the capital reside the ministers of state, six in number, three being Chinese and three Manchoos. These, with several assistants, constitute the privy council of the emperor. Next below this council is the grand college, which has important legislative and administrative functions. Besides these there is a college of censors or inspectors, who see that all officers in the country are faithful in their duties. The six privy councillors are each at the head of one of the six departments of state, viz.: (1) civil service, (2)

* In 1853 (or, according to some authorities, about 1850), the Hoang-Ho, leaving its former channel at a distance of about 200 miles from the sea, made for itself a new course towards the N. E., so that now its waters are discharged into the Gulf of Pe-Chee-Lee. Besides greatly injuring the Grand Canal, this change has made its former valley almost a desert from drought, while the country near its present course is frequently deluged with water. It is proposed by the Chinese government to restore the stream to its old bed. (See the "Journal of the Royal Geographical Society" for 1870.)

† They are said to have been able to calculate eclipses long before the Christian era, and their observations of a planetary conjunction which occurred 2375 B. C. have enabled chronologists to fix the date of the reign of the emperor Chuen-Hiu, whose date is given in Chinese official documents so as pretty nearly to agree with the above.

the finances, (3) religion, (4) war, (5) justice, (6) public works. A seventh department, that of foreign relations, has recently been established by the prince Kung, uncle to the emperor T'oong-Chee. Each of the eighteen provinces is under a governor, and has an internal administration of its own. Government officers have the title of mandarin, and are of various grades. The principle of competitive examination for the public service has long been carried out in China more thoroughly and successfully than in any other country.

Education is held in the highest esteem in China, and learning is rewarded not only by honorary titles, but by lucrative offices under the government. A great majority of the men can read and write. Recently, the government has sent quite a number of young men to America to be instructed in the sciences.

The manners and customs of the Chinese differ much from ours, but are certainly far removed from barbarism. Vice, as in all populous countries, is very prevalent, but among the better classes, at least, virtue is held in high honor. Crime is punished with extreme severity. Notwithstanding the rigor of the legal administration, the personal freedom of good citizens is remarkably secure. The position of the women, especially those of the lower classes, as in other Asiatic countries, is lamentably degraded.

In consequence of the density of the population of China, vast numbers of her people have in late years emigrated to Manchooria, Borneo, Siam, the Sandwich Islands, the United States, Peru, Guiana, and the West Indies. They are a remarkably industrious and thrifty class of emigrants, but the low rates at which they are willing to work render them objects of dislike to other laborers, and threaten seriously to complicate the social problems of the time.

Religion.—The religious (or rather philosophical) system of Confucius is the basis of the social life of China. (See CONFUCIUS.) It is received by most of the educated classes. BOODHISM (which see), modified by Confucianism, is the popular religion. The worship of deceased ancestors is a highly important part of the national religion. There is also a numerous sect called Tauists, who worship certain beings called Sang-Ching, or the "Three Pure Ones." (See TAUISM and LAO-TSE.) The Tauists are believers in spirits, and many of their performances resemble the wonders of our modern Spiritualists. There have been a few Jews and many Mohammedans in the empire for centuries. Christianity was introduced by the Nestorians in the seventh century, but Nestorianism seems to have been entirely suppressed by persecution in the fourteenth century. Roman Catholic missionaries first went to China about 1240. Huc estimates the number of Roman Catholics in the empire at 700,000, but other respectable authorities place the number at about 300,000. There are many Protestant and several Russian-Greek missionaries in China, who have had some success in making converts.

History.—Although the Chinese civilization is undoubtedly far older than that of the Greeks, only the merest hints of the existence of China are to be found in the ancient classic authors. All the best geographers appear to be agreed in considering the *Serica* of the later Latin writers (ἡ Σηρική of Ptolemy) as corresponding with the northwestern part of China. The name Serica (which is also the Latin term for "silk") was doubtless derived from the silk (called, according to Klaproth, *sirkek* by the Mongols) for which the country was so celebrated. The Latin word *Sinæ* (Gr. Σῖναι and Σίναι), supposed to be identical in origin with the Chinese *Tsin*, or *Tseen*, the name of a province which has furnished, through the Hindoos,* to the Western nations the name for the whole country, properly denoted the people of a city or province in the central part of China. It was applied by Ptolemy to the people dwelling in the south of China: it appears also to have been used in a vague and general sense for the Chinese nation. (See on this subject SERICA and SINÆ, in SMITH'S "Dictionary of Greek and Roman Geography.")

The Chinese myths give the empire a duration of 7000 years, but the historical period, according to most authorities, begins with the year 2207 B. C., though some dates previous to that time are given with tolerable certainty. Bunsen, however, states that systematic Chinese history hardly goes farther back than 1991 B. C., the date of the accession of the great emperor Yu, the Charlemagne of the East, who extended the sway of the Shen-See dynasty to Southern China, and who rendered the Great Plain habitable by diverting the Hoang-Ho to a new channel.

The national hero of China is the great emperor Shee-(Chi-) Hoang-Ti, sometimes called Ching-Wang (246–210 B. C.), who restored unity to the divided empire, expelled the Mongols, and caused a great part of the national literature to be burned, in order to destroy the power of the learned classes and overcome the popular reverence for tradition. He was the builder of the Great Wall above alluded to.

The art of printing was practised as early as 202 B. C. Booddhism was introduced in 65 A. D. The earliest authentic account of China known to have been published in Europe is that of Marco Polo, who lived seventeen years in the country, and returned to Europe in 1295. The country had been previously visited by Roman Catholic missionaries.

The long course of Chinese history has been disturbed by many civil wars and contests with the Mongols. The present reigning dynasty, said to be the twenty-sixth in number, is of Manchoo origin, and was established in 1649; and to this day the Manchoos have an influence in the national politics far exceeding their relative importance as a people.

The Chinese long excluded foreigners with the utmost jealousy from their country. China was visited by the Portuguese in 1517, but they were forbidden to land in the empire in 1521. In 1537, however, they obtained a footing at Macao, which has since been in their power. In 1862 it was definitively ceded to them. The Dutch and Spanish early opened a trade with China by way of their Eastern colonies. The British made several unsuccessful attempts to establish commerce with China. The first effort was made in the reign of Queen Elizabeth, but it was not till 1700 that Canton was opened to their trade. The Russian overland trade was established in 1727, and the first American consul was allowed to reside in Canton in 1802. During all this time foreign merchants were often treated with much indignity. In 1838, in consequence of the unlawful importation of opium by British ships, serious troubles broke out at Canton, and in the following year actual hostilities began between Great Britain and China. After the capture of Canton, Amoy, Shang-Hai, and other important cities the Chinese were compelled to make peace, to cede Hong-Kong to the victors, and to open Canton, Amoy, Foo-Chow, Shang-Hai and Ning-Po to European commerce. The number of these "treaty-ports" has since been increased to fifteen. The Russians have an overland trade and regular mails from Kiakhta on the Siberian frontier, and British merchants are attempting to establish a land trade between India and China by way of the Irrawaddy River.

In 1850 a man of humble origin, named Tae-Kwang, who had received some notion of Christianity from a tract issued by missionaries, conceived the idea of founding a new religion and at the same time expelling the Manchoo dynasty. He was joined by many of the lower orders who were suffering from want, and in October of the same year the first battle of the Tae-Ping rebellion was fought. This rebellion at one time threatened the existence of the empire, and was finally suppressed in 1864, after great bloodshed. It is probable that but for the aid of contingents furnished by England and France the rebellion might have been successful.

The foreign warehouses at Canton were burned in 1856, and attempts having been made to poison the British at Hong-Kong in 1857, hostilities were commenced against China by Great Britain and France: and in December of that year Canton was bombarded, and on the 5th of Jan., 1858, it was taken. In the following June a treaty was made by the Chinese, which was soon violated. In Oct., 1860, the English and French forces entered Peking, and the Chinese government granted all their demands. The allies then turned their arms against the Tae-Ping rebellion, which received its fatal blow by the capture of Nanking (July 19, 1864) and the suicide of the rebel emperor. The rebellion of the Mohammedans in the province of Yun-Nan, called Panthays, which began about 1850, led in 1868 to the establishment of an independent Mohammedan government in the capital of the province. The leader assumed the name of King Solomon (Ooensoai), and his empire in 1872 embraced about 63,000 square miles, with a population of 4,000,000. In 1873 this government was reported as subjugated, its sultan killed, and Yun-Nan reduced to Chinese rule. Another Mohammedan rebellion, which in 1862 broke out in the capital of the province of Shan-See, led to the establishment of the independent empire of East Toorkistan, under the rule of Yakoob Ooshbegi, which in 1872 had an area of 740,000 square miles and about 1,000,000 inhabitants. In consequence of these troubles the Chinese government, under the advice of Prince Kung, the foreign minister, has adopted the policy of seeking the alliance of foreign powers. In 1867 the American minister, Mr. Burlingame, was sent by the government as extraordinary ambassador to the U. S. and the principal European nations, but unfortunately died before his plans had been fully carried out. In 1868 the government established a university at Peking, to which American and European professors were appointed. On June 21, 1870, a bloody massacre of Europeans and native Christians took place at Tien-Tsin.

* The Hindoo name for China is *Cheen* (or *Tcheen*).

The chief articles of export are tea and raw silk. The former was, in 1870, valued at 30,280,000 taels (1 tael = $1.39), in 1871 at 40,120,000; the latter in 1870 at 21,270,000 taels, in 1871 at 25,960,000. The chief articles of import are opium (25,000,000 taels) and cotton goods (22,000,000). The total exports, exclusive of precious metals, amounted in 1870 to 61,690,000 taels, the imports to 69,290,000. The merchant-navy numbered about 8000 vessels, with an aggregate tonnage of 616,000. The number of entrances and clearances in the Chinese ports in 1870 is stated to have been 14,136, with an aggregate tonnage of 6,907,528. The duties levied in the ports open to foreigners amounted in 1870 to 9,545,848 taels. The army numbered about 600,000 men, exclusive of 200,000 Tartar troops. The soldiers, when not performing active service, carry on a trade at home. The war-navy consists of 826 vessels, with 3600 guns.

CHARLES W. GREENE.

Chinese Language and Literature. As the leading member of the group of monosyllabic languages which occupy South-eastern Asia, and constitute, with a possible exception or two, the whole of the monosyllabic class, the Chinese has for the student of language a very great interest. This monosyllabism is not, as a few scholars have held, a state to which they have been reduced by a process of phonetic decay, but manifestly a primitive condition. It represents a stage out of which all other languages, whether of the agglutinative or inflective type, have passed, while these, from arrested development, have remained behind. Chinese words are not only altogether destitute of inflection, but they are hardly parts of speech in the sense which we attach to the term, being to a great extent still in the root state. The same word may, according to its position in the sentence, be noun, adjective, adverb, or verb; *e. g., sin* must be variously translated "fidelity," "faithful," "faithfully," "believe." This indefiniteness, however, attaches to the words only when taken separately, and disappears in the sentence. Chiefly by the value given to position, but partly also (especially in the spoken language) by the use of certain words as signs of grammatical relation, logical precision of statement is attained. Of this class are such words as *tsz̆* and *erh*, both meaning "son," and *t'ou*, "head," which have nearly the force of substantive endings, and *tih*, of an adjective ending. Being cut off from the resources of derivation for the multiplication of forms, while the development of signification has gone on as in other languages, the number of homophonous words is very great. The phonetic combinations of which the language admits are comparatively few and simple, and this poverty has been still further increased by phonetic decay, the effects of which are traceable even here, though of course to a much more limited extent than in inflective languages. The number of distinct vocables differs considerably in the various dialects, the highest limit being not far from 1000 and the lowest 500. The Kwan-hwa has, according to Edkins, 532 monosyllables; according to Morrison, who, however, includes in one class the aspirate and unaspirated mutes, only 411; the Shanghai dialect (Edkins), 570; the Fuchau (Baldwin and Maclay), 928; the Canton (Williams), 707. By the aid of tones, similar to those which we use for the purpose of emphasis and expression, this number is increased two or three fold, being raised in the Kwan-hwa to about 1600. The same phonetic combination pronounced in different tones constitutes so many different words, and so essential a part of the pronunciation is the tone, that a wrong tone will sooner occasion misunderstanding of a word than will the substitution of a wrong consonant. In the modern dialects the number of tones varies from four to eight, the smaller number being found in some of the districts of Central China; in the Kwan-hwa there are five, in the Fuchau and Amoy dialects, seven, in the Canton, eight. In the dictionaries of the T'ang dynasty (A. D. 618–905), which are still the standard rhyming dictionaries, only four tones are recognized—namely, the *p'ing*, "level," *shang*, "rising," *ch'u*, "vanishing," and *juh*, "re-entering" or "abrupt;" and these, divided into an upper and lower series, constitute the eight tones of the Canton dialect. The original identity of meaning in words which differ merely in tone is in some cases still apparent; *e. g., ting* (noun), "nail," and *ting* (verb), "to nail;" *mai*, "buy," and *mai*, "sell;" but in general the etymological connection, if it exists, cannot be traced. The number of words which coincide both in sound and tone being, however, still very large, other means are necessary to remove the ambiguity, and in the spoken language phrases composed of two or more words are largely used in the place of simple terms. Two synonyms are frequently thus joined; *e. g., shu-mu*, "tree." *Shu* and *mu* have each various significations besides that of "tree," but there is no other in which they agree, and the combination thus becomes definite. Other phrases are taken in a collective sense; *e. g., hiung-ti*, "older brother younger brother," for "brother" or "brothers;" or in a derived sense; *e. g., tung-si*, "east-west," for "thing." These phrases, which often extend to four or five words, make a near approach to proper compounds, one of the words uniformly receiving a stronger accent, supported in the case of the longer phrases by a secondary accent.

Another feature not peculiar to the Chinese, but worthy of mention for the prominent part which it plays, is the frequent use of numeratives in counting; like our *head* of cattle, *brace* of ducks. More than a hundred such words are in use, each limited to a certain class or classes of objects.

Spoken by a population variously estimated at from two to four hundred millions, the Chinese not unnaturally is divided into strongly marked dialects. Of these the Kwan-hwa, commonly called by Europeans the mandarin or court dialect, has the widest currency, being spoken with minor differences over the whole north and west of the empire, and on the east reaching as far south as the Yang-tze Kiang. It is, further, the language of official communication throughout the empire, and the only one of the popular dialects which has received any considerable literary cultivation. Phonetically, it is the poorest of the dialects. The only consonant finals of which it admits are the nasals *n* and *ng*, and the sonant initials *b, d, g, v, z*, found in some of the other dialects, are wanting here. The south-eastern dialects, in the provinces of Canton and Fukien, on the other hand, are the most archaic, having preserved the final mutes *p, k, t*. Differing largely in vocabulary, as well as in the form and tone of the words common to them, these several dialects are not generally understood (except the Kwan-hwa) beyond the limits of a single province. There are in addition many local dialects, less marked in character and of a more limited currency. This diversity does not, however, extend to the written language, which is uniform throughout the empire, and, to a degree unapproached in any other literature, uniform also throughout the whole course of its history. Its development has been to some extent independent of the spoken language, and forms one of the most interesting chapters in the history of writing.

According to Chinese tradition, knotted cords, similar perhaps to the Peruvian *quippos*, were used in the earliest times for keeping records. In the mystical figures of the Yih-king, ascribed to Fuh-hi, Chinese scholars are wont to find a kind of graphic system. The date of the invention of the present characters, commonly ascribed to Tsang-kié, about 2600 B. C., cannot be fixed even approximately, but the history of the successive stages of the development of the system is written in the characters themselves. The first signs were purely ideographic, being rude representations of the objects named. A circle with a point in the centre stood for the sun, a crescent for the moon, a three-pointed peak for a mountain. The changes of form which they have undergone, arising in part from the different materials used in writing, have left in the present characters little resemblance to the objects pictured. The limits of this method of direct representation were soon reached. A few words denoting position and number were represented by points and strokes; thus, a point above or below a horizontal line signified "above" or "below;" a stroke through the centre of a circle, "middle;" one, two, or three horizontal strokes, the numerals 1, 2, 3. The combining of two or more signs to express a single idea, either by direct or symbolical representation, was another easy step; thus "water" and "eye" make up the sign for "tear;" "man" and "mountain" stand for "fairy;" "sun" and "moon" for "light."

By far the greater number of characters, however, are formed on a new principle, the combination of an ideographic and phonetic element in one sign. The number of homophonous words is, as we have seen, very large, and a sign having been found for one of these, it is used phonetically to represent the sound of the others, being differentiated in each case by an additional sign, which indicates in a general way the meaning. In this combination one of the parts, termed the *phonetic* or *primitive*, gives up its meaning and retains only its sound; the other, the *radical*, gives up its sound and retains only the meaning. For example, the syllable *tau* has among other significations the following: "sword," "anxious," "appetite," "heart of a tree," "long narrow boat," "a species of fish of a slender form." The first of these, "sword," being represented ideographically, the others are written phonetically by the same sign, further defined by the radicals for "heart," "eat," "tree," "boat," "fish." The Chinese written language aims to provide a sign not merely for every word etymologically distinct, but to a considerable extent also for the different significations of the word. In the example above given the boat and fish were sword-shaped, and hence apparently their name, and possibly the other

meanings may be traced ultimately to the same origin. The word *tau* has various other significations besides those given, and is written with at least half a dozen different phonetics, each of which enters into combination with one or more radicals. The number of different phonetics employed in writing a single word is in some cases twenty or more, and the aggregate number of characters thus formed may exceed a hundred. Some characters are used both as phonetics and radicals. *Tau*, "sword," which in the above examples appeared as a phonetic, enters into other characters as a radical, with the meaning "cut," "divide." A character composed of a radical and phonetic may itself be employed as a phonetic in forming new characters. The sound of a composite character is not always that of the phonetic which it contains, but the variation is usually not great, and more frequently in the initial than in the final sound. The number of phonetics in common use is about 1000. Marshman in his "Clavis" enumerates 3867, but more than half of these are employed only once or twice each. These phonetics represent the sound of the word as a whole, without analyzing it into its elements.

There is, however, a kind of syllabic spelling called Fan-ts'ieh, introduced from India by Booddhist priests, and first currently used in dictionaries of the fifth and sixth centuries to mark the sound of characters with more precision. One series of characters is chosen to represent the initial sounds, another the final sounds, together with the tone, the number of both varying according to the dialect. Thus, *king*, "classic," in the dictionary of K'ang-hi is spelled with the characters *k-ien l-ing*, the first being simply the sign of the initial *k*, the second of the final *ing*.

In the arrangement of the characters Chinese dictionaries follow three different methods. By the first the characters are distributed according to their meaning under a certain number of categories, such as heaven, earth, body, etc. This method is found in the "Erh-ya," the oldest dictionary in the language, containing definitions of classical terms, and itself sometimes reckoned among the classics; also in many others, especially dictionaries of foreign languages, Mongol, Mantchoo, etc. The second principle of arrangement is according to the radical part of the character. This appears first in the "Shwoh-wen," published A. D. 100, in which 10,000 characters are arranged under 540 radicals, a number slightly increased in subsequent dictionaries, but in the "Tsŭ-wui," published during the Ming dynasty, reduced to 214. This last number is retained in the two principal dictionaries of the present dynasty, the "Cheng-tsŭ-t'ung" and the "K'ang-hi-tsŭ-tien." In the last-mentioned work, with a total of about 44,000 characters, the number found under the different radicals varies from 5 to 1300, or, counting duplicate forms, 1900, the following radicals having each 1000 and upward: *mouth, heart, hand, tree, water, plant.* Under each radical the characters are arranged in the order of the number of strokes contained in the phonetic. In most cases the radical under which a given character should be sought is apparent at a glance; the doubtful cases, where the radical is obscured or where the arrangement is somewhat arbitrary, are resolved by means of a key in which these characters are arranged according to the total number of strokes under the radical to which they are assigned. The third and last method of arrangement is according to the sound of the characters. The usual order in works of this class is the following: the characters are divided into four great classes, according to the tone; each tone divided into smaller classes, according to the final sound, and these sometimes further subdivided, according to the initials. The earliest extant dictionary of this class, the "T'ang-yŭn," published in the eighth century, employs a series of 206 finals. Lieu-p'ing-shui, in the thirteenth century, reduced the number to 107, and his system has since been generally followed. Another dictionary belonging here, the "Pei-wen-yun-fu," is one of the most extensive lexicographical works in any language. It was prepared under the superintendence of the emperor K'ang-hi, and employed the labors of seventy-six scholars, most of them members of the Imperial Academy, for eight years. It gives by numerous citations the fullest illustration of the usage of the language, and was published in 1711, in 130 thick volumes. A translation was announced by Callery, but only one volume published (Paris, 1844). Of the total number of characters in the language, extravagant statements have often been made. The more complete dictionaries contain from 40,000 to 60,000, of which obsolete and duplicate forms and proper names make up perhaps one-half. The number of really different characters which have the sanction of good usage is not far from 25,000, of which about one-tenth are ideographic, and the remaining nine-tenths composed of an ideographic and phonetic element united. Even in the number last given a large proportion of the characters are of rare occurrence, and a knowledge of from 5000 to 10,000 is sufficient for almost all the needs of the scholar.

In no language are the differences between the literary and colloquial idioms so great as in Chinese. The number of characters being many times as great as the number of distinct vocables, the former are not subject to the same variety of meaning, and the precautions against ambiguity required in the spoken language are to some extent unnecessary. A sentence may be perfectly definite when written, yet when spoken be altogether unintelligible. In the classical style this conciseness is carried to the extremest limit. It is in general true of the classical books that, while to the eye they are definite, to the ear they convey no meaning. In this ancient style, termed Ku-wen, all historical, philosophical, and critical works are still written, and no accomplishment is so highly valued among scholars as the mastery of it. Novels and dramatic compositions, which are regarded as quite inferior classes of literature, are written in the Kwan-hwa, in a style but little elevated above the colloquial, and, like it, abounding in compound phrases. The Wen-chang, the style of the literary essays, which is also much cultivated, is of a more artificial character than the Ku-wen, and less esteemed.

The relation of the Ku-wen to the ancient spoken language, whether and how far it represents it, and how far it is the product of a merely literary development, are points upon which scholars are not agreed. That the Chinese have not invented or borrowed a system of alphabetic writing, as so many peoples their inferiors in civilization have done, is the less surprising when we consider that the defects of their system are less sensible in an uninflected language like the Chinese, and that it has undeniable advantages in enabling them to distinguish the great number of words which are identical in sound, but differ in meaning. Still, it is attended with very serious evils, not the least of which is this—that the labor involved in learning and holding in the memory so many arbitrary characters absorbs no small portion of the intellectual energy of the people. Attempts have been made, not without success, to romanize some of the popular idioms, the tones being marked by diacritic signs. Books have been published by missionaries in this character in the Shanghai, Ningpo, Fuchau, and Amoy dialects. To the concise classical style, however, this method is quite inapplicable.

The Chinese characters have undergone in the course of their history great changes of form, and six varieties are now in use. The oldest is the Chuen, called by foreigners the *seal* character, used in seals and often also in ornamental inscriptions and title-pages. The Li-shu, introduced not long before the Christian era, with the change from the iron style to the brush, and the substitution of silk and linen for wooden tablets and slips of bamboo, differs little, except in a certain heaviness of stroke, from the more modern forms of the characters. It is found in inscriptions and prefaces. This was succeeded by the Kiai-shu, or pattern style, which followed on the invention of paper, and is the usual character employed in careful writing, and is occasionally found in printed books. The Sung-shu, the common book-character, introduced about the tenth century, differs from the preceding in a greater squareness and angularity of form, better suited to cutting on wooden blocks. Two forms adapted to rapid writing are in use—the Hing-shu, or running hand, frequently found in prefaces and inscriptions; and another, still more abbreviated, in which there is left little trace of resemblance to the ordinary square character—the Ts'au-tsŭ, or grass character. In no country is the art of çalligraphy so highly esteemed or so sedulously cultivated as in China, and no written character is so well adapted to the display of it.

Of the Chinese language in general we may say, in conclusion, that notwithstanding its poverty of forms, it has been made, solely by the genius of those who use it, superior as an instrument of thought to many, perhaps to most, inflected languages. Whether its capacity of development will prove equal to the further demands to be made upon it is questionable. It has thus far shown a marked indisposition to the incorporation of foreign words, and yet does not seem able to supply from native resources the exact terminology which any considerable advance in scientific knowledge will require.

Chinese Literature.—In the history of literature there is hardly to be found another example of so high an antiquity, and none of so great a longevity, as the Chinese—an age which at least reaches, and perhaps exceeds, three thousand years. Neither in language, literature, nor institutions, is the modern period in China separated from the ancient by so wide an interval as elsewhere; an unbroken tradition holds together all. Such is the continuity that to the superficial observer it has the appearance of uniformity. In few countries has the cultivation of letters been so general. In theory, at least, all offices beneath the throne are

not only open to the scholar, but official promotion is made to depend directly on scholarship. The entrance to the various grades is guarded by public competitive examinations, which at each successive step become more rigorous. This system, introduced under the Han dynasty near the commencement of the Christian era, has been adhered to with more or less fidelity under the succeeding dynasties. Under such conditions, with the long history and vast population of China, a literature of immense extent is a natural result. Nor is any great literature so purely national, so little affected by foreign influences, as the Chinese. Booddhism, brought from India in the first century of the Christian era, has created for itself a literature apart, without much disturbing the general course of development. During the past three centuries of intercourse with Western nations their influence upon the literature, except in the department of mathematics, has been hardly felt. The exaggerated reverence paid to the classical models has so strengthened the conservative tendency as to check the growth of originality. Nor have the examinations for degrees, in which the chief requirement for success is familiarity with the classics, been so conducted as to attain the most happy results, either for the government or for the national literature.

There is, however, more of variety both in the history and the literature of China than the commonly received opinion gives to them. The first period of marked activity is that commencing with Confucius (died B. C. 478) and Lao-Tsŭ, and covering a period of about three centuries. Mencius and many other less celebrated writers belong to this period, which was rudely brought to a close by Shi Hwang-Ti, the founder of the Ts'in dynasty. This ruler, famous also as the builder of the Great Wall, having consolidated into an empire the petty states into which China had been divided, and fearing that the study of the literature would lead to an attempt to restore the old order of things, ordered (B. C. 212) the destruction of all books except those on medicine, divination, and husbandry, and the records of his own dynasty. Many scholars were put to death for the crime of hiding books or for the freedom of their utterances. This edict remained in force only twenty-two years, the Ts'in dynasty having been soon succeeded by the Han, under which strenuous efforts were made to recover the lost books. The catalogue of the library thus formed, which is found in the history of the Han dynasty, enumerates more than 13,000 volumes by 600 different authors. This collection perished in the burning of the imperial palace at the close of the dynasty, and similar collections made under succeeding dynasties met a like fate. Including the burning of the books by Shi Hwang-Ti, five great catastrophes of this kind are enumerated by Chinese historians, the last in the sixth century.

The period of the T'ang dynasty (A. D. 618–905) was the golden age of Chinese poetry; that of the Sung (960–1279) was the era of philosophical speculation and of criticism; the Yuen (Mongol) dynasty (1280–1367) was the most flourishing period of the drama, and produced also some of the best novels; the Ming and the reigning Mantchoo dynasties have been less distinguished for the originality of their productions than for works of an encyclopædic character, digests of the older literature. Printing from wooden blocks was invented before the close of the sixth century, but did not come into general use until the tenth. Movable types were employed as early as A. D. 1040, four centuries before the invention was known in Europe, without, however, displacing wooden blocks, which have remained in general use. During the present dynasty two large collections, of several thousand volumes each, have been printed by the government—one with copper, the other with wooden movable types. Chinese literature is abundantly supplied with works in bibliography and literary history, which for many centuries have been favorite subjects of study. One of the most admirable bibliographies to be found in any language is the catalogue of the imperial library, published in 1790 in 200 books. It contains notices of 10,500 works (a single one of which, the encyclopædia of the Ming, is composed of 22,877 books), giving the author, the history, and the contents of each, together with an estimate, almost uniformly just, of its merits. The plan of arrangement, which dates from the T'ang dynasty, is in four divisions—viz., classics, history, philosophy, belles lettres; novels and the drama are excluded. In the several dynastic histories an important section is devoted to the literature of the period. An index expurgatorius of works prohibited on account of their moral or political tendency has been published by the present dynasty. It contains many thousand volumes, mostly written about the close of the Ming dynasty.

The most important contributions by European scholars to this subject are: Wylie, "Notes on Chinese Literature," Shanghai, 1867; Schott, "Entwurf einer beschreibung der chinesischen litteratur" ("Abhand. der Berlin. Akad.," 1853); Bazin, "Le Siècle des Youên" ("Journal Asiatique," 1850–52). The last treats of the literature of the Mongol dynasty only.

The term *king* or "classic" is used in a narrower and a wider sense. It belongs *par excellence* to the "Five King," but very commonly includes also the "Four Books," and is not unfrequently used in a still wider sense. Among the "Five King" the first place is accorded to the "Yih," partly for its antiquity and partly for its enigmatical character. The proper text consists of eight trigrams, made up of horizontal lines, whole and broken, afterwards increased by combination to sixty-four hexagrams. With these are incorporated commentaries by Wĕn-Wang, the ancestor of the Chau dynasty, by his son Chau-Kung and by Confucius, which constitute the only intelligible part of the work. These mystical figures, ascribed to the ancient sage Fuh-Hi, are supposed to embody the most profound moral and political wisdom. They are much used in divination, and on this account the work is said to have been excepted from the general destruction of books under Shi Hwang-Ti. Next in rank is the "Shu King," a collection of historical documents relating to the Yu, Hia, Shang, and Chau dynasties, and covering the period, according to the received chronology, from the middle of the twenty-fourth century down to B. C. 721. The compilation is ascribed to Confucius, and is said to have comprised originally 100 chapters, but after the time of Shi Hwang-Ti, who made special efforts to destroy all copies of the "Shu," only fifty-eight chapters could be found. It was recovered in two portions, the genuineness of one of which is much disputed. The "Shu" is largely occupied with discourses on government put in the mouths of the ancient sovereigns, the historical matter being quite subordinate. The third classic is the "Shi King," or "Book of Odes," which contains 305 pieces (originally 311, but of six only the titles are preserved), selected by Confucius as the most worthy of preservation out of nearly 4000. They are divided into four classes—"Kwoh-fung," or "Manners of the States," gathered for presentation to the emperor in his visits to the feudal princes; "Siao-ya" and "Ta-ya," "Lesser and Greater Eulogiums," which bestow praise or blame upon the rulers and high officers; and "Sung," hymns of praise sung at the funeral rites of emperors and kings. The poetical merit of these pieces is very unequal, but is in general superior to that of later productions. They belong, with few exceptions, to the Chau dynasty, and for the light which they throw on the history and customs of the time are of great value. Biot has drawn from them the materials for a valuable memoir published in the "Journal Asiatique" for 1843. The fourth place among the classics is occupied by the Rituals, three in number. The "Li-ki," which is designated by imperial authority as one of the "Five Classics," is a compilation made in the first century B. C. out of the older Rituals. Two of these are preserved. One, the "Chau-li" ("Chow Ritual"), is supposed to have been written early in the Chau dynasty, and gives a detailed account of the various offices in the state, and the duties belonging to each. In it are found the models of the six administrative boards of the Chinese government. The "I-li" ("Decorum Ritual"), which is perhaps of equal antiquity, is of a more domestic character—a code of etiquette giving rules for the guidance of individual conduct under all circumstances. The last of the "Five Classics" is the "Ch'un Ts'eu" ("Spring and Autumn Annals"), the only one of which the authorship can be properly ascribed to Confucius, his labors upon the others being merely those of an editor. It is a chronicle of events from 720 to 480 B. C., written in continuation of the "Shu King." In it are recorded thirty-seven eclipses of the sun (the earliest 720 B. C.), which, with few exceptions, have been proved by calculation correct. The "Four Books" (*i. e.*, the "Books of the Four Philosophers") are next in rank. Two of them, the "Ta Hioh" and the "Chung Yung," formed parts of the "Li-ki" ("Book of Rites"), but were detached and arranged in the present order by Chu Hi, the great critic of the twelfth century. The "Ta Hioh" ("Great Learning") is a discourse on the principles of government, in eleven chapters, the first containing the words of Confucius, and the remaining ten a commentary on them, commonly ascribed to his disciple, Tsĕng Ts'an. The "Chung Yung" ("Invariable Mean") is a philosophical treatise attributed to K'ung Keih, the grandson of Confucius, in which the observance of the right mean is set forth as the highest wisdom and virtue. The "Lun Yu" ("Miscellaneous Conversations") of Confucius and his disciples is a collection of mostly disconnected sayings embodying the substance of his teaching, which was altogether of a practical character, on ethics, government, ceremonies, and the like. The last and most extensive of the "Four Books" contains the works of Mencius, who now ranks second only to Confucius in the general esteem, though not until the twelfth century were his writings defi-

nitely admitted to a place among the classics. One of the fundamental doctrines of his philosophy is the inherent goodness of human nature. The "Five King" and "Four Books" have all, with the exception of the "Ch'un Ts'eu," been translated into one or more of the European languages. Dr. Legge has undertaken an edition, now well advanced towards completion, of the whole in the original text, with English translation, commentary, and extensive introduction (vols. i., ii., "Four Books;" vol. iii., "Shu King;" vol. iv., "Shi King," Hongkong, 1861–72). An arrangement of the classics made in the T'ang dynasty enumerates thirteen—viz., besides the foregoing the two Rituals, "Chau-li" and "I li," two additional recensions of the "Ch'un Ts'eu," and the "Hiau King," or classic of Filial Piety. The last purports to be a conversation between Confucius and his disciple Tsēng Ts'an, and, though highly esteemed, entire confidence is not felt in its genuineness. Many other works bear the title of *king* ("classic"); nor is it confined to the orthodox school, but applied also to the canonical books of the Tauist and Booddhist faiths, and even to works of a more miscellaneous character, such as important technical writings. Thus we have the "Ch'a King" ("Tea Classic"), on the culture of the tea-plant, and the "Shan-hai King" ("Hill and River Classic"), an ancient geographical work from which many poetical allusions are borrowed.

The historical works, which are very voluminous, fall mostly into three classes. First in importance are the histories of the several dynasties, the work of official historiographers, and constructed mostly on a uniform plan. The variety of subjects treated of, each in a distinct section, gives them an encyclopædic character. The order, varying somewhat in the separate works, is in general the following: first, the personal history of the successive emperors of the dynasty, followed by a series of memoirs on chronology, rites, music, jurisprudence, political economy, state sacrifices, astronomy, influence of the five elements, geography, and literature, closing with biographies of the eminent men of the dynasty, and historical and geographical notices of foreign nations. The series as at present established consists of twenty-four histories, comprising 3264 books. They are of very unequal merit; some of them the work of single authors, others prepared by a board of scholars. At the head of the list stands the "Shi-ki" of Szū-ma Ts'ien of the Han dynasty, which reaches from the earliest period down to B. C. 122, and has served as a model for the subsequent histories. Not until the dynasty is ended, and has given place to another, can the official history be published. There is, however, a summary of events under the present dynasty by a private author, entitled "Tung-hwa-luh," long circulated in manuscript, and at length, after a considerable portion had been expunged, printed. The history is brought down to 1818. The second class of histories follows a chronological order. The oldest work of this class, next to the "Ch'un Ts'eu" of Confucius, is the "Bamboo Record," found A. D. 279 in the tomb of one of the princes of Wei. It reaches to B. C. 298. There is some reason to think that the original has been lost, and that the work which now passes under the title, and which is printed with a translation in the prolegomena of Dr. Legge's "Shoo King," is a forgery. The most celebrated general history on this plan is the "Tsū-chih-t'ung-kien" of Szū-ma Kwang, a writer of the eleventh century. It was revised in the next century under the direction of Chu Hi, and published with the title "Tung-kien-kang-muh." Continuations were added in the following dynasties. De Mailla translated it into French (Paris, 1777–83, 12 vols. 4to). The abridgment of the above work, entitled "Kang-kien-i-chi-luh" ("History Made Easy"), is one of the most useful compendiums. Another class of works, called "Complete Records," follows neither the one nor the other of the above methods, but gives with more freedom of arrangement a general survey of the subject treated.

In biographies the literature is unusually rich. Besides the space accorded to them in the dynastic histories and in statistical works, separate biographies, many of them of a collective character, abound. The "T'ang-ts'ai-tzū-chuen" is a collection of 397 literary biographies of the T'ang and the succeeding five short dynasties, by Sin Wĕn-fang of the Yuen. It was long given up for lost in China, and was recovered from Japan. The "Kau-sēng-chuen" of the Liang dynasty, with its continuations, contains biographies of more than a thousand Booddhist priests.

The geographical works are hardly surpassed in extent by those of any country. There are works in the geography of the whole empire, such as the "Ta-ts'ing-yih-t'ung-chi," published under the present dynasty in 500 books, which give under each province the topography, population, taxes, etc.; under each prefecture and department, the antiquities, public works, eminent and notorious characters born there, productions of the soil, and a variety of other details. In addition, every province, every prefecture, every department, nearly every district, and frequently a town or famous locality within a district, has its separate description, amounting in all to thousands of volumes. Some of these works are of considerable antiquity, and in successive editions have been gradually enlarged. Of the history and geography of Eastern Asia, beyond the limits of the empire, Chinese literature contains many valuable notices. The accounts of the journeys of Booddhist pilgrims to India between the fourth and the tenth centuries are the most important sources of information for the history of Booddhism in India during that period that we possess. Fah-Hian (A. D. 400–415) travelled overland to India, thence to Ceylon, returning by water to China. His account, "Fuh-kwo-ki," has been translated into French by Rémusat (Paris, 1836), and into English by Beal (London, 1869). Yuen-Chwang during sixteen years (629–645) traversed India in every direction. His life has been translated by Julien ("Vie de Hiouen-Thsang," Paris, 1853), as has also the "Si-yih-ki," which contains his itinerary, accompanied by copious extracts from Sanscrit works, now lost, concerning the kingdoms of India ("Mémoires sur les Contrées Occidentales," Paris, 1857, 2 vols., 8vo).

The three principal philosophical and religious sects, the Confucianists, Tauists, and Booddhists, have each an extensive literature. Of the orthodox school the most celebrated among the near successors of Confucius and Mencius was Sün-tzū, who held, in opposition to Mencius, to the original depravity of human nature. In the eleventh and twelfth centuries, under the Sung dynasty, Chau-tsū, and especially Chu Hi, gave a new impulse, and in some particulars a new direction, to philosophical speculation. The authority of Chu Hi, who was equally eminent as a commentator of the classics and in other departments of literature, has remained paramount to the present day, though under the present dynasty there is some disposition to rebel against it. The "Sing-li-ta-ch'uen-shu," published in 1415, is a collection of the principal cosmological writings of his school. Lao-tzū, the founder of the Tauist school, was a contemporary of Confucius. His philosophy is contained in the "Tau-tĕ King" (translated by Julien, Paris, 1842), one of the most sententious and profound books in the language. The most popular of the writings of this school is the "T'ai-shang kan-ying-pien" (translated by Julien under the title "Le Livre des Récompenses et des Peines," Paris, 1835), which consists of about a hundred short maxims, accompanied by illustrative narratives. Tauism has long since degenerated into superstitious practices, its followers being devoted to magic, alchemy, and the like. Booddhism was introduced from India in the first century of our era. The earliest translation from the Sanscrit, the "Sutra of forty-two sections," was made A. D. 67, and for several centuries there was constant activity in this work. The catalogue of Chi-Shing, published in 730, gives a list of 2278 separate works which had been translated up to that date. These constitute the more important part of the literature of Chinese Booddhism, though in the fifth and sixth centuries original works began to appear, and have since greatly multiplied.

In the history of Chinese poetry there are two distinctly marked periods. In the earlier, previous to the T'ang dynasty, the structure was less artificial and the rhythm freer. In the "Shi King" the verses are mostly of four syllables; the rhyme is often imperfect, and sometimes altogether wanting. In the T'ang period a more rigid consecution of tones was introduced, and verses of five and seven syllables became the favorites. The tones for rhythmical purposes are divided into two classes—the *p'ing* or "even" tone constituting one, while the other three tones are considered "uneven." In every verse the first, third, and fifth syllables are indifferent with respect to tone; the second, fourth, and sixth must alternate, so that the order is either "even," "uneven," "even;" or "uneven," "even," "uneven."

The weakest side of Chinese literature is the scientific. It has a tolerably complete system of arithmetic, older than the Christian era, a system of algebra which dates from the thirteenth century, but no theoretical astronomy worthy of the name, except what is borrowed from the West. For the regulation of the calendar, and for astrological purposes, observations of a simple character were very early made, and numerous eclipses recorded. During the Ming dynasty mathematical knowledge had greatly declined, and the first Jesuit missionaries recommended themselves to the imperial favor chiefly by their acquirements in this science. The mathematical works since published are mainly based on European methods. Medical writers are numerous, and some of them very ancient, but the science, notwithstanding its long history, has made little progress. The chief work on materia medica is the "Pun-Ts'au," in fifty-two books, compiled by Li Shi-chin of the Ming dynasty. He made extracts from more than 800 earlier writers, and gives 1892 medicaments, selected and original.

ADDISON VAN NAME, *Lib. of Yale Coll.*

Chinese White, a name sometimes given to the white oxide of zinc, used as a pigment as a substitute for white lead. It is not liable to be changed much by atmospheric action.

Ching-Hai, a fortified seaport-town of China, in the province of Che-Kiang, at the mouth of the Takia River, 9 miles N. E. of Ning-Po. It has a strong citadel on a high and steep rock, and is 3 miles in circumference. The British defeated the Chinese here in Oct., 1841.

Ching-Kiang-Foo, written also **Tchang-Kiang,** a fortified city of China, province of Kiang-Soo, on the right bank of the Yang-Tse-Kiang, near its junction with the Imperial Canal, and about 42 miles E. of Nanking. It was a populous and important commercial city before it was taken by the Tae-Pings in 1859. It was captured by the British in July, 1842. Pop. in 1868, estimated at 150,000.

Chingleput', or **The Jaghire,** a maritime district of India, in the province of Madras, has an area of 2993 square miles. It is bounded on the E. by the Indian Ocean, and is adjacent to Madras. The chief river is the Palaur. The soil is poor. Capital, Chingleput. Pop. in 1871, 940,744.

Chingleput (anc. *Singalapetta*), a town of India, in the above district, 36 miles S. W. of Madras, has a large citadel or fort. It is accessible to an enemy only on the S., being protected on the other side by a large tank.

Chin-In'dia, or **Farther India,** a name given by the celebrated geographer, Malte-Brun, to the region between China and Hindostan, also often called the Peninsula beyond the Ganges. It comprises Siam, the Burman empire, Anam, Laos, Malacca, etc.

Chi'no, a township of San Bernardino co., Cal. P. 308.

Chinon, or **Chinnon,** a town of France, department of Indre-et-Loire, on the river Vienne, 25 miles S. W. of Tours. It has remains of a large castle, which was the residence of several kings of England. Here Henry II. of England died, and here Rabelais was born. Charles VII. of France resided here when Joan of Arc presented herself to him. Pop. 6895.

Chinook' Indians, a collection or race of aborigines, consisting of several tribes or bands, formerly inhabiting the banks of the Lower Columbia in Washington Territory and Oregon. They were fish-eaters, and spoke a peculiar and very difficult language; so that the traders and trappers invented the "Chinook jargon," a *lingua franca* designed to facilitate intercourse with them. Vocabularies of this jargon and the Chinook language were prepared by the late George Gibbs (1863). Relics of this race still exist, the Chinooks proper, Clatsops, etc.

Chin'quapin, a dwarf species of chestnut (*Castanea pumila*) of the Atlantic U. S. from Maryland to Texas, bearing a small but sweet edible nut.

Chin'quepin, a twp. of Lexington co., S. C. Pop. 253.

Chintz, a highly-glazed printed muslin or calico, with a pattern in many colors on a white or light-colored ground. It is chiefly used for bed-hangings or curtains, for covering furniture, and other purposes where gay or rich colors are desirable, and where there is much exposure to dust, which does not adhere to its surface.

Chio'ggia (anc. *Fossa Clodia*), a fortified seaport-town of Italy, in the province of Udine, on an island of the Adriatic, 14 miles S. of Venice. It is built on piles like Venice, and is connected with the mainland by a stone bridge of forty-three arches. It has a fine main street lined with porticoes, a cathedral, several high schools, a theatre, and a harbor protected by two forts. Here are shipbuilding-yards, salt-works, and fisheries. Pop. in 1871, 26,336.

Chion'ides, a Greek comic poet of the old comedy, who began to exhibit, according to Suidas, in B. C. 487. Aristotle states that he was much later than Epicharmus, and this would place him some years after the date assigned above. Though not the first in time, yet from the more careful and artistic preparation of his pieces he was regarded as the leader of the old Attic comedy. The titles of three plays are preserved, and the fragments are collected in MEINEKE, "Fragm. Vet. Com. Græc.," vol. ii., pp. 5–9. HENRY DRISLER.

Chi'on of Heraclea, on the Pontus, a pupil of Plato, sought to free his native city by slaying the tyrant Clearchus (B. C. 353). He, with his associates, was slain by the friends of Clearchus, and the city fell under a worse tyranny than before. There are seventeen letters extant under the name of Chion, which are, however, the production of a later age. They have been edited by Coberus, Leipsic, 1765, and by Orelli in his edition of Memnon, Leipsic, 1816. HENRY DRISLER.

Chipica'ni, a peak of the Bolivian Andes. Height, 19,740 feet.

Chip'man (DANIEL), LL.D., born in Salisbury, Conn., Nov. 15, 1765, graduated at Dartmouth in 1788, and soon became distinguished as a lawyer and an author. He was a member of Congress from Vermont (1815–17), and was prominent in the politics of that State. He published a valuable work on the "Law of Contracts" (1822), "Reports of Cases in the Supreme Court of Vermont" (1824), and other works. Died April 23, 1850.

Chipman (NATHANIEL), LL.D., an American soldier and jurist, a brother of the preceding, was born at Salisbury, Conn., Nov. 15, 1752, graduated at Yale in 1777. He was an officer of the Revolutionary army, but was admitted to the bar in 1779. He was chief-justice of Vermont for several years, and judge of the U. S. district court for Vermont (1791–93). His works on the laws of Vermont are highly commended. He published "Principles of Government" (1793) and other works. Died in 1843.

Chipman (WARD), LL.D., a jurist of New Brunswick, born July 10, 1787, graduated at Harvard in 1804. He became chief-justice of the supreme court of the province in 1834. Died Dec. 26, 1851.

Chip'munk, a popular name for the *Tamias striatus,*

Chipmunk.

or striped squirrel of the U. S., especially common in the North. It is five or six inches long, with a tail of four and a half inches.

Chipo'la, a township of Henry co., Ala. Pop. 732.

Chip'pewa, a post-village and port of entry of Ontario, Dominion of Canada, Welland co., on the Niagara River, about 3 miles above Niagara Falls and 48 miles S. S. E. of Toronto, on the Erie and Niagara branch of the Great Western Railway. It has manufactures of steam-engines, leather, lumber, and stoves, and a large trade in grain and lumber. Pop. 1300.

This village is memorable as the scene of an important victory of a portion of the American army under Maj.-Gen. Joseph Brown, over a superior British force under Maj.-Gen. Rial, July 5, 1814. A re-invasion of Canada having been determined upon, Gen. Brown had, according to instructions, assembled at Buffalo, N. Y., a division consisting of two brigades of regulars, a brigade of volunteers, and a few Indians. The regulars were commanded by Brig.-Gens. Winfield Scott and Ripley, the volunteers and Indians by Gen. P. B. Porter; there was also a corps of artillery under Major Hindman; in all about 3500. In accordance with orders of Gen. Brown, issued on the 2d of July, Scott's brigade, with Hindman's artillery corps, passed the Niagara on Sunday morning, the 3d, landing about a mile below, while Gen. Ripley, at a later hour, landed about the same distance above Fort Erie. Gen. Scott led, and the British commandant being completely surprised, surrendered with scarcely any resistance at 6 A. M. A garrison was placed in the fort, and Gen. Scott was ordered to advance on the morning of the 4th with his brigade and Towson's artillery towards Chippewa. The enemy's outposts were soon met and driven in; a charge of the Nineteenth Dragoons was also repelled by a single company. The enemy being found strongly posted behind Chippewa Bridge, Gen. Scott took up a well-selected position for the night, where he was joined by Gen. Brown and the main body of his army. The British army lay behind Chippewa Creek, across which was a bridge; the Americans occupied a similar position at Street's Creek, a mile and a half farther up. Between those two creeks is a plain, which was the battle-ground, behind it a forest, and in front the Niagara. Skirmishing commenced soon after daybreak, but nothing serious occurred until about 4 P. M., when Gen. Porter was ordered to advance rapidly under,

cover of the adjoining wood, and throw himself between the British skirmishers and their main body. Porter, advancing as ordered, soon fell in with a body of the light troops of the enemy, which he routed, and was pursuing when, coming out of the wood, he found himself in front of the whole British army drawn up in line of battle. Scott was now ordered to cross, with his brigade and Towson's artillery, the bridge in his front, and attack the enemy's left. The order was promptly executed by Scott, and his command were soon closely engaged with the enemy. Porter's command had given way, nor could he, though displaying great gallantry, stay their flight. Scott's brigade becoming much exposed by this retreat, a portion of Ripley's brigade was ordered to fall upon the enemy's right and rear; but such was the impetuosity of the attack of Scott and his gallant troops that before Ripley became engaged the enemy's line was broken, and driven in confusion to their intrenchments behind the creek, destroying the bridge behind them. The credit of this decisive conflict between our inexperienced troops and a superior number of veteran European soldiers is mainly due to Gen. Scott, who by his skill and gallantry secured this important victory, Gen. Brown not being present till the battle had been decided. The number actually engaged on the American side was 1900; the British force numbered 2100. Our loss in killed and wounded was 328; the British loss was reported at 505.

Chippewa [native, *Ojibway* or *Ojibbewa*], a river of Wisconsin, rises in Ashland county, flows nearly southwestward through Chippewa and other counties, and enters the Mississippi River at the foot of Lake Pepin, 6 miles above Wabashaw. Entire length, about 220 miles. It traverses extensive forests of pine.

Chippewa, a county of Michigan, which forms the E. extremity of the upper peninsula. It is bounded on the N. by Lake Superior, and on the E. by the river St. Mary. It is drained by the Tequamenon River. The surface is uneven. Limestone abounds here. Oats, potatoes, butter, and maple-sugar are produced. Capital, Sault Ste. Marie. Pop. 1689.

Chippewa, a county in the W. of Minnesota. Area, 720 square miles. It is traversed by the Chippewa River. The surface is undulating; the soil is fertile. Wheat, oats, butter, and hay are staple crops. Capital, Montevideo. Pop. 1467.

Chippewa, a large county in the N. W. of Wisconsin. It is intersected by the Chippewa River, and also drained by the Yellow River and other streams. The surface is uneven, and mostly covered with forests. Large quantities of pine lumber are exported from it. Sandstone occurs here as a surface-rock. The soil is fertile. Wheat, oats, corn, cattle, hay, and butter are produced. Lumber and brick are manufactured. Capital, Chippewa Falls. Pop. 8311.

Chippewa, a township of Isabella co., Mich. Pop. 315.

Chippewa, a township of Mecosta co., Mich. Pop. 140.

Chippewa, a township of Douglas co., Minn. Pop. 164.

Chippewa, a township of Pope co., Minn. Pop. 116.

Chippewa, a post-township of Wayne co., O. Pop. 2510.

Chippewa, a township of Beaver co., Pa. Pop. 817.

Chippewa Falls, a post-village, capital of Chippewa co., Wis., on the Chippewa River, about 88 miles E. of St. Paul, Minn. It has water-power and several mills, and a trade in lumber. It has one national bank and one newspaper. Pop. 2507.

Chippewa Indians, or **Ojibways,** a tribe of North American aborigines who inhabit Michigan, Wisconsin, Minnesota, and both sides of the basin of Lake Superior. They were constant allies of the French, and waged a long warfare against the Sioux. In 1855 they ceded their lands to the government of the U. S. They have several widely separated reservations in the above States and in Canada, and are broken up into "bands." They numbered in 1869 about 19,000. They are of the Algonkin stock, as is shown by their language and customs. Long-continued efforts have been made to convert them to Christianity by Roman Catholic and Protestant missionaries, without marked success.

Chipping Bird, or **Chipping Sparrow,** a common little North American bird (*Spizella socialis*, Bonap.). It is between five and six inches long, whitish underneath, crown chestnut, back and sides ashen, with streaks of white and black. Its song consists of six or seven notes rapidly repeated.

Chiquichi'qui Palm, or **Piassa'ba** (*Leopoldinia Piassaba*), one of the palms which yield the piassaba fibre, used for making coarse brushes and brooms for sweeping streets, for cables, etc. It grows on the banks of the rivers of Venezuela and the north of Brazil, and has very large, regularly pinnate leaves, much used for thatching. The commercial fibre is obtained from the marginal processes of the leaf-stalks, which split into fine fibres, hang down five or six feet, and entirely conceal the stem. It has long been used for cables on the Amazon, and has now become an important article of commerce.

Chiquimu'la, the easternmost department of Guatemala, Central America, bordering on the Caribbean Sea, between the Bay of Honduras on the N. and the state of San Salvador on the S. Area, 4000 square miles. Pop. 80,000. Capital, Chiquimula de la Sierra, with 6000 inhabitants.

Chiri'qui, the westernmost province of Panama, in Central America. Area, 500 square miles. Pop. 17,279. Capital, David, beautifully situated, with 4625 inhabitants.

Chiriqui, Lagu'na de, or **Bahi'a del Almiran'te,** a bay of Panama, nearly enclosed by a jutting headland and islands at its mouth. The W. entrance, Boca del Dragon ("Dragon's Mouth"), affords passage for the largest ships, and the bay within is a secure harbor. Lat. 90° N., lon. 32° 30′ W. From ancient tombs in this region much gold has been of late obtained.

Chiris'ophus, a Lacedæmonian officer who joined Cyrus the Younger in his expedition against Artaxerxes (B. C. 401) at Issus, with 700 heavy-armed men. He first appeared prominently after the death of Clearchus, when he was, at the suggestion of Xenophon, appointed to lead the van of the retreating Greeks. After reaching Trapezus, Chirisophus attempted to secure vessels for the Greeks, but was unsuccessful. At Sinope, through Xenophon's refusal of the office, he was chosen commander of the Greek forces, but six or seven days after, while at Heraclea, the army was broken up into three parts, which set out separately. Chirisophus died soon after at Calpe.

HENRY DRISLER.

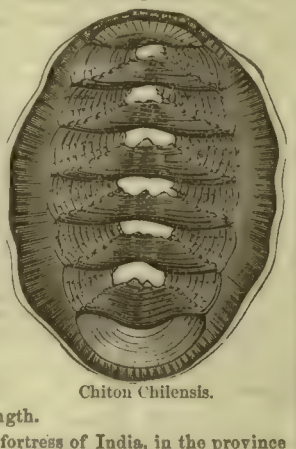
Chironec'tes [Gr. χείρ, "hand," and νήχω, to "swim"], a genus comprising numerous small marine fishes of the family Lophiidæ, remarkable for grotesque forms. The mouse-fish (*Chironectes gibbus*) of the U. S. Atlantic coast

Chironectes Histrio.

is a familiar example. The *Chironectes histrio* of the Brazilian coast is larger. (See also CHEIRONECTES.)

Chisa'go, a county of Minnesota, bordering on Wisconsin. Area, 420 square miles. It is bounded on the E. by the St. Croix River, and contains several small lakes. The surface is uneven. Cattle, grain, potatoes, and butter are largely produced. Lumber is one of the chief articles of export. It is intersected by the Lake Superior and Mississippi R. R. Capital, Chisago City. Pop. 4358.

Chisago City, a post-village, capital of Chisago co., Minn., on a small lake 35 miles N. by E. of St. Paul.



Chisago Lake, a post-township of Chisago co., Minn. It contains the greater part of Chisago Lake and other smaller lakes, which abound in fish. Pop. 775.

Chis'elhurst, a parish of England, in Kent, 11 miles S. E. of London. Here is Camden Place, the property of Earl Camden. The emperor Napoleon III. fixed his residence at Chiselhurst early in 1871, after he was released from captivity by the emperor of Germany, and here, Jan. 9, 1873, he died.

Chis'wick, a town of England, in the county of Middlesex, on the Thames. It contains the gardens of the London Horticultural Society. In Chiswick House, a villa belonging to the duke of Devonshire, both Fox and Canning expired. Hogarth lies buried in the churchyard. Pop. 8508.

Chi'tin [from the Gr. *χιτών*, a "tunic"], in chemistry, the name of the substance which forms the skeleton of all insects and crustaceans, as well as of some mollusks and other inferior animals. In insects it constitutes the external skeleton, the scales, and the tracheæ, and penetrates into the most remote portions; one of the layers of the intestinal canal consists of chitin. We can make preparations of these parts by treating insects with a solution of potash, which dissolves all but the chitin; in this way we can microscopically examine the most delicate parts. It is a white, amorphous body, which usually retains the form of the tissue from which it is prepared. Its composition is represented by the formula $C_9H_{15}NO_6$. The best method of obtaining chitin is by successively boiling the elytra of the cockchafer with water, alcohol, ether, acetic acid, and alkalies. Treated with hot dilute sulphuric acid, it is converted into glucose and lactamide.

Chi'ton, a genus regarded as the type of the family Chitonidæ, gasteropodous mollusks, near kindred of the limpets. The shell is composed of eight transverse calcareous pieces, overlapping each other, and strongly attached to the mantle, which is leathery and fibrous. They have the power of rolling themselves up into a ball. The oval foot extends the whole length. More than 200 species are known; they occur in all climates, most abundantly on rocks at low water, but some of them at great depths. All the species found on American coasts are small, but some others grow to three or four inches in length.

Chiton Chilensis.

Chitore, a town and fortress of India, in the province of Rajpootana, 64 miles E. N. E. from Odeypoor. The fortress consists of a rock smoothly scarped to a height of from 80 to 190 feet by nature, surmounted by a rude bastioned wall 12 miles in its entire circuit. The enclosure is narrow and irregular, and contains temples and palaces.

Chit'tagong, a district of British India, on the Bay of Bengal, in the presidency of Bengal, of which it is the S. E. extremity. Area, about 2800 square miles. A great part of the country is mountainous and covered with forests. The soil is fertile, but little cultivated. Towns are only found on the sea-coast. The population is more than half Mohammedan. Pop. 790,000.

Chitteldroog' (anc. *Sitala Durga*, "the spotted castle"), a town and fortress of Hindostan, in Mysore, 128 miles N. N. W. of Seringapatam. Here is a rock-fortress which is one of the strongest and most remarkable in India. It is occupied by a British garrison.

Chittenan'go, a post-village of Sullivan township, Madison co., N. Y., has a tannery, a national bank, a woollen mill, a weekly paper, and three churches. Pop. 968.

Chittenango Springs, or **White Sulphur Springs,** in Sullivan township, Madison co., N. Y., is a saline and sulphur spring, with accommodations for receiving visitors, and is highly recommended for many cases of disease.

Chit'tenden, a county in the N. W. of Vermont. Area, 516 square miles. It is bounded on the W. by Lake Champlain, and is drained by the Lamoille and Winooski rivers. The surface is partly mountainous; the soil is generally fertile. Butter, cheese, cattle, potatoes, corn, and oats are extensively produced. The manufacturing interests are important and various; those of lumber and furniture being the most extensive. It is intersected by the Vermont Central R. R. Capital, Burlington. Pop. 36,480.

Chittenden, a post-township of Rutland co., Vt. It has manufactures of lumber, etc. Pop. 802.

Chittenden (Martin), a son of the following, born in Salisbury, Conn., Mar. 12, 1769, graduated at Dartmouth in 1789. He was for several years a judge in the courts of Vermont, a member of Congress from that State (1803–13), and governor (1813–15). Died Sept. 5, 1841.

Chittenden (Thomas), an American statesman, born at East Guilford, Conn., Jan. 6, 1730. He was one of the founders of the State of Vermont, of which he was chosen first governor in 1778. He was several times re-elected. Died Aug. 24, 1797.

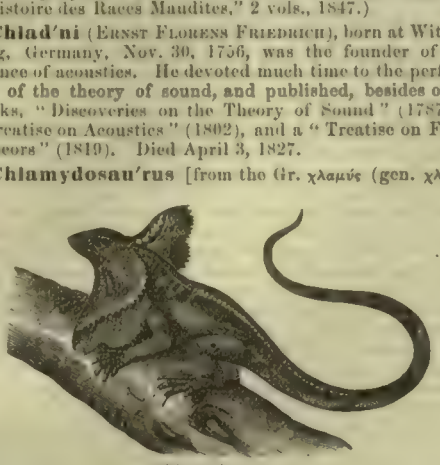
Chit'tenden's Falls, a village of Stockport township, Columbia co., N. Y., has manufactures of paper.

Chit'ty (Joseph), an English writer on law, was born in 1776, and called to the bar in 1816. He published, besides other legal works, "Pleadings and Parties to Actions" (1808), a "Practical Treatise on the Criminal Law" (1818), a "Treatise on Medical Jurisprudence" (1834), and "General Practice of the Law in all its Departments" (3d ed., 1837–42), which are highly commended. Died in 1841.

Chiu'sa-Sclafa'ni, a town of Sicily, in the province of Palermo, 30 miles S. S. W. of Palermo, was founded about 1320. Agates are found near it. Pop. 6592.

Chiv'alry [Fr. *chevalrie*, from *cheval* (Lat. *caballus*), a "horse"], a term applied to the system or dignity of knighthood, but originally denoting a body or assembly of knights or horsemen. The word has, in fact, the same etymology as *cavalry*, and in the Italian and Spanish languages the same term is used for both. Chivalry may be more fully defined as a peculiar institution originating in the Middle Ages, and including with the rank and dignity of knighthood all those customs, manners, and sentiments which were deemed appropriate to a noble and accomplished knight. Its origin is to be traced to the peculiar customs and sentiments of the Teutonic nations (in nothing, perhaps, more remarkable than for the respect which they evinced for the female sex), modified to some extent by the spirit of Christianity. It is undoubtedly closely connected with the feudal system. It has been observed that while feudality presents the political side of society in the Middle Ages, chivalry exhibits its moral and social side. Whatever may have been the follies and abuses which too often accompanied it, the institution of chivalry undoubtedly had its origin in a generous feeling, which prompted humane and brave men to provide for the protection of the defenceless. For this purpose courage was indispensable; and as women in that rude and semi-barbarous age especially needed protection, chastity and a respect for the sex bordering on adoration came to be regarded as among the cardinal virtues of a true knight. To these higher qualities were necessarily added others of a different character, growing out of the feudal system, and especially the relation between the vassal and his lord. If the conduct of those educated and trained under the influence of chivalry too often presented a glaring contrast with the ideal purity of its social and moral code, it does not prove that chivalry had not a pure and noble origin; it only proves how much easier it is to commend and admire virtue than to practise it. The history of mankind shows but too clearly how seldom the precepts of a high and noble philosophy or the principles of a pure religion are exhibited in the lives and conduct of its votaries. Yet in the case of chivalry, as in that of Christianity, the influence of its teachings has surely, though very slowly, it must be confessed, effected an important change in the sentiments and practices of society in many respects.

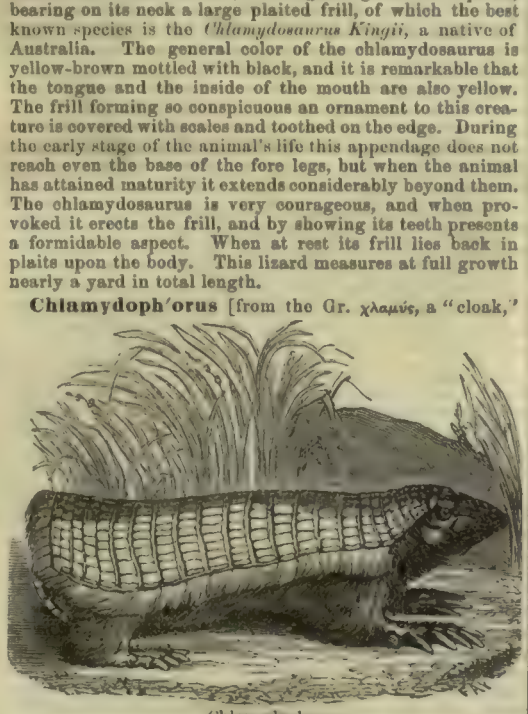
J. Thomas.



Chives, or **Cives** (*Allium Schœnoprasum*), a plant of the same genus with the onion, a perennial, six inches to one foot in height, with very small, flat, clustered bulbs. The leaves are tubular and radical; the flower-stem is terminated by a cluster of bluish-red flowers. This plant grows wild in Europe, Asia, and Western North America. Chives are sometimes cultivated in kitchen-gardens, and are used for flavoring soups and dishes. Their properties are very similar to those of the onion. The part used is the young leaves. There are several varieties.

Chizerots and **Burins,** races in France who are despised, living in the arrondissement of Bourg-en-Bresse, in the department of Ain. They are believed to be descended from the Saracens. Although industrious and prosperous, they, like the Cagots, are held in the utmost detestation by their neighbors. They are looked upon as covetous and malicious; they marry among themselves. From time im-

memorial they have been field-laborers, cattle-dealers, butchers, etc. Many of them are very good-looking. The young women are handsome, with large black eyes. Many of these people are well to-do business-men. (See MICHEL, "Histoire des Races Maudites," 2 vols., 1847.)



Chlad'ni (ERNST FLORENS FRIEDRICH), born at Wittenberg, Germany, Nov. 30, 1756, was the founder of the science of acoustics. He devoted much time to the perfecting of the theory of sound, and published, besides other works, "Discoveries on the Theory of Sound" (1787), a "Treatise on Acoustics" (1802), and a "Treatise on Fiery Meteors" (1819). Died April 3, 1827.

Chlamydosau'rus [from the Gr. χλαμύς (gen. χλαμύδος), a "cloak" or "mantle," and σαῦρος, a "lizard"], often called the "frilled lizard," a singular genus of reptiles, bearing on its neck a large plaited frill, of which the best known species is the *Chlamydosaurus Kingii*, a native of Australia. The general color of the chlamydosaurus is yellow-brown mottled with black, and it is remarkable that the tongue and the inside of the mouth are also yellow. The frill forming so conspicuous an ornament to this creature is covered with scales and toothed on the edge. During the early stage of the animal's life this appendage does not reach even the base of the fore legs, but when the animal has attained maturity it extends considerably beyond them. The chlamydosaurus is very courageous, and when provoked it erects the frill, and by showing its teeth presents a formidable aspect. When at rest its frill lies back in plaits upon the body. This lizard measures at full growth nearly a yard in total length.

Chlamydosaurus.

Chlamydoph'orus [from the Gr. χλαμύς, a "cloak," and φέρω, to "carry"], a small edentate quadruped of Chili and the Argentine Republic, nearly related to the armadillo, but resembling the common mole in size and habits. It is remarkable for being covered with a shell of square plates on the head, neck, and back, with another similar shell on the posterior extremity. Its internal skeleton resembles in several respects that of birds. Its tail is carried under its belly. There is but one known species, the *Chlamydophorus truncatus*, called pichiciago by the natives.

Chlamydophorus.

Chla'mys [Gr. χλαμύς], a woollen outer garment of the Greeks, differing from the usual *amictus* of the men, the ἱμάτιον, in being finer, gayer in color, and oblong instead of square. It was fastened round the neck by a brooch (fibula), and hung down the back to the calf, or over the left shoulder, covering the left arm.

Chlo'ral, a name composed of the first syllable of *chlorine* and the first syllable of *alcohol*, designating a liquid composed of chlorine, carbon, hydrogen, and oxygen, obtained by the action of chlorine on absolute alcohol. Its formula is $C_2HO_2Cl_3$. When kept for a time it becomes solid, but is not changed in composition, and may be restored to its original form by heat. With water it forms a solid hydrate known as chloral hydrate or hydrate of chloral. This article is now much used in medicine as a hypnotic. It enters the circulation, and is, by the alkalies contained in the blood, converted into formic acid and chloroform. The chloroform doubtless is the principal source of the hypnotic effect of the medicine. The dose is from twenty to forty grains to an adult. Much larger doses have been given with no bad results, but well-authenticated fatal cases of chloral poisoning indicate the necessity of caution in its use. The sleep produced by chloral is wonderfully sweet and refreshing to most patients. Chloral sometimes increases hysterical symptoms, and unless well diluted is irritant to the stomach. It is peculiarly valuable in tetanus. Given in large doses, chloral powerfully diminishes reflex action, and is a physiological antidote in poisoning by strychnia.

Chloranthа'ceæ [from *Chloranthus*, one of the genera], a natural order of exogenous plants nearly allied to pepper. They are herbaceous and half-shrubby, have jointed stems, opposite, simple leaves, with minute stipules between them. The flower has no calyx or corolla; the fruit is a drupe or 1-seeded berry. The order comprises but few known species, some of which are natives of China and Japan, and some are tropical. They are generally aromatic, and have important stimulating properties. The *Chloranthus officinalis* is prized in Java as a remedy for fever. The leaves and berries of the *Chloranthus inconspicuus* are used by the Chinese to impart a peculiar flavor to tea.

Chlo'rate, a compound formed by the union of chloric acid with a salifiable base. The best known of these salts is chlorate of potash, which, mixed with combustibles, such as sulphur and charcoal, forms highly explosive compounds which ignite by a blow or friction. It is also a useful medicine.

Chlorhydric Acid. See HYDROCHLORIC ACID, by HENRY WURTZ, A. M.

Chlo'ric Ac'id (ClO_5, or, in the new notation, ClO_3), a compound of one atom of chlorine with five (or three) atoms of oxygen. It occurs in combination with potash as the white crystalline salt called chlorate of potash. (See CHLORATE.) This acid has not been obtained in its anhydrous state, but combined with water it is a syrupy liquid, setting fire to dry organic substances with which it comes in contact.

Chlo'ride [Fr. *chlorure*], a binary compound of chlorine with some other substance. Common salt is a chloride of sodium, and calomel is a chloride of mercury. When chlorine unites in two different proportions with the same base, the terms protochloride and bichloride are applied to such compounds.

Chlo'rine [from the Gr. χλωρός, "pale green"], a non-metallic gaseous chemical element, discovered by Scheele in 1774, and named by him "dephlogisticated marine air." Soon after, from a mistaken view of its nature, it received the name of "oxymuriatic acid." In 1810, Davy proved it to be an elementary body, and gave it the name which it now bears. It occurs very largely as the chloride of sodium, common salt, in the vegetable, animal, and mineral kingdoms. In ordinary conditions it is a gas which may be easily obtained by moistening bleaching-powder with dilute sulphuric acid. It is a yellowish-green gas with a suffocating odor, is not combustible, and is a feeble supporter of ordinary combustion. A lighted candle placed in it burns with a smoky flame, the hydrogen of the oil alone burning. Antimony, copper, and arsenic, in fine division or in thin leaves, at once become red hot and burn when introduced into chlorine. Paper soaked in turpentine likewise bursts into flame. Chlorine is a perissad (a monad), having the symbol Cl, and the equivalent 35.5. It is very heavy, its specific gravity being 2470 (air = 1000). Two volumes of chlorine in one of water yield a solution resembling the gas in color, odor, and other properties. Chlorine is a bleacher of cotton and linen, and a powerful disinfectant. It can be condensed by pressure and cold into a transparent greenish-yellow limpid liquid, with a specific gravity of 1330, which also possesses bleaching properties and a powerful odor. Chlorine in very minute quantity produces a sensation of warmth in the respiratory passages, increasing the expectoration; in large quantities it causes spasm of the glottis, violent cough, and a feeling of suffocation. Its inhalation is liable to be followed by dangerous disease of the air-passages. The antidotes to the effects of chlorine in the lungs are the inhalation of the vapor of water, alcohol, ether, or chloroform. Chlorine unites with many substances to form a class of compounds known as chlorides.

Chlo'rite [from the Gr. χλωρός, "green"], an abundant green mineral composed of silica, alumina, magnesia, and protoxide of iron in variable proportions. It is rather

soft, and is easily broken. It rarely occurs crystallized in hexagonal crystals, and sometimes foliated like talc, from which it is readily distinguished by yielding water in a closed tube.

Chlorite Schist, or **Chlorite Slate,** a green slaty rock in which chlorite is abundant in foliated plates, usually blended with minute grains of quartz, and sometimes with felspar and mica. It is one of the metamorphic rocks, and is often found graduating into mica schist or clay-slate.

Chlorocarbon'ic A'cid ($COCl_2$), a compound formed by exposing a mixture of chlorine and carbonous oxide to the action of light. It is also called phosgene gas and carbonyl chloride.

Chlo'roform [a term derived from the first syllable of *chlorine* and the first syllable of *formyl*], ($CHCl_3$), was long known to chemists before it was discovered to have valuable properties; but the power which it possesses of producing anæsthesia has led to the preparation of chloroform on an extensive scale. It is also a useful chemical reagent. To four parts of bleaching-powder sufficient water is added to make a thin paste, to this is added one part of spirits of wine; the whole is introduced into a retort, which must not be more than half filled. Heat being applied, chloroform, water, and a little alcohol distil over. As the chloroform is heavier than water, two layers of liquid are obtained, the upper water and alcohol, and the lower chloroform. The upper liquid is poured off, the chloroform agitated with fused carbonate of potash, sulphuric acid, and alcohol, which abstract the remaining traces of water, and on subsequent redistillation the chloroform is obtained pure. It may be prepared by several other methods.

It is a remarkably limpid, volatile, mobile, colorless liquid, which has a characteristic odor and an agreeable sweetish taste. It has a specific gravity of 1.48, that of water being 1, and boils at 142° F. It has been regarded as a terchloride of formyl, and also as a chloride of methenyl. It is analogous to bromoform, iodoform, and nitroform. It is not inflammable in the ordinary sense, but when thrown on hot coals it burns with a green flame, evolving much smoke. It is slightly soluble in water, readily in alcohol and ether. It dissolves camphor, amber, resins, wax, caoutchouc, iodine, and bromine, as well as many alkaloids. The employment of chloroform as an anæsthetic has already been considered under ANÆSTHESIA; but it may be here observed that numerous cases of death from its use have occurred, even when administered by skilful physicians. It is sometimes administered by the stomach as an anodyne; and when applied to the surface of the body is a powerful blistering agent, very useful as a derivative.

Chlo'rophane [from the Gr. χλωρός, "green," and φαίνομαι, to "appear"], a name given to those varieties of fluor spar which when heated shine with a beautiful emerald-green, phosphorescent light.

Chlo'rophyl [from the Gr. χλωρός, "green," and φύλλον, a "leaf"], the green coloring-matter of the leaves of plants. It is soluble in alcohol, but insoluble in water, and is somewhat similar to wax. Light is indispensable to its formation, and hence arises the phenomenon of blanching which occurs when plants are deprived of light. It is also called endochrome, especially in the lowest orders of plants.

Chloro'sis [from the Gr. χλωρός, "pale green"], a disease almost peculiar to young women and girls, and usually associated with other troubles peculiar to that time of life. It takes its name from a greenish-yellow tint of the skin which some patients exhibit. There is also great pallor and debility, often disturbance of the heart's action, breathlessness, and a variously perverted and capricious appetite. The disease is characterized by a deficiency of the cell-elements of the blood. Most cases are readily curable by the use of exercise, good air, proper food and clothing, and, above all, by the administration of iron, which is almost a specific in this disease.

Chlorosis is also the name of the "yellows," a disease which attacks plants and trees, especially the peach tree. A deficiency of chlorophyl causes a blanched and yellow appearance. Damp soil, wet weather, and insufficient culture and manuring are assigned as causes, but widespread climatic influences of a character which is little understood appear to be the principal cause of this destructive malady. No treatment except underground drainage and good culture promises any benefit.

Chlorox'ylon [from the Gr. χλωρός, "green," and ξύλον, "wood"], a genus of plants of the order Cedrelaceæ, its fruit having only three cells and splitting into three parts. *Chloroxylon Swietenia* is the satin-wood of India, a tree which grows about sixty feet high. The satin-wood is exported, and is used by cabinet-makers and brushmakers.

Choate (RUFUS), LL.D., one of the most eminent advocates and orators that America has produced, was born in Essex, Mass., the 1st of Oct., 1799. Both his parents were distinguished for quickness of intellect, as well as weight of character. He entered Dartmouth in 1815. After taking his degrees, he remained in the college as tutor for one year. He commenced the study of law at Cambridge, and subsequently studied under the distinguished orator and lawyer, Mr. Wirt, then U. S. attorney-general at Washington. He began the practice of law in his native State at Danvers, whence he removed to Salem and afterwards to Boston. While at Salem he was elected to Congress (1832), and later (1841) he was chosen Senator as successor to Mr. Webster, who had been appointed secretary of state under President Harrison. After Webster's death Mr. Choate was the acknowledged leader of the Massachusetts bar, and was regarded by the younger members of the profession with a love equal to their reverence. His health having failed, in 1858 he retired from business, and a sea-voyage having been recommended by his physicians, he embarked for Europe in 1859, but he was unable to proceed farther than Halifax, where he died on the 13th of July.

As an orator Mr. Choate's powers were of the rarest order. He was not merely eloquent when he spoke on themes that were calculated of themselves to touch the feelings or stir the passions of his audience, but his genius enabled him to interest and fascinate his hearers even while discussing the driest and most unpromising subjects. Mr. Choate's superior foresight made him dread more than many others the dangers that threatened his country. And it may be that his anxiety to conciliate the South, whence the principal danger was to be apprehended, was carried too far; his conduct in this respect certainly gave serious offence to many who were jealous of the rights and dignity of the North. But there can be no reasonable doubt that had he lived till the breaking out of the civil war he would have been found no less true to his country than many others who, after having long earnestly advocated in vain a policy of conciliation towards the South, proved themselves among the most determined and most devoted supporters of the Union. (See "Works of Rufus Choate, with a Memoir of his Life," by S. G. BROWN, 1862.)

Choate (RUFUS), son of the preceding, born in Salem, Mass., in 1834, graduated at Amherst College in 1855, and was admitted to the bar in 1861. On the outbreak of the recent civil war he entered the service as lieutenant of Massachusetts volunteers, participating in the battles of Winchester, Cedar Mountain, Antietam, etc., and was promoted to be captain for good conduct. Resigned in 1862 on account of failing health. Died Jan. 15, 1866.

Cho'card, or **Choquard** (*Pyrrhocorax*), a bird of the family Corvidæ, differing from the chough in having a shorter bill, but resembling it in its habits. The only European species is the alpine chocard, called alpine chough and alpine crow. It is about the size of a jackdaw, of brilliant black, with yellowish bill and red feet.

Choc'olate [Fr. *chocolat;* from the Mexican name *chocolatl* (from *choco*, "cacao," and *latl*, "water")], a dried paste made from the seeds of *Theobroma cacao*, mixed with sugar and spices, as cinnamon, cloves, cardamom, vanilla, etc. The paste is poured into moulds to cool and harden. Chocolate, when used as a beverage, is dissolved in hot water or milk. Sometimes the yolk of an egg is added, and sometimes it is dissolved in soup or wine. It is also employed in making certain liqueurs, and is extensively employed in confectionery. In a pure state it is very nourishing. Good chocolate is smooth, firm, soluble, aromatic, not viscid after having been boiled and cooled, but oily on the surface, and leaves no sediment. Chocolate is often adulterated with rice-meal, oatmeal, flour, potato-starch, roasted hazel-nuts, or almonds. The Mexicans, from time immemorial, were accustomed to prepare a beverage from roasted cacao, mixed with maize-meal and spices.

Choc'olay, a township of Marquette co., Mich. Pop. 260.

Cho'conut, a post-township of Susquehanna co., Pa. Pop. 939.

Chocowin'ity, a township of Beaufort co., N. C. Pop. 1630.

Choc'taw, a county of Alabama, bordering on Mississippi. Area, 800 square miles. It is bounded on the E. by the Tombigbee River. The surface is hilly or undulating; the soil is fertile. Cotton, corn, wool, and some tobacco are raised. Capital, Butler. Pop. 12,676.

Choctaw, a county in N. Central Mississippi. Area, 900 square miles. It is drained by the Big Black River, which rises in it. The surface is undulating; the soil is fertile. Cotton, corn, and wool are produced. Capital, Greensborough. Pop. 16,988.

Choctaw, a township of Arkansas co., Ark. Pop. 860.

Choctaw Corner, a post-township of Clarke co., Ala. Pop. 891.

Choctaw Indians, a tribe which formerly inhabited the State of Mississippi, on both sides of the Yazoo River. They are now settled in the Indian Territory, on the S. side of the Arkansas River. They cultivate the soil, are partially civilized, and are governed by written laws. They are politically connected with the Chickasaws, who live near them, and are represented in the same general council. Their number, exclusive of the Chickasaws, was in 1869 estimated at 12,500 souls, and they had sixty-nine public schools, with 1847 pupils.

Chodowie'cki, a distinguished German engraver and painter, born Oct. 16, 1726, who lived in Berlin, and engraved as many as 3000 plates, most of them small, in a manner original and graceful. Died Feb. 7, 1801. Wilhelm Engelmann has published a catalogue of his works (Leipsic, 1857; sup. 1860).

Chœr'ilus [Gr. Χοιρίλος], an Athenian tragic poet who flourished about 500 B. C. He was a competitor of Æschylus in a tragic contest, and gained prizes for thirteen of his dramas. None of his works are extant. He is supposed to have been the first author of written tragedies.

Chœr'ilus of Iasus, an inferior poet, was an attendant of Alexander on his march to the East, and sought to flatter him by his verses. To him, according to the scholiast on Horace, Alexander said, "He would rather be the Thersites of Homer than the Alexander of Chœrilus." The scholiast adds that Alexander agreed with him to give him a gold piece for every good verse, but a blow for every bad one, and that Chœrilus received only seven gold pieces in all, but was killed by the blows for his numerous bad verses. This author is treated of by Näke in his work on Chœrilus of Samos. HENRY DRISLER.

Chœr'ilus (or **Chœril'lus**) **of Samos,** born about B. C. 470, though Suidas places him somewhat earlier, was the author of an epic poem the exact title of which is not known, but which treated of the wars of the Greeks with Darius and Xerxes. Suidas attributes his taste for literature to his intercourse with Herodotus, who had formed an attachment to him. He afterwards found a shelter at the court of Archelaus, king of Macedonia, where he died, not later than B. C. 399. Chœrilus departed from the usage of the earlier epic poets in taking for the subject of his poem a contemporary historical event. Fragments are preserved in the writings of Aristotle, Ephorus, Josephus, etc. These have been collected into a volume with a dissertation on the life and poetry of Chœrilus, by Näke, Leipsic, 1817. HENRY DRISLER.

Choir [Lat. *chorus;* Fr. *chœur*], a company of singers in a church; also that part of a church in which the choristers sing. In ordinary language, and even as used by architects, it denotes the entire space which is enclosed for the performance of the principal part of the service. In this sense is includes the choir proper and the presbytery, and corresponds to the chancel in parish churches.

Choiseul, de (ÉTIENNE FRANÇOIS), DUC DE CHOISEUL ET D'AMBOISE, a French statesman, born June 18, 1719. He entered the army, gained the rank of lieutenant-general, and was sent as ambassador to Vienna in 1756. Favored by Madame de Pompadour, he became prime minister and favorite of Louis XV. He was considered an able diplomatist, and was popular with the nation, but he was removed from power by the influence of Madame du Barry in 1770. Died May 7, 1785. (See Mémoires de M. le Duc de Choiseul, écrites par lui-même," 2 vols., 1790.)

Choiseul-Gouffier, de (MARIE GABRIEL FLORENT AUGUSTE), COUNT, a French scholar and traveller, ambassador to Turkey, born Sept. 27, 1752. Having visited Greece and Asia Minor in 1776, he published a "Picturesque Journey in Greece (1782; new ed. 1841). Died June 20, 1817.

Choisy-le-Roi, a town of France, in the department of the Seine, on the Seine and on the Paris and Orleans Railway, 6¼ miles S. of Paris. It has manufactures of porcelain, glass, chemicals, etc. Pop. 5172.

Choke-Cherry, the *Prunus Virginiana* and its fruit, a species of bird-cherry, a native of North America, having small fruit in racemes; the fruit is rather agreeable, but astringent. The bark is used as a febrifuge and tonic, under the name of wild-cherry bark; and by distilling with water a volatile oil is obtained from it, associated with hydrocyanic acid.

Choke Damp. See CARBONIC ACID.

Cho'king, the obstruction of the pharynx or œsophagus, or more rarely of the larynx or trachea, by masses of food or other foreign bodies. Choking by obstruction of the pharynx or œsophagus is sometimes relieved by the operation of an emetic, sometimes by the use of gullet-forceps, of which there are many varieties, or by other appropriate instruments. Œsophagotomy, or cutting, has been resorted to, but this is one of the most formidable operations of surgery, and is not often necessary. When foreign bodies lodge in the larynx, aphonia, or loss of speech, is one of the symptoms. If the substance is in the windpipe or bronchi, the surgeon may often detect its presence by auscultation. The symptoms caused by foreign bodies in the œsophagus are often surprisingly like those which occur when similar bodies lodge in the air-passages. These symptoms are various; there may be spasmodic coughing, redness of the face, ineffectual attempts to swallow, and great discharge of saliva, and generally there is great difficulty of breathing. Surgical aid should always be called.

Chol'era [Gr., probably from χολή, "bile"], a disease characterized by purging and vomiting, followed by great prostration, and in many cases by fatal collapse. Comparatively mild cases occur with frequency even in temperate latitudes, and are known as sporadic cholera or cholera morbus; and such cases, though very distressing, are seldom fatal, while the more severe or epidemic form (known as Asiatic cholera) appears to arise in India, where it is endemic, and to be carried by ships, caravans, religious pilgrimages, etc., westward to Egypt, Persia, and Arabia, and thence to Europe and around the world by the regular channels of commerce. The disease is probably of miasmatic origin, and local conditions may favor or check its local development; but whether the disease ought to be called contagious or not is one of the most warmly disputed points in medicine. It is certain that habitual personal contact with the sick is often not followed by the disease. It is held by many that the disease is propagated by drinking water; by others, that its germs are taken up from the air the patient breathes. It is regarded by many as certain that the disease is largely propagated from the stools or alvine discharges of the sick; and all such discharges should be treated with powerful disinfectants, and deposited, if possible, in places not frequented by those who are well; and especial care should be taken not to let them be thrown into vaults and privies in common use. As to whether personal quarantines and cordons do any good in preventing the spread of cholera, the most diverse opinions are held, some writers strongly affirming, and others as strongly denying, their usefulness.

Without describing the various stages of the fatal disease—the premonitory painless diarrhœa, the alarming and profuse purgation which follows, carrying off the fluids of the body, the profound collapse, the reaction, with the dangerous febrile condition which may follow—it is enough to say that treatment should be chiefly preventive. No diarrhœa in a cholera season should be neglected. Opiates will usually control the precursory diarrhœa. During the active stage of the disease cold compresses to the bowels are sometimes useful. The administration of diffusive stimulants in small doses during the stage of collapse should be persisted in. Friction by the hand may relieve the spasm of the muscles. Great care should be taken for a long time lest a relapse should occur. The food of convalescents should be of the very lightest and blandest character for some days. REVISED BY WILLARD PARKER.

Chol'era Infan'tum, or **Acute Intes'tinal Catarrh'.** This intense and dangerous form of infant diarrhœa is mostly found in hot climates, the hot season, and close air; more amongst the poor than the rich. It is by no means confined to the U. S.; on the contrary, it is very frequent in Europe, and just as frequent in the first summer of the infant as in the second. It has no direct relation to dentition, which is illogically accused of being the cause of so many diseases of infancy, and results but rarely from exposure or from mental emotions of either infant or mother (wet-nurse). The usual cause is improper feeding in hot weather. The former is a direct injury; the latter, by debilitating the nervous system and lowering the functions of all the digestive organs, diminishes the general strength and power of endurance. Nursing infants are but seldom affected; many infants will recover from an attack by being returned to the mother's or nurse's breast. Still, an improper condition of breast-milk (an undue proportion of water, or fat, or caseine, or the admixture of medicinal agents taken by the mother or nurse, or a change produced by mental emotions in the latter) is known to be injurious. Weaned infants, however, and such as are brought up on artificial food, are mostly attacked. Artificial food is seldom identical, in its nutritive value, with mother's milk. Cow's milk contains less sugar and more butter and caseine than mother's milk, and requires cook-

ing and skimming before being diluted with water (better still, barley water). Vegetable food is dangerous unless carefully selected and prepared. Thus it is that the first passages in cholera infantum contain undigested food of all sorts, particularly lumps of coagulated milk, which is also brought up by vomiting. Afterwards the passages are very thin, watery, of an acid or fetid smell, very copious and frequent; vomiting accompanies this diarrhœa, more or less. Moaning and crying are soon replaced by debility, and even complete collapse; the body is rapidly deprived of a large portion of the water contained in it, and emaciates; the eyes lie deep in the orbits; the sutures and fontanelles of the skull sink; the skin becomes dry, the feet and hands cold, while the temperature of the trunk is rising; the face looks shrunk and senile; the pulse becomes weak and frequent, the voice feeble, the expression of eyes and face listless, and sopor or coma or convulsions set in. Death is a frequent result. The principal preventive consists in supplying the well infant with proper artificial food when no breast-milk is available, and at regular times, and in attending to its general health. When the disease has made its appearance the principal means of checking it are the following: during the first few (3–6–8) hours no food or drink ought to be given. The irritated stomach must be kept at rest; vomiting will cease on that condition only. After that time give a teaspoonful of ice-water or a small piece of ice (size of a bean), with or without a few drops of brandy, every five or ten minutes, as long as the tendency to vomit persists. When feeding is to be recommenced, avoid milk (except breast-milk) in whatever form. Barley-water, oatmeal gruel (strained), in tea or tablespoonful doses, now and then, with the white of eggs (1–3 in twenty-four hours), will readily be taken and well digested. Many cases will get well with this dietetical treatment. At the same time the air must be kept as cool and fresh as possible, day and night. The infant will recover faster out of than in doors. The medicinal treatment, which is, under all circumstances, the domain of a physician, varies according to the nature of the case. Mercurial remedies (calomel) can be avoided. Subnitrate of bismuth, with opium in small doses, and preparations of chalk, nitrate of silver, astringents, such as tannic or gallic acids, catechu, are frequently resorted to, the latter principally in cases which threaten to become chronic. A. Jacobi.

Choles'terin [from the Gr. χολή, "bile," and στέαρ, "fat"], one of the lipoids, or non-saponifiable fats, was originally discovered in gall-stones, but is an ordinary constituent (in very minute quantity) of bile, blood, the tissue of the brain, and of pus and other morbid fluid products. It is generally thought to be a product of disassimilation, and is hence considered an excrementitious substance. It separates from its solutions in glistening pearly scales, which, when examined under the microscope, appear as very thin rhombic tablets. Different formulæ have been assigned for its composition, the one generally accepted being $C_{26}H_{44}O$. It is not always easy of detection, but it may be readily distinguished from all similar substances by its rhombic tablets.

Cholet, a town of France, department of Maine-et-Loire, on the river Maine, 32 miles S. S. W. of Angers. It is well built, and has manufactures of fine woollen and mixed fabrics. Pop. 13,360.

Cholmondeley, chum'ly, Marquesses of, and Earls Rocksavage (United Kingdom, 1815), Earls Cholmondeley (1706), Viscounts Malpas (1706), Barons Cholmondeley (England, 1689), Barons Newburgh (Great Britain, 1716), Viscounts Cholmondeley (1661), Barons Newburgh (Ireland, 1714), and baronets (1611).—William Henry Hugh Cholmondeley, third marquess, joint hereditary lord grand chamberlain of England, born Aug. 31, 1800, was member of Parliament for South Hants 1852–57, and succeeded his brother May 8, 1870.

Cholu'la, a decayed town of Mexico, in the state of Puebla, is situated on the table-land of Anahuac, about 70 miles E. S. E. of Mexico. Elevation above the sea, 6912 feet. According to Cortez, it contained 20,000 houses in the first part of the sixteenth century, and about 400 temples. The present population is about 5000. Here is a remarkable ancient pyramid of clay and brick, which is 164 feet high, with a base each side of which measures 1440 feet. It is supposed that this was erected by the aborigines or ancient Mexicans. Humboldt reported that he found 16,000 inhabitants, but it has greatly decreased since.

Chone'tes [from the Gr. χώνη, "cup" or "funnel-shaped cavity"], a genus of fossil brachiopodous molluscoids nearly allied to the genus *Productus*. It is characterized by a transversely oblong shell, and by having the long margin of the ventral valve armed with a series of tubular spines. More than twenty-eight species have been found in the palæozoic formations. They are found in Europe and America.

Chopin (Frédéric François), a Polish pianist and composer, born near Warsaw Mar. 1, 1809, removed to Paris about 1832. He composed concertos, waltzes, nocturnes, preludes, and mazurkas which display a poetic fancy and abound in subtle ideas, with graceful harmonic effects. His compositions are strikingly peculiar in melody, rhythm, and harmony, and possess a delicate though powerful charm. He was one of the first of pianists, and his playing, like his music, was marked with a strange and ravishing grace. Died in Paris Oct. 17, 1849. In 1869 a monument was erected to him at Warsaw. (See Liszt, "Chopin," 1852; Barbedette, "Chopin," 1869.)

Chopine, or **Chiopine,** chop-een' [Sp. *chapin;* probably from the It. *scappino,* a "sock"], a high clog or slipper. Chopines were probably of Eastern origin, but were introduced into England from Venice during the reign of Elizabeth. They were worn by ladies, and were usually made of wood covered with leather, often of various colors, and frequently painted and gilded. Some of them were as much as half a yard high; and in Venice, where they were universally worn, their height distinguished the quality of the lady.

Chop'tank, a river which rises in Kent co., Del., and flows south-westward into Maryland. It expands into an estuary, forming the boundary between Talbot and Dorchester counties, and communicates with Chesapeake Bay. Length, nearly 100 miles. Sloops can ascend it about fifty miles.

Chora'gus, or **Chore'gus** [Attic Gr. χορηγός], a person at Athens who, on behalf of his tribe, supported the chorus, and who, in competition with the other tribes, exhibited musical or theatrical performances. The choragus who surpassed his competitors received a tripod for a prize, but he had the expense of consecrating it and of building the monument on which it was placed. (See Chorus.)

Chora'le [Low Lat., from *chorus,* a "choir"], or **Cho'ral,** a melody to which hymns or psalms are sung in public worship by the congregation in unison. The melody of the chorale moves in slow and strictly-measured progression, and is of a character that disposes the mind to devotion. The term chorale is now applied only to the music of the Protestant churches, but choral melodies still in use can be traced with certainty to the early centuries of Christianity. The pure, simple chorale has in a great degree been cast aside.

Chord [Fr. *corde,* from the Gr. χορδή, a "string"], in geometry, is the straight line which joins the two extremities of the arc of a curve; so called because while the arc resembles the bow (*arcus*), the chord may be likened to the bow-string. The chord of a circular arc may be found by multiplying the radius by twice the sine of half the angle which the arc subtends. The use of chords in trigonometry is mostly superseded by the use of sines, which are much more convenient.

Since two circles can cut each other in only two points, they can have only one common chord. But by the transcendental "principle of continuity," to which modern geometry owes so much, the circle may be considered as a curve of the second order, and as such two circles may be said to have four points of intersection, two of which are, however, always imaginary. These imaginary points are called "circular points at infinity." This view also gives the two circles six common chords, instead of one. Four of these chords are imaginary, and the fifth is infinitely distant; while the sixth (and most obvious) chord may or may not cut the two circles in real points. This last chord is often called the Radical Axis (which see), and has many remarkable properties.

Chord, in music. See Consonance.

Chore'a [Gr. χορεία, a "dance"], or **St. Vitus's Dance,** a disease characterized by irregular, involuntary, and often grotesque muscular action, without appreciable organic change in any tissue, and generally without pain or any known derangement of mental action or of sensation. It is most common in children after the second dentition and before puberty; much more common in girls than in boys; sometimes attacks pregnant women and other adults, though some cases once called adult chorea would now be recognized as locomotor ataxy, a very different disease. Chorea is sometimes hereditary, sometimes epidemic. Many writers have classed the dancing mania (the original "St. Vitus's dance"), tarantism, and the strange excesses of certain religionists (dervishes, French prophets, "jumpers," and "convulsionists") all as varieties of chorea. Stammering has been called a chorea of the vocal organs. The

disease is sometimes associated with rheumatism and with anæmia. Such complications should receive special treatment. The metallic tonics are generally useful, and so are systematic gymnastics, life in the open air, and a kind and unobtrusive discipline, which shall teach the young patient the power of the will over the movements of the body.

Chor'ley, a town of England, in Lancashire, on a hill and on the river Chor, 20 miles N. W. of Manchester. It is connected by a railway with Preston and Bolton. It has an ancient parish church in the Norman style, and a handsome Gothic church. The place owes its prosperity to various manufactures of cotton yarn, muslin, jaconet, calico, and gingham. Mines of coal and lead and quarries of slate are worked in the vicinity. Pop. 15,013.

Cho'roid Coat [from the Gr. χορίον, "skin," and εἶδος, "appearance"], the second of the tunics of the eye, covering the posterior five-sixths of the eyeball, and coming as far forward as the edge of the cornea. In front it is continued by the ciliary processes and the iris. It joins the sclerotic by means of the ciliary ligament and muscle. It is highly vascular, and is pigmentary, being of a kind of chocolate color. It is in three layers. The outermost is connected to the sclerotic by the *membrana fusca*. This coat consists principally of the vorticose veins, with pigment-cells. The middle layer (*tunica Ruyschiana*) consists of capillaries. The inner layer consists of tesselated epithelium, charged with pigment. This layer is lined by the retina. The choroid coat is liable to an inflammatory disease known as choroiditis.

Cho'rus [Gr. χορός; Lat. *chorus*], a Latin word by which is understood the union of musicians for the performance of a musical work. In modern music a combination of voices or instruments is called a chorus. A vocal chorus is mixed or complete where it consists of all or part of the four principal voices. There are also choruses for male and female voices. An instrumental chorus is the name applied especially to a combination of wind instruments. A musical passage thus unitedly rendered is termed also a chorus. In operas and the oratorio it is of the greatest importance. In the immense musical festivals or jubilees recently held in different parts of Europe and America the choruses have comprised many thousand voices.

Chorus in the ancient drama was a band of singers and dancers employed on the stage. In the Attic tragedy and comedy the chorus consisted of a group of males and females, who remained on the stage during the performance as witnesses. When a pause took place in the drama the chorus sang or spoke verses having reference to the subject. At times the chorus took part with or against the persons in the drama, by way of advice, comfort, or dissuasion. Its leader was called the coryphæus. The charge of organizing it was considered a great honor. At times the chorus was divided, and spoke or sang antiphonally. How the musical element of the ancient chorus was constituted is not known. It was doubtless very simple, and was accompanied by flutes.

Chose in Action, in law, a thing in action. This is a term used to express all rights enforceable by action in a court of justice. Blackstone, in his "Commentaries," confines it to rights growing out of contracts. Modern usage extends it to claims arising from torts or wrongs. (See Contracts, Torts, Assignment, Chattel, etc.)

Cho'tank, a township of King George co., Va. Pop. 2814.

Choteau, a county in the N. part of Montana. It is intersected by the Missouri River and the Milk River. The surface is partly mountainous, but it contains some broad treeless plains and considerable arable land. Area, 14,195 square miles. The climate is quite moderate, from the comparatively small elevation above the sea. Capital, Fort Benton. Pop. 517.

Cho'tyn, Kho'tin, or **Choc'zim,** a fortified town of Southern Russia, in Bessarabia, on the Dniester, 45 miles S. W. of Kamieniec. It is an important military post, which formerly belonged to the Turks, from whom it was taken by the Russians in 1739. Pop. in 1867, 20,917.

Chouans, a name of the French royalists of Brittany who revolted against the French Convention in 1792. Chouan, which signifies an "owl," was the nickname of Jean Cottereau, who was the leader of the insurgents, and had previously been a smuggler. This insurrection was called *La Chouannerie*. Cottereau gained some success in guerilla warfare, and eventually united his troops with the Vendeans. They were defeated at Le Mans in Dec., 1793. Cottereau was killed in a fight in July, 1794. New movements of the Chouans took place in 1799, and again in 1814 and 1815, but they were easily suppressed.

Chough, chŭf [etymology uncertain], (*Fregilus*), a bird of the crow family, approaching the character of the starling, but resembling the crow in having its nostrils covered with bristles. The beak is long, strong, arched, and pointed.

Chough.

The tail is slightly rounded. The Cornish chough, or red-legged crow (*Fregilus graculus*), inhabits many parts of Europe and Asia and the north of Africa, dwelling on high cliffs. Its long claws enable it to cling to a rock, but it seems unwilling to set its feet on turf. It lives in societies like the rook. It feeds on insects, berries, grubs, and grain. It is easily tamed, and exhibits in the highest degree the disposition which characterizes others of the crow family. Other species of chough are natives of Australia, Java, etc. The alpine chough is a Chocard (which see).

Choules (John Overton), D. D., born at Bristol, England, Feb. 5, 1801, studied theology at Bristol College (England). He arrived in America in 1824, and engaged immediately in teaching, for which he seems to have had unusual adaptation, and to which he devoted himself, to some extent, throughout his life. He was pastor of Baptist churches in New Bedford, Mass., Buffalo, N. Y., Jamaica Plain, Mass., and Newport, R. I., and edited several works, the most important of which was Neal's "History of the Puritans," and published "The Young Americans Abroad" and "A History of Christian Missions." Died in New York Jan. 5, 1856.

Chouteau (Auguste and Pierre), two brothers noted as the founders of the city of St. Louis, Mo. They removed from New Orleans to the site of St. Louis in 1764. Auguste died in 1829, and Pierre in 1849. The latter had a son Pierre (born 1789; died Sept. 8, 1865), an eminent merchant in the fur-trade.

Chowan', a river of North Carolina, is formed by the Meherrin and Nottoway rivers, which unite about 5 miles above Winton. It flows south-eastward, and then southward, forms the boundary between Chowan and Bertie counties, and enters Albemarle Sound at its western end. It is about 50 miles long, and is navigable for sloops.

Chowan, a county in the N. E. of North Carolina. Area, 240 square miles. It is bounded on the S. by Albemarle Sound, and on the W. by the Chowan River. The surface is nearly level. Corn and cotton are staple products. Capital, Edenton. Pop. 6450.

Chrestom'athy [Gr. χρηστομάθεια], according to the etymology, is that which is useful to learn. The Greeks frequently formed commonplace books by collecting the various passages to which in the course of reading they had affixed the mark χ (χρηστός). Hence books of extracts chosen with a view to utility have received this name.

Chres'tus of Byzantium, one of the most distinguished pupils of Herodes Atticus, a contemporary of the emperor Aurelius. He was celebrated for his eloquence, and taught rhetoric with great success, having many distinguished men among his hearers. Of his writings nothing is preserved. Philostratus has given notices of him in his lives of the Sophists. Henry Drisler.

Chrism [Gr. χρῖσμα, from χρίω, to "anoint"], the oil which is used in the Greek, Roman Catholic, and Oriental churches in the administration of baptism, confirmation, ordination, extreme unction, etc. There are two kinds of chrism—the one, a mixture of oil and balsam, is used in baptism, confirmation, and ordination; the other, which is mere oil, is used in extreme unction. The chrism of the Eastern Church contains more than forty ingredients.

Chris'ome [from the Gr. χρῖσμα, an "anointing"], the white vesture laid by the priest on the child in former times at baptism, to signify its innocence. It was generally presented by the mother as an offering to the church, but if the child died before the mother was churched after the next child's birth, it was used as a shroud. A chrisome child is a child in chrisome cloth.

Christ [Gr. Χριστός; Lat. *Christus*], a word which was

at first a title of our Saviour, now in general use as part of his name. It is Greek, signifies *anointed*, and corresponds exactly in meaning and use with the Hebrew word Messiah. As kings were anointed on being called to their offices, so the Saviour was anointed (Acts x. 38) "with the Holy Ghost and with power." This anointing signifies a consecration or setting apart for a peculiar work. (For the historical account of Christ, see JESUS; for an account of the doctrines held with regard to Christ's nature, see CHRISTOLOGY, by PROF. W. G. T. SHEDD, D.D.)

Christadel'phians ("brothers of Christ"), a religious body of recent origin who are becoming numerous in some parts of the U. S. They attach equal importance to the Old and New Testaments, and believe that the intention of the Creator is to recall to immortal life all who love him in this life, who shall people this world. All who have not caught the immortal principle perish in death. They reject the doctrine of a personal devil. Christ, they believe, is the Son of God, deriving from the Deity moral perfection, but from his mother the common nature of Adam. They ascribe to him the threefold character of prophet, priest, and king. The first office he fulfilled by his life and death on earth; as priest he now mediates before the Deity; and as king he will return to earth and reign from the throne of David over the glorified world.

Christ'church, a borough and seaport of England, in Hampshire, on the English Channel, and at the head of the estuary formed by the rivers Avon and Stour, 24 miles S. W. of Southampton. Here is a priory church, one of the most interesting of English ecclesiastical structures, which was partly built on an ancient foundation in the reign of William Rufus. Christchurch has manufactures of springs for watches and clocks, and several breweries. The phenomenon of a double tide occurs here every twelve hours. Pop. 9368.

Christ Church, a town of New Zealand, capital of the province of Canterbury, is situated on the banks of the river Avon, 7 miles from the sea. It is connected by railway with Lyttleton, which is its port, and by telegraph with nearly all the leading towns. It is the seat of an Anglican bishop, and has a college. Pop. in 1871, 7931; with the suburbs, 12,466.

Christ Church, a township of Charleston co., S. C. Pop. 4493.

Chris'tening, a term used as a synonym for baptism. It is disliked by some as favoring the doctrine of baptismal regeneration, being, according to its derivation, expressive of the notion that a person is made a Christian in baptism. But it is usually employed without the intention of conveying any such opinion.

Chris'tian, a county in S. Central Illinois. Area, 875 square miles. It is bounded on the N. by the Sangamon River, and intersected by the South Fork of that river. The surface is nearly level; the soil is fertile. Corn, wheat, cattle, hay, tobacco, and butter are produced. It is traversed by the Central, the Toledo Wabash and Western, the Springfield and Illinois South-eastern, and the Indianapolis and St. Louis R. Rs. Coal is found here. Capital, Taylorsville. Pop. 20,363.

Christian, a county of Kentucky, bordering on Tennessee. Area, 700 square miles. It is drained by Little River and several creeks. The surface of the N. part is hilly, and that of the S. is level; the soil is fertile. Tobacco, corn, wheat, and live-stock are largely raised. Coal and limestone abound here. The county is intersected by the St. Louis Evansville Henderson and Nashville R. R. Capital, Hopkinsville. Pop. 23,227.

Christian, a county in the S. W. of Missouri. Area, 500 square miles. It is drained by the James River and Swan Creek. The soil of some parts is fertile. Corn and tobacco are the staple crops. Copper, iron, and lead are found here. Capital, Ozark. Pop. 6707.

Christian, a township of Independence co., Ark. Pop. 1327.

Christian II., king of Denmark, a son of John, was born July 2, 1481. He began to reign in 1513, and married Isabella, a sister of the emperor Charles V., in 1515. In 1520 he invaded Sweden, which he partially conquered. He usurped the throne of Sweden, and abused his power by cruelty, but he was expelled by Gustavus Vasa in 1522. His Danish subjects also revolted, deposed him, and elected his uncle, Frederick I., in 1523. Christian retired to Flanders, and returned with an army in 1531, but was defeated and kept in prison until his death, Jan. 25, 1559. (See BEHRMANN, "Kong Christiern II., Historie," 1815.)

Christian IV., king of Denmark, born April 12, 1577, was the son and successor of Frederick II., who died in 1588. He became in 1625 the commander of the Protestant armies in the Thirty Years' war against the emperor of Austria. In 1626 he was defeated by the imperialist general Tilly at Lutter. He waged war against Sweden from 1611 to 1613, and again from 1643 to 1645. He was an able ruler, and promoted the prosperity of Denmark. He died Feb. 28, 1648. (See RASMUS NYERUP, "Charakteristik af Kong Christian IV.," 1816.)

Christian VII., king of Denmark, born Jan. 29, 1749, was a son of Frederick V. His mother was Louisa, a daughter of George II. of England. He began to reign in Jan., 1766, and married his cousin Caroline Matilda, a sister of George III. of England, in the same year. His physician, Struensee, obtained the chief power in 1770, and was supported by the favor of the queen, but he was unpopular with the nation. Christian VII. was so feeble and morbid that he was incapable of reigning. He died Mar. 13, 1808, and was succeeded by his son, Frederick VI., who had been regent since 1784.

Christian VIII., king of Denmark, born Sept. 18, 1786, was a cousin of Frederick VI. He was chosen king of Norway in 1814, but being unable to defend it against Bernadotte, who invaded Norway, he abdicated in Oct., 1814. He succeeded Frederick VI. in 1839, and died Jan. 20, 1848, leaving the throne to his son, Frederick VII.

Christian IX., king of Denmark, a son of Friederich Wilhelm, duke of Sleswick-Holstein, was born April 8, 1818. He ascended the throne in Nov., 1863, and was soon involved in a war against the German confederation, which disputed the right of the king to incorporate Sleswick with Denmark. The Danes were defeated, and Christian IX. signed in Aug., 1864, a treaty by which he ceded the duchies of Sleswick, Holstein, and Lauenburg to Austria and Prussia.

Christia'na, a post-hundred of Newcastle co., Del. Pop. 5370.

Christiana, a post-village of Sadsbury township, Lancaster co., Pa., on the Pennsylvania R. R., 21 miles E. by S. of Lancaster, has manufactures of iron castings and machinery, and a brisk trade.

Christiana, a post-township of Dane co., Wis. Pop. 1342.

Christiana, a township of Vernon co., Wis. Pop. 1133.

Chris'tian Commis'sion, or, more fully, **The United States Christian Commission,** a great organization in the Northern U. S. during the late civil war. It was organized Nov. 14, 1861, at New York. Its work was designed to supplement that of the great Sanitary Commission, for while the object of the latter was more especially the care of the sanitary condition of the national armies, the relief of the wounded and sick, etc., the Christian Commission also gave especial attention to the religious needs of the troops, co-operating with the chaplains, while the Sanitary Commission more especially co-operated with the medical officers of the army. At the same time the two societies entered into a generous rivalry in the work of supplying the material wants of the sick and wounded soldiers. The Christian Commission was first proposed by Mr. Vincent Collyer of New York, and originated by a call of the Young Men's Christian Association of New York (Sept. 23, 1861) upon all similar associations in the North to unite in this great undertaking. (See Moss, "Annals of the Christian Commission.") (See UNITED STATES CHRISTIAN COMMISSION.)

Chris'tian Connec'tion (or simply **Christians***), a religious denomination which arose in the U. S. about the beginning of the present century. This body originated in three distinct movements in three of the older denominations of the U. S.: (1) in the "O'Kelly Secession" (1793) from the Methodist Episcopal Church. O'Kelly's followers were at first called "Republican Methodists," but afterwards chose the name of "Christians," and declared the Bible alone to be their rule of faith and church government. (2) Dr. Abner Jones of Hartland, Vt., a Baptist, organized in 1800 a church which disavowed all creeds and sectarianism, and received the Bible as their only rule. They were joined by many ministers and others, chiefly of the Baptist and Freewill Baptist denominations. (3) A body of Presbyterians of Kentucky and Tennessee, who seceded in 1801 from the parent Church, and in 1803 took the name of Christians. The above three bodies were finally united into a "general convention," which meets quadrennially. The churches, however, are independent in church government.

The "General Baptists" of England and Wales hold

*This name is often pronounced Krist'chan, in order to distinguish it from the common word, Christian.

doctrinal views very similar to those of the Christians, and the two bodies are in fellowship with each other. They invite all believers to their communion. The Christians are opposed to infant baptism, have no creed except the Bible, practise immersion in baptism, and are, as a general rule, Unitarian in their doctrines. They have in the U. S. about 150,000 communicants, and support several colleges and other schools. They are also found in England and her colonies. The denomination called "Campbellites" and "Disciples" also call themselves "Christians." (See DISCIPLES OF CHRIST.)

Christiancy (ISAAC P.). See APPENDIX.

Christian Era [Fr. *ère Chrétienne*], the name of the great era from which all Christian nations compute their time, once supposed to correspond to the date of the birth of Christ. But, according to some of the best authorities, Christ was born on the 5th of April, four years before the commencement of our era (others say on the 25th of December, four or five years before that time). The practice of reckoning time from the (supposed) birth of Christ appears not to have been introduced into the Christian Church until the sixth century, when Dionysius surnamed the Little (Exiguus), a monk of Syria, first made use of it about 527 A. D. It was soon after introduced into Italy, and into France in the following century. The first instance recorded of its being employed in England was in 680. But the practice did not become universal throughout Christendom until about the middle of the fifteenth century.

Christia'nia, the capital of Norway and of the stift of the same name, is picturesquely situated in a valley and at the head of the navigable Christiania Fiord, about 55 miles from the sea; lat. of observatory, 59° 55′ N., lon. 10° 43′ E. The environs of the city are beautiful, and visitors who approach it by the fiord pass through magnificent scenery. It contains a cathedral, a citadel, a royal palace, a great arsenal, a town-hall, two theatres, an exchange, an asylum for lunatics, and a university founded in 1811, which has a library of 150,000 volumes. The average number of students is nearly 600. Connected with the university is an astronomical observatory. Here are manufactures of cotton, paper, glass, soap, etc. The chief articles of export are timber, iron, and glass. The harbor and fiord are closed by ice for three or four months in the year. It is a bishop's see, and was founded in 1624 by Christian IV. on the site of the burned royal city of Opslo. Pop. in 1869, 64,935.

Christian'ity [from the Gr. Χριστιανός, a "follower of Christ"], a system of religion which comes to us with a claim to be accepted as of divine origin. It professes to be no product of the human intellect, and acknowledges no author but the Being whom it sets before us as the object of worship. It claims to be the only true religion, and is consequently exclusive; that is to say, it admits of no compromise with any other religious system.

As a system it cannot be viewed as distinct from the religion of the Jews and of the patriarchs; it is the same religion adapted to new circumstances; there has been a change of dispensation alone. In studying Christianity we are obliged constantly to revert from the New Testament to the Old, and in some measure to trace the history of this through the preparatory dispensations. Christianity may be regarded as having its foundation in the doctrine of the existence of one God. Man is represented as involved in misery, incapacitated for the service of God, and liable to punishment for sin in a future state. The doctrine of the atonement claims special attention—a doctrine taught in all the sacrifices of the patriarchal and Jewish dispensations, as well as by the words of the Bible. Man being utterly incapable of effecting his own deliverance, God sent his Son to save sinners, to make them holy and partakers of eternal life.

By Unitarians and others who do not accept the above view, atonement or reconciliation with God is made to depend on repentance, while the life and death of Christ are represented as an example to us of obedience, virtue, goodness, and beneficence, under most trying circumstances; in which view the doctrines of a propitiatory sacrifice and imputed righteousness fall to the ground. These doctrines, however, are held by most of those who receive the doctrine of the Trinity and the generally received doctrine as to the incarnation of the Son of God, which is regarded as a glorious example of Divine condescension and a very great exaltation of human nature, while the highest dignity and bliss of which humanity is capable is believed to be attainable only by faith in Jesus Christ. According to this view, the connection between faith and salvation arises from the Divine appointment, which, however, provides for bringing into exercise, in harmony with the intellectual and moral nature of man, most powerful and excellent motives for all that is morally good, the partakers of salvation being thus fitted for the fellowship of God.

The doctrine of divine grace is a part of the system of Christianity on which very important differences of opinion subsist, especially as to the relation of grace to individual men. Such are the differences concerning election, and concerning man's ability or inability to exercise saving faith of himself. But by Christians generally the relation of the believer to Christ, and his faith in Christ, are ascribed to the Holy Ghost or Spirit of God, the third person of the Godhead. (See CALVINISM and ARMINIANISM.)

Salvation is viewed as beginning in regeneration, and as carried on in sanctification, and all its joys as connected with the progress of sanctification in this life or in that which is to come. Faith in Christ cannot be unaccompanied with repentance; though believers are holy in contrast to what they once were, yet there is none in this life free from sin, the tempter of our first parents being still the active enemy of men. Responsibility belongs to human nature; and the doctrine of a judgment to come may be considered as to a certain extent a doctrine of natural religion, as may also that of the immortality of the soul; but the clear and distinct enunciation of these doctrines belongs to the Christian religion.

Of the moral element of Christianity it is sufficient here to state that it is harmonious with the doctrinal part and inseparable from it; that it is founded upon the teachings of the Bible with regard to the moral attributes of God, and is exemplified in the character of Jesus Christ; and that it is divisible into two great parts—one of the love of God, and the other of the love of man.

Among what are termed the means of grace, which form so important a part of the system, the doctrine contained in the Bible first claims attention as the means of conversion and of edification, the instrument by which salvation is begun and carried on. The ordinances of worship, prayer, and sacraments are means of grace, concerning the relative importance of which, as compared with the other means, considerable difference of opinion prevails. The same remark applies also to the combination of Christians into an organized body with its own system of church government and discipline.

The truth of Christianity is supported by many different evidences, independent, but mutually corroborative. It appeals to reason, and demands to have its claims examined. Nor is there any faith where there is not a mental conviction arrived at by reasoning, direct or indirect. (See EVIDENCES OF CHRISTIANITY.)

Christianity is now the dominant religion in all countries of America, in Australia, and in Europe (except in Turkey), and it makes steady progress in Asia and Africa. It is divided into a large number of denominations or sects, which may be classed in three large groups—the Roman Catholic Church, the Oriental churches, and all the other churches. Most or all of the denominations of the third class are sometimes comprised under the name Protestants. In 1872 the aggregate population connected with the various denominations of Christians was estimated at about 380,000,000, in a total population of the globe of about 1,380,000,000. The Roman Catholic Church numbered a population of about 197,000,000, and the Oriental churches about 83,000,000. (See EASTERN CHURCHES, GREEK CHURCH, ROMAN CATHOLIC CHURCH, and the names of various denominations.)

Christians (a religious denomination). See CHRISTIAN CONNECTION.

Chris'tiansand, a fortified seaport-town of Norway, is near its southern extremity and on the Skager-Rack, about 160 miles S. W. of Christiania. It has a good harbor, a citadel, a Gothic cathedral, the finest sacred building in Norway except the one at Trondhjem, a custom-house, and a gymnasium. Shipbuilding is the principal industry. It is a bishop's see and the capital of a stift. Timber, salmon, etc. are exported hence. Pop. 10,876.

Chris'tiansburg, a post-village of Shelby co., Ky., on the Louisville and Lexington R. R., 49 miles E. of Louisville.

Christiansburg, a incorporated town, capital of Montgomery co., Va., on the Atlantic Mississippi and Ohio R. R., 86 miles W. of Lynchburg, 2200 feet above the sea-level. It has a female college, an academy, tobacco and shoe factories, two churches, and one newspaper. Pop. 864; of township, 3316.

NELSON CONRAD,
ED. MONTGOMERY "MESSENGER."

Christians of St. Thomas, a very ancient Christian sect of India, found especially along the Malabar coast. They claim to be descendants of converts made in India by the apostle Thomas, but they are generally believed to have been converted by Persian missionaries in the early ages of the Church. In 1599 the greater part were induced

by the Jesuits to unite with the Church of Rome, and at present about three-fourths of their number are Roman Catholics. Of the latter class more than one-half have a Syriac church-service, while the remainder are of the Latin rite. Of those who are not united to the Church of Rome there were in 1859 about 70,000, and ten years later they claimed for themselves 190,000 members, which is undoubtedly in excess of their number. They acknowledge the supremacy of the Jacobite patriarch of Antioch, though they were formerly Nestorians of the patriarchate of Mosul. Our knowledge of the history of this interesting people will probably be always limited, most of their literature having been burned as heretical by order of the synod of Diamper (1599). There was anciently, it would seem, more than one sect among them. According to Mr. Ludlow, they are at present both socially and morally much debased, though they were once the dominant class in Malabar. They are now found principally in Travancore. (See HOUGH'S "History of Christianity in India," 4 vols., 1839–45.)

Chris'tianstad', a fortified town of Sweden, capital of a læn of its own name, is on the river Helge, about 9 miles from its entrance to the Baltic and 267 miles S. W. of Stockholm. It has broad streets and wooden houses. In the vicinity are the immense alum-works at Andrarum (5000 tons annually). It has an arsenal, a barrack, and a fine church; also manufactures of linen and woollen fabrics and gloves. Pop. 7710.

Chris'tiansted', the chief town of the island of St. Croix, in the West Indies, is on the N. E. coast. It has a good harbor, which is defended by a fort. The governor-general of the Danish West Indies resides here. Pop. 6560.

Chris'tiansund', a seaport-town of Norway, on three islands, which enclose its harbor. It is in the district of Romsdal, and 85 miles W. S. W. of Trondhjem. The trade is good, and fishing is largely pursued. Pop. 5709.

Chris'tiansville, a township and post-village of Mecklenburg co., Va., 15 miles S. of Lunenburg. Pop. 2550.

Christian Union Churches. See APPENDIX.

Christie (WILLIAM D.). See APPENDIX.

Christi'na, queen of Sweden, born Dec. 6, 1626, was the only surviving child of Gustavus Adolphus. She received a solid and masculine education, and learned Latin, Greek, Hebrew, politics, etc. When her father died, in 1632, she was recognized as his successor, under the regency of Oxenstiern. In 1644 she assumed royal power, and in 1648 concluded the treaty of Westphalia, by which Pomerania was annexed to Sweden. Her mind was strong and her character eccentric. Her subjects wished that she should choose a husband, but she manifested a constant aversion to marriage. Her eccentricity was also exhibited in the extravagant patronage of authors, pedants, artists, and buffoons. In 1650 her cousin, Charles Gustavus, was designated as heir to the throne by the states of Sweden, with the assent of the queen. Impatient of the personal restraint which the etiquette of court imposed on her, she abdicated the throne in June, 1654, while still in the bloom of youth. This act has been variously attributed to levity and magnanimity. She reserved supreme power over her suite and household, embraced the Roman Catholic religion, and became a resident of Rome. She patronized artists, founded an academy at Rome, and meddled with astrology and other chimerical pursuits. In 1657 she caused her grand equerry, Monaldeschi, to be put to death for treason. It is said she wished to recover the crown of Sweden when the king died in 1660, but she did not succeed. Died April 19, 1689. (See LACOMBE, "Histoire de Christine," 1762; ARCHENHOLZ, "Memoirs of the Life of Christina," Stockholm, 4 vols., 1751, in French; H. WOODHEAD, "Memoirs of Christina of Sweden," 1863.)

Christi'nos, the name of a political party in Spain during the regency of Queen Maria Christina, embracing the adherents of the queen. They were opposed by the CARLISTS (which see).

Chris'tison (Sir ROBERT), a Scotch physician, professor of materia medica in the University of Edinburgh, born July 18, 1797, studied in Paris with Orfila. He has written, among other works, a "Treatise on Poisons" (1829), a standard authority. He was made a baronet in Nov., 1871.

Christ'lieb (THEODOR), D. D., was born in Würtemberg in 1833, studied at Tübingen, taught in France, and became a preacher in London, where he published his famous lectures on "Modern Doubt and Christian Belief." He returned to Germany in 1865, and in 1868 became university preacher and professor of theology at Bonn. In 1873 he visited the U. S. as a delegate of the Evangelical Alliance. Here he delivered an address of great ability upon the rationalism of the present day.

Christ'mas [so called because an especial mass, the "mass of Christ," was celebrated on that day; Fr. *Noël*; Ger. *Weihnachten*; It. *Natale*, *i. e.* "birthday"], the day on which the birth of the Saviour is celebrated. The observance of the 25th of Dec. is ascribed to Julius, bishop of Rome, A. D. 337–352. The Eastern Church had previously observed the 6th of Jan., in commemoration both of the baptism and of the birth of Christ. Before the end of the fourth century the East and the West had exchanged festivals, the West adopting Jan. 6, in commemoration of our Lord's baptism, and the East adopting Dec. 25, in commemoration of our Lord's birth. The exact date of Christ's birth appears not to have been known to the early Church, and cannot now be determined. That the date was preserved in the public archives at Rome, though asserted by some of the ancient Fathers, is now not generally credited. As for the year, critical opinion is gravitating towards the year 5 or 4 B. C. And as for the day, we may be helped to a decision by considering that between the middle of December and the middle of February there is generally in Palestine an interval of comparatively dry weather, preceded and followed by the early and the latter rain. Thus, there might have been shepherds on the plain of Bethlehem watching their flocks by night.

Christmas is celebrated on the 25th of Dec. in nearly every part of Christendom. Among the causes that operated in fixing this period, perhaps the most powerful was that most heathen nations regarded the winter solstice as the beginning of the renewed life and activity of the powers of nature. The Romans, Celts, and Germans, from the oldest times, celebrated the season with great feasts. At the winter solstice the Germans held their Yule-feast, and believed that during the twelve nights reaching from the 25th of Dec. to the 6th of Jan. they could trace the personal movements on earth of their great deities. Some of these usages passed over from heathenism to Christianity, and have partly survived to the present day. But the Church sought to banish the deep-rooted heathen element by introducing its grand liturgy, besides dramatic representations of the birth of Christ and the first events of his life. Hence the so-called "manger-songs" and Christmas carols. Hence also the Christmas trees adorned with lights and other decorations, the custom of reciprocal presents and of Christmas meats and dishes. Christmas became a universal festival.

In the Roman Church three Christmas masses are usually performed—one at midnight, one at daybreak, and one in the morning. The day is also celebrated by the Anglican churches. The Greek and Lutheran churches likewise observe Christmas, but the Presbyterians and the English dissenters reject it in its religious aspect, although in England and the U. S. people of nearly all sects keep it as a social holiday, on which there is a cessation from all business. The festivities formerly lasted with more or less brilliancy till Candlemas, and with great spirit till Twelfth Day. (See CASSEL, "Weihnachten Ursprung, Bräuche und Aberglauben," 1862.)

REVISED BY R. D. HITCHCOCK.

Christmas Carols [Fr. *carole*; It. *carola*, a "round dance," perhaps from the Lat. *corolla*, a "circlet;" Welsh, *coroli*, to "dance," the name being thence applied to the music or song accompanying such a dance]. The word carol signifies a song of joy. The practice of singing sacred songs in celebration of the nativity of Christ as early as the second century is considered as established. Christmas carols are believed to have been devised as a substitute for the songs of the old heathen festivals. The oldest printed collection of English Christmas carols bears the date of 1521. By the Puritan Parliament Christmas was abolished altogether, and holly and ivy were made seditious badges; and in 1630 the Psalms, arranged as carols, were advertised. After the Restoration, the Christmas carols again exhibited their ancient hearty, jovial character. Those with which the dawn of Christmas is now announced in England are generally religious, though not universally so. The custom is by no means peculiarly English, being found in other countries of Europe.

Christol'ogy [Gr. Χριστολογία, "doctrine concerning Christ"] may include everything relating to the work as well as to the person of Christ, but as the work of Christ is discussed under Soteriology, it is better to confine Christology to the person, and we shall so employ it.

The incarnation of one of the persons of the Trinity results in a peculiar kind of self-consciousness, which is neither divine alone nor human alone, but Divine-human. Jesus Christ is not merely God, for in this case he would not differ as a person from the unincarnate Logos in the bosom of the Father. (John i. 18.) Neither is he merely man, for in this case he would not differ in respect to the

species of his personality from Socrates or any other human being. But he is God and man united—the God-man—a unique and singular species of person.

The early Church was not forced, by false theories respecting the nature of Christ, to make nice distinctions and definitions, and consequently made none. It was content with worshipping Jesus Christ; and worship is a more direct and impressive affirmation of his divinity than even a dogmatic assertion of it. In course of time, however, several errors arose which compelled the Church to make a careful and guarded statement of the peculiarity of Christ's complex person. The first of these errors was Arianism, which denied the existence of a truly and properly divine nature in Jesus Christ. The Arians allowed that he had in the composition of his wonderful personality a very exalted nature, which is higher than that of any creature whatever, but which is not literally and metaphysically divine. This highly exalted and superhuman nature, united with a human soul and body, constituted the Arian Christ. The second error was Patripassianism. The Patripassians asserted the real and strict Deity in Christ's person, but denied his humanity. According to them, the one solitary person of God (for they also denied a real distinction of persons in the Godhead) united itself with a human body, but not with a human soul. This single person of God, whom they denominated the Father, thus united with a material body, was the Patripassian Son of God, or Christ. Anterior to this union there was no Son of God. The third error was the Nestorian. This pertained to the relations of the two natures to each other, and not to the natures themselves, both of which were conceded. The Nestorian Christ is two persons, one divine and one human, in union. The important distinction between a nature and a person is not recognized. Nestorianism overlooked the fact that the second person in the Trinity did not assume into union with himself a human individual, but a portion of human nature not yet individualized. The Logos, in the words of Hooker, "did not assume a man's person into his own person, but a man's nature to his own person; he took *semen*, the seed of Abraham (Heb. ii. 16), the very first original element of our nature, before it was come to have any personal subsistence." The union is embryonic, and thus yields only a single personality. But instead of thus blending the divinity and the humanity into one self, the Nestorian scheme places two distinct selves, one divine and one human, side by side, and allows only a moral and sympathetic union between them. There is a God and there is a man, but there is no God-man. The fourth of the ancient errors in Christology is the Eutychian or Monophysite. This is the opposite error to Nestorianism. It asserts the unity of self-consciousness in the person of Christ, but loses the duality of the natures. In and by the incarnation the human nature is transmuted into the divine, so that after the incarnation there remains only one nature. For this reason the Monophysites held that it is correct to say that "God suffered," meaning thereby that Jesus Christ suffered in the divine nature.

The Council of Ephesus in 431 made some beginning towards the settlement of the questions involved, but it was reserved for the Council of Chalcedon in 451 to make the final statement. The Chalcedon symbol defines Christ's person as follows: "We teach that Jesus Christ is perfect as respects Godhood and perfect as respects manhood—that he is truly God, and truly a man consisting of a rational soul and body. He was begotten of the Father before creation as to his deity, but in these last days he was born of Mary, the mother of God, as to his humanity. He is one Christ existing in two natures, without mixture, without change, without division, without separation—the diversity of the two natures not being at all destroyed by their union in the person, but the peculiar properties of each nature being preserved, and concurring to one person and one subsistence."

This statement asserts the continued and everlasting existence of two natures in Christ's complex person, and adjusts their relations to each other. In the first place, the union of the two natures does not confuse or mix them in such a manner as to destroy their distinctive properties or transmute one into the other. The deity of Christ is just as pure and simple deity after the incarnation as before it; and the humanity of Christ is just as pure and simple human nature as that of Mary his mother or any other human individual, sin being excluded. In the second place, the Chalcedon statement prohibits the division of Christ into two selves or persons. The incarnating act, while it makes no changes in the properties of the two united natures, gives as a resultant a person that is a *tertium quid*—a resultant that is neither a human person nor a divine person, but a *theanthropic* person. Contemplating Jesus Christ as the result of the union of God and man, he is not to be denominated simply God, and he is not to be denominated simply man, but he is to be denominated God-man.

This union of two natures in one self-conscious ego may be illustrated by reference to man's personal constitution. An individual man is one person, but this person consists of two natures—a material nature and an immaterial nature. The personality, the self-consciousness, is the result of the *union* of the two. Neither one taken by itself would yield the person. Both body and soul are requisite in order to a complete individuality. The two natures do not make two individuals in union and alliance. The material nature, taken by itself, is not the man, and the mental part, taken by itself, is not the man; only the union of both is. Yet in this intimate union of two such diverse substances as matter and mind, body and soul, there is not the slightest alteration of the properties of each substance or nature.

It follows from this statement of the Council of Chalcedon that while the properties of one nature cannot be attributed to the other nature, the properties of both natures may be attributed to the person resulting from their union. While it is not proper to say that the Divine nature suffered, it is proper to say that the God-man suffered. The first statement attributes to one nature the properties and acts of the other, and is therefore not allowable. The second statement asserts that Jesus Christ, the self-conscious Ego resulting from the incarnation, endured a passion the seat and medium of which was the human nature in this Ego. Here, again, the analogies of finite existence furnish an illustration. A man suffers the sensation of heat from a coal of fire. In this instance it would not be correct to say that the man's immaterial nature suffers, in the sense of being itself burned by the fire. The immaterial soul is not the sensorium in this instance. It is not the seat of the physical sensation. To say that it is would be to attribute to an immaterial nature the properties of a material nature. Yet, at the same time, the self-conscious person, the Ego resulting from the union of body and soul, feels the sensation of physical pain, but it feels it in and through the material part, and not the immaterial. In like manner, the entire humanity of Christ, the true body and reasonable soul, sustained the same relation to his divinity that the fleshly part of a man does to his rational part. It was the sensorium, the passible medium, by and through which it was possible for the self-conscious Ego, the God-man, to suffer. Hence, while it is proper to say that Jesus Christ, the God-man, existed before Abraham, and was born in the reign of Augustus Cæsar, that he was David's son and David's Lord, it would not be proper to say that the divine nature of Jesus Christ was born in B. C. 750, or that it died upon the cross in A. D. 30.

The positions taken at Chalcedon have been reaffirmed both in the mediæval and the modern Church. The doctrine of Christ's person is in some of its aspects even more mysterious and baffling to finite comprehension than the doctrine of the Trinity, and Christian science has not been inclined to go beyond the general outlines and distinctions made in 451. The Lutheran Church, in connection with the doctrine peculiar to them of the ubiquity of Christ's person, have made some attempts to explain that peculiarity of Christ's self-consciousness by which it is sometimes that of finite weakness and sorrow, and at other times that of infinite majesty and power. But the endeavor runs too near the brink of the confusion of natures, and their transmutation into each other, to be regarded as a real advance upon the Chalcedon Christology. (For the literature of Christology see DORNER'S "Person of Christ;" HAGENBACH'S "History of Doctrine;" HOOKER'S "Ecclesiastical Polity," book v., chs. 51–55; PEARSON "On the Creed;" SCHAFF'S "Church History," III., 747–777; SHEDD'S "History of Doctrine," I., ch. 5.)

W. G. T. SHEDD.

Christophe (HENRI), a negro king of Hayti, was born Oct. 6, 1767. He joined in 1790 the insurgents who were fighting against the French, and was appointed a general of brigade by Toussaint l'Ouverture. He had a high command under Dessalines, and after the death of the latter in 1806 became master of the northern part of the island. Civil war ensued between Christophe and Péthion. Early in 1811, Christophe was made king of Hayti and crowned in 1812 as Henri I. He instituted orders of nobility with such titles as duke of Marmalade and count of Lemonade. His cruelty provoked his subjects to revolt, and, unable to quell this rebellion, he killed himself Oct. 8, 1820. Boyer then became ruler of Hayti.

Chris'topher, POPE, deposed and succeeded Leo V. in 903, and was himself deposed and put to death in the following year. He was succeeded by Sergius III.

Christopher, SAINT, a native of Syria or Palestine, supposed to have suffered martyrdom about 250 A. D. The

Roman Catholic Church celebrates his festival on the 25th of July. Many wonderful legends are told of his gigantic size and his miraculous deeds, but modern antiquaries are disposed to doubt whether this popular hero ever existed.

Christopou'los (Athanasius), a modern Greek lyric poet, born at Castoria in May, 1772. He lived in Constantinople and Moldavia. He produced erotic and drinking songs much admired by his countrymen. He has written also learned works on the modern Greek tongue. Died Jan. 29, 1847.

Christ's Hospital, or the **Blue-Coat School,** London, was founded by Edward VI. in 1553 as a hospital for orphans and foundlings. The dress worn by the boys at present consists of a blue woollen gown, with a red leather girdle, yellow breeches and stockings, a clergyman's bands, and a blue worsted cap, but this they seldom wear, generally going about bareheaded. The color of the dress was formerly russet. No child is admitted before seven or after ten years of age, and none can remain after fifteen, except "king's boys" (who attend the mathematical school founded by Charles II. in 1672) and "Grecians" (the highest class), of whom eight are sent on scholarships to the universities. About 800 boys can be admitted. The great hall of the hospital is a magnificent room. Latin and Greek are the basis of instruction, but the modern languages, drawing, etc. are taught. In 1683 the governors built a preparatory school at Hertford, where the children are instructed till they are old enough to enter the hospital, the girls remaining permanently there. It can receive about 400 of both sexes. Among the eminent persons educated at Christ's Hospital were Stillingfleet, Coleridge, and Lamb.

Chris'ty, a township of Lawrence co., Ill. Pop. 2904.

Chro'mate of Lead, a fine yellow pigment often called chrome yellow. It is a native compound of chromic acid and lead, and is extensively used by painters.

Chromat'ic [from the Gr. χρῶμα, "color" or "modification" in music], in music, is a term applied to a succession of notes at the distance of a semitone from each other. The word χρωματικός was used in a somewhat similar sense by the ancient Greeks. Ascending chromatic passages are formed by the whole tones of the diatonic scale being raised or elevated by a sharp or a natural, according to key, and descending passages by their being lowered by a flat or a natural. It is usual to speak of the chromatic scale, but the foundation of the system of music does not rest on a chromatic basis, but on a diatonic one.

Chromatics. See Colors.

Chrome. See Chromium.

Chrome Green, an oxide of chromium useful in coloring porcelain and enamel.

Chrome Yellow. See Chromate of Lead.

Chro'mic A'cid, a compound of trioxide of chromium (CrO_3) with water (OH_2). The formula is CrO_4H_2. It forms several colored compounds, which are used as pigments or dyes. Among these are the chromate and bichromate of potash and the chromate of lead. The ruby derives its color from this acid. Chromic acid is used in surgery as a caustic.

Chro'mic I'ron, or **Chro'mite,** is the most abundant ore of chromium, and is found at Unst in the Shetland Isles, near Portsoy in Scotland, near Gassin in France, in Maryland, Pennsylvania, and in other regions. It is composed chiefly of the oxides of chromium and iron. It sometimes occurs crystallized in octahedrons, but commonly massive. Archæ... holm, 4 vols.

Christ'lieb (Theodor), D. D., was born in Würtemb...tter in 1833, studied at Tübingen, taught in France, and began in a preacher in London, where he published his famous lectures on "Modern Doubt and Christian Belief." He returned to Germany in 1865, and in 1868 became university preacher and professor of theology at Bonn. In 1873 he visited the U. S. as a delegate of the Evangelical Alliance. Here he delivered an address of great ability upon the rationalism of the present day.

writers of chronicles were Froissart, Eginhard, Monstrelet, Holinshed, and Geoffrey of Monmouth.

Chron'icles [Lat. *Chronica*; Gr. τὰ Χρονικά], the name of two canonical books of the Old Testament. They were originally one book, containing a resumé of the sacred history from the creation until the Babylonian exile; the last two verses are repeated as the first verses of Ezra. The Hebrew name signifies "annals." The Septuagint named it Παραλειπόμενα ("Paraleipomena," Supplements), and the Vulgate borrowed this name. The character of the book, however, does not justify the name. It supplements the other historical books only occasionally, often it is identical with them. Hence the usual title is more correct. The book was composed at or soon after the time of Nehemiah by an unknown author. Its peculiar characteristic is that it is written from the stand-point of interest in the Levitical and ritualistic institutions, and not from the stand-point of the theocracy. Its authority was assailed, during the first half of this century, by the rationalists, but the searching criticism to which it has been subjected has convinced unprejudiced scholars that, allowance being made for the peculiarities of view which it acquired from the post-exilic Judaism, it contains valuable contributions to our knowledge of the history of the Israelites.

W. G. Sumner.

Chron'ogram [from the Gr. χρόνος, "time," and γράμμα, a "letter"], an inscription in which a certain date is indicated by printing some of the letters in larger type than the others, and taking them as Roman numerals. The date 1632 is thus expressed in the inscription of a medal of Gustavus Adolphus: ChrIstVs DVX ergo trIVMphVs. If it is a verse, it is called chronostichon.

Chron'ograph [Gr. χρόνος, "time," and γράφω, to "write"], an instrument used (chiefly in astronomy) for recording the exact instant of the occurrence of an event, such as the transit of a star over the spider-lines of a telescope. The record is made by electro-magnetism. One point or pen, governed by the clock, marks uniformly the seconds. Another is brought into action by an electric key under the finger of the observer. The first chronograph was simply Morse's telegraphic instrument slightly modified. The method was originally suggested by Prof. Locke of Cincinnati about 1850. The chronographs now in use usually employ a rotating cylinder covered with paper, and turning on a helical axis, each revolution occupying one minute.

Chronol'ogy [from the Gr. χρόνος, "time," and λόγος, a "treatise"] is the science of the dates of events in history. Mathematical chronology deals with such units of time as begin and end with the period of complete evolution of recurring celestial phenomena. (See Calendar.) As in geography and navigation longitude is measured from some arbitrary line, such as the meridian through Greenwich, so in historical chronology dates are fixed by giving their distance from some arbitrary point of time, usually chosen because of some remarkable occurrence which signalized it. Such a point, or epoch, forms the beginning of an era. The mathematical or astronomical units of time have not been the only units used in historical chronology. In early times accurate methods of mathematics were unknown, and such vague periods as "a generation," or the life of leading persons in a nation, such as kings, were assumed as units in chronology. The great variety of eras in ancient times confuses the student. Thus, the era of the Greeks began with the year of the Olympiad in which Coræbus was victor, being the first of those games at which the victor's name was recorded (776 B. C.). From this point the Greeks reckoned time by Olympiads or periods of four years. The Romans reckoned from the founding of the city (753 B. C.), which is believed the first fixed point from which time was ever computed. The Mohammedan era commences with the flight of Mohammed (622 A. D.), called the Hejra. The Roman and Greek methods of recording time continued in use long after the birth of Christ. After 312 A. D., however, the authorized system throughout the Roman empire was by indictions, periods of fifteen years, and this mode was at one time almost universal in the West, though the Olympiads were followed in the East till 440 A. D. The Christian era, first proposed in 527 A. D., is now universally used in Christendom (except among the Oriental Christians, many of whom profess to reckon time from the creation), though its use was not uniform in Europe till a short time before the discovery of America by Columbus. Chronology has to determine the relationship of different eras, so as to express in language appropriate to one mode of computation the date of an event recorded in another. The Christian era is attended by this inconvenience, that we must count backward for the dates of occurrences prior to the birth of Christ.

Different systems of chronology, such as the Chinese, Egyptian, Indian, and Chaldean, have been used in differ-

ent countries. Of sacred chronology there have been various schemes. In these the epochs are the Creation of the World and the Flood, but the manuscripts of the Bible do not agree as to the dates of these events. The chronology of Ussher reckons 4000 years from the creation to the birth of Christ, and to the flood 1656 years; the Samaritan makes the former much longer, though it counts from the creation to the flood only 1307 years; the Septuagint removes the creation of the world to 6000 years before Christ, and 2250 years before the flood. These differences have never been reconciled. It is now, however, universally admitted that the first chapter of Genesis leaves the period of the creation quite indefinite, and the most generally approved scheme interprets the *days* of creation as periods of indefinite length. (Manuals of chronology have been written by Ideler, 1831; Brinckmeier, 1843; Blair, 1851; and Lecke, 1862.)

Chronom'eter [from the Gr. χρόνος, "time," and μέτρον, a "measure"], a watch of peculiar construction and great perfection of workmanship, used for determining geographical longitudes, or other purposes where time must be measured with extreme accuracy. The chronometer differs from the ordinary watch in the principle of its escapement, which is so constructed that the balance is entirely free from the wheels during the greater part of its vibration; and also in having the balance compensated for variations of temperature. Marine chronometers generally beat half seconds, and are hung in gimbals in boxes about six or eight inches square. The pocket chronometer does not differ in appearance from the ordinary watch, excepting that it is generally a little larger. Chronometers are of immense utility in navigation, and ships going on distant voyages are usually furnished with several, for the purpose of checking one another, and also to guard against the effects of accidental derangement in any single one. The accuracy with which chronometers have been found to perform is truly astonishing, the departures from perfect uniformity of rate of running amounting only to small fractions of a second from day to day for long periods of time.

Chron'oscope [from the Gr. χρόνος, "time," and σκοπέω, to "see"], an instrument invented in 1835 by Wheatstone for measuring the duration of the electric spark. It consisted essentially of a plane mirror revolving with a high but known velocity; the elongation of the image of the spark as seen in this mirror furnishing the measure of the duration. In 1858, Feddersen substituted a concave for the plane mirror, with better results. In 1867, Rood replaced the concave mirror by a set of achromatic lenses and a plane mirror, and succeeded in measuring intervals of time as small as 40 one-billionths of a second. A chronoscopic apparatus was constructed by Fizeau for measuring the velocity of light. In this there was employed a rotating circular disk with sectors alternately open and closed. A ray from a luminous source transmitted through one of the open sectors, and reflected back from a distant mirror, is, with a certain velocity of rotation, intercepted by a closed sector, and with a higher velocity is transmitted through the next following open sector. The distance traversed in Fizeau's experiment was 8633 mètres (about 5⅜ miles). With this and the known velocity of rotation the velocity of light per second is computed. Foucault used for the same determination a chronoscope with a concave revolving mirror and a distance of only three mètres (about ten feet). Chronoscopes for measuring the time of flight of projectiles have been invented by Wheatstone, Hipp, Henry, Navez, Benton, De Brettes, Gloesener, Schultz, and Bashforth. In these the beginning and end of the interval measured are marked by the passage of the induction spark, or mechanically by electro-magnetism, generally upon a revolving cylinder, but in some upon a fixed arc before which a pendulum swings. For marking *equal* minute intervals steel tuning-forks have been recently used in various ways.

Chru'dim, a town of Bohemia, on the Chrudimka, a small river, 62 miles S. E. of Prague. It has a noble collegiate church, a convent, and a gymnasium; also manufactures of cloth and a large market for horses. Pop. 11,218.

Chrys'alis [Gr. χρυσαλλίς, from χρυσός, "gold"], a name originally belonging to those pupæ of butterflies which have golden-yellow spots, but extended to the pupæ of lepidopterous insects generally, and even to those of other orders. The chrysalides of lepidopterous insects are enclosed in a horny case, sometimes angular, sometimes round, generally pointed at the posterior end, sometimes at both ends. Before the caterpiliar goes into this state it often spins a silken cocoon, with which foreign substances are sometimes mixed, in which the chrysalis is concealed. Chrysalides are often suspended by cords, and generally remain nearly at rest; some bury themselves in the earth. Most of them have at least a slight power of motion.

Chrysan'themum [from the Gr. χρυσός, "gold," and ἄνθεμον, a "flower"], a genus of herbs and shrubs of the order Compositæ, tribe Senecionideæ, having an involucre with imbricated scales, a naked receptacle, the fruit destitute of pappus. The species of this genus are annuals, perennials, or shrubby, and all have leafy stems. They are natives chiefly of the temperate parts of the Old World. *Chrysanthemum carinatum*, a annual species with white ray florets and dark-red disk, a native of Barbary, is frequently cultivated. *Chrysanthemum Indicum*, the Chinese chrysanthemum, a native of Eastern Asia, has long been cultivated as an ornamental plant. Its colors are various—red, lilac, rose-color, white, yellow, orange, or variegated. It flowers in autumn and winter, is easy of cultivation, and is easily propagated by cuttings, suckers, or parting the roots.

Chrys'elephan'tine [from the Gr. χρυσός, "gold," and ἐλέφας, ἐλέφαντος, "ivory"] **Statues,** a term applied to images of gold and ivory extensively made among the ancient Greeks. The works executed by Phidias at Athens in the time of Pericles are the most famous of this class, the greatest being the colossal Athena of the Parthenon, twenty-six cubits high, representing the goddess in armor. The Olympian Zeus of Phidias was also of world-wide renown. The combination of gold and ivory was chiefly employed in temple statues; and though the more famous works of this class belong to an advanced period, this kind of art was very ancient, and probably borrowed from the adorning of wooden images with the precious metals. The flesh parts were oftenest of ivory, the clothing and ornaments of gold.

Chrysip'pus [Gr. Χρύσιππος], an eminent Stoic philosopher, born at Soli, in Cilicia, in 280 B. C., was a son of Apollonius of Tarsus. He was a pupil of Cleanthes, and was distinguished for his skill in dialectics and his subtlety as a disputant. He once said to Cleanthes, "Teach me only your doctrines, and I will find the arguments to defend them." The Sorites is said to have been invented by Chrysippus. He wrote a great number of works, none of which are extant. He was considered to be the greatest Stoic philosopher except Zeno. Died in 207 B. C. (See Ritter, "History of Philosophy;" J. F. Richter, "Dissertatio de Chrysippo Stoico," 1738.)

Chrysober'yl [from the Gr. χρυσός, "gold," and βήρυλλος, "beryl"], a gem, the finer specimens of which are very beautiful, is an aluminate of glucina. Lapidaries sometimes call it Oriental or opalescent chrysolite. It is of a green color, inclining to yellow, semi-transparent, and has a double refraction. It occurs crystallized in six-sided or eight-sided prisms; sometimes in macles or twin crystals. Some specimens exhibit a beautiful opalescent play of light.

Chrysocol'la [Gr. χρυσόκολλα], a hydrated silicate of copper, sometimes called copper-green, was used as a pigment by the ancient Greeks. The color is verdigris or emerald-green, passing into sky-blue, with a shining or dull resinous lustre. It is found native in considerable abundance in Missouri and Wisconsin.

Chrys'olite [Gr. χρυσόλιθος, from χρυσός, "gold," and λίθος, a "stone;" Fr. *chrysolithe*], a mineral composed of silica, magnesia, and protoxide of iron, of a fine green color, with vitreous lustre, transparent, and having double refraction, in hardness about equal to quartz, and with a conchoidal fracture. It often crystallizes in four-sided or six-sided prisms, variously modified. Very fine specimens are brought from Egypt and from some parts of the East, also from Brazil. Chrysolite is used as an ornamental stone, but is not highly valued.

Chrys'oprase [Gr. χρυσόπρασος, from χρυσός, "gold," and πράσον, a "leek," from its peculiar tint], a very rare variety of chalcedony, valued far above common chalcedony as an ornamental gem; a stone of this kind fit for mounting in a ring is worth from fifty to one hundred dollars. It is of a fine apple-green color in choice specimens, but inferior ones exhibit other shades. It is often set in a circlet of diamonds or pearls. It is apt to lose its color through time if kept in a warm place, but dampness is favorable to its preservation, and it is therefore kept in damp cotton. It is found in Lower Silesia, in Colorado, and in Northern New York. The chrysoprase of the ancients is not certainly identified by modern authorities.

Chrys'ostom [Gr. Χρυσόστομος (*i. e.* "golden-mouthed")], (John), the most accomplished orator of the ancient Greek Church, was born at Antioch in Syria about 347 A. D. He was brought up by his widowed mother, Anthusa, his father, Secundus, having died soon after his birth. He studied rhetoric under Libanius, the famous Sophist, and philosophy under Andragathius. Quitting the

legal profession, upon which he had entered, he was ordained deacon by Bishop Meletius in 381, and presbyter by Bishop Flavian in 386. His fame as a preacher spread throughout Christendom. On Feb. 26, 398, he was consecrated archbishop of Constantinople, having, by a mixture of force and fraud, been carried thither against his will. His boldness as a reformer brought him into trouble. Both among the clergy and at the imperial court enemies rose up against him. In 404 he was banished to Cucusus, a mountain-village in the Tauric range, between Cilicia and the Lesser Armenia; and in 407 he died at Comana, in Pontus, on his way into still remoter exile on the eastern shore of the Black Sea. He was little of stature, with a large, bald head, hollow cheeks, and deep sunken eyes. His eloquence was of the highly ornate Asiatic type, but also very incisive and practical. In rebuke he was terrible, calling things by their right names. He had great reverence for the Scriptures, lived abstemiously, defied danger, promoted missions, and died exclaiming, "Glory be to God for all things! Amen." The best edition of his works is the Benedictine, 13 vols. folio, Paris, 1718–38. (See NEANDER, "Life of Chrysostom," in German, 2 vols., 1821, 3d ed. 1848; G. HERMANT, "Vie de Saint J. Chrysostome," 1664; PERTHES, "Life of Chrysostom," 1854; STEPHENS, "Life of Chrysostom," 1872.)

Chrzanow'ski (ADALBERT), a Polish general, born in 1788, served in the Polish revolution in 1830, when he was suspected of sympathy with the Russians, and in Piedmont in 1849, where he commanded the Sardinian army. After the disastrous battle of Novara he was dismissed. His last years he passed in Louisiana, where he died Mar. 2, 1861.

Chub (*Leuciscus cephalus*), a European fish of the family Cyprinidæ, of the same genus with the roach, dace, etc. The color is bluish black, passing into silvery white on the

Chub.

belly; the cheeks and gill-covers a rich golden yellow. The chub rarely attains a weight exceeding five pounds. It is plentiful in many of the rivers of England, and occurs in the south of Scotland. It is found in many rivers of the continent of Europe. There are several species in the U. S. very much like the above. They are not in great esteem for the table. The chub rises well at a fly, and takes freely a variety of baits.

Chuck-Will's-Widow (*Antrostomus Carolinensis*), a bird of the family Caprimulgidæ, a native of the southern parts of the U. S. It has received its singular name from its note, which resembles these syllables articulated with distinctness, and is repeated like that of the whippoorwill.

Chucui'to, or **Chuquito,** a town of Peru, department of Puno, is pleasantly situated on the western shore of Lake Titicaca, 101 miles E. of Arequipa. Mines of gold and silver have been opened in the vicinity. Pop. about 5000.

Chudleigh Cape, the N. E. point of Labrador.

Chumbul', a river of India, rises in the Vindhyan Mountains, flows nearly north-eastward, and enters the Jumna 85 miles S. E. of Agra. Length, 500 miles.

Chunam', the name of a fine quicklime made in India from calcined shells or from very pure limestone, and used for chewing with BETEL (which see); also used for cement and plaster. When chunam is used for plaster it is mixed with fine river sand and thoroughly beaten up with water; coarse sugar and eggs are sometimes added. When beautiful work is desired, three coats are applied to a wall, the last being in the form of a fine paste consisting of four parts of lime and one of fine white sand, beaten up with whites of eggs, sour milk, and butter (*ghee*).

Chunar', a town of British India, in the presidency of Agra, on the Ganges. It is fortified, and has several military institutions. Pop. 11,058.

Chu'prah, a town of British India, presidency of Bengal, on the Ganges, 35 miles W. N. W. of Patna. It is the chief town of the district of Sarun. It contains many mosques and pagodas. Here is a British military station. Pop. estimated at 30,000.

Chuquibam'ba, a mountain of Peru. Height 21,000 feet.

Chuquisa'ca, the extreme south-eastern department of Bolivia. Area, 72,802 square miles. The surface is variable. The rainfall is considerable. The mountainous western part only is inhabited, where the climate is pleasant. The soil yields cinchona, grain, tobacco, sugar, coffee, and cocoa. The exports are cattle, horses, wine, spirits, and sugar. Capital, Chuquisaca. Pop. 223,868, besides 50,000 wandering Indians.

Chuquisaca (golden bridge), **Su'cre,** or **La Pla'ta,** the capital of Bolivia, is situated on a plateau near the Andes, 9343 feet above the level of the sea; lat. 19° 23′ S., lon. 65° 30′ W. It is well built, with regular, spacious, and clean streets. It has a magnificent cathedral with a large dome, a president's palace, a university, a college, several monasteries, and a theatre. It is an archbishop's see and the seat of the national legislature. The climate is pleasant. Rich silver-mines are worked in the vicinity. Pop. 23,979.

Chur [Fr. *Coire*], the capital of the Swiss canton of Grisons, is in a valley and on or near the river Rhine, 60 miles S. E. of Zurich, with which it is connected by railway. It has an ancient cathedral of the eighth century and a bishop's palace; also manufactures of cutting tools and zinc-ware. Pop. in 1870, 7552.

Church [from the Gr. *κυριακόν, i. e.* the "Lord's house" (from Κύριος, the "Lord"); Anglo-Saxon, *cyric* or *circ;* Ger. *Kirche;* Scottish, *kirk;* Lat. *templum;* Fr. *église;* Sp. *iglesia;* It. *chiesa*]. The primary signification of the English word church is the "house of the Lord;" it came afterwards to denote a collective body of Christians meeting in such a house for worship, and also the entire body of Christian people, as when we speak of Christ as "the Head of the Church." In this last sense it corresponds to the Greek ἐκκλησία (Lat. *ecclesia,* whence the Fr. *église,* Sp. *iglesia,* and It. *chiesa*), from ἐκκαλέω, to "call out," to "summon," to "assemble."

The earliest Christian ecclesiastical structures were copied not from the heathen or Jewish temple, but from that combination of a hall of justice and a market-place to which the name basilica was given. The reason of this is probably to be found not so much in the opposition between Christians and heathens, as in the different conceptions which they formed of the nature and objects of worship. The rites of heathenism were performed exclusively by the priest, the people remaining without the often roofless temple, which was not for worshippers, but was the abode of Deity. This mysterious character rendered it unsuitable for services in which the people were to participate, and for the delivery of those public addresses which were employed as a means of Christian teaching and exhortation. To such purposes the basilica was readily adapted. Slightly changed in form, it served the purposes of Christian worship, but there was nothing in its form which tended to awaken sentiments of devotion. The cross had been used by Christians from a very early period, and gradually it had become the principal distinctive emblem of Christianity. Nothing could be more natural than that when it became desirable to give distinctively Christian character to the basilica, this should be effected by such a modification as should convert it into a representation of this emblem. Nor did this alteration lead to any very extensive change in form. The basilica frequently has side entrances, in place of, or in addition to, that from the end. All that was requisite, then, to convert the simple parallelogram into a cross was, that at each side, in place of direct communication with the exterior, should be passages or arms running out at right angles; which arms cut the building across, and were therefore *transepts.*

A central tower or spire is very frequently erected over the point at which the arms or transepts intersect the body of the cross. From this point the portion of the building westward to the Galilee or great entrance is called the nave, while the portion eastward to the high altar is the choir. In the more complete churches the nave, and frequently the choir, are divided longitudinally by two rows of pillars, the portion at each side being generally narrower and less lofty than that in the centre. These side portions are the aisles. Vestries for the priests and choristers generally exist in connection with the choir. Along the sides of the choir are seats or stalls, usually of carved oak; and amongst these seats, in a bishop's church, the most conspicuous is the *cathedra,* or seat for the bishop, from which the cathedral takes its name. The larger English cathedral churches have a chapter-house attached, which is

commonly octagonal, and is often one of the most beautiful portions of the whole. Cloisters are frequent, and the sides of those which are farthest from the church or chapter house are enclosed by other buildings, such as a library and places of residence for officials. It is here that, in Roman Catholic churches, the hall, dormitories, and kitchens for the monks are commonly placed. Beneath the church there is the crypt. The baptistery is another adjunct, frequently altogether detached. The position of the nave, choir or chancel, aisles, and transepts is nearly invariable, but the other portions vary greatly.

In ordinary language, any building set apart for Christian ordinances is called a church, though when of a minor kind it is frequently designated as a chapel. After a long period of neglect the building of churches in a style emulative of the older architecture has greatly revived.

When applied to a body of Christian people, the word Church is very nearly the equivalent of the Greek word ἐκκλησία, as used in the New Testament. The whole body of the Church on earth is called the "Church militant," as contending with evil and sin; the saints after death are called collectively the Church triumphant. Protestants distinguish between the *visible* and the *invisible* Church—the invisible Church consisting of all who are spiritually united in Christ; the visible Church consisting of all who profess the religion of Christ. Roman Catholics do not in the same manner acknowledge the distinction, but regard a connection with the hierarchy and participation of ordinances as establishing a connection with the true Church. Many Protestants regard the Church as subsisting in virtue of the authority of Christ and through the faith of individual believers; Roman Catholics regard the succession of the hierarchy and the regular administration of the sacraments as essential to the existence of that catholic or universal Church which Christ planted. They also regard the Church in its official action as so guided by Heaven as to be infallible. Protestants, for the most part, regard the Church of Rome and the Greek Church as forming part of the visible Church, but Roman Catholics are not accustomed to make a corresponding admission with respect to Protestants. From the hierarchical principle of the Church of Rome and of the Greeks results an employment of the word Church to designate the hierarchy alone. But most Protestants employ it to denote collectively all the followers of Christ, or to designate some particular body of Christians worshipping in one place, or the members of some particular denomination.

REVISED BY J. THOMAS.

Church, a township of Wetzel co., West Va. Pop. 1607.

Church (ALBERT E.), LL.D., an American officer and mathematician, born in 1807 in Salisbury, Conn., graduated at West Point in 1828. He served, while lieutenant of artillery, at the Military Academy as assistant professor 1831 and 1833–37, and as acting professor of mathematics 1837–38, and in garrison at Newport and Boston harbors 1832–33. He resigned Mar. 13, 1838, and was appointed professor of mathematics in the U. S. Military Academy, and still holds the position. He is member of several scientific associations and author of valuable mathematical works, specially prepared for the use of his cadet pupils—viz. "Elements of Differential and Integral Calculus," 1842, and of an "Improved Edition containing the Elements of the Calculus of Variations," 1851, of "Elements of Analytical Geometry," 1851, of "Elements of Analytical Trigonometry," 1857, and of "Elements of Descriptive Geometry, with its application to Spherical Projections, Shades, and Shadows, Perspective and Isometric Projections," 1865.

GEORGE W. CULLUM, *U. S. Army.*

Church (Rev. ALONZO), D. D., LL.D., an eminent Presbyterian divine, and president of the University of Georgia from 1829 to 1859. He was a native of Vermont, and was a graduate of Middlebury College in that State.

Church (BENJAMIN), a famous Indian fighter, born in Plymouth (now in Massachusetts) in 1639. He fought in King Philip's war, and commanded the colonists in the battle in which Philip was slain. He also led five expeditions against the French and Indians in Maine. He removed in 1674 to Little Compton, R. I., where he died, in consequence of a fall from his horse, Jan. 17, 1718. He was distinguished for piety, valor, and integrity.

Church (FREDERICK EDWIN), an American landscape-painter, born at Hartford, Conn., in May, 1826. He visited South America in 1853, and derived from the scenery of the Andes materials for several paintings. He gained a high reputation by his "View of Niagara Falls from the Canadian Shore." Among his other works are "The Heart of the Andes," "Morning on the Cordilleras," "Sunrise on Mt. Desert Island," "The Parthenon," and "Jerusalem."

Church (JOHN HUBBARD), D. D., a Congregational minister, born at Rutland, Mass., Mar. 17, 1772, graduated at Harvard in 1797, became pastor of a church in Pelham, N. H., in 1798, where he was minister for forty years. He was prominent in the Bible and missionary societies, and an advocate of classical learning. Died June 13, 1840.

Church (PHARCELLUS), D. D., born Sept. 11, 1801, in Seneca, Ontario co., N. Y., educated at Hamilton, N. Y., pastor of Baptist churches in Poultney, Vt., Providence, R. I., Rochester, N. Y., Boston, Mass., was for ten years editor of the "Chronicle" (Baptist), New York City, a frequent contributor to other journals, and author of "Philosophy of Benevolence," "Religious Dissensions," "Antioch," "Pentecost," "Memoir of Theodosia Dean," "Templeton," etc.

Church (Sir RICHARD), a Greek general, was born in Ireland in 1785, and entered the British army. In the Greek war for independence he commanded the land forces. Afterwards he was the chief of the anti-Russian party, and minister under King Otho. Died Mar. 20, 1873.

Church (SAMUEL), LL.D., a distinguished American jurist, born at Salisbury, Conn., in 1785, graduated at Yale in 1803, was eleven years a judge of probate in his native State, a judge of the superior court in 1833, and chief-justice of Connecticut (1847–51). Died Sept. 12, 1854.

Church (SANFORD E.), LL.D., an eminent American jurist, b. in Milford, Otsego co., N. Y., Apr. 18, 1815, studied law and rose to prominence in his profession. He was chosen lieutenant-governor of the State of New York in 1850, and again in 1852. In 1857 he was elected comptroller, this latter being the last elective office held by him. He was nominated in 1859 for comptroller, but defeated, and nominated again in 1863, with the same result. In 1862 he was Democratic nominee for Congress from the twenty-seventh New York district. In May, 1870, he was appointed by Gov. Hoffman chief-justice of the State of New York, which position he accepted and still holds. In 1872 he was requested to stand as candidate for the Democratic nomination for governor, but he declined the honor. In politics he has ever been a steadfast Democrat, and, though frequently approached by opposing parties, he has never sacrificed his political principles to personal preferment. Under Pierce and Buchanan the opposition made him tempting offers, but notwithstanding he was opposed to the Nebraska bill, he rejected all proffers of prospective patronage. After 1864 he retired from active political life.

Church Calendar. See CALENDAR, EASTER, and EPACT, by F. A. P. BARNARD.

Church Creek, a post-township of Dorchester co., Md. Pop. 1144.

Church Dis'cipline, in its more limited sense, includes the means employed by the Church, besides the ministration of the word and sacraments, to secure on the part of its members faithfulness to their profession and blamelessness of life. It rests upon the authority of Christ, and arises out of the very constitution of the Church. Among early Christians it assumed forms of great severity towards offenders. At a later period discipline was chiefly exercised with respect to persons accused of heresy and schism. The penances of the Church of Rome form an important part of its discipline, and therewith its indulgences are connected, as well as its rule of auricular confession. In the Protestant churches public confession of sins by which scandal has been given, and submission to public rebuke, are sometimes required. The power of exclusion from church membership is generally retained until repentance and reformation of life. In a wider sense, church discipline is used to designate the whole polity of a Church, including its CHURCH GOVERNMENT (which see).

Church Gov'ernment. It is obvious that the Church must have a fixed polity according to which its affairs are administered. It is disputed among Christians how far this has been prescribed by Divine authority, and how far left to the discretion of men. The form of government depends primarily on the idea entertained of the constitution of the Church. Congregationalists place church government in the hands of the members of the congregation and the office-bearers whom they have elected. Baptists distinguish between the church proper and the congregation, hence they lodge this power in the church, as the primary body. Episcopalians, Presbyterians, and the various Methodist churches agree that many congregations are to be united under a common government; but this, according to Presbyterians, is properly carried on by ministers and elders of these congregations meeting for this purpose; while, according to Episcopalians, it is more or less absolutely in the hands of bishops. The government of the Methodist Episcopal churches is chiefly in the hands of the quarterly conference and the annual and general conferences, in which the laity have more or less share.

Church History. See Ecclesiastical History, by Prof. Philip Schaff, Ph. D., S. T. D.

Church Hill, a post-township of Queen Anne co., Md. Pop. 3655.

Chur'chill, or **Missinnip'pi,** a river of North America, rises in a lake near lon. 109° W. It flows nearly northeastward, passes through Nelson's Lake, and enters Hudson's Bay in lat. 59° N. Length, estimated at 800 miles.

Churchill, a county in the W. of Nevada. Area, 6000 square miles. It contains Humboldt and Carson Sink, a lake which has no outlet. The western part is traversed by Carson River. The surface is mountainous; the soil is mostly sterile. The streams are absorbed by the sands of the desert. Sulphur, salt, and soda abound. Ores of silver are found here. Capital, Stillwater. Pop. 196.

Churchill, a township of Lyon co., Nev. Pop. 40.

Churchill (Lord Alfred), a brother of the duke of Marlborough, was born in 1824, studied at the Sandhurst Military College, served in the British army (1842–48), and afterwards was long a member of Parliament. He is distinguished for his interest in the African race, and was a delegate to the sixth meeting of the Evangelical Alliance at New York in 1873.

Churchill (Charles), an English poet and satirist, was born at Westminster in 1731. He was a fellow-student and friend of the poet Cowper. Although he had a strong aversion to the clerical profession, he was ordained as a priest in 1756. In 1758 he succeeded his father as curate at St. John's, Westminster. His parishioners were scandalized by his dissipated and licentious habits, and by his negligence of his duties. He produced in 1761 "The Rosciad," a witty satire on theatrical managers and performers, which was very successful. About this time he resigned his curacy and quitted the profession of clergyman. He defended himself against certain critics by an admired poem entitled "The Apology." He was an intimate friend of John Wilkes, whom he assisted in the "North Briton." In 1763 he published "The Prophecy of Famine," a satire on the Scots, which is much admired. Among his other works are "The Conference," "Gotham," and "The Author." "Churchill," says Thackeray, "has those brilliant flashes of insight and spontaneous felicities of expression by which every true critic at once distinguishes the man of natural power from the man of mere cultivation." He died at Boulogne, France, during a visit, in 1764. (See Tooke, "Life of Churchill;" and Macaulay's essay entitled "Charles Churchill," 1845.)

Churchill (Sylvester), an inspector-general in the U. S. army, born in Woodstock, Vt., Aug. 2, 1783, educated in Vermont, published a newspaper till 1812, when he was appointed a first lieutenant of artillery U. S. A.; promoted to be captain Aug., 1813; assistant inspector-general, with the rank of major, Aug. 29, 1813; retained May, 1815, in artillery; major Third Artillery 1835; inspector-general, with rank of colonel, June 25, 1841. Gen. Churchill served with credit during the war of 1812–15; from 1815 to 1836 was on garrison or special duty; served during the war with the Creek Indians, and in Florida 1836–41, when he was appointed inspector-general; accompanied Gen. Wool in the war with Mexico, and for distinguished services at Buena Vista was brevetted brigadier-general U. S. A.; retired from active service Sept. 25, 1861. Died at Washington, D. C., Dec. 7, 1862.

Church'ing of Wom'en, a usage prevailing in certain branches of the Church, of women on recovery after childbearing going to church to give thanks. It appears to have been borrowed from the Jewish law (Lev. xii. 6). In the Church of the early ages it was accompanied with various rites, and in the Roman Catholic and Greek churches it is imperative. In the Anglican Church, also, a service for the churching of women finds a place in the Liturgy.

Church'man (John), an able preacher of the Society of Friends, was born at Nottingham, Pa., June 4, 1705, entered upon his ministry in 1733, and preached in many parts of the U. S. and Europe. A narrative of his experiences was published in 1780 in London. Died July 24, 1775.

Church Methodists. See Primitive Wesleyans.

Church Mills, or **Wegat'chie,** a post-village of Rossie township, St. Lawrence co., N. Y., on the Oswegatchie River, has a woollen mill and other manufactories. Pop. 201.

Church of England and Wales. See England, Church of, by Rev. Beverley R. Betts.

Church of God, a denomination of Christians first organized at Harrisburg, Pa., in 1830, by the converts and followers of John Winebrenner, formerly a minister of the German Reformed Church. The doctrines of this Church are a belief in the Bible as the authoritative revelation of God; also in the Trinity, in human depravity, the vicarious atonement, and the freedom of the will (rejecting the Calvinistic doctrine of election). This Church also practises adult immersion as the only baptism, and administers the Lord's Supper to all Christians who desire it. They believe that literal washing of the feet is one of the ordinances of the Church. In all other respects the Church of God agrees with other evangelical Christian churches. The congregations of this denomination are in part independent in church government, but are united into "elderships," which are again joined into one "general eldership," which owns the church property. They have several newspapers and colleges, and in 1873 numbered over 30,000 members, 460 churches, and 410 ministers.

Church of Scotland, Free. See Free Church of Scotland, by David Inglis, LL.D.

Church Rates, in England, and formerly in Ireland, a tax on the parishioners and occupiers of land for repairing the church and defraying all expenses (other than that of maintaining the minister) incident to divine service. The chancel being regarded as belonging to the clergy, the expense of maintaining it is frequently laid on the rector or vicar. The origin of church rates is a matter involved in obscurity. It is certain that the expenses paid in this manner formerly were paid out of the tithes. Lord Campbell is of opinion that the contributions of the parishioners were at first voluntary, and that the custom at last assumed the form of an obligation. There is no legal mode of compelling the parishioners as a body to provide the rate; and this has occasioned difficulty in imposing the tax in parishes in which dissent is prevalent. In recovering the rates from individuals refusing to pay, formerly the only mode was by suit in the ecclesiastical court; at present, in cases under ten pounds, the justices of the peace, on complaint of the church-wardens, inquire into the merits of the case and order payment. Against the decision of the justices an appeal lies to the quarter sessions. There are few social arrangements in England that have been the cause of greater irritation than the church rates. Since the first bill for the abolition of church rates was introduced by Lord Althorp in 1834, scarcely a session has passed in which some attempt has not been made at legislation on this subject. Church rates in Ireland ceased with the disestablishment of the Church of Ireland in 1871. In Scotland the system is similar to that in England, though the name of church rates is not used.

Church'ville, a post-village of Riga township, Monroe co., N. Y., on the New York Central R. R., 15 miles W. by S. of Rochester. It has five churches, a flouring and saw mill, a machine-shop, and a foundry.

Church-Wardens in the Anglican churches are officers whose duty is to protect the church edifice, to superintend the performance of public worship, and maintain order during service. There are generally two in each parish. In some dioceses they are appointed by the clergymen, and in others are chosen by the parishioners. Their assistants are sometimes called questmen.

Church'yard (Thomas), born in 1520, was a prolific author of prose and verse in the early part of Queen Elizabeth's reign. He was at first a servant of the earl of Surrey, and afterwards a soldier. Some of his works have been from time to time reprinted, more for the pleasure of bibliophiles than on account of any great merit. His "Worthiness of Wales," "Chips concerning Scotland," and "Legende of Jane Shore" are the best known of his works. Died in 1604.

Churn, an apparatus for agitating cream for the separation of butter, of which many forms are in use. Trials to test the merits of different churns have failed to settle which is the best for actual use, for the same machine under different conditions does not always yield the same result. The oldest form is the upright or plunge churn. Barrel churns, sometimes of monster size, are used in large dairies in Holland. For small or moderate-sized dairies perhaps the most suitable is the box churn, having the agitators fixed on a horizontal spindle. To all forms of churns power can be and is applied. Horse-power is in very general use in large dairies in Great Britain. In exceptional cases steam-power is used. (See Butter, by Prof. C. F. Chandler.)

Chur'ton (Ralph), archdeacon of St. Andrew's, is best known for his Bampton Lecture on the prophecies relating to the destruction of Jerusalem, delivered in 1785. He was born near Bickley, Cheshire, Dec. 8, 1754, was educated at Brazenose, Oxford, and died Mar. 23, 1831. He was a laborious and faithful minister, and the author of several biographical and other works of decided merit.

Churubus'co, a village or hamlet of Mexico, on the

Rio de Churubusco, about 6 miles S. of the city of Mexico, the scene of a battle between the American forces under Gen. Winfield Scott, marching on the city of Mexico, and the Mexicans, defending the approaches to their capital, under President Santa Anna. The battle of Contreras was fought on the same day, and both can be described in connection.

Leaving a competent garrison at Puebla, Gen. Scott advanced his forces upon the capital Aug. 7–10, 1847, the army becoming united about the head of Lake Chalco. Reconnoissances made Aug. 12–13 upon the Peñon, a strongly fortified, isolated mound, commanding the principal approach to the capital from the E., and upon Mexicalcingo to the left of the Peñon, resulted in Scott's falling back upon a previously entertained project of turning these strong eastern defences by passing S. of Lakes Chalco and Jochimilco, thus reaching the hard though much broken ground to the S. and S. W. of the capital, near San Augustin. By a sudden inversion, Worth's division, followed closely by Pillow's and Quitman's, marched on the 15th. Twiggs' division being left at Ayotla till the 16th to threaten the Peñon and Mexicalcingo, and deceive the enemy as long as practicable, marched on the 16th towards Chalco, met and dispersed a force of Mexicans double his own in numbers, under Gen. Valencia.

Worth's division arrived at San Augustin on the 18th, and was pushed forward to San Antonio, 3 miles distant, on the direct road to the capital.

A reconnaissance was commenced on the 18th, and continued next day, to the left of San Augustin over difficult fields of rocks and lava which extend from San Antonio towards Magdalena; Pillow's division was advanced to make a road for heavy artillery, and Twiggs's thrown forward to cover this operation. At 3 P. M. of the 19th this advance came to a point where the road could only be continued under the fire of twenty-two pieces of the enemy's artillery, strongly entrenched and supported by cavalry and infantry. Our batteries had advanced within range of the enemy's camp, and Pillow's and Twiggs' divisions moved forward to dislodge him from his position. A battle ensued which lasted till nightfall, our troops maintaining their position.

Observing the hamlet of Contreras on the road leading from the capital, through the entrenched camp, to Magdalena, and the streams of reinforcements advancing from the capital by that road, Gen. Scott determined to occupy that place and arrest reinforcements, and Col. Morgan was ordered with his regiment (the Fifteenth) to move forward for this purpose. Riley with his brigade was already on the enemy's left and in advance of this hamlet, and Shields was ordered to follow and support Morgan. The night of the 19th found these troops, with the brigades of Gens. P. F. Smith and Cadwalader, all under Smith, in and about Contreras, on the same road with the enemy's entrenched camp, and half a mile nearer the capital. At 3 A. M. (Aug. 20th) the movement was commenced on the rear of the enemy's camp, Riley leading, followed by Cadwalader and Smith. Despite the darkness, rain, and mud, an elevation behind the enemy was reached by Riley, from whence his intrenchments were stormed and carried in seventeen minutes. Cadwalader successfully executed the part assigned him of diverting the enemy, and brought up to the general assault two of his regiments, who poured destructive volleys into the works. Smith's brigade (temporarily under Major Dimick, First Artillery), in the mean time following, discovered a long line of Mexican cavalry outside the works, which were attacked and routed. Shields, remaining at Contreras, held large numbers of the enemy in check, and by pursuit added largely to the brilliant results of the day. The American force here engaged numbered (including Shields) not more than 4500, while the Mexican army numbered 20,000, all of whom, not captured or killed, now fled. Two 6-pounders taken from the Fourth Artillery at Buena Vista (though without dishonor) were here recaptured, besides twenty-two pieces of ordnance, 800 prisoners, 700 mules and many horses, and immense quantities of small-arms and ammunition.

The battle being over before the advancing brigades of Worth's and Quitman's were in sight, they were ordered back to their old position, and Worth was ordered to attack San Antonio, which place he soon forced, its garrison being shaken by the news of the victory at Contreras. While these operations were going on on the left, a party was sent to reconnoitre the strongly fortified church or convent of San Pablo in the hamlet of Churubusco, and Twiggs with a brigade and a battery ordered to follow and attack the convent. Pierce's brigade was at the same time sent to attack the Mexican right and rear, in order to favor the movement on the convent and cut off retreat: Shields to follow Pierce closely and take command of the left wing. The line from right to left soon became briskly engaged; Shields, in the rear of Churubusco, being hard pressed, was reinforced by the rifles and Sibley's troop Second Dragoons.

Worth's division, being soon reunited and in hot pursuit from San Antonio, was joined by Gen. Pillow, who, discovering that San Antonio had been carried, hastened to the attack of Churubusco. The hamlet bearing this name, besides the strongly fortified convent of San Pablo, presented a strong field-work at the head of a bridge over which the road passes from San Antonio to the capital, and within and about these works the entire remaining forces of Mexico were collected, some 27,000 men; the American force being about 8000.

Twiggs hotly pressing the convent, Worth and Pillow manœuvred closely upon the *tête-de-pont*, which latter was finally assaulted and carried at the point of the bayonet; and twenty minutes after the convent, which had held out for two hours and a half, yielded to Twiggs' division, and signals of surrender were displayed; but not, however, until the Third Infantry had entered the works.

Shields in the mean time had been hotly engaged on the right against superior numbers with varying success, but resulting in a final victory for him; so that on the forces of Worth and Pillow coming up in rapid pursuit of the enemy, they were joined by Shields, and the three pursued the fugitives to within a mile and a half of the capital. Thus, in a single day were two great battles fought and victories won, by which 3000 prisoners were taken, 4000 killed or wounded, thirty-seven pieces of ordnance captured, the entire army dispersed, and the capture of the ancient capital and an honorable peace ensured. The American loss was 1053, killed and wounded.

Chusan', an island near the E. coast of China, province of Che-Kiang, about 45 miles N. E. of Ning-Po. It is nearly 50 miles in circumference, and is mountainous, but mostly fertile and well cultivated. The products of the soil are tea, rice, cotton, tobacco, etc. The camphor tree and bamboo flourish here. The climate is pleasant and healthy. Ting-Haj, the capital, was taken by the British in July, 1840, and again in Oct., 1841, but it was restored to the Chinese at the end of the war.

Chut'ny, or **Chut'ney**, a stimulating condiment very largely used in India, and to a considerable extent in Great Britain and America. Chutny is a compound of mangoes, capsicum, and lime-juice, with some portion of other fruits, such as tamarinds, etc., the flavor being heightened by garlic. It is sometimes manufactured for sale in England, but not in large quantities. Families occasionally make it for their own use, and various receipts are given for its manufacture.

Chwalynsk', a town of Russia, in the government of Saratov, a river-port on the Volga. It has various manufactures and large fruit gardens. Pop. 14,262.

Chyle [from the Gr. χυλός, "juice," "chyle"], a fluid produced in the small intestines, and absorbed from them by the lacteals and the veins. The food undergoes various changes in the alimentary canal, one of which is its conversion in the stomach into a pulpy mass termed *chyme*. The chyme, which passes into the small intestine, is acted upon by the bile, pancreatic fluid, and intestinal juice, and through their influence is separated into the *chyle*, and into matters unfit for nutrition, which ultimately find their way out of the system. The mode in which the nutritious chyle is taken up by vessels distributed over the small intestines is described in the article DIGESTION. Obtained from the thoracic duct of an animal that has been killed while the process of digestion is going on (especially if it has taken fatty food), chyle is a milky-looking or yellowish fluid, with a faint alkaline reaction. Like the blood, it coagulates after its abstraction from the animal, and in about three hours a small clot is separated. On examining chyle under the microscope we find that it contains enormous numbers of minute molecules of fat, together with nucleated cells (chyle-corpuscles), apparently identical with the white blood-cells. The chemical constituents of chyle are much the same as those of blood—fibrin, albumen, fat, extractive matters, and salts being the most important. But it may be regarded as certain that the greater part of the saccharine and nitrogenous elements of food enters the veins directly from the stomach and the small intestines, through the capillaries, and that the chyle of the thoracic duct consists principally of the fatty parts of food mingled with lymph from the lymphatic glands.

Chyme [from the Gr. χυμός or χύμα, "liquid," for χεύμα, verbal noun from χέω, "to pour"], a name sometimes given to the food after the process of stomach-digestion, and before the action of the intestinal juice, bile, and pancreatic fluids has taken place upon it. The name is of late not much used, but it is a convenient term, and as such deserves to be retained.

It is a recognized fact that during the process of stomach-

digestion some part of the nutritive matter of the food is taken up by the walls of the stomach, and passes directly into the venous blood. Of the remainder, Mialhe states that the albuminoid elements are changed by the gastric juice into a new substance called albuminose; while Lehmann and others, following up a hint from Mialhe, have shown that each albuminoid affords a peculiar kind of albuminose (or peptone, as it is now often called). The principal varieties now recognized are albumen-peptone, caseine-peptone, and fibrine- (or musculine-) peptone. The peptones are believed to be already fitted for absorption into the circulation. Upon starch, sugar, and oils the gastric juice has but little effect. Chyme, then, consists of the peptones and the starchy, saccharine, and fatty elements of food, mingled with certain residual matters which are not useful as food, but which, with other waste products, are ultimately expelled directly from the alimentary canal.

Chytræ'us (David Kochhaff), a German theologian, born in Swabia Feb. 26, 1530, was a scholar of Camerarius and Melanchthon, professor at Rostock, and member of the Diet of Augsburg, of which he wrote an account (1576), and various other religious conferences. He was one of the framers of the "Formula Concordiæ" and author of "Chronicon Saxoniæ," "De Lectione Historiarum," etc. Among his other writings are "Historia Confessionis Augustanæ" (1578) and "De Morte et Vita Æterna" (1590). His complete works have been several times reprinted. Died June 25, 1600. He was one of the most learned and influential Lutheran divines of his time. His life has been written by Schutzius and several others.

Cialdi'ni (Enrico), an able Italian general, born in Módena Aug. 8. 1811. He entered the Spanish army in 1835, and fought in several campaigns against the Carlists. In 1848 he returned to Italy, and joined the Italian patriots in the war against Austria. He served Victor Emmanuel as a general in the Crimean war (1854–55). In June, 1859, he commanded with success against the Austrians at Palestro. He defeated the papal general Lamoricière at Castelfidardo in 1860, and besieged Gaeta, which he took in Feb., 1861. He became a senator of Italy in 1864, commanded one of the armies operating against Austria in 1866, and was appointed chief of the royal staff in the same year. In Oct., 1867, he was requested by the king to form a cabinet after the resignation of Ratazzi, but without success. He withdrew from the army, and opposed the ministry of Lanzi. He accompanied Amadeo as ambassador extraordinary to Madrid, and after discharging his mission remained in Spain.

Cib'ber (Colley), an English dramatist and actor of German extraction, was born in London in 1671. He began to act comedies in 1689, and married a Miss Shore in 1693. In 1695 he produced a play called "Love's Last Shift, or the Fool in Fashion," which was successful. He also wrote "The Careless Husband" (1704), "The Nonjuror" (1717), and "An Apology for the Life of Colley Cibber," which is an amusing work. In 1730 he was appointed poet-laureate. Died Jan. 30, 1766. Notwithstanding the reputation for stupidity which Pope's "Dunciad" has conferred upon Cibber, there is no doubt that he was in reality one of the most brilliant writers of that brilliant age. His morals, however, were not of the purest.—His son Theophilus (1703–58) was an actor, an author, and a writer of repute, and husband of Susanna Maria Cibber, a celebrated actress, the sister of Dr. Arne, the musical composer.

Cib'ol, a plant of the onion or garlic genus, the *Allium fistulosum*, an Asiatic plant, much cultivated in parts of Europe for its tops, which are tubular, somewhat like those of the onion. It stands in the ground all winter, growing from year to year without replanting, and has no bulb.

Cibo'lo, a river of Texas, rises in Kendal county, flows south-eastward, and enters the San Antonio near Helena. Entire length, about 110 miles.

Cibo'rium [Gr. κιβώριον, the "pod" of the lotos-bean; hence a cup-shaped vessel], in the Roman Catholic Church, a variety of the pyx, or vessel used to contain the consecrated host. The ciborium is of gold or silver, and its cover is frequently surmounted by a cross. The name is also given to a canopy over the altar sustained by four columns, to which the pyx, in the form of a dove, was suspended by chains.

Cibra'rio (Luigi), an Italian historian, born at Turin Feb. 23, 1802. He published, besides other works, "Economia Politica del Medio Evo" (1839), a "History of the Monarchy of Savoy" (1840), and a "History of Turin" (1847.) Became minister of public instruction in 1852, and minister of foreign affairs in 1855. Died Oct. 1, 1870.

Cica'da [Gr. τέττιξ], the Latin name of a well-known European insect, called also **Cica'la** [It.], which gives its name to a genus of Hemiptera noted for the shrill noise which it makes. The cicada of the ancient classic poets was chiefly admired for its shrill song. The cicadas frequent shrubs and trees, and feed on their juices, having an apparatus for piercing the bark and sucking out the juice or sap. Their organ of sound is situated on each side of the under and anterior part of the abdomen. Cicadas abound in tropical and sub-tropical regions. They mostly have transparent and veined wing-covers. We have several species of cicada in the U. S., of which the best known is the "seventeen-year locust," *Cicada septemdecim*. The *Cicada canicularis* is a well-known species with a W-shaped mark on the back. Its appearance was once said to be a forerunner of wars.

Cicatriza'tion [from the Lat. *cicatrix*, a "scar"], the healing of a broken surface in the skin or in a mucous membrane, by which process a dense fibrous material is substituted for the lost texture. The new tissue is called the cicatrix, and usually resembles, to a considerable extent, the structure which it replaces; it is, however, less elastic, and from its shrinking in volume sometimes produces an appearance of puckering. The glands and other special structures of the original tissue are wanting in the cicatrix, which, however, usually performs its office well. The cicatrix of burns and scalds has often a remarkable tendency to contract and distort the neighboring surface.

Cic'ely (*Myrrhis*), a genus of umbelliferous plants, of which one species, sweet cicely (*Myrrhis odorata*), is common in Central and Southern Europe and in Asia, but in Great Britain it appears to have been introduced. It is a branching perennial, two feet high or upward, with large triply pinnate leaves and pinnatifid leaflets, somewhat downy beneath; the fruit and the whole plant powerfully fragrant, the smell resembling that of anise. The seeds, roots, and young leaves are used in soups, etc. The plant was formerly much in use as a medicinal aromatic. The U. S. have at least four wild plants somewhat resembling the above—the rough and the smooth sweet cicely, *Osmorrhiza brevistylis* and *longistylis*, of the Atlantic States, and *Myrrhis occidentalis* and *Osmorrhiza nuda* of the far West. The roots are sometimes eaten, having an agreeable taste, but several poisonous umbelliferous plants closely resemble cicely, and caution should be observed in gathering it.

Cic'ero, a township and village of Cook co., Ill., on the Chicago Burlington and Quincy R. R., 4 miles W. of Chicago. Pop. 1545.

Cicero, a post-village of Jackson township, Hamilton co., Ind. It has one weekly newspaper. Pop. 422.

Cicero, a township of Tipton co., Ind. Pop. 3646.

Cicero, a township and post-village of Onondaga co., N. Y. Pop. 2902.

Cicero (Marcus Tullius), an illustrious Roman orator, author, and statesman, was born at Arpinum (now Arpino), about 70 miles E. S. E. of Rome, on the 3d of Jan., 106 B. C. He is often called Tully by English writers. He was liberally educated by his father, an opulent *eques* of the same name, was a pupil of Archias, the Greek poet, and learned to speak Greek fluently. He also became deeply versed in Greek literature and philosophy. His disposition was genial and amiable, his habits temperate and exemplary. In the year 91 B. C. he assumed the manly gown (*toga virilis*), and began to study law under Mucius Scævola the Augur, who was a jurist of great eminence. In his early youth he wrote "Pontius Glaucus" and other poems, which were admired by his contemporaries, but are not extant. According to Plutarch, "he was regarded as the best poet, as well as the greatest orator, in Rome." He passed through a course of discipline in rhetoric and elocution, studied logic under Diodotus the Stoic, attended the lectures of the Greek philosopher Philo, and neglected no mental exercise, however arduous. At the age of twenty-five he began to plead in the Forum, and, according to the custom of Roman advocates, his services were always gratuitous. About the year 80 he defended Roscius Amerinus with courage and success when he was prosecuted for a capital crime by an agent or favorite of Sulla, then dictator, the fear of whose enmity deterred the other advocates from pleading for the defendant.

His constitution was naturally delicate, and his physical condition was such that his friends advised him to abandon the bar or to improve his health by travel. In 79 B. C. he departed from Rome and went to Athens, where he passed about six months, and studied philosophy with Antiochus of Ascalon, Zeno the Epicurean, and Demetrius Syrus. He there formed an intimate friendship with the celebrated Titus Pomponius Atticus. He afterwards extended his travels through Asia Minor, and returned to Rome with a great improvement in his lungs, voice, and constitution.

In 75 B. C. he obtained the office of quæstor, the first step in the gradation of public honors, and it was decided

by lot that he should perform the duties of quæstor in Sicily. The integrity, moderation, and humanity of his official conduct excited general admiration among the people of Sicily. He returned to Rome in the year 74, married (about 79 B. C.) an heiress named Terentia, and soon rose to the foremost rank in his profession. His chief forensic rival was Hortensius. Cicero excelled in sarcasm and witticisms, with which he often seasoned and enlivened his orations and arguments. No advocate had greater power over the feelings and sympathies of his auditors. It was his habitual practice to act as counsel for the defence in criminal trials, but he deviated from this rule in the case of Caius Verres, who was prosecuted by the Sicilians in 70 B. C. for nefarious acts of cruelty and rapine. Only two of his admirable orations against Verres were actually spoken in court, for the evidence against the accused was so convincing that his counsel declined to plead, and Verres went into exile before the decision of the cause. Cicero was elected ædile in 69 B. C. by a majority of the voters of every tribe, and in that capacity had the charge of the temples and public edifices. Having offered himself in 66 as a candidate for the office of prætor, which was the next in the ascending scale of public honor, he was elected first *prætor urbanus* by the suffrages of all the centuries. The duty of prætors was to preside as judges over the highest courts. According to Plutarch, "he acted with great integrity and honor as president in the courts of justice." During his term of office as prætor he made an important political oration for the Manilian Law ("Pro Lege Manilia"), the object of which was to appoint Pompey commander-in-chief in the war against Mithridates the Great.

After the expiration of his term of office (which was one year) he prepared to compete for the consulship, and offered himself as a candidate in 64 B. C. Catiline was one of the defeated candidates in this election, which resulted in the choice of Cicero and C. Antonius. Cicero entered upon the office on the 1st of January, 63, at a time when the republic was in a critical condition in consequence of the prevalence of corruption, sedition, and treasonable designs. He succeeded in forming a political alliance between the senate and the equites or knights, and by this wise policy promoted the cause of liberty and order. "He was," says Middleton, "the only man in the city capable of effecting such a coalition, being now at the head of the senate, yet the darling of the knights." He acquired great celebrity by the courage and energy with which he defeated the conspiracy of Catiline, whom he denounced in four eloquent orations. Catiline, who was the leader of a large number of desperate men, had formed a plot to burn the city and massacre many of the senators. Cicero, who was notified of this plot by a woman named Fulvia, pronounced before the senate on the 8th of November his first oration against Catiline, who was present and rose to reply, but his voice was drowned by cries of "traitor!" and "parricide!" (See CATILINE.) The versatility and elasticity of Cicero's mind were signally exemplified by the fact that during the crisis of this conspiracy, before Catiline was defeated in battle, he defended Murena against a charge of bribery in an oration which abounds in witty and good-humored raillery.

For the defeat of this great conspiracy, Cicero received unbounded honor and applause. Men of all ranks and all parties hailed him as the saviour of the republic and father of his country. In the language of Juvenal,

"Roma Patrem Patriæ Ciceronem libera dixit."

"Cicero could boast," says William Ramsay, "of having accomplished an exploit for which no precedent could be found in the history of Rome. In the garb of peace he had gained a victory of which the greatest among his predecessors would have been proud, and had received tributes of applause of which few triumphant generals could boast." He incurred, however, the enmity of many persons by the capital punishment of Lentulus, Cethegus, and other accomplices of Catiline. He was censured for violation of the constitution and laws by the execution of these conspirators, although they had been condemned to death by the senate. At the expiration of his consulship, having refused to accept the government of a province, he returned to the senate as a private individual (62 B. C.), and purchased an elegant mansion on the Palatine Hill. He also owned villas or country-seats at Tusculum, Arpinum, Formiæ, and other places. He opposed the triumvirs Cæsar, Crassus, and Pompey, whose coalition he considered to be dangerous to the peace and liberty of the state, and he endeavored, without success, to detach from that coalition Pompey, who was his personal friend. In 59 B. C. his malignant enemy Clodius obtained power as tribune of the people, and proposed a law "that whoever has put to death a Roman citizen without due trial shall be interdicted from fire and water." Many thousands of Roman citizens now expressed sympathy for Cicero, but as the consuls were hostile to him, he yielded to the storm and went into exile in April, 58 B. C. A law was then speedily enacted to interdict Cicero from earth and water, and his house on the Palatine Hill was burned by Clodius. The lack of fortitude which he exhibited in his exile (which was passed in Greece) is severely criticised by several writers. In a letter to his wife Terentia he wrote, "It is not my crimes, but my virtue that has crushed me." The excessive violence of his enemies tended to produce a speedy and strong reaction. The new consuls and tribunes elected for the year 57 were friendly to Cicero, whose recall was also advocated by Pompey and a majority of the senate. In August, 57, a bill for his restoration was adopted by an overwhelming majority of the voters, who had come from various parts of Italy to the *comitia centuriata* at Rome. "There had never been known," says Middleton, "so numerous and solemn an assembly of the Roman people as this." On his return to Rome he was greeted with abundant demonstrations of popular favor and enthusiasm. Between 57 and 52 he pleaded several causes in the courts, and found leisure to write two important works, entitled "De Republicâ" ("On the Republic, or the Principles of Government"), and "De Legibus," a philosophical treatise on the origin, nature, and perfection of law.

For a term of one year (51 B. C.) he acted as proconsul or governor of Cilicia and Pisidia, where his administration was a model of moderation, purity, and probity. He returned to Italy in the year 50, and found that a civil war was imminent between Cæsar and the senate. He hesitated whether he should take an active part in the coming contest, and wished to act as a mediator, but eventually he joined the army of Pompey, who fought for the senate. "He fluctuated greatly," says Plutarch, and was in the utmost anxiety; for he says in his letters, "Whither shall I turn? Pompey has the more honorable cause, but Cæsar manages his affairs with the greatest address. In short, I know whom to avoid, but not whom to follow." His wit, however, did not fail even in this gloomy crisis. When Pompey asked him, "Where is your son-in-law?" (Dolabella), Cicero replied, "He is with your father-in-law." After the battle of Pharsalia (August, 48 B. C.), Cato offered the command of the army to Cicero, but he declined it, and, returning to Italy, submitted to the power of Cæsar, who treated him with clemency. He afterwards devoted himself to literary labors in retirement, and found consolation in the calm enjoyments of speculative philosophy. In the ensuing period of three or four years (47–44) he produced numerous works on philosophy and rhetoric, which are admirable monuments of his profound and varied learning as well as of his immense mental activity. As a philosopher he preferred the principles of the New Academy. In the year 45 he lost his accomplished daughter Tullia, whom he regarded with the fondest affection. He approved the assassination of Cæsar, and denounced the conduct of Mark Antony in a series of orations called Philippics, the first of which was spoken in the senate in September, 44. The second Philippic is a masterpiece of eloquent invective. For a few months in the year 43, while Octavius co-operated with the senate against Antony, Cicero was the most prominent statesman in Rome. Between December, 44, and May, 43 B. C., he uttered his last twelve Philippics, which were received with general applause, but the republican cause was soon ruined by the coalition of Octavius with Antony and Lepidus. Cicero was proscribed by them, and was killed by the soldiers of Antony near his Formian villa in December, 43 B. C. He left one son, named Marcus Tullius. The moral character of Cicero is admitted to be excellent even by those who censure his public conduct. His worst foible was vanity, exhibited in a habit of self-laudation. According to Niebuhr, "The predominant and most brilliant faculty of his mind was his wit. In what the French call *esprit*—light, unexpected, inexhaustible wit—he is not excelled by any of the ancients." As an orator he surpassed all the ancients except Demosthenes. Modern critics concur in unanimous admiration of the consummate grace and beauty of diction which enchant successive generations in the periods of Cicero. He amplifies everything. His words seem to gush forth without effort in an ample stream; and the sustained dignity of his oration is preserved from pompous stiffness by the lively sallies of a ready wit and a vivid imagination. His periods are sonorous, but present a great variety of cadences. His "Letters," of which more than eight hundred are extant, are models of exquisite Latinity, and are highly prized for the light which they throw on the history and antiquities of the Roman republic. Among his works which remain entire are about fifty orations; also treatises, entitled "De Finibus, libri v." (an Inquiry into the Supreme Good); "Brutus seu de Claris Oratoribus" (a critical notice of Roman orators); "De Amicitiâ" (a dialogue on friendship); "Tusculanæ Disputationes" (disputations

on various questions of philosophy); "De Naturâ Deorum, libri iii." ("On the Nature of the Gods"); "Orator, seu de Optimo Genere Dicendi." ("The Orator, or On the Best Manner of Speaking"); and "De Officiis, libri iii." (an excellent treatise on ethics). One of his greatest works, "De Republicâ," is lost except a large fragment. He also wrote treatises, "De Gloriâ" ("On Glory") and "De Virtutibus" ("On the Virtues"), which are not extant. Mutilated copies have been preserved of his works entitled "De Legibus" and "Academicorum, libri iv." Among the best editions of his complete works are those of Ernesti, Halle, 5 vols. 8vo, 1774–77; Olivet, Paris, 9 vols. 4to, 1742; and Orelli, Zurich, 9 vols. 8vo, 1826–37. (See PLUTARCH, "Life of Cicero;" CONYERS MIDDLETON, "History of the Life of Cicero," 1741; F. FABRICIUS, "Historia Ciceronis," 1563; ABEKEN, "Cicero in Seinen Briefen," 1835, and an English version of the same, 1854; W. FORSYTH, "Life of M. T. Cicero," 2 vols., 1864; LAMARTINE, "Cicéron," 1852; ORELLI, "Onomasticum Tullianum;" J. MORABIN, "Histoire de Cicéron," 3 vols., 1745; DRUMANN, "Geschichte Roms.")

WILLIAM JACOBS.

Cicero (MARCUS TULLIUS), the only son of the preceding, was born in 65 B. C. He is said to have been dissipated, indolent, and intemperate. In the year 49 he joined the army of Pompey, and received the command of a squadron of cavalry. Soon after the battle of Pharsalia (48 B. C.) he went to Athens, and studied philosophy under Cratippus. Having been appointed a military tribune by Brutus in 44 B. C., he defeated C. Antonius, and did good service in the Macedonian campaign. By the favor of Octavius (Augustus) he became consul in the year 30, and was governor of Asia (Syria) in 29–28.

Cicero (QUINTUS TULLIUS), a brother of Cicero the great orator, was born about 102 B. C. He was elected prætor for the year 62, after which he officiated as governor of Asia for three years, and returned to Rome in 58 B. C. He was appointed in the year 55 legate (*legatus*) to Cæsar, whom he attended in an expedition to Britain, and in 54 he commanded a legion in winter quarters in Gaul. He defended his camp with success against the attack of a large army of Gauls. In the civil war he took arms for the senate against Cæsar, but he made his peace with him in 57 B. C. He was proscribed by the triumvirs, and killed in 43 B. C.

Cicero Corners, a village of Cicero township, Onondaga co., N. Y., has a large steam-mill and three churches. Pop. 212.

Cicerone, che-chā-ro'nā [from *Cicero*, a derisive reference to the loquacity of guides], an Italian word signifying a guide who shows and explains to travellers the interesting objects, antiquities, and famous places which abound in Italy.

Cicisbeo, che-chis-bā'o [Fr. *cicisbée* or *sigisbée*), a name applied since the sixteenth century, in Italy, to the acknowledged attendant upon a married lady. In Italian society it was at one time unfashionable for the husband to associate with his wife anywhere except in his own house. In society or at places of amusement the wife was accompanied by her cicisbeo, who attended at her toilet to receive her commands for the day. This custom, which was once universal, has now almost disappeared. Cicisbeo is synonymous with *cavaliere servente*. The custom is highly commended by several Italian writers.

Cicogna'ra, da (LEOPOLDO), COUNT, an Italian antiquary and writer on art, was born at Ferrara Nov. 26, 1767. He was for many years president of the Academy of Fine Arts in Venice, and was a friend of Canova. His chief work is a "History of Sculpture from the Renaissance of that Art to the present Century" (3 vols., 1813–18), which is highly esteemed. He wrote a "Life of Canova" (1823). Died Mar. 5, 1834.

Cicu'ta, the ancient Latin name of the *Conium maculatum* (hemlock), a poisonous plant which was used at Athens as means of capital punishment. This is the plant which is popularly called cicuta in the U. S. and Europe. (See CONIUM.) Cicuta is also the name of a genus of umbelliferous plants which are poisonous. The *Cicuta maculata* (spotted cowbane) grows in swamps in the U. S. Its root is a very deadly poison. Other equally poisonous species grow in the U. S. and in Europe.

Cid [Arab. *seid*, a "lord"], surnamed EL CAMPEADOR (the "champion"), the most celebrated national hero of Spain, was a Castilian whose proper name was RODRIGO (or RUY) DIAZ DE BIVAR. He was born at Burgos about 1040. He became commander of the army of Sancho II. of Castile, who reigned from 1065 to 1072. About 1085 he was banished by Alfonso VI. He had married Doña Ximena, a relative of King Alfonso. Even while in exile he was the commander of a retinue of knights and vassals, and he waged war with success against several princes. He gained a victory over the Moors, and became sovereign of Valencia in 1094. Died in 1099. His exploits have been embellished by many marvellous and fabulous inventions. His life is the subject of an anonymous epic called "The Poem of the Cid," which, according to Southey, is the "oldest and finest poem in the Spanish language," and also of a tragedy by Corneille (1636). (See R. SOUTHEY, "Chronicle of the Cid," 1808; M. J. QUINTANA, "Life of the Cid," in Spanish and French, 1837; "Romancero General," 1604.)

Ci'der [Fr. *cidre*; It. *cidro*], the fermented juice of apples, extensively prepared in parts of England, in Ireland, in the northern districts of France, and in North America. In Normandy vast quantities of apples are grown for the preparation of cider. The apples are first reduced to pulp in a mill, and the pulp is afterwards subjected to pressure. The apple-juice is placed in casks in a cool place, when fermentation begins, part of the sugar is converted into alcohol, and a clear liquid is obtained, which can easily be racked off from sedimentary matter. Cider is largely used as a beverage. It contains from 5½ to 10 per cent. of alcohol, and is intoxicating when drunk in large quantities. Cider quickly turns sour, becoming *hard cider*, owing to the development of acid, and great difficulty is experienced in the attempt to keep it sweet. Large quantities are used in the manufacture of VINEGAR (which see, by PROF. C. F. CHANDLER, PH. D., LL.D.)

Cienfue'gos, a town of Cuba, 111 miles S. E. of Havana, is the capital of a district of its own name. Sugar is exported from this place. Pop. 9950.

Cie'za, a town of Spain, in the province of Murcia, near the river Segura, and on a railway, 24 miles N. W. of Murcia. It has manufactures of linen cloth. Pop. 9516.

Cigar', or **Segar'** [Fr. *cigare*; Sp. *cigarro*], a small roll of tobacco-leaves for smoking. The cigars of Havana are the most highly prized, but those from Manila, usually called cheroots, are also excellent. The manufacture of cigars in the U. S. is an important industry. For the outer part or wrapper of a cigar the tobacco raised in the Connecticut Valley is considered the best, from its fine elastic quality. A very small cigar wrapped with paper is called a cigarette.

Cil'ia [the plu. of *cilium*, the Lat. for "eyelash"], the hairs which grow from the margin of the eyelids. The term is also applied to microscopic filaments which project from animal membranes, and which are often endowed with quick, vibratile motion. In most of the very low animals the respiratory function is effected by means of vibratile cilia; many animalcules and the gemmules of the acrites move by a similar mechanism; and it has recently been ascertained that vibratile cilia have a share in the performance of some important functions in the highest classes of the animal kingdom, where they have been detected on the membrane lining the female generative organs and in the respiratory passages and the ventricles of the brain. Cilia in botany are long hairs situated on the margin of a vegetable body.

Cilic'ia [Gr. Κιλικία], an ancient division of Asia Minor, was bounded on the N. by Mount Taurus, on the E. by Mount Amanus, on the S. by the Mediterranean, and on the W. by Pamphylia. The surface is partly mountainous, and partly occupied by fertile plains adjacent to the sea. The chief river was the Cydnus. The principal towns were Tarsus, Soli, Seleucia, Mallus, and Aphrodisias. The ancient Cilicians were distinguished for maritime enterprise and also for piratical habits. In early ages Cilicia was an independent kingdom. It was afterwards a part of the Persian empire, and was reduced to a Roman province in the time of Pompey. It coincides nearly with the Turkish division of Adana. Among the eminent natives of Cilicia were Saint Paul, Chrysippus the Stoic philosopher, and Aratus the poet.

Cil'ley (JONATHAN), an able lawyer and politician, born at Nottingham, N. H., July 2, 1802, graduated at Bowdoin College in 1825, was admitted to the bar of Maine in 1829, became Speaker of the Maine house of representatives, and in 1832 a presidential elector; was elected to Congress in 1837, and Feb. 24, 1838, was killed in a duel by William J. Graves of Kentucky. The combatants fought with rifles, eighty yards apart, and fired three times each. The affair caused much excitement at the time, Cilley's friends declaring the duel to have been unfairly conducted, and denouncing Graves as a murderer.

Cimabu'e (GIOVANNI), an Italian painter, born in Florence in 1240, was eminent as a restorer and reformer of the art of painting. The fine arts at that time had degenerated into a formal conventionalism. He received lessons in art from two Greek or Byzantine painters, and formed a more natural style than that of his masters. He painted in distemper and in fresco, and adorned the church of St. Francis at Assisi with his works. He excelled in design and expression. Died about 1302. Among his pupils was Giotto. (See VASARI, "Lives of the Painters.")

REVISED BY C. C.

Cimaro'sa (Domenico), an Italian composer, born at Naples Dec. 17, 1755, was a pupil of Durante. He resided at St. Petersburg and at Vienna and other German courts. He composed a number of successful operas, among which are "Il Matrimonio Segreto" ("The Secret Marriage") and "L'Olimpiade." His works are remarkable for originality and spirit. Died Jan. 11, 1801.

Cimarron', a post-village, capital of Colfax co., N. M. It has one weekly newspaper.

Cim'bri [Gr. Κίμβροι], a warlike people of ancient Europe whose origin is involved in obscurity. They were regarded as Germans by Cæsar and Tacitus, whose opinion has been adopted by most moderns. H. Müller and other writers suppose that they were Celtic, and that Cimbri is another form of *Cymri*, which is the Welsh name of their own nation. In 113 B. C. the Cimbri and the Teutones issued from the N. part of Germany, crossed the Eastern Alps, and invaded the territory of the Romans, whom they defeated in battle. They afterwards moved across the Rhine, and pillaged part of Gaul. The Cimbri and Teutones gained another victory over the Romans in the year 109. Within a period of six years they defeated four consuls and routed five Roman armies, so that great consternation prevailed at Rome. They invaded Spain in 104 B. C. In 102 B. C., Marius defeated the Teutones at Aquæ Sextiæ (Aix), in Gaul. The army of Cimbri at the same time invaded the north of Italy by a different route, and gained a victory over the Roman consul Catulus near the Adige. The infantry of the Cimbri had shields fastened together with chains. The two Roman armies were then united under the joint command of Catulus and Marius, who gained a great victory over the Cimbri near Vercellæ (Vercelli) in July, 101 B. C. It is said that more than 100,000 Cimbri were killed in this battle. The Cimbri in the time of Tacitus lived near the North Sea, and in Jutland, which was called the Cimbric Chersonese. (See Pullmann, "Die Cimbern," 1870.)

Cimin'na, a town of Sicily, in the province of Palermo, 19 miles S. E. of the city of Palermo. Pop. 5269.

Cimme'rians [Gr. Κιμμέριοι], according to the Homeric legends, were a people dwelling "beyond the ocean-stream," where the sun never shines and perpetual darkness reigns. Hence the proverbial expression, "Cimmerian darkness." The historical Cimmerii were a nomadic race of great antiquity, who lived between the Borysthenes (Dnieper) and the Tanais (Don). According to Herodotus, they were expelled from that region by the Scythians, and migrated to Asia Minor. They waged war against Alyattes, king of Lydia, about 600 B. C. The Strait of Yenikale derived from them the name of Cimmerian Bosphorus. Some antiquarians identify the Cimmerii with the Cimbri and the Cymry (which see).

Cimo'lian Earth [Gr. γῆ Κιμωλία], a kind of earth which the ancients used to obtain from the islands Cimolus and Siphnus in the Cyclades. It was sometimes used in medicine, but was especially employed instead of soap in washing clothes. It appears to have been a variety of steatite or soapstone.

Ci'mon, or **Ki'mon** [Κίμων], an eminent Athenian commander and statesman, born about 502 B. C., was a son of Miltiades, who commanded at Marathon. He served with distinction at the great battle of Salamis, 480 B. C. Cimon and Aristides commanded the Athenians, who, cooperating with the other Greek armies, prosecuted the war against Persia in 476 B. C. Soon after this date he became commander-in-chief of the allies, who preferred him to the Spartan Pausanias. He defeated the Persians on the Strymon, and in 466 gained a great naval victory at the mouth of the Eurymedon. He was for some time the most prominent statesman of Athens, and a rival of Pericles. Cimon improved Athens by planting trees and building walls to the Piræus. It 461 B. C. he was banished by ostracism, but he was permitted to return in 456. He obtained command of a fleet in 449, and besieged Citium, in Cyprus, where he died in the same year. He was a conservative in politics. (See Plutarch, "Life of Cimon;" Cornelius Nepos, "Cimon;" Grote, "History of Greece;" Thirlwall, "History of Greece.")

Cinalo'a, or **Sinalo'a,** a state of the Mexican confederation, is bounded on the S. W. by the Gulf of California, and intersected by the rivers Culiacan and Cinalon. Area, 28,915 square miles. The surface is partly mountainous. The rainy season begins about June 20, and lasts nearly two months. Capital, Culiacan. Pop. 163,095.

Cincho'na, commonly pronounced sin-ko'na [for etymology see below], a genus of trees of the order Rubiaceæ, tribe Cinchoneæ, producing the bark commonly known as Peruvian bark, Jesuits' bark, etc., and from which the alkaloids quinia (quinine) and cinchonia are obtained. The trees of this genus are sometimes of great magnitude, but some of them in high mountain-regions are shrubs with stems only eight or ten feet in height. They are all natives of South America, between lat. 20° S. and lat. 10° N., and chiefly grow on the eastern slopes of the Cordilleras. Other tropical countries have of late been stocked with cinchona trees, especially Java and some other Dutch colonies. The British government has successfully introduced them into India and St. Helena; and the bark produced on the Neilgherry Hills is remarkably rich in quinia. All cinchonas are evergreen, with laurel-like, entire opposite leaves, and generally with beautiful fragrant flowers. Of more than thirty species, several are comparatively worthless in medicine.

Much difficulty has been experienced in ascertaining the species by which the different varieties of cinchona bark are produced. The commercial names are derived partly from the color of the kinds, and partly from the districts in which they are produced or the ports whence they are shipped. The best sort, known as Calisaya or royal yellow bark, is chiefly the product of *Cinchona Calisaya*, a large tree, growing in hot mountain-valleys of Bolivia and Peru. The proper discrimination of the different kinds requires experience. The taste is always bitter, but it is possible to distinguish by the taste those varieties which contain quinia most largely from those in which cinchonia is the principal alkaloid.

The collection of the bark is carried on by Indians, who pursue their occupation during the dry season. The trees are felled as near the root as possible, that none of the bark may be lost, and the bark, being stripped off, is carefully dried; the quilled form of the thinner bark is acquired in drying. Even the roots of the best species are carefully peeled. The bark is made up into packages averaging 150 pounds weight, called drums or seroons. A number of spurious kinds of bark are either sent into the market separately or are employed for adulterating the genuine kinds. The very numerous varieties are classed as (1) yellow, (2) red, (3) pale, and (4) Carthagena barks.

The Peruvian Indians call the trees *kina*, from which the Spanish name *quina* is derived, but it is not certain that they knew the use of the bark before the arrival of the Spaniards. It is a medicine of great value in the cure of intermittent fevers and diseases attended with much debility, also in certain diseases of the nervous system. It seems to have been first imported into Europe in 1639 by the wife of the viceroy of Peru, the countess of Cinchon (from whom it was named), who had been cured of an intermittent fever by means of it. The Jesuits afterwards carried it to Rome and distributed it, and thus it acquired the name of Jesuits' bark. It acquired great celebrity in Spain and Italy, being sold at high prices by the Jesuits, by whom it was lauded as an infallible remedy, while by physicians it was coldly received, and by the Protestants generally repudiated. It was, however, used in England in 1658. It seems to have been employed without discrimination, and to have fallen into the hands of empirics. It was again brought into notice by Sir Robert Talbor, who acquired great celebrity through the cure of intermittents by means of it, and from him Louis XIV. purchased his secret in 1679. Soon afterwards Morton and Sydenham, the most celebrated English physicians of that age, adopted the remedy, and its use from this period gradually extended. The discovery of the alkaloids on which its properties chiefly depend, within the present century, constitutes a new era in the history of this medicine.

The active principles of cinchona are the alkaloids Quinia (which see), cinchonia, and several other alkaloids of less importance. When isolated, the alkaloid cinchonia has the formula $C_{40}H_{24}N_2O$, and can be obtained in a crystallized state. The alkaloid quinia is now extensively in use in medicine in the form of disulphate of quinia, and is given in doses of from one to twenty grains in almost all the cases to which the bark is applicable, and for this reason the bark itself is much less used than formerly.

Revised by Willard Parker.

Cincinna'ti, a township of Tazewell co., Ill. P. 758.

Cincinnati, a township of Harrison co., Ia. Pop. 447.

Cincinnati, the "Queen of the West," the county-seat of Hamilton co. and metropolis of the State of Ohio, one of the largest and most important inland cities of the U. S., is situated in lat. 39° 6′ 30″ N. and lon. 84° 24′ W., 764 miles from New York and 610 miles from Washington, in the beautiful Valley of the Ohio, extending along the northern bank of the Ohio River and over the adjacent hills for miles. The main portion of the city is in the valley, and is built on two plateaux. The territory of the city has an area of twenty-four square miles, on which regular streets, mostly 66 feet in breadth, are laid out, and paved with boulders or wooden blocks. Cincinnati is di-

vided into twenty-five wards, besides the suburbs Clifton and Avondale, which, in connection with Mount Auburn and East Walnut Hills, now parts of the city, contain some of the most beautiful private residences and country villas. Quite a number of other suburban towns surround the city; among which may also be counted the cities of Covington, Newport, Dayton, and Ludlow in the State of Kentucky, which are situated right opposite Cincinnati, and connected with the same by bridges and ferries. The government of the city rests in the hands of the mayor, who is endowed with the veto power, boards of councilmen, of aldermen, of police commissioners, fire commissioners, of education, park commissioners, of health, of sewerage, of city improvements, of water-works, of revision, and a number of minor boards. While the population of the city in 1800 amounted only to 800, it had increased in 1860 to 161,044, and in 1870 to 216,239, of whom 136,627 were born in the U. S., 49,448 in Germany, 18,264 in Ireland, 4033 in England and Wales, and the rest in other foreign countries.

Cincinnati occupies a prominent position as a commercial and manufacturing city, and is the native place of many prominent men. Its favorable position, extensive railroad connections, and numerous factories make it the commercial emporium of the adjacent fertile and densely settled States and the centre of Western manufacture. The best proofs of its growing prosperity are the numerous new buildings and the rapid extension of the business portion of the city beyond its former boundaries. Among the public buildings the most prominent are the Cincinnati College, the court-house, the city hall, the Ohio and Miami colleges, the Public Library, the Masonic Temple, Odd Fellows' Hall, the workhouse, house of refuge, the new city hospital, the post-office, and the house of the Jesuits, while Pike's and Robinson's opera-houses, the Catholic Institute, Sinton's and Mitchell's blocks, the Wesleyan Female College, and the Cincinnati Hotel may be ranked among its finest private structures. The finest view of the city may be had from the house of the Passionist Fathers on Mount Adams (formerly the observatory), the Catholic seminary, and the Lookout House. Among the churches, St. Peter's cathedral, with its beautiful steeple of Dayton stone and its chimes; St. Francis Xavier's church of the Jesuits, St. Paul's Methodist church, the Second Presbyterian, St. John's Episcopal, and the Central Christian church are the most prominent. The total number of churches is 151 (11 Baptist, 2 Christian, 4 Congregational, 4 Disciples of Christ, 2 Friends, 5 German Evangelical Unionists, 3 German Reformed, 1 Independent Methodist, 4 German Lutheran, 27 Methodist Episcopal, 2 Protestant Methodist, 1 Calvinistic Methodist, 3 colored Methodist, 1 Swedenborgian, 14 Presbyterian, 2 United Presbyterian, 3 Reformed Presbyterian, 8 Protestant Episcopal, 42 Catholic, 3 United Brethren in Christ, 1 Universalist, 3 Unitarian, 5 Jewish synagogues). Cincinnati has 5 literary colleges, 2 academies of the Sisters of Notre Dame, 6 medical colleges, 1 law school, 1 college of dentistry, 5 commercial colleges, and a university. The city has 26 district, 4 intermediate, a normal, and two high schools, with 91 male and 420 female teachers, and 26,449 pupils. The colored population has its own schools, as well as the Catholics and other religious associations. Among the numerous libraries, the most prominent are the Public Library, with 59,695 volumes, open to everybody; the Young Men's Mercantile Library, with 26,800 volumes; the Historical Library, with 1738 volumes and many valuable MSS. Among the benevolent institutions under the control of the city government are the house of refuge, the poorhouse, the hospital, the lunatic asylum. Besides these city institutions, private charity supports three orphan asylums, three hospitals, a widows' home, a children's home, a home for the friendless, House of the Good Shepherd for fallen women, Union Bethel, a protectory for fallen boys, and a vast number of benevolent aid societies. Cincinnati has 22 lodges of Free Masons, 43 of Odd Fellows, 15 of Good Fellows, 6 of Red Men, 12 of Knights of Pythias, 4 of the Seven Wise Men, 4 of the Grand Army of the Republic, 5 of the B'nai B'rith, 10 of the Druids, 12 of the American Protestant Association, 7 divisions of the Sons of Temperance, 4 orders of Good Templars, and 11 of the Harugaris. It has an academy of medicine, an astronomical society, an historical and philosophical society, a society of natural history, a zoological society, an acclimatization society, a society for the prevention of cruelty to animals, a wine-growers' association, a horticultural society, and a literary club. There are also a chamber of commerce and a board of trade. Cincinnati has 7 daily and 33 weekly papers, 3 semi-monthly and 27 monthly publications. It has 6 theatres. Eighteen railroads connect Cincinnati with all parts of the country; 354 steamboats ply between the different points on the river. It has 11 horse railroads, 1 inclined plane railroad, 4 steam ferries, and two fine bridges (one of them, the splendid Cincinnati and Covington suspension bridge, built by Roebling, connects Cincinnati with Covington, Ky.).

The commerce of Cincinnati is very large. Its chief article of exportation, pork, has given it the name of "Porkopolis." It has also a large trade in tobacco, groceries, beer, and whisky. The imports in 1872 amounted to $317,646,608, and the exports to $200,607,040. The manufactures of Cincinnati are not less important than its commerce. In 1871 different articles, amounting altogether in value to $235,988,365, were manufactured. The principal manufactures are iron, metal, and wooden wares, leather, soap, candles, clothing, whisky, beer, chemicals, earthenware, carriages, paper, boots and shoes, books, tobacco, cigars, etc. Cincinnati has five national banks, with an aggregate capital of $4,000,000, and thirty private banks. In 1872 the tax receipts of the city amounted for ten months to $3,956,218.92; the expenses to $4,009,837.20. The bonded debt amounted to $6,001,500, and the real estate of the city to more than $20,000,000. The taxable property was estimated on the duplicate of 1873 at $175,084,296. Cincinnati has 21 steam fire-engines and 326 fire-alarm telegraph stations.

Spring Grove Cemetery, containing 443 acres, is the finest and largest burial-place. Among the seven parks of the city, the Garden of Eden, containing 225 acres, is the largest. The beautiful Tyler Davidson fountain on Fifth street, surrounded by an esplanade and cast in Müller's bronze foundry in Munich (Bavaria), after designs by Albert von Kreling, by order of Henry Probasco, is one of the grandest ornaments of the city. Cincinnati is the seat of a police court, superior court, court of common pleas, 1 district court, 1 probate court, and the U. S. court for the southern district of Ohio. Since 1853 Cincinnati is the seat of a Catholic archbishop.

Cincinnati was founded by New Jersey men in 1789, and laid out by Col. Ludlow, who plotted it on a plan similar to that of Philadelphia. The nucleus was formed by Fort Washington, below which the village of Cincinnati was mainly built. For years it did not promise to rise much above the ordinary village, and not until 1816, when steamboat navigation was introduced on the Western rivers, did it push forward. From that date, however, it made rapid strides to prominence, and occupied in a few years the first rank among Western cities, which it maintained for a long while. It was incorporated as a town in 1802, and as a city in 1819. Its first mayor was Major Ziegler. Towards the middle of the century it attracted a vast German immigration, and several parts of the city, called "Over the Rhine," are almost entirely settled by Germans.

Of the local works on Cincinnati, the following are some of the most important:

DRAKE, DANIEL, "Notices concerning Cincinnati," Cincinnati, 1810, 8vo; "Natural and Statistical View or Picture of Cincinnati and the Miami Country," Cin., 1815, 12mo; "Early Physicians, Scenery, etc. of Cincinnati," Cin., 1852, 12mo; DRAKE, B., and MANSFIELD, E. D., "Cincinnati in 1826," Cin., 1827, 12mo; CIST, C., "Cincinnati in 1841," Cin., 1844, 12mo; "Cincinnati in 1851," Cin., 1851, 12mo; "Cincinnati in 1859," Cin., 1859, 12mo; LEA, T. G., "Plants of Cincinnati," Phila., 1849, 8vo; STEVENS, G. E., "The Queen City in 1869," Cin., 1869, 18mo; FOOTE, J. P., "Schools of Cincinnati," Cin., 1855, 8vo; "Spring Grove Cemetery Illustrated," Cin.; MAXWELL, S. D., "Suburbs of Cincinnati," Cin., 1870, 4to; TAFT, A., "Cincinnati and her Railroads," Cin., 1870, 8vo; "Cincinnati and the Miami Country Celebration," Cin., 1834, 8vo; CLARK, P. H., "Black Brigade of Cincinnati," Cin., 1870, 8vo.

REVISED BY G. BRÜHL.

Cincinna'ti, Order of [named from the patriot Cincinnatus], a society founded in the U. S. in 1783 by the officers of the Revolutionary army, whose object was to cherish and perpetuate the feelings of patriotism, friendship, and fraternity which had been produced by the toils and dangers they had experienced in common, and to relieve the wants of the families of such as had fallen in the war. General Knox was one of the authors of its constitution. The badge of this society is a bald eagle, suspended by a dark-blue ribbon with white borders, a symbol of the union of the U. S. with France. The privilege of membership was extended to a number of French officers. Considerable dissension and discussion was excited on the question of the succession of regular membership, which at first was limited to the eldest male posterity, together with their kindred who should be worthy, etc. Popular jealousy was roused by the privilege granted to primogeniture, which was denounced as a germ of hereditary aristocracy. At a general meeting held in Philadelphia in 1784 this subject was discussed, and some change was made in the constitution as a concession to the popular sentiment. Gen. Washington accepted in 1787 the office of president of the order, which he continued to hold by successive re-elections until his

death. Branches of the order were organized in each of the States. Of these some have been abolished or discontinued, but others remain active and hold annual meetings. Hamilton Fish was elected president of the order in 1872.

Cincinnatus, a township and post-village of Cortland co., N. Y., 75 miles S. E. of Oswego. Pop. 350; of township, 1155.

Cincinna'tus (Lucius Quintius), [so called because he wore his hair in long curling locks, *cincinni*], an eminent Roman patriot and dictator, born about 519 B. C., belonged to the patrician order. He cultivated a small farm with his own hands, and was regarded as a model of pristine virtue and simplicity of habits. About 458 B. C. he became consul. According to Smith's "Dictionary," he was illegally appointed consul suffectus in 460 B. C. He was appointed dictator two years later, and gained a victory over the Æqui. In the year 450 he was an unsuccessful candidate for the office of decemvir. He was chosen dictator in 439 B. C., to oppose the machinations of Spurius Melius, accused of treason. Much of what is related of him by Livy is now thought to be legendary.

Cinc'ture [Lat. *cinctura*, a "girding," from *cingo, cinctum*, "to gird"], in architecture, is the ring or fillet at the top and bottom of a column which divides the shaft from the capital or base. It is also used, like the Latin *cinctura*, for a girdle.

The Gabine Cincture (*cinctus Gabinus*), in ancient Rome, was a peculiar mode of wearing the toga, the garment itself being tied in a knot in front. This cincture was seldom employed except upon the most solemn occasions. It took its name from the town of Gabii, where its use is said to have been once common.

Cin'eas [Gr. Κινέας], a Thessalian orator and negotiator, who, as Plutarch says, in youth had heard Demosthenes. He became a confidential minister of Pyrrhus, king of Epirus, who, in 280 B. C., sent Cineas to Rome to negotiate a treaty of peace or alliance. His artful and plausible speeches were frustrated by Appius Claudius, and his mission was a failure. Died after 278 B. C.

Cin'erary Urn [Lat. *urna cineraria*, from *cinis* (gen. *cineris*), "ashes"], a vessel used by the people of antiquity to contain the ashes of the dead gathered from the funeral pile. The embers were drenched with wine, and placed in the urn, which was then placed in a family mausoleum. Only the rich could afford so expensive a rite. Slaves and inferior persons were burned, and their ashes placed in the *olla*, or common clay pot, which was then stored in a columbarium. Cinerary urns were of marble, clay, glass, alabaster, or sometimes even of gold. The celebrated urn known as the Portland vase in the British Museum is of this character. (See Portland Vase.) Cinerary urns often had epitaphs and beautifully wrought artistic figures upon them.

Cini'si, a town of Sicily, in the province of Palermo, is 14 miles W. N. W. of Palermo, and near the sea. Here is an old feudal castle which has been converted into a convent. Pop. 6714.

Cin'na (C. Helvius), a Roman poet and a friend of Catullus, was perhaps the same as the Cinna whom Virgil compliments in his ninth eclogue. He wrote an epic poem called "Smyrna," of which only a few lines are extant. He was killed in 44 B. C. by a mob of Cæsar's adherents, who mistook him for another Cinna, who was an accomplice of Brutus.

Cinna (Lucius Cornelius), a Roman patrician who was a partisan of Marius in the civil war between Marius and Sulla. He became consul in 87 B. C., while Marius was in exile and Sulla was conducting a campaign in Asia. By an effort to reinstate Marius he provoked a violent conflict, and was driven out of Rome, but he and Marius soon returned with an army and obtained the mastery in that capital. They massacred many friends of Sulla. Cinna was re-elected consul as a colleague of Marius, who died in 86 B. C. He raised an army and marched to oppose Sulla, who was returning from Asia, but was killed by his own mutinous soldiers in 84 B. C. His daughter Cornelia was married to Julius Cæsar.

Cin'nabar [Fr. *cinabre* or *cinnabre*; Ger. *Zinnober*; Lat. *cinnabaris*; Persian *kambar*], a red pigment sometimes called vermilion, is an ore of mercury, from which nearly all the mercury of commerce is obtained. It is a sulphide of mercury, composed, when pure, of 86.2 per cent. of mercury and 13.8 of sulphur. It occurs massive and crystallized in six-sided prisms; has an adamantine, almost metallic lustre, and a carmine color. Specific gravity, nearly 8.5. The term vermilion is usually applied to this mineral when it is reduced to powder in order to be used as a pigment. It is a rare mineral. The most productive mines of cinnabar are those of China, of Almaden in Spain, New Almaden in California, and Idria in Carniola. The annual product of the mine of New Almaden is about 2,600,000 pounds.

Cin'naminson, a post-township of Burlington co., N. J. Pop. 3112.

Cin'namon [Lat. *cinnamomum*] is the aromatic bark of certain trees of the genus *Cinnamomum*, which belongs to the order Lauraceæ, natives of tropical and sub-tropical parts of the East. Cinnamon is mentioned in the Old Testament by a name almost the same as that which it still bears. True cinnamon is chiefly produced by the *Cinnamomum Zeylanicum*, which grows in the island of Ceylon; introduced into the West Indies in 1782, it is now cultivated there also. The tree attains the height of twenty to thirty feet, and is eighteen inches in thickness. The leaves are oval, four to six inches long, with a blunt point; they have the taste of cloves. The fruit is somewhat like an acorn in shape; it is a small drupe, brown when ripe. The branches of three to five years' growth being cut down, the epidermis is scraped away; the bark is split longitudinally with a knife and taken off. The pieces are then exposed to the sun, when it curls up into quills, the smaller of which are thrust into the larger, and the whole tied up in bundles. Cinnamon is arranged according to its quality by persons who chew it, although in a short time it produces painful effects on their mouths. It is used by cooks and confectioners, and in medicine as a stomachic and carminative. Its virtues depend chiefly upon the essential oil which it contains. Oil of cassia is very often substituted for this oil, as cassia is for cinnamon. Indeed, the ordinary cinnamon of commerce is cassia, that name being given to the product of probably eighteen or twenty different species of *Cinnamomum*. The root of the cinnamon tree contains camphor. The fruit yields a highly fragrant, concrete oil, called "cinnamon suet," and in Ceylon was formerly made into candles for the use of the king. *Cinnamomum Loureirii*, of Cochin-China and Japan, yields a bark even superior to that of *Cinnamomum Zeylanicum*. A species of cinnamon grows at the elevation of 8500 feet in the Himalaya Mountains. The oil of cinnamon is generally prepared in Ceylon by grinding coarse pieces, soaking them in sea-water for two or three days, and then distilling. Two oils pass over—one lighter, the other heavier, than water. Oil of cinnamon varies in color from yellow to cherry-red; the yellow variety is the best. Oil of cinnamon leaf is prepared in Ceylon, and is met with in commerce under the name of clove oil, which it resembles. Cinnamon water is obtained by adding water to cinnamon, and distilling, or by diffusing the oil of cinnamon through water by the aid of sugar or carbonate of magnesia. Spirit of cinnamon is procured by acting upon cinnamon with spirit of wine and water and distilling; and tincture of cinnamon, by soaking cinnamon in spirit of wine. The medicinal properties of cinnamon are aromatic and carminative, and it is serviceable in nausea and vomiting, and in cases of flatulence and of spasm of the stomach. The eocene deposits of the U. S. and other countries abound in fossil remnants of trees referred to the genus *Cinnamomum*.

Cin'namon Bear, or **Yellow Bear,** a bear occasionally found in the U. S., is regarded as a mere variety of the common black bear. (See Bear.)

Cinnamon Stone is a variety of lime garnet of a clear cinnamon-brown color, and is a silicate of alumina and lime. The finer specimens are highly prized and used in jewelry. Many of the stones sold as hyacinths are in reality cinnamon stones. They are found most abundantly in Ceylon.

Cinque Cento, chĕn-kwà chĕn'to [an Italian word signifying "five hundred"], a term used to designate the style of art which arose in Italy about the year 1500, after the fall of the great schools. It is sensuous in its character, the subjects being usually borrowed from ancient mythology or history. The same term is also applied to the literature and architecture of that period, and is nearly synonymous with the later Renaissance (which see).

Cinquefoil, sink'foil [from the Fr. *cinque*, "five," and *feuille*, a "leaf"], a common name of the five-finger or Potentilla (which see); also a bearing in heraldry, which is usually depicted with five leaves issuing from a ball as a centre point. Cinquefoil, in architecture, is an ornamental foliation in five compartments, used in the tracery of windows, panellings, and the like. The cinquefoil is often represented in a circular form, the spaces between the points or cusps representing the five leaves.

Cinque Hommes, a township of Perry co., Mo. Pop. 2910.

Cinque Ports (*i. e.* "five ports"), the English seaport-towns of Dover, Sandwich, Hastings, Romney, and Hythe, to which William the Conqueror granted important privileges. Winchelsea, Rye, and Seaford were subsequently

added to the original five ports. They are under the government of a lord warden. The Cinque ports in early times were required to furnish such shipping as the sovereign required for the public service. In the time of Edward I. they were bound to furnish fifty-seven ships, equipped and manned at their expense, for fifteen days. The Cinque ports became so powerful and audacious that they sent out piratical expeditions and waged war without authority from the king. The Municipal Reform act has broken up the ancient organization of the ports.

Cin'tra, or Sintra, a town of Portugal, in Estremadura, on the slope of the Serra de Cintra, 14 miles N. W. of Lisbon. It is remarkable for the picturesque beauty of its situation and its delightful climate. It has an ancient castle, originally occupied by Moorish kings, and afterwards by Christian sovereigns. On two hills are the Penha convent and a Moorish castle, and within the town is a palace. The citizens of Lisbon are accustomed to spend their Sundays in Cintra.

Cione di Andrea. See Orcagna.

Ciotat, La (anc. *Citharista*), a maritime town of France, department of Bouches-du-Rhône, is on a bay of the Mediterranean 14 miles S. E. of Marseilles. It is well built, and has a good harbor, with an active trade in wine, fruits, and olive oil. Pop. 10,017.

Ci'pher [Fr. *chiffre;* Arabic, *kifr,* "empty"], the symbol 0 in numerical notation, which is sometimes called "naught," and has no intrinsic value, but serves to determine the local value of the other digits or figures by which it may be accompanied in the expression of a number.

Cipher, or Mon'ogram, an intertexture of letters, as the initials of a name; an arrangement of the initial letters of a person's name, used as a private mark by artists and others. The term is also applied to certain characters or arbitrary signs used in writing despatches, etc. in cases where secresy is desirable. (See Cryptography.)

Circæ'a, a genus of herbaceous plants of the order Onagraceæ, having a corolla of two petals and two stamens. The *Circæa Lutetiana* (enchanter's nightshade) is a native of Europe and the U. S., growing in damp woods. It bears small whitish flowers in racemes.

Circars, Northern, an extensive maritime province of British India, in the presidency of Madras, with 470 miles of sea-coast. The surface is diverse. The principal rivers are the Godavery and Kishna. The soil is fertile, yielding cotton, grain, and tobacco. Area, 23,760 square miles. Pop. estimated at 3,000,000.

Circas'sia, a region in the Western Caucasus belonging to Russia, and extending from lat. 42° 30′ to 45° 40′ N., and from lon. 37° to 46° E. The soil is fertile, and the climate cool and healthful. The forests are of luxuriant growth. Coal and iron abound. Area, about 33,000 square miles.

The name Circassians is often applied to the people of the neighboring parts of the Caucasus, but the Circassians proper inhabit only the north-western part of the Caucasus, with the exclusion of Abkasia, or the portion between the Black Sea in the W. and the lower bank of the river Kuban in the N. They number from 500,000 to 600,000, and are divided into fifteen tribes or clans. The language of the Circassians, like the other tongues spoken in the Caucasus, is difficult to learn, and its philological relations, and the ethnological relations of these peoples, are very difficult questions. The Circassians are a warlike people, among whom it is held more honorable to live by plunder than by industry. They cherish the most unrestrained love of independence. There are five distinct ranks—viz. chiefs, nobles, freemen, dependants, and slaves. The class of freemen makes up the great mass; they possess property and enjoy the same political rights as the nobles. The fourth class, the dependants, are the vassals of the princes and nobles. The fifth class comprises the slaves, or those who have been made captive in war. The princes and nobles are principally Mohammedans, while the great mass of the people have a religion which is a mixture of Christianity and paganism. The Circassians are ignorant. Besides agriculture and the rearing of cattle, they possess few other branches of industry, and are given to wild and lawless pursuits. The Circassians are handsome, strong, active, and temperate, and are characterized by self-dependence, courage, and prudence. They are chiefly known through their struggles to maintain their independence against Russia, and for their custom of selling their daughters to the Turks and Persians.

Cir'ce [Gr. Κίρκη], a sorceress of classic mythology, celebrated for her skill in magic arts, was a sister of Pasiphaë. According to Homer, she was a daughter of the Sun, and lived on the island of Ææa, where she transformed many men into swine and other beasts by her drugs and incantations. Ulysses passed a year with her. (See the "Odyssey," book x.)

Circensian Games. See Circus.

Cir'cle [from the Lat. *circulus,* a diminutive of *circus,* a "ring"], in geometry, is a plane figure bounded by a curved line which is everywhere equally distant from a point within called the centre. The curved line which bounds the circle is called the circumference. The distance from the centre to the circumference is called the radius, and any two radii which together form a straight line constitute the diameter.

In the mechanic arts the ratio of the diameter to the circumference is assumed to be as 7 to 22, which is exact enough for practical operations, though the real ratio can never be perfectly expressed. In ordinary mathematical work it is assumed to be as 1 to 3.1416, which is very slightly too large. Mr. William Shanks, a British mathematician, has carried out the decimal to 607 places. The diameter and circumference are in fact incommensurable, and it is conclusively demonstrated that the famous problem of "squaring the circle" can never be solved.

The circle is one of the conic sections, it being exhibited by cutting a right cone in a plane parallel to its base. It is often referred to the second order of curves, and regarded as an ellipse, whose foci coincide with each other.

In astronomy, the term "great circle" is applied to those circles which divide the celestial sphere into two equal parts, as the equator and the Meridian (which see).

Six-points Circle, the circle which passes through the middle points of the sides of a triangle. It passes also through the feet of the three perpendiculars let fall from the angles upon the opposite sides, and possesses many remarkable properties. The same circle is referred to by some European writers as the *nine-points circle,* since, besides the six points already named, the middle points of the three lines joining the corners of the triangle to the intersection of the three perpendiculars also lie in its circumference. Feuerbach, Brianchon, and many others have investigated the properties of this circle. The first of these geometers discovered that it touched the inscribed as well as the three exscribed circles of the triangle.

Circle, Mural. See Mural Circle.

Circle of Perpetual Apparition, a lesser circle of the celestial sphere, is parallel to the equator, and increases with the latitude of the place where the observer is stationed. All stars included in it are always above the horizon. These are called circumpolar stars.

Cir'cleville, a city, the capital of Pickaway co., O., is on the Scioto River, the Ohio Canal, and the Cincinnati and Muskingum Valley R. R., 104 miles E. N. E. of Cincinnati and 25 miles S. of Columbus. It occupies the site of highly interesting ancient works, consisting of a circle and square, perfect in form, fully described in Howe's "History of Ohio." It has 14 churches, 2 national banks, 1 private bank, 7 building-and-loan associations, 2 large pork-packing establishments, a number of mills and factories, and 3 weekly newspapers. The lands in the vicinity of Circleville are largely devoted to broom-corn culture, thus making it a leading market for that article. The celebrated speech of Logan the Indian chief was made 4 miles S. of Circleville. Camp Charlotte, where Lord Dunmore encamped in 1774, and made a treaty of peace with Indians, is 7 miles S. E. of Circleville. Pop. 5407; of Circleville township, 515.

Alfred Williams, Ed. "Herald and Union."

Circleville, a township and village of Pendleton co., West Va., 130 miles S. E. of Wheeling. Pop. 1108.

Cir'cuit [Lat. *circuitus,* from *circum,* "around," and *eo, itum,* to "go"], a name given in England, Wales, and Ireland to certain divisions of the country made for judicial purposes. These circuits are visited by judges at appointed times for holding courts. The judges were anciently called justices in eyre (from the Lat. *eo, ire,* to "go").

Circuit Court, the name of the courts of the U. S. next inferior to the supreme judicial court. The U. S. are divided into circuits, and in each circuit one of these courts is held. The presiding judge is either the chief-justice of the U. S., one of his associates, a special circuit justice, or, in some instances, a district judge. The circuit court has jurisdiction, direct or appellate, both in law and equity. It also hears appeals from a court of admiralty in certain cases. Criminal cases may also in some circumstances come before it. Several States of the Union have circuit courts. (See Courts, by George Chase, LL.B.)

Cir'cular [Lat. *circularis;* Fr. *circulaire*], round, like a circle, circumscribed by a circle; ending in itself, as a parologism in which the second proposition proves the first, and is proved by it. "Circular sailing" is the

method of sailing by the arc of a great circle. As a noun, circular sometimes signifies a document addressed to a circle of persons or to a number of persons having a common interest, as a circular letter.

Cir'cular Func'tions, a term which, as generally employed, is synonymous with trigonometrical functions.

Circular Notes. See LETTERS OF CREDIT.

Cir'cular Numbers are numbers whose powers end on the same figure as they do themselves; such are numbers ending in 0, 1, 5, 6.

Cir'cular Parts, in spherical trigonometry, the name given to two rules invented by Lord Napier, and demonstrated in his "Mirifici Logarithmorum Canonis Descriptio" (see also TODHUNTER'S "Spherical Trigonometry"), for obtaining the formulæ relative to a right-angled spherical triangle.

Circular Points at Infinity, the two imaginary points in which any circle intersects the infinitely distant right line in its plane.

Cir'culating (or **Recur'ring**) **Dec'imal,** a decimal in which certain digits are continually repeated. Thus, .15723723 . . . . , *ad infinitum*, is a circulating decimal of which the figures 723 constitute the *recurring period*, called also the *repetend*.

Circulating Library. See LIBRARIES, by A. R. SPOFFORD, Esq., Librarian of Congress.

Circula'tion of the Blood. In all animals, even the simplest and lowest, there is a movement, more or less regular, of blood, or of a fluid equivalent to it, furnishing material for the formation and repair of the body. Sponges, while living, have no closed *internal* circulation, but their nutrition and aëration are sustained by the incessant flow of the water in which they exist through their numerous pores. Other Protozoa (as the lowest group of animals is designated), as Rhizopoda, have, within their soft, jelly-like substance, cavities (vesicles) which alternately contract and dilate, serving the purpose of aëration of their bodies, with redistribution of their material. Animals a grade higher, as the Actinia (sea-anemone), have a free communication between the stomach and the general cavity of the body, from which, through fine ramifications to certain parts, the nutritious fluid is circulated, though never separated as true blood. In worms no distinct circulation of blood has been proven to exist. Cavities (*lacunæ*) there are, and in some, as the leech, vessels called *pseudo-hæmal* vessels, ramifying through the body and containing a fluid, generally red, but these always have a tubular communication with the exterior. In insects there is a dorsal segmented vessel, with valves between the segments, which conveys the blood forward by its rhythmical contractions. The blood, which is often colored, and contains corpuscles (though never colored, as in vertebrates, by the corpuscles), then flows into lacunæ, or spaces through the body, coming in contact with the air introduced by the tracheal tubes. Crustaceans, as the lobster, have a muscular heart, with six arterial branches, going to the head, stomach, liver, and posterior parts. Thence the blood passes through a number of lacunæ, and returns by a number of veins, which expose it, in the *gills*, to the air before reconveying it to the heart. Thus the heart of the crustacean is *systemic*, not respiratory, in its mode of distribution of the blood. The oyster has a heart, not far from the muscle which closes its shell; its vascular system, however, is incompletely closed. In the cuttle-fish there is a strong systemic heart, with valves; it sends blood to all the organs except the gills. The blood returns into a contractile venous enlargement (*sinus*), which conveys it to the gills through from two to four branches or veins. Other sinuses then receive it, and these, being contractile, send it back to the heart. All invertebrates (animals without an internal skeleton) have, if any, a *systemic* heart, and none of them have *colored* corpuscles in their blood.

Vertebrated animals always (except the anomalous *Amphioxus*) have blood containing both red and colorless corpuscles, the former of which give to it its color. In fishes the heart is branchial or respiratory. Consisting of an auricle and a ventricle, it receives venous blood from the body, and propels it, by four or five arched vessels, through the gills, whence it circulates, to be returned by veins to the auricle. In the eel, torpedo, and one or two other fishes, contractile venous sinuses assist this return.

In fishes generally it is supposed that the impulse of the heart suffices for the whole round of the circulation. More probably, however, this is supplemented by arterial, if not venous, propulsion, and by a power acting in the (intermediate) capillary region. All vertebrated animals have a closed circulatory system, consisting of a heart, arteries, capillaries, and veins. In all vertebrates there is, also, a portal system, composed of veins going from the digestive, and sometimes other, organs to the liver—in fishes to the kidney also—whence veins again convey the blood to the heart.

Reptiles and amphibia have a heart with three cavities—two auricles and one ventricle. Of the auricles, one receives blood from the lungs (except in the early stage of life of the frog, and some other amphibia; and from the lungs and gills *both* in the perennibranchiate amphibia, as Proteus); and the other receives the blood from the body generally. These two kinds of blood (aërated, or arterial, and non-aërated, or venous) mingle in the single ventricle, whence they are redistributed to the lungs and all over the body by arteries. In the crocodile, however, a partition almost separates the two halves of the ventricle, thus approaching the arrangement in the higher animals.

Birds have four cavities—two auricles and two ventricles—making a completely double heart, always situated in the middle of the thorax or chest. One auricle receives the blood by large veins coming from the body generally. This auricle passes the blood into its connected ventricle, which sends it, by pulmonary arteries, to the lungs. Thence it returns, by pulmonary veins, to the other auricle, and this conveys it into its attached ventricle. That cavity then propels it through the aorta, or main arterial trunk, for general distribution over the body. In birds the portal venous system mainly connects the liver with the digestive organs; but a few of its veins communicate with the kidneys, posterior internal organs, and lower extremities.

All mammals (viviparous vertebrated animals which suckle their young) have a double heart, consisting of two auricles and two ventricles—a respiratory and a systemic heart conjoined. In man, for instance, the right auricle and ventricle constitute the respiratory or pulmonary heart—the left, the systemic; and after birth, although closely adherent together, no direct communication exists between them. In the dugong the two ventricles are partly separated by a deep notch. In the ox and many other ruminants a bony deposit strengthens the inter-ventricular wall. Only in man and some of the anthropoid (man-like) apes does the heart incline to the left side; in other animals it is usually median. This promotes the symmetry which is so especially important in swift-running animals, as the hound and deer, and in birds for flight.

The arrangement of the branches of the aorta differs in the several classes of vertebrated animals. Fishes have four or five aortic arches, going to the gills. The lower reptiles have three aortic arches on each side; the higher reptiles, one on each side, descending over the roots of the two lungs to form together the abdominal aorta. Birds have only one—the right aortic arch, passing over the root of the right lung. In mammals, including man, there is only a single aortic arch, over the root of the left lung; this, giving off branches above, becomes in its descent the abdominal aorta. The manner of origin of the ascending branches (subclavian and carotid) of the aorta differs also, even among the Mammalia. In man it is least symmetrical; two arterial trunks passing upward from the aorta on the left side (left carotid and subclavian), while there is one (*arteria innominata*), only on the right, soon subdividing into two. The horse and ruminants have but a single aortic principal branch, which gives off all four of the carotid and subclavian arteries. The portal circulation in mammals is never connected with the kidneys.

A *rete mirabile* is a network of closely interjoining (anastomosing) arteries, which finally unite into a single trunk. Whales and other Cetacea (aquatic, fish-like mammals) have *retia mirabilia* connected with their intercostal arteries within the chest, evidently serving the purpose of reservoirs to retain and distribute aërated blood while the animal is submerged for a long time. There are also in the same animals venous plexuses or *retia*, for the detention, under like circumstances, of impure, non-aërated blood. Protective arrangements of the arteries exist in certain special instances, as the passage through the pelvic bones of the main artery of the hind part of the tail in the whale; of the great artery of the anterior extremity through the humerus or arm-bone of the lion; and of the corresponding artery through the coffin-bone (hoof-bone) of the horse. In all these cases vigorous action of the muscles in locomotion or prehension might unduly obstruct, at times, the flow of arterial blood but for such a provision, by which muscular or tendinous pressure upon the artery is prevented by its enclosure within bony walls.

The circulation of the blood in man corresponds altogether (except in the unsymmetrical location of the heart and of some of the arterial trunks) with the mammalian type above described. In connection with the human circulation, however, some additional particulars may be here given.

Action of the Heart. (For anatomy, see HEART; also ARTERY, CAPILLARY, and VEIN.)—Being composed of spirally-arranged muscular fibres, the heart, by its rhythmical

contractions and relaxations, empties itself and becomes filled with blood alternately, in an adult man or woman, between sixty-five and seventy-five times a minute while at rest in health. From the right ventricle the venous blood (poured into it from the right auricle, which receives it from the great *venæ cavæ*) is sent through the pulmonary artery and its branches to the capillaries which ramify minutely throughout the lungs. These combine to form small veins whose union into larger trunks finally constitutes the four pulmonary veins, which empty the (now aërated or arterialized) blood into the left auricle. This conveys it into the left ventricle, whence it is impelled through the aorta, by the branches of which it becomes distributed all over the body in capillary networks, to return to the heart by means of the veins; all of which empty at last into the ascending and descending *venæ cavæ*.

For the maintenance of this round of the circulation the *valves* of the heart are indispensable. Membranous and muscular valves (tricuspid and mitral) intervene between each auricle and its corresponding ventricle. Pocket-like (three-folded, semilunar) valves also exist at the mouths of the two great arteries which convey blood from the heart; namely, the pulmonary artery from the right ventricle, and the aorta from the left ventricle. When the auricles are contracting, the (tricuspid and mitral) valves between them and the ventricles are open, allowing the blood to flow through. The auricles being emptied and the ventricles filled, the latter then contract, and at the same time, and in the same act, close the auriculo-ventricular valves; so that the blood is forced onward through the two arteries above named (pulmonary artery and aorta). While the ventricles are contracting (this being called the *systole*), the heart is spirally twisted, elongated,* and thrust slightly forward against the space between the fifth and sixth ribs, below the left nipple. This quite perceptible movement is the impulse of the heart. No power other than that of elasticity has been proved to exist in the dilatation (*diastole*) of the cavities of the heart. The immediate cause of the systolic contraction is most probably the contractility resident in the heart's muscular tissue, acting under the stimulus of aërated (oxygenated) blood. It is also placed under the modifying influence of the nervous apparatus or system, having minute ganglia upon its surface, and being connected with the brain and spinal cord by branches of the pneumogastric nerve. Why the action of the heart should be so regularly rhythmical is not known. But as it has been shown (by Bowman and Marey) that *all* muscular action is alternating or vibratory in its character, it is possible that the spiral arrangement of the heart's fibres may have to do with the peculiar manner of the heart's contraction. With some (especially cold-blooded) animals the heart has been found to contract for some minutes, or even hours, after its removal from the body, and sometimes when quite emptied of blood.

Of the *sounds* of the heart, audible when the ear is placed over it against the chest, the first (longest and loudest) is explained principally by the closing, with vibration, of the auriculo-ventricular walls during the systole of the ventricles. Other minor causes are the impulse of the heart, the rush of blood into the great arteries, and the friction of the heart's muscular fibres amongst themselves. The second sound has been shown experimentally to be caused by the flapping together, *after* the systole, of the pocket-like (semilunar) valves at the mouths of the aorta and pulmonary artery.

Arterial Circulation.—Since the arteries contain, in their middle coat, a portion of (smooth, pale, involuntary) muscular as well as elastic tissue, this must have an important influence upon the blood-movement. The fact that the relative amount of muscular tissue is greatest in the smallest arteries, which are farthest from the heart, suggests their adaptation to the purpose of supplementing the action of the heart in propelling the blood through the capillaries. The same idea is reasonably connected with the observation that after death the arteries are always found to have emptied themselves, by their last contraction, into the veins. It is also supported by the apparent need of such an arterial power to complete the circulation commenced by the merely branchial (not systemic) heart in fishes, and by the fact that in acephalous (born without a head) children the heart is found to be absent, so that the circulation in them must have been arterial and capillary only; as well as by the proof that during early embryonic life every human being is likewise without a heart, the blood-movement then depending on the blood-vessels alone. Notwithstanding these and many other obvious reasons in favor of such a view (which was accepted by the distinguished John Hunter and Sir Charles Bell), the more common opinion among physiologists has been, for many years, that the office of the muscularity of the arteries is of a "stop-cock" or "floodgate" nature, opposing a graduated resistance to the impulse given to the flow of blood by the heart. Lately, however, careful experiments by Legros and Onimus ("Journal de l'Anatomie et de la Physiologie," 1868–70) have given new confirmation to the former opinion, in favor of a truly active part taken by the arteries in the circulation. Certainly, in some way these vessels have to do with the regulation of the changing supply or determination of blood to various parts of the body at different times. This variation we see in blushing; in the erectile tissues and organs; in the effect of friction or mustard, etc. upon the skin; in the increased flow of blood to the jaws during the time of dentition in infants, to the ovaries during ovulation, the uterus in gestation, the male reproductive organs of some animals at certain periods, and the antlers of the deer during their annual new growth. In all these variations the vaso-motor nerves (belonging to the ganglionic system) must have an important influence.

Capillaries.—Having but a single elastic coat, without muscularity, these very (microscopically) minute vessels simply adapt themselves to the blood that passes through them. Yet besides the transudation of the lymph or plasma of the blood *from* them for the nutrition of the tissues, and the absorption *into* them of waste materials, a force is probably added to the forward movement of the blood in the capillary region. Prof. Draper of New York has pointed out that this may occur in two ways, both of which are common to animals and plants. One is capillary attraction—*i. e.* the attraction of fine tubes for liquids in which they are immersed, such as is observed in inanimate (metallic or glass) tubes or porous bodies, as well as in living plants and animals. The other is the "vital affinity," or attraction of nutrition, exercised by the tissues towards materials present in the blood, and withdrawing them constantly from the current, thus making room, by diminution of resistance, for its onward flow. The volume of the capillary system in man is about 300 times that of the arteries.

Venous Circulation.—On account of the distance traversed by the blood (passing as it does through the capillary ramifications) before it reaches the veins, and their greater aggregate volume (three times that of the arterial system), as well as the obtuseness of the angles made generally by their branches with the main trunks, the flow of the blood is much slower through the veins than through the arteries. Veins have, as the arteries have not, valves along their course, opening only towards the heart. By these the propulsive power is economized, and on account of their influence also, the effect of muscular pressure, during exercise, upon the veins, always favors the blood-movement towards the heart. Inspiration, by lessening the pressure upon the auricles and *venæ cavæ* during the expansion of the chest, tends to promote the return of venous blood to the heart. Forced expiration has an effect the reverse of this, but by increase of pressure upon the heart it favors the expulsion of the blood through the arteries.

The velocity of the movement of the blood through the arteries averages from twelve to twenty feet in a second; in the capillaries, about two inches in a minute; in the veins, from six to twelve feet in a second. Experiments prove that the whole round of the circulation is accomplished in a little less than half a minute during rest and health.

The discovery of the circulation of the blood, as now understood, was made by Dr. William Harvey in 1619, first published by him, however, in 1628. He was *partially* anticipated by Servetus, Realdus Columbus, and Cæsalpinus; almost entirely so by Paolo Sarpi, whose claim in this respect has been generally overlooked. The discovery was completed by the demonstration (with the aid of the microscope) of the blood-corpuscles and the capillaries, between 1658 and 1687, by Swammerdam, Malpighi, and Leeuwenhoek. (See, on the circulation, CARPENTER'S, MARSHALL'S, or DALTON'S "Treatises on Physiology;" "Essay on the Circulation of the Blood," by CHARLES BELL, London, 1819; "Physiologie Médicale de la Circulation du Sang," par E. J. MAREY, Paris, 1863; LEGROS and ONIMUS, "Experimental Observations" in the "Journal de l'Anatomie et de la Physiologie," 1868–70; and "Essays upon the Arterial Circulation and Vaso-motor Physiology," by H. HARTSHORNE, in "Transactions of the American Medical Association," 1856 and 1872.) HENRY HARTSHORNE.

Circulation of Sap in plants is its ascent from the roots to the leaves and other green parts, and its partial descent after elaboration in these organs. The sap drawn from the ground by the roots (see ENDOSMOSE) ascends in exogenous plants especially through the alburnum. The descent takes place chiefly through the liber or inner bark. It appears that on its return to the root a small portion is excreted, and that the greater part ascends again, readapted to the use of the plant. Much of the water which is taken

*This was proved by the late Dr. Pennock of Philadelphia, many years ago, by many elaborate experiments, although not yet admitted by all writers on physiology.

up by the roots is thrown off by the bark and leaves. The sap is also laterally diffused through the cellular tissue of plants. Physiologists dislike the term *circulation* applied to sap, as suggesting a closer analogy than really exists to the circulation of blood in animals, since sap does not flow freely through vessels, but exists in closed cells, passing from cell to cell through the cell-walls, being impelled by osmotic action. (See CYCLOSIS and LEAF.)

Cir'cum, a Latin preposition signifying "round" or "about," and forming the prefix to many compound words.

Circumcis'ion [Lat. *circumcisio*, from *circum*, "around," and *cædo, cæsum*, to "cut"], the cutting off of the prepuce, a religious or sanitary practice in many ancient and modern nations. The prevalent idea has been that it originated with Abraham, who circumcised himself and his household, and transmitted the custom to his descendants. But circumcision was common in Egypt as early as the fourth dynasty of kings, and probably earlier, long before the birth of Abraham, 1996 B.C. At the present day it prevails from China to the Cape of Good Hope and in parts of Australia and in many of the South Sea Islands, and early Spanish travellers found it to be prevalent in the West Indies and in Mexico. It has been long practised by tribes in South America. Whether Abraham obtained his knowledge of circumcision from the Egyptians we cannot determine. The Philistines and some of the Canaanites were not circumcised; and the institution in the family of Abraham was sufficient to mark off that family from the surrounding nations. In the case of Abraham's descendants the rite acquired a religious significance as the token of the covenant between God and his people. Saint Paul looked upon circumcision as symbolical of the spiritual change of heart.

The Jews are accustomed to circumcise their children on the eighth day after birth; the Arabians, in the thirteenth year, in remembrance of their ancestor Ishmael. The Copts and Abyssinians are perhaps the only people professing Christianity among whom circumcision is practised, though it is probable that some Christians of the Caucasus have adopted it from their Mohammedan neighbors. The circumcision of females, or what is equivalent, is not unknown among various African and Arabian tribes.

Circum'ference [from the Lat. *circum*, "round," and *fero*, to "carry"], a curved line which encloses a plane figure, and is synonymous with periphery. It is applied especially to the curved line which encloses a circle, and bears a certain constant ratio to its diameter. (See CIRCLE.) The term perimeter is used to designate the whole bounding lines of a plane figure enclosed by several straight lines, as a square or polygon.

Cir'cumflex [from the Lat. *circum*, "about," and *flecto, flexum*, "to bend;" literally, "bent about" or "over"], in grammar, a character or accent originally denoting a rise and fall of the voice on the same long syllable, marked in Greek ~ or ⌒, and in Latin ^.

Cir'cumnaviga'tion [from the Lat. *circum*, "around," and *navigo, navigatum*, to "sail"] means, literally, a sailing round, and is usually applied to the act of sailing round the globe. This was formerly considered a great achievement. The first person who circumnavigated the earth was Magellan, in 1519. Sir Francis Drake sailed round the globe in 1577. Among the other celebrated navigators who performed this voyage was Captain James Cook, in 1768–79.

Cir'cumpo'lar [from the Lat. *circum*, "around," and *polus*, the "pole"] **Stars,** stars which revolve within the circle of perpetual apparition, and appear to move around the pole, and complete their diurnal circles without setting. The number of stars so circumstanced increases with the latitude of the place, or, in other words, with the elevation of the pole above the horizon of the observer.

Circumstantial Evidence. See EVIDENCE, by PROF. T. W. DWIGHT, LL.D.

Circumvalla'tion [from the Lat. *circum*, "about," and *vallum*, a "rampart"]. In fortification, an intrenchment or series of defensive works erected by a besieging army, facing outward from the place invested or besieged, is called a line of circumvallation. It is designed to defend the besieging army against an attack from a hostile army operating in the rear. It usually consists of a chain of redoubts, either isolated or connected by a parapet.

Cir'cus (plu. **Cir'ci**), [originally, a "circle" or "circular space"]. The circus of ancient Rome was a large structure without a roof, for chariot and horse races, and for the exhibition of athletic exercises and conflicts of wild beasts. It appears that it was originally of a circular or oval form, whence the name. The Circensian games, according to tradition, originated in the time of Romulus, when they were dedicated to the deity Consus, and called *Consualia*. The rape of the Sabines occurred at the Circensian games. After the war in which Tarquinius Priscus captured Apiolæ, his victory was celebrated by games. A space was marked out for a circus, and the senators and knights erected scaffoldings round it for themselves. The games thenceforth were held annually, and a permanent edifice was afterwards constructed. This was distinguished as the Circus Maximus. It was enlarged at various times. In the time of Julius Cæsar it was 1875 feet long and 625 feet wide; the depth of the buildings surrounding the space was about 312 feet. Its dimensions were subsequently much greater. All the circi in Rome, of which there were a considerable number, are nearly obliterated, but a circus on the Appian Way, about two miles from Rome, known as the Circus of Maxentius, is still in a state of preservation. Its construction is believed to have differed very little from that of other ancient buildings for similar purposes. Along the sides and at the end were ranges of stone seats for the spectators. At the other end were the *carceres* or stalls, covered and furnished with gates, and in which the horses and chariots remained until on a given signal the gates were thrown open. In the centre was the *spina*, a long and broad wall round which the chariots drove, terminating at both ends in *metæ*, or goals. The games were inaugurated by a procession from the Capitol, in which persons bearing the images of the gods went first, and were followed by the performers in the games, the consuls, and others. The circus was particularly designed for races, an amusement of which the Romans were passionately fond. In consequence of the popular enthusiasm, the victor received substantial pecuniary rewards. A pitched battle was sometimes represented. By the formation of canals and the introduction of vessels a seafight was occasionally exhibited, but under the empire this was transferred to the amphitheatre. In providing for the killing of wild beasts vast sums of money were expended. Animals were procured from every part of the Roman empire. The exhibition attained a political importance which none who aspired to popularity ventured to overlook. Pompey is said to have given public exhibitions in the circus for five days, during which 500 lions and twenty elephants were destroyed. The principal Circensian games were held annually in September, and lasted five days.

Cirencester (pron. sis'eter), (anc. *Corinium*), a town of England, in Gloucestershire, on the river Churn, and on a branch of the Great Western Railway, 89 miles by rail W. N. W. from London. It has an agricultural college, several hospitals, and manufactures of carpets, woollen cloths, and cutlery. Canute held a council here in 1020. Cirencester partly occupies the site of *Corinium*, an ancient Roman town two miles in circuit. Pop. in 1871, 7681.

Ciril'lo (DOMENICO), M. D., F. R. S., a meritorious Italian savant and patriot, was born at Grugno in 1734. He practised medicine in Naples, and published, besides other works, "Fundamenta Botanica" (1771), which is an able treatise on botanical philosophy, and a "Flora of the Kingdom of Naples" (1788–93). In 1799 he was chosen a member of the legislature of the Parthenopean Republic. He was put to death by the royalists in the same year.

Cirrhopoda, an incorrect form of CIRRIPEDIA (which see).

Cirripe'dia (plu.), or **Cir'ripeds** [from the Lat. *cirrus*, a "curl," and *pes* (gen. *pedis*), a "foot"], a name applied to certain animals which were for a long time considered as an order of mollusks. More recently, however, they have been shown to belong to the Articulata (Arthropoda), either as a distinct class, a sub-class of Crustacea, or as a group of ostracoid entomostracans. Barnacles are familiar examples of cirripeds, but quite a number of species are now known, all marine, and all in their mature state attached to objects of various kinds, as rocks, seaweeds, shells, etc. Some are found in the skin of whales, some in the flesh of sharks. They are distributed over the world; the species, however, are not very numerous. They are divided into pedunculated and sessile, those of the former family supported on a flexile stalk, which is wanting in the latter. Barnacles (Lepadidæ) are pedunculated cirripedia, and Balani (acorn-shells, sessile barnacles) are without a stalk.

The likeness of these animals to mollusks is chiefly external. The gills, when these exist, occupy the same relative position as in crustaceans, but the aëration of the blood is also effected in the *cirri*, as the limbs are called, of which there are six pairs on each side, each composed of many joints and fringed with stiff hairs. The *cirri* nearest the mouth are short and form a sort of net for the capture of minute animals, being incessantly thrown out from a lateral opening, and drawn in again in such a manner as to convey to the mouth any prey which they may have caught. Almost all are hermaphrodite, but in a

few genera the sexes are distinct, the males being not only very small in comparison with the females, and more short-lived, but, in their mature state, parasitic on the females, or attached to them: while in some appear complemental males attached to hermaphrodites. The young swim freely in the water, and are furnished with eyes, which disappear after they have permanently fixed themselves. They have also shells different from those of their mature state. The shelly coverings of the cirripedia are all formed according to a certain type, but they differ extremely in the number of pieces of which they consist, some having only five valves, and others have more than 100 additional pieces. They are from half an inch to several inches in length.

Cir'rus (plu. **Cirri**), a Latin word signifying a "lock of curled hair," is used in botany to denote a tendril, a spiral and filiform appendage of climbing plants. It twines around such objects as occur in the vicinity, and thus obtains support for the stem, which is too weak to support itself in an erect position. The cirrus is a modified leaf, or in some cases is an elongation of the midrib of a pinnate leaf.

The term *cirrus* is also applied to a thin fleecy cloud floating in the sky at a great elevation, and called mare's tail, or curl-cloud.

Cis, a Latin preposition meaning "on this side," is often prefixed to the names of rivers or mountains to form adjectives; as Cisalpine, "on this side of the Alps;" Cispadane, "on this side of the Po." These terms are used with reference to Rome.

Cisal'pine Republic, a former state in the north of Italy, founded by the French in 1797, comprised Lombardy, Rovigo, the duchy of Módena, the Venetian territory S. and W. of the Adige, the Valtelline, and the legations of Bologna, Ferrara, and the Romagna. Area, about 16,000 square miles, with a population of 3,500,000. Milan was the capital. An intimate connection was formed in 1798 between this republic and France by a treaty of alliance offensive and defensive. In 1802 it took the name of the Italian Republic, and chose Napoleon as its president. It was transformed into the kingdom of Italy in 1805, and continued to be subject to Napoleon until 1814.

Ciscauca'sia, one of the two divisions of Caucasia. Area, 86,030 square miles. It contains the government of Stavropol and territories of Kuban and Ter. Pop. 1,418,698.

Cisleitha'nia, since 1867 the usual, though not official, collective name of that part of the Austro-Hungarian monarchy which is situated this side (as viewed from Vienna) of the river Leitha. It embraces all the German crownlands, Istria, Dalmatia, Galicia, and the Bukovina; in general, all the provinces not appertaining to the Hungarian crown. (See Transleithania.)

Cis'padane Repub'lic, a former state of Italy, was organized by the French after the battle of Lodi in 1796. It was bounded on the N. by the river Po (anc. *Padus*), and comprised Módena, Reggia, Bologna, and Ferrara. In 1797 it was merged in the Cisalpine Republic.

Cis'platine Repub'lic, for some time (from Oct., 1828, to July, 1831) the name of the republic of Uruguay. Previously this republic had been, under the name of Cisplatine Province, a part of Brazil.

Cis'rhenane Repub'lic, a name selected for the projected confederation of the German towns situated west of the Rhine in 1797. The project was not carried into execution, because the peace of Campo Formio transferred the entire left bank of the Rhine to France.

Cissam'pelos [Gr. κισσάμπελος, the name of a kind of vine, from κισσός, "ivy," and ἄμπελος, a "vine"], a genus of plants of the order Menispermaceæ, of which some possess valuable medicinal properties, particularly *Cissampelos Pareira*, a native of the warm parts of America, the root of which is known by the name of Pareira Brava (which see).

Cissey, de (Ernest Louis Octave), a French general, born in Paris in 1810. A general of division (1859), he shared in the events attending the investiture and capitulation of Metz, 1870. He served against the Commune in the siege of Paris in March and April, 1871, and was appointed minister of war in June, 1871.

Cis'soid of Di'ocles [Gr. κισσώδης, "ivy-like," from κισσός, "ivy"], a curve invented by the Alexandrian mathematician Diocles, with a view to the solution of the problem of the duplication of the cube, or the insertion of two mean proportionals between two given straight lines. It may be regarded as the pedal of a parabola with respect to the vertex; in other words, it is the locus of the vertex of a parabola which rolls upon an equal parabola, so that corresponding points of the curves always coincide with their point of contact; it is also the inverse of a parabola with respect to its vertex. Its equation is $(a-x)y^2=x^3$.

Cista'ceæ [from *Cistus*, one of the genera], a natural order of exogenous plants, herbs, or shrubs, mostly natives of Southern Europe and Northern Africa. Several are natives of the U. S. They have regular flowers, hypogynous and mostly indefinite stamens, and an inverted embryo in mealy albumen. Many of the species are prized for the beauty of their flowers. The *Cistus creticus* and a few others yield the resinous balsamic substance called gum labdanum.

Cister'cians [from *Cistercium*, now *Citeaux*, their first abbey], or **Bernardines,** an order of Benedictine monks and nuns which was founded in 1098. Through the influence chiefly of Saint Bernard of Clairvaux, who became a monk of Citeaux in 1113, the order in little more than a century after its foundation had more than 1800 abbeys. The Cistercians were distinguished from the order of Clugny by their severe rule and strict poverty; by being submissive to the bishops; by not meddling with the cure of souls; by their dress and by their peculiar government. Among the fraternities of Cistercians were the nuns of Port Royal, the Recollets, and the Trappists. Among the English abbeys were Woburn, Tintern, and Rievaulx; among the Scottish, Melrose, Glenluce, Balmerino, and New Abbey. Riches and indolence brought this order into decay. Before the Reformation many of its convents had ceased to exist. In 1872 only a small number of convents were in existence, chiefly in France and Austria.

Cis'tern [Lat. *cisterna*, from *cista*, a "box" or "chest"], a tank constructed for holding water. Where the supply of water is uncertain, or where rain-water is used, every house requires a cistern. Cisterns are variously constructed—of iron, or wood lined with lead, zinc, cement, or of slate, in which case, the sides and bottom are grooved, and cemented to prevent leakage; large cisterns are generally made cylindrical, so that the pressure acts at all points equally from the centre. Some are simply excavated in the earth and plastered with hydraulic cement.

Cis'tus, or **Rock Rose,** a genus of plants, the type of the order Cistaceæ, comprises several species which are natives of the Levant and Southern Europe, and are cultivated for the beauty of their flowers. (See Cistaceæ.) The cistus of the English poets is the rock-cist (*Helianthemum*), a genus of which there are four British and several American species.

Cit'adel [It. *citadella*, dimin. of *città*, a "city," a "little city," because in ancient times, though but a small portion of the city, it was the most essential part of all, and in fact represented the whole], a fort of four or five bastions in or near a town, or a strong fort constructed within fortifications. It is designed partly to enable the garrison to keep the inhabitants of the town in subjection; and in case of a siege it serves as a place of retreat for the garrison, and enables it to hold out after the town has been captured.

Citadel (post-office name **New Memphis**), a post-village of Douglas co., Col., on the Denver and Rio Grande R. R., 30 miles S. of Denver, near Castle Rock, a remarkable mass of sandstone. The "Independence Colony" is settled here.

Cita'tion, in law. 1. This term is principally used in connection with an ecclesiastical court, to indicate the act of summoning persons to appear before it. A citation gives the court jurisdiction over the parties cited or summoned. The surrogates' or probate courts in the U. S. have a jurisdiction corresponding in part with the English ecclesiastical courts, and resort to a citation unless some other method is supplied by statute. The citation is prospectively abrogated in England by an act of Parliament taking effect Nov. 2, 1874. After that time proceedings in all the higher courts will be commenced by a uniform method—the summons.

2. "Citation" is also employed to mean a reference to precedents or authorities in support of a law argument. These are commonly indicated by well-known abbreviations, to be found in such works as Bouvier's "Law Dictionary," 12th and later editions.

Citeaux, formerly **Cisteaux** (anc. *Cistercium*), a hamlet of France, in Côte-de'Or, about 10 miles S. S. E. of Dijon. Here was a celebrated monastery of the Cistercian order founded in 1098. Remains of the magnificent buildings of this monastery are still visible.

Cithæ'ron [Gr. Κιθαιρών], **Mount,** now **Elatea,** a famous mountain-range of Greece, on the boundary between Attica and Bœotia, was covered with forests. The highest summit rises 4620 feet above the level of the sea. It is often mentioned by ancient classical poets.

Cith'ara [Gr. κιθάρα], a stringed musical instrument of the ancient Greeks and Romans, resembled a guitar or harp.

Derived from this word, or cognate with it, are the English *guitar* (Old Eng. *gittern* and *cithern*); Dutch *cyter;* Ger. *Zither.*

Cit'ies of Ref'uge. The Levitical law set apart six cities of refuge for the manslayer, in which he might be safe from the avenger of blood. These cities were Hebron, Shechem, and Kadesh-Naphtali on the west of Jordan: Bezer, Ramoth-Gilead, and Golan on the east. The Hebrews kept the roads to the cities clear, and signs were set up to show the way. The manslayer was protected in the cities of refuge until the death of the high priest, after which the avenger of blood had no claim against him. Thus this institution was connected with the typical emblems of the Jewish religion, while it restrained the avenging of blood.

Cit'izen [Lat. *civis;* Fr. *citoyen*, from *cité*, a "city"], a resident in a city; in free states one who has the elective franchise, and may take part in legislative or judicial deliberations. Between a citizen and a subject this distinction is sometimes made, that while the latter is governed, the former also governs; and thus, though a citizen may be a subject, many subjects are not citizens. In this sense, which is substantially that attached to the term by the Romans, it has come down to modern times. In Greek communities the citizenship was at first readily attained by those who were not born to it; but at a later period, when the organization of Greek civic life had reached a higher degree of perfection, admission to citizenship was procured with much greater difficulty. In Sparta, according to Herodotus, there were only two instances of their conferring citizenship in full measure on strangers. The Perioeci, who shared the Spartan territory, though not on equal terms, were probably, as regarded political rights, much in the same position with the Roman plebeians. In Rome there were perfect and less perfect citizens. All the private rights of citizenship belonged to the citizens of the lower class, but the honors of the magistracy were denied them. But all citizens of all classes in the *comitia centuriata*, and in the tribes even the *liberti* or freedmen, had the right of voting. But it would appear that in the case of the Ærarians and Cærites, though they were reckoned citizens, the right of voting was in abeyance. Inferior in rank to the citizens there were two other classes—the Latini and the Peregrini. Roman citizenship was acquired most frequently by birth, but for this it was requisite that both father and mother should be citizens. If a citizen married a Latina or a Peregrina, the children followed the status of the mother. In earlier times the citizenship could be conferred only by a vote of the people assembled in the comitia. In some of the provinces the *Latinitas* was given as a step to the *Civitas*, the former being converted into the latter in the case of any one who had exercised a magistracy in his own state or city. The constitution of Caracalla extended citizenship to the whole Roman world, the distinction between Cives and Latini being preserved only in the case of freedmen and their children. Even this distinction was abolished by Justinian, the only divisions of persons henceforth being into subjects and slaves.

REVISED BY T. D. WOOLSEY.

Citizen, in modern law, is used to indicate the class of persons who owe an indefeasible allegiance to a state, and are entitled to certain rights and privileges appertaining to freemen. This view prevailed at a date as early as the time of Bodin (A. D. 1576), who defines a citizen to be "a free subject holding of the sovereignty of another man." (Knolles' translation, A. D. 1606.) Citizenship, in this sense, is not to be confounded with the elective franchise or the holding of offices of government. Children, the insane, and the non-voting classes in general are citizens. The same writer says: "They are to be called citizens that enjoy the rights and privileges of the state. This is to be understood according to the condition and quality of every one; the nobles as nobles, the commons as commons, the women and children in like case according unto the age, sex, and condition and deserts of every one of them. . . . It may be well said that special privileges make not a man a citizen, but the mutual obligation of the sovereign to the subject, to whom, for the faith and obeisance he receiveth, he oweth justice, counsel, aid, and protection which is not due unto strangers."

The subject may be further considered under the following general divisions: I. The mode of becoming a citizen; II. The obligations, rights, and privileges of a citizen with special reference to the Constitution of the U. S.

I.—1. The leading mode of acquiring citizenship is by birth in the country or under a state of allegiance. Birth in the country confers citizenship without reference to the citizenship of the parent, who at the moment of birth owes at least a local allegiance, and though an alien is temporarily a subject, except in the case of foreign ambassadors and ministers. This rule would apply to the case of persons, though in a foreign country, who were in our army, as their allegiance would be due to the U. S. On this same principle the children of American ambassadors born abroad are citizens.

2. A more difficult question is as to the citizenship here of children born abroad of American parentage. It should be noted in the discussion of this question that allegiance is twofold—perpetual and local. When an American citizen goes to a foreign country, he cannot by his own act put off his citizenship. He is still subject to our laws, and can, according to modern views, still be governed by our criminal legislation. "The power to tie and bind the subject cannot be tied down to places." It would seem on principle that as the mutual obligation from which citizenship springs still exists, his child would still be a citizen, though not born within the territory of the state to which allegiance is due. Lord Bacon, who would naturally look upon this subject with the eye of a philosopher, plainly took this view. In his famous argument concerning the *post nati* in the time of King James I., he said: "If a man look narrowly into the law on this point, he shall find a consequence that may seem at the first strange, but yet cannot be well avoided; which is, that if divers families of English men and women plant themselves at Rouen or at Lisbon, and have issue, and their descendants do intermarry among themselves, without any intermixture of foreign blood, such descendants are naturalized to all generations, for *every generation is still of liege parents*, and therefore naturalized; so as you may have whole tribes and lineages of English in foreign countries." (Harg., *State Trials*, 81.) If this broad proposition should be attended with any evil consequences, they could be corrected by suitable legislation. The strictly legal authorities are, however, hopelessly in conflict. The proposition that the foreign-born children of citizens are aliens is argued with great force and power by Mr. Horace Binney in his well-known article on the "Alienigenæ of the United States" (2 *Am. Law Register*, 193, A. D. 1854). An outline of his argument is that there are no early legal decisions affirming the citizenship of such persons, but that, on the other hand, the preamble to an early statute on this subject (25 Ed. III., stat. 2) of the year 1350, the language of text-writers, such as Lord Coke, Jenkins, and Blackstone, the expressions of authors of digests, such as Comyns and Mr. Bacon, all point to the fact that the persons in question are aliens. The argument is legal and based upon authorities, and does not enter into the philosophy of the subject as depending on the doctrines of allegiance. Opposed to this view of Mr. Binney is a recent and carefully considered case in the New York court of appeals (*Ludlam* vs. *Ludlam*, 26 New York R., 356). This case maintains that the statute of 25 Ed. III., ch. 2, above referred to, was simply an affirmation of already-existing law, and that the common law proceeds solely upon the doctrine of allegiance, which does not depend upon locality and place, and cannot be confined within boundaries. It holds that the true test of the allegiance of the child is parentage, that it is transmitted from the father to the child, and that, accordingly, the state may claim allegiance from the children of its citizens wherever born. These doctrines are supported by a reference to *Calvin's Case*, 7 Coke R., 1, in the sixth year of James I., and other authorities. The doctrine of this case appears to be based on sound principles of political philosophy, whatever view may be taken of the result of the legal decisions. The discussions of this subject by various writers led to the following important enactment by Congress in Feb., 1855: "Persons heretofore born, or hereafter to be born, out of the limits and jurisdiction of the U. S. whose fathers were or shall be at the time of their birth citizens of the U. S., shall be deemed and considered, and are hereby declared to be, citizens of the U. S.: Provided, however, that the rights of citizenship shall not descend to persons whose fathers never resided in the U. S." If the theory of Mr. Binney be correct, this statute conferred citizenship where it did not before exist; if that of *Ludlam vs. Ludlam* be sound, then it restricted the rights of the foreign-born descendants of citizens, perhaps unnecessarily.

3. Citizenship by Naturalization.—An alien may be made a citizen by the act of a state or a nation co-operating with his own act. Sometimes this citizenship is complimentary or honorary; usually it is attended with true, or intended, renunciation of foreign citizenship. The question thus recurs, Whether a person can by his own act put off his citizenship? The prevailing opinion of jurists, with some dissent, is that he cannot. This proposition seems quite clear where the sovereign distinctly refuses to permit the renunciation of citizenship. The tie of allegiance creates reciprocal rights and duties; the state cannot rightfully discard the citizen without just cause of forfeiture, nor can the citizen repudiate his obligations to the state without its consent. Assuming that mutual agreement is necessary

to dissolve the relation of sovereign and citizen, the more difficult question is, Whether the agreement of dissolution can be *inferred* from the prolonged absence of the citizen, coupled with foreign naturalization, and the failure of the state, after notice, to reclaim him? The better opinion would seem to be that there must be some affirmative act of renunciation on the part of the state to which the allegiance is due, though there are weighty opinions to the contrary. For the purpose of settling the perplexing and irritating questions that frequently arise, the U. S. have entered into treaties of naturalization with a number of foreign powers. (For details see NATURALIZATION.) Naturalization may take place either by a mere law of a general nature, such as that which provides that every alien woman who marries a citizen of the U. S. shall be deemed and taken to be a citizen, or it may occur in special instances affirmative on the part of the individual to be naturalized. In this country the power to naturalize is exclusively vested in Congress by a provision in the U. S. Constitution. There is an important provision concerning citizenship in the fourteenth amendment to the U. S. Constitution as follows: "All persons born or naturalized in the U. S., and subject to the jurisdiction thereof, are citizens of the U. S. and of the State wherein they reside." The precise effect of this provision has not yet been settled by judicial decision. It would seem, however, that it should not be construed by implication to deprive any person of citizenship who would possess it by common law, such as the children of ambassadors or other citizens born abroad. The ninth amendment would lead to this conclusion: "The enumeration in the Constitution of certain rights shall not be construed to deny or disparage others retained by the people." Citizenship at present, as will be shown hereafter, leads to important rights and privileges of which it would be unjust to deprive any one entitled to them. The words "subject to the jurisdiction of the U. S." would exclude from citizenship the children of foreign public ministers and members of the Indian tribes, though Indians born out of the tribal organizations would seem to be citizens.

Interesting questions concerning citizenship arise in case of the union of two separate nations, or of the division of a single nation into two separate states. The first of these cases was discussed with much acuteness and learning when Scotland and England were united under James I.; the second has been extensively considered by the courts, both in England and America, in connection with American independence. *Calvin's case* (7 Coke's Reports) is the leading English authority upon the whole subject, where it was declared that the *post nati* (persons born after the union) of Scotland were natural-born subjects, and could inherit lands in England. In respect to the result of our own Revolution, opinions differ as to the time when the separation between England and the U. S. became complete, though they substantially agree as to the effect of the division. The American view is, that the separation took place at the Declaration of Independence, July 4, 1776; the English, that it was consummated at the treaty of peace in 1783. Accordingly, a person born in England before July 4, 1776, who did not reside in the U. S. after that date, became, as to this country, an alien, as well as all his descendants. The effect of this rule is not to work a forfeiture of vested rights, and the real estate owned by a former citizen continued to be vested in him, though he could not, after the day named, acquire an indefeasible title to land.

II.—The provisions of the U. S. Constitution concerning citizenship have recently assumed great importance, growing out of the controversies concerning the legal condition or *status* of persons of African descent. The Constitution as originally adopted made no provision concerning citizens of the U. S., except an incidental direction that Senators, Representatives, and the Executive should be such citizens. There were, however, distinct clauses concerning the rights and privileges of the citizens of the several States, such as that the judicial power of the U. S. shall extend to controversies between a State and a citizen of another State, and between citizens of different States, and that the citizens of each State shall be entitled to all privileges and immunities of citizens in the several States. This last clause has led to much judicial discussion, some points of which will be noticed hereafter. Under the clause which provided that the judicial power should extend to controversies between citizens of different States, the question arose in the now famous case of *Scott* vs. *Sandford* (19 Howard's Reports, 39), whether an emancipated negro could be considered as a "citizen of a State;" and it was decided that he could not be so regarded, and accordingly that he could not maintain an action on that basis in the Federal courts. It would seem to follow that he could not claim the benefit of the other constitutional provision respecting privileges and immunities. The division of public opinion occasioned by this decision, and the desire to settle by a positive rule the condition of the slaves emancipated by the thirteenth amendment to the Constitution, as well as that of the colored race in general, led to the fourteenth and fifteenth amendments, the provisions of which are now to be considered, as far as they affect citizenship. All persons born or naturalized in the U. S. are declared to be citizens of the U. S. and of the State in which they reside; and it is provided that "no State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the U. S.;" and also that the "right of citizens of the U. S. to vote shall not be denied or abridged by the U. S. or by any State on account of race, color, or previous condition of servitude." Though the condition of the colored race led to these amendments, their construction is not to be confined to it. It will be observed that the same words are here used as in the body of the Constitution—"privileges and immunities"—except that they are here declared to belong to "citizens of the U. S.," while there they appertain to "citizens of each State" in reference to the "several States." The meaning of the words "privileges and immunities" in the body of the Constitution has been, as already stated, much considered. They have been held to mean such privileges, etc. as are of a general nature, such as security to life and liberty, the right to acquire property, to have access to courts of justice, and freedom to pursue and obtain happiness and safety, with such restrictions as are necessary to the public good. Whatever guarantees upon these points a State accords to its own citizens, it must extend to citizens of other States. But the Constitution before the amendments gave no directions as to the mode in which a State should treat its own citizens, except in a few specially marked instances, such as the prohibition to pass bills of attainder and *ex-post facto* laws. In other respects the State was left to its own action towards its people. Under the amendments there is provision made for the privileges and immunities of citizens of the U. S. A momentous question now arises: Does this provision trench on the great power which has all along been vested in each State to regulate the conduct of its own citizens? Does Congress under it have the right to enter upon the once exclusive field of State legislation and the domain of State constitutions, and to override all its action as to privileges and immunities of citizens? This question came up for careful consideration before the Supreme Court of the U. S. in the very important case of the *Butchers' Benevolent Association* vs. *the Crescent City Live-stock Company* (A. D. 1872). The State of Louisiana had granted an exclusive right to the latter company to engage in the business of slaughtering cattle within a certain district, including the city of New Orleans. It was claimed by the plaintiffs, who had been engaged in the same business, and who were by the act prohibited from following it, that the law created a monopoly, that its exclusiveness was contrary to the spirit of free institutions, and that it was opposed to this provision of the U. S. Constitution. It was, however, considered by the court that there is now a clear distinction between citizens of the U. S. and citizens of a State—that there may be persons of the former class who are not members of the latter, and that the constitutional amendment is solely applicable to privileges and immunities of citizens of the U. S., *as such;* and that accordingly the clause does not refer to such regulations as the State may make for *its own* citizens, though they may also fill the character of citizens of the U. S. If it be asked, What scope there is in this construction for the amendment? the answer is, that the court does not seek to lay down any abstract rule on the subject, and will decide questions as they arise. Some instances of its application may be suggested, such as the right to visit the seat of government to assert a claim or to seek its protection; to freely approach its seaports, sub-treasuries, land-offices, and courts of justice; to be protected on the high seas; to assemble and petition for the redress of grievances; to invoke the privilege of the writ of *habeas corpus;* and freely to change the residence from one State to another. These appertain to citizens of the U. S. in general. It was decided by the same court that a claim to practice law in a State by one of its citizens (Mrs. Bradwell) did not come within the phrase "privileges and immunities" of a citizen of the U. S. It is a matter of congratulation to all who desire to see the equilibrium of forces between the general government and the States properly preserved, that the court was able to see its way clear to a somewhat rigorous construction of the clauses of this amendment. The effect of the fifteenth amendment has not been settled by the courts, but its object is well known. It of course abrogates all State law or constitutional provisions creating distinctions among citizens of the U. S. as to the exercise of the right of suffrage based upon race and color, and for ever prevents the

introduction of them either through the action of the States or the general government. T. W. Dwight.

Cit'ric A'cid [from the Lat. *citrus*, a "citron"], a vegetable acid present in limes and lemons, and to a less extent in gooseberries, currants and other fruits. In preparing it the juice of lemons is allowed to ferment, and chalk being added citrate of lime is formed. This precipitate being treated with sulphuric acid, sulphate of lime is formed, and the acid remains in solution. It is tribasic, having the symbol $C_6H_8O_7$. It is readily soluble in water, and has an intensely sour taste; it is used in medicine as an antiscorbutic and refrigerant, and by the silk-dyer to heighten the colors of safflower and cochineal, and by the calico-printer for discharging mordants.

Citrine Ointment. See Mercury, Medicinal Uses of.

Cit'ron [Gr. *κίτρον*; Lat. *citro* and *citrus*; It. *cedro*; Fr. *citron*], the fruit of the citron tree (*Citrus medica*), which is cultivated in the south of Europe and other warm countries. It is a native of India. By some botanists it is regarded as perhaps the original type of the species which produces the lemon, sweet lemon, lime, and lume; but by others some of these are regarded as distinct species. The citron tree has oblong leaves; the fruit is large, rough, and furrowed; the rind thick and tender; the pulp sub-acid and refrigerant. The part chiefly valued is the rind, which has a delicious odor and flavor, and is made into preserves. The juice is employed to make a syrup for flavoring liquors. The cedrat is a variety of the citron, from which chiefly the fragrant oil of cedrat, used by perfumers, is procured. The varieties of citron are numerous. The fruit of the largest kinds is sometimes nine inches long and twenty pounds in weight.

Citronel'la [Fr. *citronelle*], a perfume prepared from the *Melissa officinalis*, or common Balm (which see); also, a liquid prepared in Barbados from the rind of the citron, and used in France for flavoring the best brandies. The name *citronelle* is also given in France to the common southernwood (*Artemisia Abrotanum*). The term citronella is, however, chiefly applied by perfumers at present to an oil imported from Ceylon. It is the product of *Andropogon Schœnanthus*, a kind of grass.

Citron Melon. See Melon.

Citros'ma [from the Gr. *κίτρον*, "citron," and *ὀσμή*, "smell"], a genus of trees of the order Monimiaceæ, natives of the tropical parts of South America. The leaves abound in an oil similar to the oil of citron.

Ci'trus [a Latin name from the Gr. *κιτρία*, the "citron tree"], a genus of evergreen trees of the order Aurantiaceæ, natives of the warm parts of Asia. It comprises the citron (*Citrus medica*), the orange (*Citrus Aurantium*), the lemon (*Citrus Limonum*), bergamot, cedrat, lume, tangerine, shaddock, lime, and other trees which are extensively cultivated for their fruit or for their leaves and flowers, which are used in perfumery. The genus is distinguished by numerous stamens irregularly united in bundles by their filaments, and a pulpy fruit with a spongy rind. The leaves and the rind abound in volatile oil. These oils are isomeric with each other, with the oil of turpentine, and with a great variety of other oils. The fruit (*hesperidium*) is in structure a sort of large berry.

Cittadel'la, a town of Northern Italy, in the province of Padua, on the Brentella, 14 miles N. E. of Vicenza. It has manufactures of paper and woollen fabrics. Pop. 7213.

Città-della-Pie've, a town of Italy, in the province of Perugia, 23 miles W. S. W. of Perugia, was the native place of the eminent painter Perugino. Pop. 6755.

Città di Castel'lo (anc. *Tiberinum*), a town of Italy, in the province of Perugia, on the Tiber, about 28 miles N. W. of Perugia. It has a cathedral, several palatial mansions, and Gothic structures. Pop. in 1872, 24,088.

Cittano'va, a town of Italy, in the province of Catanzaro. Pop. 11,103.

Città Vec'chia, a fortified city of Malta, 6 miles W. of Valetta, is on a limestone hill in which extensive catacombs were excavated at a remote period. It has a large and handsome cathedral. It was called *Medina* by the Saracens, who occupied it for some time. Pop. 7000.

Cit'y [Fr. *cité*; Lat. *urbs* or *civitas*; Ger. *Stadt*], a large town, an incorporated town; a term used to include both a large collection of houses and its inhabitants. As first used in the languages of modern Europe, the word *city*, like the Latin *civitas*, was equivalent to state rather than to town or borough (*urbs*); and while the latter signified a collection of households governed by municipal laws, but subject to the laws of the country of which they formed a part, the title *city* was given to such towns as, with their surrounding district, were independent of external authority. Nearly the only cities in this sense now are the free towns of Germany and such of the cantons of Switzerland as consist of a town and its surroundings. In England the cities are towns which either are or have been sees of bishops, though there are several towns which were anciently episcopal, but which are not now called cities. In America the term is applied to most towns which are incorporated and governed by a mayor and aldermen.

City Point, a post-village and port of entry of Prince George co., Va., on the James River, at the mouth of the Appomattox, 10 miles by railroad E. N. E. of Petersburg. This point being a good landing, was seized by the troops under Gen. Butler in his movement up the James, May, 1864, and later, June, 1864, became the head-quarters of Gen. Grant after his passage of this river; and during his subsequent operations against Petersburg and Richmond was the principal landing and dépôt of supplies for his army.

Ciudad de las Casas, the capital of the Mexican department of Chiapa, is about 450 miles S. E. of Mexico. It has a cathedral, a Catholic college, and several monasteries. It was formerly called *Ciudad Real*. Pop. 6430.

Ciudade'la, a city and seaport of the island of Minorca, on its W. coast, 25 miles N. W. of Mahon. It has a cathedral and several convents; also manufactures of woollen fabrics. Pop. 5726.

Ciudad' Real', a province of Spain, is intersected by the river Guadiana, and bounded on the S. by the Sierra de Morena. Area, 7840 square miles. Capital, Ciudad Real. Pop. 264,908.

Ciudad Real ("city of the king"), a town of Spain, capital of the above province, is situated on a plain about 5 miles S. of the Guadiana and 102 miles S. of Madrid. It has several fine churches, monasteries, and hospitals. The nave of the parish church is a magnificent Gothic structure. Here are manufactures of linen and coarse woollen fabrics. This town was the head-quarters of the Hermandad, or Holy Brotherhood, founded in 1249 for the suppression of robbery. Pop. 10,366. The French here defeated the Spaniards in Mar., 1809.

Ciudad' Rodri'go, a fortified town of Spain, on the river Agueda, here crossed by a fine bridge, about 90 miles S. W. of Salamanca. It has a Gothic cathedral founded in the twelfth century, and a citadel. During the Peninsular war it was considered an important point as a key of Spain on the west. It was invested and taken by the French general Massena in July, 1810. The army of the duke of Wellington assaulted and took this place, with 150 guns, in Jan., 1812. For this achievement the Spanish government gave him the title of duke of Ciudad Rodrigo. Pop. 6429.

Cives. See Chives.

Civ'et [Fr. *civette*; Arabic, *zubâd*], a brown substance of a strong, offensive odor which is used in perfumery, because when mixed in small proportions with certain other

Civet.

perfumes it is considered to improve them greatly. It is quite costly, and is consequently much adulterated. It is produced by a carnivorous animal called the civet or civet-cat (*Viverra Civetta*), an animal which ranks between the weasels and the foxes. Other species are found—one in India and one in Java, and the latter produces part of the civet of commerce. The civet-cat, when wild, feeds upon birds, small quadrupeds, and reptiles, and generally takes its prey by surprise. It is very commonly kept in confinement for the sake of its perfume, which is removed from a glandular sac twice a week by means of a spatula, and is obtained most abundantly from the male, and especially after he has been irritated. A dram is a large quantity to obtain at a time. The civets kept for this purpose are fed on raw flesh, the young partly on farinaceous food. The town of Enfras, in Abyssinia, is a principal seat of the civet trade. The civet-cat of the South-western U. S. is of a different genus from the above. (See BASSARIS.)

Civiale (JEAN), a French surgeon, was born July, 1792. He was the inventor of lithotrity. Died in June, 1867.

Civida'le (anc. *Forum Julii*), a walled town of Northern Italy, in the province of Udine, on the river Natisone, here crossed by a bridge, 10 miles E. N. E. of Udine. It has a fine Gothic church, said to be about 1000 years old; also manufactures of silk and cotton. Pop. 6838.

Civ'il Death, in law, is the cessation of legal rights while the physical life remains. Civil death occurs where a man by act of Parliament or judgment of law is attainted of treason or felony; he loses his civil rights and capacities, and becomes, as it were, *dead* in law. It also took place formerly where any man abjured the realm by the process of the common law, or went into a monastery and became there a professed monk, in which cases he was absolutely dead in law, and his next heir succeeded to the estate. In New York the sentence of a criminal to imprisonment for life causes civil death.

Civ'il Engineer', a person whose profession is the science or construction of bridges, railroads, aqueducts, harbors, canals, machinery, etc. (See ENGINEERING, by GEN. J. G. BARNARD, U. S. Army.)

Civil'ian, in general or in popular use, signifies a person whose pursuits and employment are civil—*i. e.* neither military nor clerical. As a legal term, it denotes a man learned in the civil or Roman law; also a person who is versed in the principles and rules in accordance with which civil rights may be freely, blamelessly, and successfully vindicated. In England the term is applied particularly to a member of the college of doctors of law exercent in the ecclesiastical and admiralty courts, in which the civil law is recognized.

Civi'lis (CLAUDIUS), a heroic chief of the Batavi who served for many years in the Roman army. When Vespasian and Vitellius were contending in civil war for the imperial throne, the adherents of the former induced Civilis to make a feigned demonstration of hostility to the Romans, in order to detain in Gaul the Roman army, which was inclined to fight for Vitellius. Having raised a large army, Civilis revolted in earnest in 69 A. D., was joined by many Germans, and defeated the Romans in several battles. In 70 A. D. he was defeated by Cerealis, a general of Vespasian. Tacitus states that negotiations ensued between Cerealis and Civilis, but his history here ends abruptly.

Civiliza'tion [Fr. *civilisation*, from the Lat. *civilis*, "like a citizen" (*civis*), and hence "refined," "polite"], a term denoting a refined and improved state of society, as distinguished from a barbarous or savage condition. Whether civilization is an artificial condition, or the original state of mankind, from which the savage races have descended, is an interesting but still unsettled question. The idea that our civilization is the result of development from the rudest beginnings is a favorite one with many popular scientific writers. (See LUBBOCK'S "Uncivilized Man.") The progress of our civilization from the barbarism of the Dark Ages affords one of the most interesting phases of history. (See GUIZOT'S "History of Civilization," and DRAPER "On the Intellectual Development of Europe.")

Civil Law. See LAW, THE CIVIL, by JOHN NORTON POMEROY, LL.D.

Civil List, in Great Britain, the name given to an annual appropriation for the expenses of the royal household, for certain civil offices, for pensions, etc. The appropriation of money for the civil list by Parliament, and its acceptance by the Crown, has been regarded as the fulfilment of a kind of contract between these two branches of government. The same name is used for a similar appropriation in other countries.

Civ'il Ser'vice is a name for the duties rendered to the state, other than naval and military service. The reform of civil service has received of late much attention in Great Britain and the U. S.; and in the former country much has already been accomplished. At the head of the British civil service are placed the officers of the royal household, under several departments. Then come the officers of the House of Lords and the House of Commons, and a vast number of departments which cannot here be enumerated. The general designations for the civil servants of the Crown are commissioners, secretaries, and clerks. Nearly all enter the service as clerks, and they rise chiefly by seniority. Those officials belong to the civil service who receive annual salaries and whose chief occupation is writing. This class does not include men to whom weekly wages are paid; they come under a different category. The "Civil Service List" contains the names of about 15,000 persons. In old age they are pensioned.

Appointments to the British government offices were formerly obtained by favor, but now merit and abilities are conditions superadded. In 1855 a commission was appointed to examine candidates for the service. If a candidate fails at the first examination, he is generally allowed another chance, and sometimes a third. When the candidate has received his certificate, he enters one of the public offices and goes through a six months' probation; if successfully, he then becomes a clerk at a definite salary.

In the U. S. civil service a much-needed reform has been inaugurated. Office-seeking has become one of the most corrupting trades in our country, and there has long been a demand for a system of competitive examinations for those offices which are non-elective. Such a system has been introduced, and, though its details are not yet perfect, it is hoped that it may lead to greater efficiency in the performance of official duties, and prevent, to some extent at least, the alarming evils which result from a wrong use of government patronage.

Civil War of the United States. See CONFEDERATE STATES, by HON. HORACE GREELEY, LL.D.

Ci'vita Vec'chia (anc. *Centum Cellæ* and *Trajanus Portus*), a city and fortified seaport of Italy, in the province of Rome, 36 miles W. N. W. of Rome by railway. It is enclosed by walls and well built, has a large church, an arsenal, a theatre, and a lighthouse. The harbor was constructed by the emperor Trajan, and is formed by two large moles, and a breakwater which protects shipping from a heavy sea. It is a free port, and is regularly visited by steam-packets from Genoa, Marseilles, Naples, etc. It is connected by a railway with the city of Rome. Pop. 8533.

Clack'amas, a county in the N. W. of Oregon. Area, 1700 square miles. It is bounded on the E. by the Cascade Range of mountains, and drained by the Willamette and Clackamas rivers. The soil is fertile. Wool, wheat, oats, butter, and potatoes are raised. It is heavily timbered. There are manufactures of woollens and paper. It is intersected by the Oregon and California R. R. Capital, Clackamas. Pop. 5993.

Clackamas, a post-village, capital of Clackamas co., Or., on the Oregon and California R. R., 12 miles S. of Portland.

Clackman'nan, the smallest county of Scotland, has an area of 47 square miles. It is bounded on the S. by the river Forth, and on the N. by the Ochil Hills. It consists chiefly of the romantic valley of the North Devon. The soil is partly fertile. Coal, ironstone, copper, sandstone, and greenstone are found here. The chief articles of export are coal and iron. Capital, Clackmannan. Pop. in 1871, 23,742.

Clackmannan, the capital of the above county, is on the river Devon, near its entrance into the Forth, 9 miles E. of Stirling. This town is noted for its ale. King David Bruce resided here in 1330. Pop. in 1871, 6425.

Cladras'tis, a genus of leguminous trees represented in the U. S. by the *Cladrastis tinctoria* of the Southern States, a small tree somewhat resembling the common locust. It is called yellow locust, yellow wood, fustic, and yellow ash. Its wood is yellow and its bark is cathartic.

Clap'lin (LEE), a distinguished philanthropist of Boston, Mass., born in 1791. He acquired wealth in the manufacture of shoes, and bestowed munificent gifts of money upon the Wesleyan academy at Wilbraham, Mass., the university at Middletown, Conn., and the Boston Theological Seminary. Died Feb. 23, 1871.

Clap'lin (WILLIAM), LL.D., born at Milford, Mass., Mar. 6, 1818, was governor of Massachusetts from 1869 to 1871. He has been for many years a prominent leather-merchant in Boston.

Clag'gett (JOHN THOMAS), D. D., the first Protestant Episcopal bishop of Maryland, was born in Maryland Oct. 2, 1742. He graduated at Princeton in 1764, became bishop of Maryland in 1792, and died Aug. 2, 1816.

Clai'borne, a parish of Louisiana, bordering on Arkansas. Area, 1050 square miles. It is drained by Bayou d'Arbonne. The surface is undulating: the soil is productive. Cattle, corn, and cotton are extensively raised. Capital, Homer. Pop. 20,210.

Claiborne, a county in the W. of Mississippi. Area, 710 square miles. It is bounded on the N. W. by the Big Black River, and on the W. by the Mississippi. The soil is fertile, especially near the rivers. Corn and cotton are staple crops. Capital, Port Gibson. Pop. 13,386.

Claiborne, a county of Tennessee, bordering on Virginia. Area, 350 square miles. It is bounded on the S. by Clinch River. The surface is mountainous. Grain, tobacco, and wool are staple products. Cumberland Gap, a pass through the Cumberland Mountains, is on the N. border of this county. Capital, Tazewell. Pop. 9321.

Claiborne, a post-tp. of Monroe co., Ala. Pop. 2245.

Claiborne, a township of Union co., O. Pop. 1947.

Claiborne (John Herbert), A. M., M. D. See Appendix.

Claiborne (William Charles Cole), an American lawyer and statesman, born in Virginia in 1773, was a member of Congress from Tennessee (1797–1801), governor of Mississippi Territory (1802), governor of Louisiana Territory (1804), and of the State of Louisiana (1812–16). He was chosen U. S. Senator in the latter year, and died Nov. 23, 1817.

Claim [from the Lat. *clamo*, to "call," to "call for," to "demand"], a demand of a right; the act of demanding from another person something due; a right to claim or demand; a title to any debt or privilege. The term is sometimes applied to the thing claimed, as land or other property. In law, claim is a challenge of interest in anything that is in possession of another, or at least out of the possession of the person who claims it.

Claims, Court of, a court of the U. S. for the relief of those persons who have claims against the government. Before the year 1855 such claims could be settled only by act of Congress. In that year this court was created, consisting of three judges appointed by the President with the advice and consent of the Senate. (See, for further information, Courts, by George Chase, LL.B.)

Clairaut (Alexis Claude), a French geometer, born in Paris May 7, 1713. He produced in 1731 "Researches on Curves of Double Curvature," "Theory of the Figure of the Earth" (1743), a "Theory of the Moon, etc." (1750), and "Elements of Geometry." His reputation was increased by his prediction of the return of Halley's comet in 1759. Died May 17, 1765.

Clair'mont, a village of West Farms township, Westchester co., N. Y. Pop. 158.

Clairvoy'ance [Fr., from *clair*, "clear," and *voir*, to "see"]. Hitherto, the nature of spirit has been discussed theologically and metaphysically. Its scientific investigation has been considered either impracticable or undesirable. In this border-land between the known and unknown ignorance and charlatanism have held high carnival. Science, purely material, is entirely occupied with matter and its inherent force, and beyond the retort and crucible has no place for spirit. Belief in spiritual being outside of physical existence is superstition. The mention of a fact bearing in that direction provokes a smile of scornful pity. When the oil is exhausted the flame no longer burns; when the fuel is spent the fire goes out; when the instrument is destroyed the music is not heard; when the complex co-ordination of conditions called a living being is subverted, life, intelligence, spirit are no more. Such are the illustrations of material science. The spiritual realm has remained unknown, or rather, its existence has been denied.

These reflections are rendered pertinent by the consideration that whatever else of pretence and folly be blown away, the central fact of clairvoyance remains undisturbed; and clairvoyance is a super-sensuous perception depending on the spiritual nature of man, without which it would be impossible. In the present state of psychological knowledge the facts are ill-observed, loosely recorded, and theories out of place. The world of spirit, to which "force" furnishes the key, perhaps may at some future time broaden into as wide a field as the physical world now presents. Superstition will then have no place for concealment. Ghosts, witchcraft, visions, trance, ecstasy, and the innumerable phases of spiritual phenomena will be co-ordinated, the chaff blown away, the vital facts preserved, and a true science of the soul, based on accurate observation and discriminating research, founded.

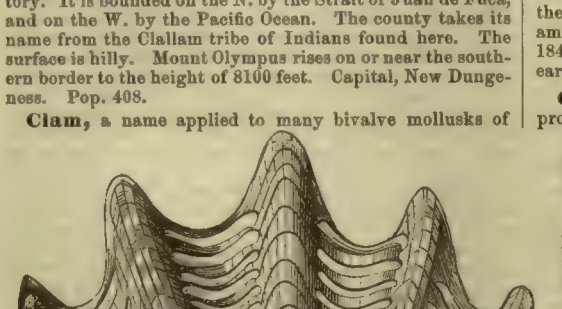
The existence of a somnambulic or sleep-walking state, induced by unknown causes and accompanied by peculiar phenomena, is generally admitted. It is also admitted that a state similar to, if not identical with, these can be induced by artificial means, usually by fixing the attention in gazing intently into a "magic mirror" or "crystal," repeating formulæ, by incantations, fasting, drugs, or by an operator making what are termed magnetic passes. The interference of a second person is not essential, and perhaps without exception distorts the result. This admission by no means endorses the theories which have sprung fungus-like therefrom, of mesmerists, biologists, magnetists in an endless array, best known by their barbarous terminologies.

The trance or clairvoyant state has been observed in all ages and among all races of mankind—Chinese, Hindoos, Turks, as well as Christians. It has in seasons of great religious excitement become epidemic, the devotee falling in convulsions, becoming cataleptic, and after hours, days, or even months of apparent death, awakening with mind overwrought with visions of the strange world in which it had dwelt during its apparent unconsciousness. The records of clairvoyance are as old as history. If prophecy, the "clear-seeing" of the future, be its fruit, the prophets and sages of the past were all more or less endowed with this gift. Socrates and Apollonius predicted and were conscious of events transpiring at remote distances. Cicero mentions that when the revelations are being given some one must be present to record them, as "these sleepers do not retain any recollection of them." Pliny, speaking of the celebrated Hermotinus of Clazomenæ, remarks that his soul separated itself from the body and wandered in various parts of the earth, relating events occurring in distant places. During the periods of inspiration his body was insensible. The day of the battle of Pharsalia, Cornelius, a priest of renowned piety, described, while in Padua, as though present, every particular of the fight. Nicephorus says that when the unfortunate Valens, taking refuge in a barn, was burned by the Goths, a hermit named Paul in a fit of ecstasy cried out to those who were with him, "It is now that Valens burns!" Tertullian describes two females celebrated for their piety and ecstasy, that they entered that state in the midst of the congregation, revealed celestial secrets, and knew the innermost hearts of persons. Saint Justin affirms that the Sibyls foretold events correctly, and quotes Plato as coinciding with him in that view. Saint Athenagoras says of the faculty of prescience that "It is proper to the soul." Volumes might be readily filled with quotations like the foregoing, showing that clairvoyance has been manifested and received as a truth by profound thinkers in every age. Swedenborg, Zschokke, and Davis are not peculiarities of modern times, but are repetitions of Socrates, Apollonius, and countless other sages who deeply impressed their personality on their times.

Perhaps for purposes of investigation the artificially induced mesmeric state has advantages over the spontaneous, which presents itself at undeterminate times, although its spontaneous exhibition is more reliable in its results. Its natural manifestation requires a finely developed nervous system. It is not always, though at times it may appear to be, the result of disease. The more perfect the health the more reliable the results. The visions produced by disease, like those by drugs, bear to true clairvoyance the same relations that the dreams of indigestion do to those of refreshing sleep.

Clairvoyance must be regarded as a peculiar state of the mind, in which it is in a greater or lesser degree independent of the physical body. It presents many gradations from semi-consciousness to profound and death-like trance. However induced, the attending phenomena are similar. The condition of the physical body is that of deepest sleep. A flame may be applied to it without producing a quiver of the nerves; the most pungent substances have no effect on the nostrils; pins or needles thrust into the most sensitive parts give no pain; surgical operations can be made without sensation. Hearing, tasting, smelling, feeling, as well as seeing, are seemingly independent of the physical organs. The muscular system is either relaxed or rigid; the circulation impeded in cases until the pulse becomes imperceptible; and respiration leaves no stain on a mirror held over the nostrils.

In passing into the clairvoyant state the extremities become cold, the brain congested, the vital powers sink, a dreamy unconsciousness steals over the faculties. There is a sensation of sinking or floating. After a time the perceptions become intensified. We cannot say the senses, for they are of the body, which for the time is insensible. The mind sees without physical organs of vision, hears without organs of hearing, and feeling becomes a refined consciousness which brings it *en rapport* with the intelligence of the world. The more death-like the condition of the body the more lucid the perceptions of the spirit or mind, which for the time owes it no fealty. If, as there is



every reason to believe, clairvoyance depends on the unfolding of the spirit's perceptions, then the extent of that unfolding marks its perfection. However great or small this may be, the state itself is the same, differing only in degree, whether observed in the Pythia of Delphic oracles, the vision of Saint John, the trance of Mohammed, the epidemic catalepsy of religious revivals, or the illumination of Swedenborg or Davis. The disclosures made have also a general resemblance, but they are so colored with surrounding circumstances that they are extremely fallible. The tendency of the clairvoyant is to make objective the subjective ideas he has acquired by education—if a Christian, to see visions of Christ; if a Moslem, of Mohammed—somewhat as dreams reflect the ideas of wakefulness. Yet there is a profound condition which sets all these aside, and the mind appears divested of all physical trammels, and to come in direct contact with the thought-atmosphere of the world. Time and space have no existence, and matter becomes transparent.

If there is an independent spiritual existence after the death of the physical body, the clairvoyant in this independent stage closely approximates to that existence. It may be an open question whether the spirit leaves the body and actually visits the remote places it describes, or gains such knowledge by intensity of perception that annuls space, as it does time, in its retrospection and prevision. The many authentic instances of "double-presence" which have been observed lead to the former conclusion.

Baron Reichenbach, in his "Dynamics," has investigated the sensitiveness of the clairvoyant to refined emanations of force, and Denton, in his "Soul of Things," has carried the investigation still farther, though in a somewhat similar direction. The field is broad as the spirit of man, and its threshold has been scarcely crossed. Clairvoyance is no miraculous power, but an inherent faculty, a foregleam in this life of the next spiritual life. For if man exists as a spirit after the dissolution of the physical body, his present life is that of a spirit clad in flesh, and should manifest some of the characteristics of the next untrammelled condition. HUDSON TUTTLE, *Berlin Heights, O.*

Clal'lam, a county in the N. W. of Washington Territory. It is bounded on the N. by the Strait of Juan de Fuca, and on the W. by the Pacific Ocean. The county takes its name from the Clallam tribe of Indians found here. The surface is hilly. Mount Olympus rises on or near the southern border to the height of 8100 feet. Capital, New Dungeness. Pop. 408.

Clam, a name applied to many bivalve mollusks of

Giant Clam (*Tridacna gigas*).

various genera. Perhaps the most noteworthy of these is the *Tridacna gigas*, which is said to possess the largest shells known. A single pair of these has been known to weigh over 500 pounds. The flesh is used as food. Two of these valves are used in the church of St. Sulpice, Paris, to contain the holy water. This species is found in the Pacific. The common clam of the U. S. (*Mya arenaria*) is much used as food, and is very important as furnishing bait for the fisheries. It is found also in Europe and Asia, and on the shores of Alaska. The round clam, or quahaug, has the name of *Venus mercenaria*, because its shells were made into *wampum* by the North American Indians, and used as money. The fresh-water clams are properly mussels. The genus *Chama* comprises numerous species, which are perhaps those to which the name is most appropriately given.

Clamecy, a town of France, department of Nièvre, on the river Yonne, about 24 miles S. of Auxerre, was formerly fortified. It has several Gothic churches, a fine modern château, and manufactures of paper and earthenware. Pop. 5616.

Clam Lake, a post-village of Wexford co., Mich. It has one weekly newspaper.

Clan [Irish and Gaelic, *clann;* Manx, *cloan*, "children," *i. e.* descendants of a common ancestor], a body of men confederated together by common ancestry. It is applied especially to the communities of the Scottish Highlanders, divided from each other by distinctive surnames. It has sometimes been applied to the great Irish septs, but these were completely broken down by the power of the English before the word came into use in the English language. In Scotland it was used to designate the freebooters of the Border as well as the Celtic tribes. There were characteristics common to both—such as predatory habits and their distribution into communities, each with a common surname. It was long the policy of Scotland to require all the Highland clans to have some representative who should be security at court for their behavior. Clans that could find no such security were called "broken clans," and their members were outlaws. The Macgregors were a broken clan, whom the law followed for centuries with cruel ingenuity. The clans are never treated in the old acts otherwise than as nests of thieves. The clans cannot be better understood than by keeping in view some peculiarities which set them in contrast with feudal institutions. Feudality has a relation to land, from the serf bound to the soil, through the vassal who possesses it, up to the feudal lord. Among the Highlanders the relation was patriarchal, and had no connection with land. It often happened that the head of a clan and the feudal lord of the estates occupied by it were different persons.

Clancar'ty, EARLS OF (1803), Viscounts Dunlo (1807), Barons Kilconnel (Ireland, 1797), Viscounts Clancarty (1823), Barons Trench (1815, United Kingdom), and Marquesses Heusden in the Netherlands, a noble family of England.—WILLIAM THOMAS LE POER TRENCH, third earl, born Sept. 21, 1803, succeeded his father Dec. 8, 1832.

Clanric'arde, MARQUESSES OF (1825), Barons Dunkellin (1543), Viscounts Burke (1629, Ireland), Barons Somerhill (United Kingdom, 1826).—ULICK JOHN DE BURGH, first marquess, K. P., P. C., lieutenant and custos rotulorum of the county and town of Galway, born Dec. 28, 1802, was ambassador to St. Petersburg 1835–40, postmaster-general 1846–52, lord privy seal 1857–58, succeeded his father as earl of Clanricarde July 27, 1808.

Clanton (JAMES H.) studied law and practised his profession in Montgomery co., Ala., which in 1855 sent him to the House. From 1861 to 1865 he served as a general in the Confederate army, but after the end of the war he returned to his old profession. He died Sept. 27, 1871.

Clap (ROGER), born at Sallom, in Devonshire, England, April 6, 1609, settled at Wareham, Mass., in 1630, and was afterwards one of the founders of Dorchester, Mass. He held prominent public offices, and served (1665–86) as captain in Castle William, now Fort Independence. He wrote for his children valuable memoirs of the prominent men of New England. These have been several times reprinted. He was eminent for piety. Died Feb. 2, 1691.

Clap (THOMAS), a Congregational divine, born at Scituate, Mass., June 26, 1703, graduated at Harvard in 1722. He was president of Yale College from 1739 to 1766. He was an eminent natural philosopher and astronomer. He published "The Nature and Foundation of Moral Virtue" (1765), a "History of Yale College" (1766), and other works. Died Jan. 7, 1767.

Clapp (THEODORE), an eloquent Unitarian minister, born in Easthampton, Mass., in 1792. He preached in New Orleans for about thirty-five years. Died in 1866.

Clap'perton (HUGH), CAPTAIN, a Scottish traveller and explorer of Africa, was born at Annan in 1788. In 1823 he accompanied Dr. Oudney and Denham in an expedition to Lake Tchad. Having returned to England in 1825, he soon renewed the enterprise in company with Richard Lander and others. His chief object was to discover the course of the Niger. He entered Africa at the Bight of Benin and penetrated to Saccatoo, where he was detained nearly a year by the sultan. He died near that place in April, 1827. (See R. LANDER, "Records of Captain Clapperton's Last Expedition," 1830.)

Claqua'to, a post-village, capital of Lewis co., Wash. Ter., on the Newaukum River, 35 miles S. by W. from Olympia.

Claque, clăk [a French word signifying the noise made in clapping the hands], a body of persons called "claqueurs," employed for securing the success of a performance

by bestowing applause upon it, and thus giving a false notion of the impression it has made. This artifice came first into operation in theatres and concert-rooms, and arose from friendly or party motives. It was in Paris that it was first turned into a trade. One Sauton, in 1820, established an office for the insurance of dramatic success, and was thus the organizer of the Parisian claque. The directors or managers of a theatre send an order to the office for whatever number of "claqueurs" they think necessary. Although no public offices of the kind have yet been established in the U. S., the artifice is extensively practised.

Cla'ra, a post-township of Potter co., Pa. Pop. 195.

Clare, a maritime county of Ireland, in Munster, is bounded on the N. W. by Galway Bay, on the E. and S. by the Shannon River, and on the W. by the Atlantic Ocean. Area, 1200 square miles. The surface is mostly hilly; the soil of the valleys is fertile. This county contains many small lakes. The principal rock is carboniferous limestone. Coal, copper, lead, and marble are found here. The staple products of the soil are oats, potatoes, wheat, and barley. Capital, Ennis. Pop. in 1871, 147,994.

Clare, a county in N. Central Michigan. Area, 576 square miles. It is intersected by the Muskegon River. The surface is nearly level, and mostly covered with forests. In this region the grayling is caught, hence it is a summer resort for sportsmen. It is intersected by the Flint and Pere Marquette R. R. Pop. 366.

Claremont, a township and post-village of Richland co., Ill., on the Ohio and Mississippi R. R. Pop. 1278.

Claremont, a post-township of Dodge co., Minn. Pop. 538.

Claremont, a pleasant post-village of Sullivan co., N. H., near the Vermont Central R. R., about 48 miles W. by N. from Concord. It has a national bank, and manufactures of cotton and wool. The Concord and Claremont R. R. passes through it. Claremont township is bounded on the W. by the Connecticut River. It has a savings bank, three paper-mills, a furnace, a water-wheel manufactory, a high school, and a library of 4000 volumes. It has three weekly, one semi-weekly, and one monthly newspaper. Pop. of township, 4053.

Ed. Claremont "Compendium."

Clar'ence, a post-village of Cedar co., Ia., on a branch of the Chicago and North-western R. R., 34 miles E. by S. from Cedar Rapids. It has one weekly newspaper. P. 726.

Clarence, a post-township of Calhoun co., Mich. Pop. 1075.

Clarence, a post-village of Clay township, Shelby co., Mo. It has one weekly newspaper. Pop. 444.

Clarence, a township and post-village of Erie co., N. Y. The village is near the New York Central R. R., and 15 miles N. E. of Buffalo. The township contains several villages, fifteen churches, and an academy. Pop. 3147.

Clarence, Duke of, a name sometimes given to the younger princes of the royal house of England. The title was derived from Clare or Clarence (Lat. *Clarentia*) in Suffolk. Some authorities, however, say it was derived from Clarenza in the Morea, of which an English knight was duke during the Crusades.

Clar'enceville, a port of entry and post-village of Missisquoi co., Quebec (Canada), near the Vermont line and the head of Lake Champlain. It has an academy.

Clarenceux, or **Clarencieux,** anciently **Surroy,** the first of the two provincial kings of arms in the English college of heralds, the second being Norroy. The jurisdiction of Clarenceux extends to the Trent, that of Norroy comprehending the portion N. of that river. Clarenceux is named after the duke of Clarence, third son of King Edward III. It is his duty to visit his province, to survey the coat-armor within it, to register descents and marriages, and to marshal funerals which are not under the direction of Garter king of arms, who is his superior, or of Bath king of arms, who manages the heraldry of the order of the Bath, and who has heraldic duties in Wales. Clarenceux also grants arms with the approval of the earl-marshal.

Clar'endon, a county in Central South Carolina. Area, 700 square miles. It is bounded on the S. and W. by the Santee River, and is drained by the Black River. The surface is undulating or level. Corn, rice, and cotton are the staple crops. Capital, Manning. Pop. 14,038.

Clarendon, a post-village, capital of Monroe co., Ark., on White River, 60 miles E. of Little Rock, and on the Arkansas Central R. R. at the junction of the Pine Bluff branch.

Clarendon, a township and village of Calhoun co., Mich. The village is on the Michigan Central R. R., 105 miles W. S. W. of Detroit. Pop. of township, 1150.

Clarendon, a township and post-village of Orleans co., N. Y. The village is 4 miles from the New York Central R. R., and 11 miles from Lake Ontario. Pop. of township, 1668.

Clarendon, a township and post-village of Rutland co., Vt. The village is on the Vermont Central R. R., 6 miles S. of Rutland. Clarendon has mineral springs, which are visited for the cure of kidney and skin diseases and other complaints. Pop. of township, 1173.

Clarendon, Constitutions of, a name given to certain laws made by a general council (or parliament) of the English barons and prelates at Clarendon, in Wiltshire, in 1164, whereby King Henry II. checked the power of the Church, and narrowed the exemption which the clergy had claimed from secular jurisdiction. These ordinances, sixteen in number, defined the limits of the patronage and jurisdiction of the pope, and provided that the Crown should be entitled to the election to vacant dignities in the Church. The constitutions were unanimously adopted, and Becket, the primate, reluctantly signed them. But they were at once rejected by Pope Alexander III. when sent to him for ratification, and Becket thereupon retracted his consent, and imposed upon himself the severest penances. This, and the other measures adopted by the archbishop to vindicate the independence of the clergy, led to disputes between him and the monarch. (See Becket.) Notwithstanding the humiliation to which the king submitted after Becket's death, most of the provisions of the constitutions of Clarendon continued permanent.

Clarendon, Earls of (1776), Barons Hyde (1756, Great Britain).—Edward Hyde Villiers, fifth earl of this line, born Feb. 11, 1846, was M. P. for Brecon district 1869–70. He succeeded his father June 27, 1870.

Clarendon (Edward Hyde), first earl of, an eminent English statesman and historian, born at Dinton, Wiltshire, Feb. 18, 1609. He was educated at Oxford, and studied law under his uncle, Nicholas Hyde, who became chief-justice. He was a member of the Long Parliament, which met in 1640, and he voted at first with the popular party, but when the civil war broke out in 1642 he attached himself to the royalist cause. He wrote several able state papers, which defended the policy of the king against the Parliament. In 1643 he was appointed chancellor of the exchequer and privy councillor. He accompanied Charles, prince of Wales, to Jersey in 1645–46, and served him as counsellor while he was an exile in France and Holland. On the restoration of Charles II. in 1660, Hyde became prime minister and lord chancellor of England, and in 1661 he was created earl of Clarendon. He opposed popery, and was more moderate than many of the royalists. In Aug., 1667, he was removed from office and impeached by the House of Commons, which condemned him to perpetual banishment. He died at Rouen in Dec., 1674. His daughter, Anne Hyde, was married to the duke of York (James II.). He left a "History of the Rebellion and Civil Wars" (1702). A complete edition with annotations by Bishop Warburton was published at Oxford in 1826. (See "Life of Edward, Earl of Clarendon," by himself, 1759; T. H. Lister, "Life of Lord Clarendon," 3 vols., 1838.)

Clarendon (George William Frederick Villiers), fourth earl (of the Villiers family), born Jan. 12, 1800, was the eldest son of the Hon. George Villiers, who was a son of the earl of Clarendon. He was sent as ambassador to Madrid in 1833, and succeeded to the earldom on the death of his uncle in that year. In 1840 he became lord privy seal in the Whig ministry, which he resigned in 1841. He was president of the board of trade in the new ministry formed by Lord John Russell in 1846, and was appointed lord lieutenant of Ireland in 1847. He exhibited moderation, tact, and energy in the government of that island, which was then much agitated. Having been recalled in 1852, he entered the ministry of Lord Aberdeen in Jan., 1853, as secretary of foreign affairs. He retained this office in the cabinet of Lord Palmerston, who became premier early in 1855, and acquired a high reputation as a diplomatist. He resigned with his colleagues in 1858, and again became secretary of foreign affairs in Nov., 1865. The Liberal ministers resigned in consequence of the defeat of the Reform bill in June, 1866. Lord Clarendon was appointed secretary of foreign affairs by Mr. Gladstone in Dec., 1868. Died June 27, 1870.

Clarendon Press, a celebrated printing and publishing establishment connected with Oxford University, England. It was founded in 1672, and took its name from the fact that the printing-house, erected in 1711, was built from the profits arising from the sale of Clarendon's "History of the Rebellion," of which work the university has a perpetual copyright.

Clar'et [Fr. *vin de Bordeaux*], a name given in England and the U. S. to red French wines produced near Bordeaux. The French *clairet* signifies "pale wine."

Clar'idon, a township of Geauga co., O. Pop. 909.

Claridon, a township and village of Marion co., O., 7 miles E. of Marion. Pop. 1483.

Clarin'da, a post-village, capital of Page co., Ia., on the Nodaway River, 62 miles S. E. of Council Bluffs. It has two weekly newspapers, a woollen factory, and a national bank. Pop. 1022.

Cla'rinet', or **Clar'ionet'** [Fr. *clarinette*], a wind-instrument invented in Nuremberg in 1690. Its tone is produced by a thin piece of reed nicely flattened and fixed on the mouth-piece. On the body of the instrument there are holes and keys for the fingers of the performer. In fulness and variety of tone the clarinet is the most perfect of wind-instruments. Its construction, however, does not admit of every key in music being played on the same instrument.

Clar'ington, a post-village of Salem township, Monroe co., O. Pop. 728.

Clar'ion, or **Clar'in,** a species of trumpet more shrill in tone than the ordinary trumpet; also the name of an organ-stop.

Clar'ion, a county in the N. W. of Pennsylvania. Area, 600 square miles. It is intersected by the Clarion River, and bounded on the S. W. by the Alleghany River. The surface is hilly; the soil is generally fertile. Cattle, grain, and wool are raised extensively. Coal, petroleum, and iron are found here. Capital, Clarion. Pop. 26,537.

Clarion, a township and village of Bureau co., Ill., on the Chicago Burlington and Quincy R. R., about 18 miles N. E. of Princeton. Pop. 1023.

Clarion, a post-village in a township of the same name, capital of Wright co., Ia., about 85 miles N. of Des Moines. It has one weekly newspaper. P. 37; of township, 153. A. M. White, Pub. Wright County "Monitor."

Clarion, a post-borough, capital of Clarion co., Pa., is on the Clarion River, about 75 miles N. N. E. of Pittsburg. It has a national bank and three weekly newspapers. Carrier Seminary, a large institution of learning, is located here. The county of Clarion now produces a large amount of oil, and the county-seat is improving rapidly. Pop. of Clarion borough, 709; of township, 1059.
R. B. Brown, Ed. of "Democrat."

Clarion River, of Pennsylvania, rises in McKean co., flows nearly south-westward through Elk and Clarion counties, and enters the Alleghany River. Entire length, about 130 miles.

Clark, a county in the E. of Illinois. Area, 460 square miles. It is bounded on the S. E. by the navigable Wabash River. The surface is diversified by prairies and forests; the soil is fertile. Grain, cattle, live-stock, butter, tobacco, hay, and timber are largely produced. Coal is found here. The most numerous manufactories are those of carriages and wagons. It is intersected by the St. Louis Vandalia Terre Haute and Indianapolis R. R. Capital, Marshall. Pop. 18,719.

Clark, a county of Mississippi, bordering on Alabama. Area, 650 square miles. It is intersected by the Chickasawha River. The surface is undulating, the soil productive. Corn, wool, rice, and cotton are raised. It is traversed by the Mobile and Ohio R. R. Capital, Enterprise. P. 7505.

Clark, a county of the S. W. central part of Ohio. Area, 380 square miles. It is intersected by Mad River, and also drained by Lagonda Creek. The surface is finely diversified; the soil is very fertile. Wheat, corn, wool, butter, tobacco, and live-stock are largely produced. The manufacturing interests are varied and important; the most numerous are those of flour, agricultural tools, and carriages. It is traversed by the Atlantic and Great Western R. R. and several other railroads. Capital, Springfield. Pop. 32,070.

Clark, a county of the N. W. central part of Wisconsin. Area, 1584 square miles. It is intersected by Black River. The surface is uneven or hilly; the soil is productive. Lumber, wheat, oats, butter, and potatoes are produced. It is intersected by the West Wisconsin R. R. Capital, Neillsville. Pop. 3450.

Clark, a township of Greene co., Ark. Pop. 500.

Clark, a township of Johnson co., Ark. Pop. 1399.

Clark, a township of Pope co., Ark. Pop. 966.

Clark, a township of Johnson co., Ind. Pop. 1474.

Clark, a township of Montgomery co., Ind. Pop. 2175.

Clark, a township of Perry co., Ind. Pop. 1567.

Clark, a township of Tama co., Ia. Pop. 336.

Clark, a township of Faribault co., Minn. Pop. 347.

Clark, a township of Atchison co., Mo. Pop. 1276.

Clark, a township of Cole co., Mo. Pop. 800.

Clark, a township and village of Lincoln co., Mo., on the St. Louis Kansas City and Northern R. R., 135 miles N. W. of St. Louis. Pop. 1887.

Clark, a township of Union co., N. J. Pop. 331.

Clark, a township of Brown co., O. Pop. 1691.

Clark, a twp. of Harrison co., West Va. Pop. 2085.

Clark, a township of Randolph co., West Va. Pop. 496.

Clark (Abraham), an American patriot, born at Elizabethtown, N. J., Feb. 15, 1726. He was chosen a delegate to the Continental Congress in 1776, and signed the Declaration of Independence. He was re-elected to Congress. Died Sept. 15, 1794.

Clark (Alonzo), M. D., an eminent physician of New York City, graduated A. B. at Williams College 1828, took the degree of M. D. in the College of Physicians and Surgeons of New York in 1835, was for a time professor of pathology and materia medica in the Vermont Medical College at Burlington, professor of physiology and pathology in the New York College of Physicians and Surgeons from 1848 to 1855, professor of pathology and practical medicine in the same institution in 1855, which place he still holds. He was appointed physician to the Bellevue Hospital, New York, in 185–, and to St. Luke's Hospital, New York, in 1861. In 1853 he was elected president of the New York State Medical Society. No member of the profession in New York State or City enjoys a more honorable reputation. Dr. Clark has published valuable professional papers.

Clark (Alvan), born at Ashfield, Mass., Mar. 8, 1804, was an ingenious farmer's boy who became in youth an engraver for calico print-works at Lowell, Mass. He possessed native skill in portrait-painting, an art which he practised with great success, but when over forty years old he took up, with his sons, the construction of refracting telescopes. He was the first American who successfully made large achromatic lenses. In this department, and in the field of astronomical observation, he won great fame at home and abroad. He invented a valuable double eye-piece for measuring small arcs, and received in 1863 the La Lande prize of the French Academy of Sciences for his discoveries.

Clark (Charles E.), U. S. N., born Aug. 10, 1843, in Vermont, graduated at the Naval Academy, an ensign in 1863, became a master in 1866, a lieutenant in 1867, and a lieutenant-commander in 1868. He was attached to the steamer Ossipee from 1863 to 1865, participating in the battle of Mobile Bay, Aug. 5, 1864, and was commended for "zeal and energy" by his commanding officer, Commander William E. Leroy. Foxhall A. Parker, U. S. N.

Clark (Daniel), an American jurist, born at Stratham, N. H., Oct. 29, 1809, graduated at Dartmouth in 1834, was U. S. Senator from New Hampshire (1857–66), and judge of the U. S. district court in 1866.

Clark (Rev. Daniel A.), a Congregational preacher of uncommon pungency and power, born at Rahway, N. J., Mar. 1, 1779. Among other places he was settled for four years (1820–24) in Amherst, Mass., and rendered valuable service in starting the college there. His sermons were published in 3 vols. 12mo, 1836–37. Died in New York City Mar. 3, 1840.

Clark (Davis Wasgatt), D. D., a bishop of the Methodist Episcopal Church, born in Maine Feb. 25, 1812, graduated at Wesleyan University in 1836, became distinguished as a preacher, editor, and author. Was elected editor of the *Ladies' Repository* in 1852, which position he held twelve years. Became a bishop in 1864. He published an "Algebra" (1843), "Mental Discipline" (1848), "Man all Immortal" (1864), and other works. D. May 23, 1871.

Clark (George Whitefield), D. D., an American clergyman, born Feb. 15, 1831, at South Orange, N. J., graduated at Amherst College in 1853, and at Rochester Theological Seminary in 1855. He was ordained Oct. 31, 1855, and became pastor of the Baptist church at New Market, N. J. In 1859 he accepted the pastorate of the First Baptist church at Elizabeth, N. J. About 1868 he became pastor at Ballston Spa, N. Y. In 1870 he published his "New Harmony of the Four Gospels" and his "Notes on Matthew," and near the close of 1872 "Notes on Mark." He is now engaged in preparing "Notes on the Gospels of Luke and John."

Clark (Horace F.), LL.D., born at Southbury, Conn., Nov. 29, 1815, was a son of the Rev. D. A. Clark. He graduated at Williams College in 1833, was admitted to the New York bar in 1837, and became a leading lawyer. He married in 1848 a daughter of Cornelius Vanderbilt. He was a Democratic member of Congress from New York

City (1856–61), after which he was a prominent and successful railroad president, banker, and stock operator. He was distinguished for energy, liberality, and agreeable social qualities. He also took a prominent part in the reform movement in N. Y. City in 1871–72. Died June 19, 1873.

Clark (Sir James), Bart., K. C. B., F. R. S., a physician, born at Cullen, Scotland, Dec. 14, 1788. He studied medicine at Edinburgh. About 1826 he settled in London, where he attained eminence as a physician. In 1829 he published an able work "On the Sanative Influence of Climate." He was appointed physician in ordinary to Queen Victoria in 1837. His "Treatise on Pulmonary Consumption" (1835) is highly esteemed. Died June 29, 1870.

Clark (Dr. John), born in Bedfordshire, England, Oct. 8, 1609, emigrated to Massachusetts, but was driven to Rhode Island in 1638, and in the same year founded the first Baptist church at Newport. This church claims to be older than the first church at Providence, and therefore the first of that faith in the New World. Clark visited England in company with Roger Williams, and together they obtained from Charles II. the charter which secured civil and religious liberty to Rhode Island. Callender, in his history of that State, classes Clark with the ablest projectors and legislators of that commonwealth. While he was pastor at Newport he preached once at Lynn, Mass., for which he was imprisoned and fined twenty pounds, under the act of Nov. 15, 1644. Died April 20, 1676.

Clark (Laban), D. D., a Methodist Episcopal minister, born at Haverhill, N. H., July 19, 1778, began to preach in 1800. He was one of the founders of the Wesleyan University at Middletown, Conn., and was for many years an able and influential preacher. Died Nov. 28, 1868.

Clark (Lewis), U. S. N., born in 1845 in Connecticut, graduated at the Naval Academy in 1863, became a master in 1866, a lieutenant in 1867, and a lieutenant-commander in 1868. While attached to the steam-sloop Richmond he participated in the battle of Mobile Bay, Aug. 5, 1864, and was commended for "coolness and courage" by his commanding officer. Foxhall A. Parker, U. S. N.

Clark (Lewis Gaylord), an American writer, born at Otisco, N. Y., in 1810. He was for many years editor of the "Knickerbocker Magazine." He was a writer of much humor and pathos. His style was admirable and his temper genial. Died Nov. 3, 1873.

Clark (Lincoln) was born in Massachusetts, but removed to Alabama, where he settled first in Pickens, then in Tuscaloosa, which, in 1845, sent him to the House. In 1848 he removed to Dubuque, Ia., from which he, in 1851, was elected to Congress.

Clark (Myron), born at Hoosick, N. Y., Sept. 12, 1790, became a tanner of Bennington and Manchester, Vt., was (1824–29) an assistant judge of the county court, and became one of the governor's council (1829–31), judge of probate (1831–34), and State senator (1862–64). He was much interested in railroad affairs. Died Mar. 9, 1869.

Clark (Thomas March), D.D., LL.D. Cantab., Protestant Episcopal bishop of Rhode Island, was born at Newburyport, Mass., in 1812, graduated at Yale in 1831, received holy orders in 1836, became bishop in 1854. He has published several religious works, and is a popular and influential preacher.

Clark (Willis Gaylord), an American poet, born at Otisco, N. Y., in 1810, was a twin-brother of Lewis Gaylord, noticed above. He wrote for the "Knickerbocker Magazine" a series of amusing articles called "Ollapodiana." Among his poems is "The Spirit of Life" (1833). In the latter part of his life he was the chief editor of the "Philadelphia Gazette." Died June 12, 1841.

Clarke, a county in the S. W. of Alabama. It is bounded on the S. E. by the Alabama River, and on the W. by the Tombigbee. The surface is moderately diversified; the soil is partly fertile and partly sandy. Cotton and corn are staple crops. Capital, Grove Hill. P. 14,663.

Clarke, a county in S. W. Central Arkansas. Area, 900 square miles. It is bounded on the E. by the Washita River, and on the S. and W. by the Little Missouri. The surface is undulating; the soil fertile. Wheat, corn, cattle, wool, and cotton are produced. Timber and minerals abound, and lime is extensively burned. The Cairo and Fulton R. R. traverses the county. Capital, Arkadelphia. Pop. 11,953.

Clarke, a county in N. E. Central Georgia. Area, 280 square miles. It is intersected by the Oconee River. The surface is hilly. Gold, granite, kaolin, and pyrites are found here. Wheat, wool, corn, and cotton are the chief products. Capital, Watkinsville. Pop. 12,941.

Clarke, a county of Indiana, bordering on Kentucky. Area, 400 square miles. It is bounded on the S. E. by the Ohio River. The surface is nearly level; the soil fertile. Wool, cattle, grain, and tobacco are extensively raised. It is intersected by the railroad which connects Indianapolis with Louisville, and also by the Louisville division of the Ohio and Mississippi R. R. and the Louisville New Albany and Chicago R. R. The manufacture of cooperage is important. Capital, Charlestown. Pop. 24,770.

Clarke, a county in the S. of Iowa. Area, 432 square miles. It is drained by the Whitebreast River and several creeks. The surface is undulating; the soil fertile. Wheat, corn, and wool are largely produced. It is intersected by the Burlington and Missouri River R. R. Capital, Osceola. Pop. 8735.

Clarke, a county in E. Central Kentucky. Area, 210 square miles. It is bounded on the S. by the Kentucky and Red rivers. The surface is uneven; the soil is productive. Live-stock, wool, grain, and tobacco are staple products. Capital, Winchester. Pop. 10,882.

Clarke, a county which forms the N. E. extremity of Missouri. Area, 516 square miles. It is bounded on the N. E. by the Des Moines River, and on the E. by the Mississippi. It is intersected by the Fox and Wyaconda rivers. The surface is undulating; the soil fertile. Grain, tobacco, cattle, and wool are largely raised. It is intersected by the Missouri Iowa and Nebraska R. R. Capital, Waterloo. Pop. 13,667.

Clarke, a county in the N. of Virginia. Area, 208 square miles. It is intersected by the Shenandoah River, and is part of the Great Valley of Virginia. The Blue Ridge extends along the south-eastern border. The soil is based on limestone, and is fertile. Grain, stock, and wool are the staple products. Capital, Berryville. Pop. 6670.

Clarke, a county in the S. W. of Washington Territory. Area, 1350 square miles. It is bounded on the S. by the Columbia River, which also forms half of the western boundary, and it is intersected by the Cathlapootle River. The surface is partly mountainous. Wheat, wool, and cattle are raised. Capital, Vancouver. Pop. 3081.

Clarke, a township of Chariton co., Mo., Pop. 939.

Clarke, a township of Clinton co., O. Pop. 1877.

Clarke, a township of Coshocton co., O. Pop. 867.

Clarke (Adam), LL.D., a celebrated Wesleyan divine and commentator, was born at Moybeg, Ireland, in 1760. He was educated at Wesley's Kingswood school, sent out by Wesley as an itinerant preacher in 1782, president of the Wesleyan Conference in 1806, 1814, 1822, became eminent for his Oriental and biblical learning, and published a "Bibliographical Dictionary" (6 vols. 12mo, 1802); "Bibliographical Miscellany" (2 vols., 1806); "Succession of Sacred Literature" (1808); "Commentary on the Bible" (1810–25); "Rymer's Fœdera" (1819); "Wesley Family;" sermons and miscellaneous works, published since his death, 13 vols. 8vo. Died in 1832.

Clarke (Dorus), D. D., a Congregational minister, born in Westhampton, Mass., Jan. 2, 1797, graduated at Williams College in 1817, and became an influential and able editor and author of religious and denominational literature.

Clarke (George Rogers), an American general, born in Virginia Nov. 19, 1752. He took a British fort at Vincennes in 1779, and served against Benedict Arnold in Virginia in 1780. He became a brigadier-general in 1781, and after peace was concluded in 1783 settled in Kentucky. Died Feb. 13, 1818.

Clarke (Henry F.), an American officer, born in 1820 in Pennsylvania, graduated at West Point in 1843, and became, June 29, 1864, assistant commissary-general of subsistence, rank of lieutenant-colonel, and colonel A. D. C. Sept. 28, 1861, U. S. volunteers, having been in the artillery till 1857. He served at seaboard posts 1843–45; in military occupation of Texas 1845–46; in war with Mexico 1846–48, engaged at Palo Alto, Resaca de la Palma, Monterey, Vera Cruz, Cerro Gordo, Amazoque, San Antonio, Churubusco, Molino del Rey (wounded), Chapultepec (brevet captain), and the city of Mexico; as assistant instructor at the Military Academy 1848–51; in Florida hostilities 1851–52; as adjutant Second Artillery 1852–55; as instructor of artillery and cavalry at the Military Academy 1855–56; as chief of commissariat on Utah expedition 1857–60; and assistant in commissary department at Washington, D. C., 1860–61. In the civil war was chief commissary of the department of Florida 1861, engaged in defence of Fort Pickens; of Army of Potomac in its various operations 1861–64 (brevet colonel and brigadier-general); as purchasing commissary at New York, in charge of subsistence supplies for the States of Connecticut, New York, and New Jersey 1864–67. Brevet major-general Mar. 13, 1865, for faithful and meritorious services in the subsistence department. Since 1867 chief commissary division of the Missouri. George W. Cullum, *U. S. Army.*

Clarke (James Freeman), D. D., an eminent American Unitarian preacher, editor, and author, born at Hanover, N. H., April 4, 1810, since 1841 settled in Boston, Mass. Besides other works he has published "Service-Book and Hymn-Book for the Church of the Disciples" (1844–56), "Christian Doctrine of Forgiveness" (1852), "Christian Doctrine of Prayer" (1854), "Orthodoxy" (1866), "Steps of Belief" (1870), and "Ten Great Religions" (1871).

Clarke (John A.), D. D., an Episcopalian divine, born at Pittsfield, Mass., May 6, 1801, graduated at Union College in 1823, became rector of St. Andrew's Church, Philadelphia, and was a popular pulpit orator and writer of religious works. Died Nov. 27, 1843.

Clarke (Mary Cowden), an English authoress, a daughter of Vincent Novello, the composer, was born in London June 22, 1809. She was married in 1828 to Charles Cowden Clarke. Among her works are "The Complete Concordance of Shakspeare" (1846), a work remarkable for completeness and accuracy, and "World-Noted Women" (1858).

Clarke (Richard H.), LL.D., born at Washington, D. C., in 1827, graduated at Georgetown College, D. C., in 1846. He has been a lawyer and *littérateur* of Washington, D. C., and of New York. As a writer he has given much labor to the preparation of biographies of American Roman Catholics; his principal work is "The Lives of the Deceased Bishops" of his Church in this country (2 vols. 8vo, 1872).

Clarke (Samuel), D. D., an English philosopher and theologian, born at Norwich Oct. 11, 1675. He was educated at Cambridge. He published in 1704 his "Demonstration of the Being and Attributes of God," his chief work. He became in 1706 chaplain to Queen Anne and rector of St. James, London. In 1712 he published "The Scripture Doctrine of the Trinity," on which point his opinions were semi-Arian. He defended the Newtonian philosophy against Leibnitz, with whom he corresponded. The correspondence was published in 1717. His edition of Homer, with a Latin version and notes, was extensively used by students. Died May 17, 1729. (See Hoadley, "Life of S. Clarke;" William Whiston, "Historical Memoirs of Samuel Clarke," 1748.)

Clarke (William), an American general and explorer, born in Virginia Aug. 1, 1770, was a brother of George Rogers Clarke. Associated with Captain Lewis, he conducted an exploring expedition across the continent to the mouth of the Columbia River in 1804. He was afterwards raised to the rank of brigadier-general, and was governor of Missouri Territory from 1813 to 1820. Died Sept. 1, 1838.

Clarke (William Cogswell), born at Atkinson, N. H., in 1810, graduated at Dartmouth in 1832, and at the Law School in Cambridge, Mass. He practised law at Laconia and Manchester, N. H. He held, among other offices, that of judge of probate and attorney-general of New Hampshire. Died April 25, 1872.

Clarke River, or **Flathead River,** rises in the Rocky Mountains, in the W. part of Montana. It flows north-westward, traverses the northern part of Idaho, and enters Washington Territory. Near the northern boundary of Washington it enters the Columbia. Entire length, about 650 miles. Gold is found near this river in Montana.

Clarke's Creek, a township of Morris co., Kan. Pop. 320.

Clarkesville, a post-village, capital of Habersham co., Ga., is on the Chattahoochee River near its source, about 85 miles N. E. of Atlanta. It has four churches. Pop. 263.

Clarkesville. See Clarksville.

Clarks'burg, a post-village of Collingwood township, Grey co., Ontario (Canada), on Beaver River, 1 mile from Georgian Bay. It has woollen mills and other manufactures, and a postal savings bank. Pop. about 300.

Clarksburg, a post-township of Montgomery co., Md. Pop. 3064.

Clarksburg, a township of Berkshire co., Mass. Lumber, gunpowder, and brick are manufactured. Pop. 686.

Clarksburg, capital of Harrison co., W. Va., on the Monongahela, at the confluence of the Fork and Elk rivers, and on the Baltimore and Ohio R. R. It is situated in a coal-region, and has two banks, two academies, three newspapers, and numerous manufactories.

C. W. Walters, Ed. Clarksburg "Conservative."

Clarks'dale, a township of Coahoma co., Miss. Pop. 1931.

Clark's Fac'tory, a post-village of Middletown township, Delaware co., N. Y., has extensive tanneries.

Clarks'field, a post-township of Huron co., O. P. 1062.

Clark's Fork, a post-township of Cooper co., Mo. Pop. 1126.

Clark's Mills, a post-village of Kirkland and Whitestown townships, Oneida co., N. Y., has a cotton-factory and other manufacturing interests. Pop. 420.

Clark'son, a post-township of Monroe co., N. Y. Pop. 1884.

Clarkson (Thomas), an English philanthropist, born at Wisbeach, in Cambridgeshire, Mar. 28, 1760. He was educated in the University of Cambridge, where he wrote in 1786 a Latin prize-essay on the question, "Is Involuntary Servitude Justifiable?" He was so deeply interested in that subject that he resolved to devote his life chiefly to the abolition of the slave-trade and the relief of the oppressed. He became an associate of William Dillwyn, George Harrison, and other members of the Society of Friends, who had previously formed themselves into an anti-slavery committee. Mr. Wilberforce co-operated, and was the chief advocate of the cause in Parliament. Clarkson diligently collected and diffused information about the slave-trade. Their efforts excited violent opposition, and were several times defeated in Parliament, but finally an act to abolish the slave-trade was passed in Mar., 1807. He published in 1808 "The History of the Abolition of the Slave-Trade." In 1823 he was chosen president of the Anti-Slavery Society. Among his works is a "Memoir of the Life of William Penn" (1813). Died Sept. 26, 1846.

Clark's Sta'tion, a township of Washoe co., Nev. Pop. 16.

Clarks'ton, a post-village of Independence township, Oakland co., Mich. Pop. 471.

Clarks'town, the capital of Rockland co., N. Y., is 3 miles W. of the Hudson River and 35 miles N. of New York. It is sometimes called New City. The name of the post-office is Clarkstown. Pop. of Clarkstown twp. 4137.

Clarks'ville, a township of Clarke co., Ala. Pop. 200.

Clarksville, a post-village, capital of Johnson co., Ark., about 3 miles N. of the Arkansas River and 100 miles W. N. W. of Little Rock. Pop. 466.

Clarksville, a post-village of Butler co., Ia. It has one weekly newspaper.

Clarksville, a post-village of Calumet township, Pike co., Mo. It has one weekly newspaper. Pop. 1152.

Clarksville, a post-township of Coos co., N. H. Pop. 269. It has manufactures of starch.

Clarksville, a post-village of New Scotland township, Albany co., N. Y. Pop. 236.

Clarksville, a township of Allegany co., N. Y., has manufactures of pine lumber. Pop. 784.

Clarksville, a village of Brookfield township, Madison co., N. Y., has several large manufactories, and is the seat of Brookfield Academy. Pop. 322.

Clarksville, a township of Davie co., N. C. Pop. 919.

Clarksville, a post-village of Vernon township, Clinton co., O., on the Pittsburg Cincinnati and St. Louis R. R., 46 miles N. E. of Cincinnati. Pop. 389.

Clarksville, a borough of Mercer co., Pa., on the Erie and Pittsburg R. R., and 11 miles N. W. of Mercer. P. 359.

Clarksville, a post-village, capital of Montgomery co., Tenn., on the Cumberland River and the Memphis and Louisville R. R., 199 miles N. E. of Memphis and 50 miles N. W. of Nashville. It has a male and female academy, a national bank, two weekly newspapers, various manufactories, three tobacco warehouses, and ships 15,000 hogsheads of tobacco a year. There are iron-mines near. Pop. 3200.

Ingram & Doak, Props. "Tobacco Leaf."

Clarksville, the county-seat of Red River co., Tex., is the oldest town in Northern Texas. The Trans-Continental R. R. runs through it. It has several schools and churches, Protestant and Catholic. It is 350 miles N. of Galveston, in the N. E. corner of the State, and is the centre of a very rich country. It has two weekly papers. Pop. 613.

Ed. "Standard."

Clarksville, a post-village of Mecklenburg co., Va., on the Roanoke River at the junction of the Dan and Staunton, 102 miles S. W. of Richmond. It has a State bank, a building and loan association, six tobacco warehouses, and one newspaper, and is the terminus of the Roanoke Valley R. R. from Keysville on the Richmond and Danville R. R. Pop. of township, 3700.

Wm. Townes, Jr., Ed. "Roanoke Valley."

Clar'no, a post-township of Green co., Wis. P. 1637.

Cla'ry (*Salvia Sclarea*), a plant of the order Labiatæ, and of the same genus with sage; it is a native of Southern Europe, and cultivated in gardens for its aromatic proper-

ties. The seed is sown in spring, and the plants flower in the second year. Clary is stimulating and antispasmodic. It has an odor resembling that of balsam of Tolu, and is used for seasoning soups and for flavoring.

Class [Lat. *classis*], a term applied in natural history to a large group of plants or animals formed by the reunion or association of several orders. Classes, orders, genera, and species are common to all methods of classification. The term *class* is also used to denote a portion of society separated from other portions by some distinction of rank, fortune, or more intrinsic qualities. (For the well-defined classes of the Hindoos, see CASTE.)

Clas'sic, or **Clas'sical** [Lat. *classicus*, from *classis*, a "rank" or "class"], pure, refined; conformed to the best and most perfect standard; also pertaining to the ancient Greek or Latin authors, or rendered famous by association with ancient writers, as "classic ground." The ancient Roman people were divided into six classes, and the persons of the first or highest class were called *classici*. Hence the term came to signify the highest and purest class of writers in any language, though formerly it was applied only to the most esteemed Greek and Latin authors. The epithet "classical," as applied to ancient writers, is determined less by the purity of their style than by the period at which they wrote. The classical age of Greek literature begins with Homer, the earliest Greek writer whose works are extant, and extends perhaps to the time of the Roman emperor Antonine, but signs of decadence appeared about 300 B. C. The Latin classical period is shorter; its earliest writer is Plautus, and it ended about 200 A. D. Some critics, however, include Claudian, who was born about 365 A. D., among the classics.

Classifica'tion [from the Lat. *classis*, a "class," and *facio*, to "make"], literally, the "making of classes" or the act of classifying, has various applications in science and art. In natural history it is the grouping of the various species under their proper genera, families, orders, classes, etc. Thus, all material bodies are arranged under the three kingdoms—viz., animal, vegetable, and mineral (the last-named kingdom including every inorganic substance found in a state of nature, comprising not merely what are popularly termed minerals, but also air and water).

Again, for the sake of illustration, we will consider the classification of the animal kingdom. This is usually divided by naturalists into four great sections, termed "grand divisions"—namely, Vertebrata (or vertebrates), Articulata (or articulates), Mollusca (or mollusks), and Radiata (or radiates). Each of these grand divisions is subdivided into classes. Thus, all the vertebrates are sometimes grouped under four great classes—namely, mammals, birds, reptiles, and fishes, while each of these classes is further divided into orders, families, genera, and species.

In geology, classification denotes the grouping of the various kinds of rock, either according to their composition or according to the period in which they are supposed to have been formed. (See GEOLOGY.)

In æsthetics, classification is an arrangement by which works of art are distributed into certain classes; as, for instance, in galleries of paintings the works should be arranged according to the schools, each school being subject to a chronological order of the masters. In numismatology the coins should be arranged by countries, and these again by the chronological order of the monarchs; and so with other branches of the arts.

Clas'sis [Lat., a "class"], in the Reformed churches in America and in Holland a church court corresponding to the presbytery in Presbyterian churches. It is composed of the pastors and a number of elders of a certain district. The classis hears appeals from the consistories, and appeal from the classis is to a particular synod. The classis also confirms and dissolves pastoral connections, ordains and deposes ministers, sends two ministers and two delegates to the synod, and three ministers and three delegates to the general synod.

Clat'sop, a county which forms the N. W. extremity of Oregon. Area, 1050 square miles. It is bounded on the N. by the Columbia River, on the S. by the Nehalem, and on the W. by the Pacific Ocean. The surface is partly mountainous; the soil fertile. Wheat, cattle, wool, and lumber are produced. Capital, Astoria. Pop. 1255.

Claude (JEAN), an eminent French Protestant theologian, born near Agen in 1619. He was distinguished for eloquence and wisdom, and had several doctrinal disputes with Bossuet. In 1666 he became pastor of the Protestant church at Charenton, near Paris. Among his works is a "Defence of the Reformation" (1673). When the Edict of Nantes was revoked (1685) he removed to the Hague, where he died in 1687.

Claude Lorrain. See GELÉE (CLAUDE).

Claudia'nus (CLAUDIUS), a Latin epic poet, born at Alexandria about 365 A. D. He became a resident of Rome, and gained the favor of Stilicho. His poems were so popular that a statue was erected to him in Rome by the senate and the emperor. Among his works are "The Rape of Proserpine," "The Battle of the Giants," and a "Eulogy of Stilicho" ("De Laudibus Stilichonis"). Died after 408 A. D. He had a fertile imagination, and is regarded as the last of the classical Latin poets. (See T. MAZZO, "Vita di Claudiano," 1668.)

Clau'dius, or, more fully, **Tiberius Claudius Drusus Nero,** the fourth emperor of Rome, was born at Lugdunum (Lyons) in 10 B. C. He was a son of Drusus Nero, and a nephew of the emperor Tiberius. He was naturally infirm in body, and his education was neglected. On the death of Caligula (who was his nephew) he was proclaimed emperor by the army in 41 A. D., and was unwillingly recognized by the senate, who preferred a republic. He began his reign with a show of clemency, but his wife, the infamous Messalina, acquired great power, which she abused by acts of cruelty. He built a great aqueduct called Aqua Claudia, and successfully invaded Britain in person. He was poisoned in 54 A. D. by his wife Agrippina. (See SUETONIUS, "Claudius;" "TACITUS, "Annales.")

Claudius (APPIUS), surnamed CRASSUS, a Roman patrician and decemvir, was elected consul in 451 B. C. He rendered himself infamous by an attempt to enslave and dishonor Virginia. For this offence he was imprisoned. According to Livy, he committed suicide. (See ARNOLD, "History of Rome.")

Claudius (MARCUS AURELIUS), surnamed GOTHICUS, an emperor of Rome, was born in Illyricum in 214 A. D. He was proclaimed emperor by the army on the death of Gallienus (268 A. D.), and their choice was ratified by the senate. He defeated the rebel Aureolus in the same year, and gained a victory over the Goths or Scythians in Servia in 269. He died at Sirmium in 270 A. D., and was succeeded by Aurelian.

Clau'dius Cæ'cus (APPIUS), a Roman patrician who was censor about 310 B. C. He constructed the great road called Via Appia from Rome to Capua. He was afterwards consul, and became blind (hence his name Cæcus). He wrote a legal work and a poem.

Clau'dius Pul'cher (APPIUS), a Roman patrician, was a brother of P. Clodius the demagogue, whom Milo killed. He became consul in 53 B. C., and censor in the year 50. During his censorship he expelled Sallust the historian from the senate. He was an adherent of Pompey in the civil war. Died about 48 B. C.

Claudius Pulcher (PUBLIUS), a Roman general, was a son of Appius Claudius Cæcus, noticed above. He was noted for his pride. During the first Punic war he was elected consul for 249 B. C., and took the command of the fleet. He was defeated by the Carthaginians in a naval battle.

Clau'sen (HENRIK NICOLAI), an able Danish theologian and liberal statesman, born in the island of Laaland April 22, 1793. He became in 1820 professor of theology in the University at Copenhagen, and wrote, besides other works, "Popular Discourses on the Reformation" (1836). In 1840 he was chosen a deputy to the States, and near the end of 1848 was appointed minister of Denmark without a portfolio.

Clau'sewitz, von (KARL), a Prussian general and writer on war, was born at Burg June 1, 1780. He served on the staff of the Russian army in 1813, and wrote an "Account of the Campaign of 1813" (1814). He died Nov. 16, 1831, and his posthumous works were published in 10 vols. (1832–37; 3d ed. 1869).

Clau'sius (RUDOLF JULIUS EMANUEL), a prominent physicist, born Jan. 2, 1822, became in 1855 professor at the Polytechnic Institution of Zurich, in 1867 at the University of Würzburg, and in 1869 at that of Bonn. He obtained distinction by mathematical calculations based upon the dynamical theory of heat—calculations which, it is claimed, show the necessity of a Creator and the possibility of miracles. These calculations have received the approval of many scholars.

Claus'thal, a town of Germany, in the province of Hanover, is situated on a hill 1740 feet above the level of the sea, and about 56 miles S. S. W. of Hanover. It is the chief mining town of the Harts, and has a mint, a mining academy, a gymnasium, and a valuable museum; also manufactures of camlet and other fabrics. Silver and lead are mined in the vicinity. Pop. in 1871, 9138.

Cla'verack, a post-village and township of Columbia co., N. Y. The village is on the Hudson and Chatham branch of the Boston and Albany R. R., 4 miles S. E. of

Hudson. It is the seat of Claverack Academy and the Hudson River Collegiate Institute, a very flourishing institution. The township contains Philmont and Smoky Hollow, important factory villages. Pop. of township, 3671.

Clav'icle [from the Lat. *clavicula*, a diminutive of *clavis*, a "key" (perhaps because it "locks" or "makes fast" the scapula with the sternum)], or **Collar-bone**, a bone which, with the scapula and the head of the humerus, forms the shoulder. In man it is horizontal and immediately above the first rib, and articulates internally with the sternum or breast-bone, and externally with the acromion process of the scapula. Its office is to keep the shoulders apart, and to afford a fulcrum by which the muscles give lateral movement to the arm. It is absent in those animals in which the movement of the fore limbs is only backward and forward, as in the ox, the horse, etc.; it is present in all Quadrumana and in those Rodentia in which the anterior extremities are used for prehension, as the squirrel; it exists in the bat, mole, and hedgehog. In the mole it is a cube, very short, broad, and of extreme strength. In many Carnivora the clavicle is a small bone suspended (like the hyoid bone) amongst muscles, and not connected with the sternum or the scapula. In birds, to counteract the tendency of the pectoral muscles to approximate the shoulders, the clavicles are large, and united at an angle in the median line into a single bone, the "furculum," popularly called the "merry-thought" or "wish-bone." In this class of animals additional support to the anterior extremity is afforded by the extension of the coracoid process of the scapula into a broad thick "coracoid bone." This bone presents various modifications in reptiles, fishes, and certain mammals.

In man the ossification of the clavicle takes place sooner than that of any other bone, commencing the thirtieth day after conception; and at birth it is ossified in nearly its whole extent; but the sternal end is not complete till the eighteenth or nineteenth year. The clavicle in transcendental anatomy is considered to be the hæmapophysis of the atlas.

Clay [Ang.-Sax. *clæg;* Fr. *argille;* Lat. *argilla*], a term applied to those kinds of earth which when moist have a notable degree of tenacity and plasticity. Clays are not easily definable as minerals, but they appear to owe their origin to the decomposition of other minerals, such as felspar, etc., and consist largely of alumina, with silica and water. They owe their plasticity to the alumina which they contain. (See ALUMINA and KAOLIN.) Common clay, when sufficiently plastic, is of great use for making bricks, tiles, etc. Clay is used in plastic art as a means of adjusting the form which is to be given to any work in the more enduring material of which it is ultimately to be composed. As modelling clay is apt to crack, it must be kept damp by sprinkling it or by covering it with a wet cloth when the artist is not at work. Clays of the finer sorts are much used in making pottery, porcelain, etc. These are called fictile clays.

Argillaceous earth not unfrequently contains 40 per cent. of alumina, but generally the proportion is much smaller. The felspar which yields the alumina of clay soils contains also soda and potash, substances essential to vegetation, and which render clays fertile under cultivation. A mixture of calcareous matter exercises a favorable influence on crops. Thorough drainage has greatly increased the value of clay soils under cultivation. Wheat, beans, and clover are crops which they yield in great perfection. Chemical investigations have shown that clay soils have remarkable powers for absorbing ammonia and other substances which constitute the food of plants. On account of these powers dry argillaceous earth is an excellent disinfectant.

Clay, a county in the E. of Alabama. Area, 600 square miles. It is drained by several creeks, affluents of the Tallapoosa River. The surface is undulating; the soil fertile. Corn, tobacco, cotton, and wool are staple products. Capital, Ashland. Pop. 9560.

Clay, a county in the S. E. of Dakota. Area, 396 square miles. It is bounded on the S. by the Missouri, and is intersected by the Vermilion River. The soil is fertile, consisting of rolling prairie ("bench-land") and river-intervale ("bottom-land"). Wheat, oats, and hay are the chief crops. There is considerable timber in the county. It is intersected by the Dakota Southern R. R. Capital, Vermilion. Pop. 2621.

Clay, a county in the N. E. of Florida. Area, 430 square miles. It is bounded on the E. by the St. John's River. The surface is nearly level, and is heavily timbered. Cotton, sugar-cane, fruit, and rice are raised. Capital, Green Cove Spring. Pop. 2098.

Clay, a county of Georgia, bordering on Alabama. It is bounded on the W. by the Chattahoochee River. The surface is nearly level; the soil fertile. Cotton, wool, rice, and corn are staple products. It is intersected by the South-western R. R. Capital, Fort Gaines. Pop. 5493.

Clay, a county in the S. E. of Illinois. Area, 450 square miles. It is intersected by the Little Wabash River. The surface is nearly level; the soil is fertile. Grain, hay, wool, butter, tobacco, and live-stock are raised. It is traversed by the Ohio and Mississippi and the Springfield and Illinois South-eastern R. Rs. Capital, Louisville. P. 15,875.

Clay, a county in the W. of Indiana. Area, 360 square miles. It is drained by the Eel River. The surface is nearly level; the soil is fertile. Grain, hay, butter, and stock are largely raised. Timber, coal, and iron are found here. Clay county is intersected by the Indianapolis and St. Louis and the Terre Haute and Indianapolis R. Rs. Capital, Bowling Green. Pop. 19,084.

Clay, a county in the N. W. part of Iowa. Area, 576 square miles. It is intersected by the Little Sioux River. The soil is productive. Grain, live-stock, and hay are the chief products. Capital, Peterson. Pop. 1523.

Clay, a county in the N. N. E. of Kansas. Area, 720 square miles. It is intersected by the Republican River. The surface is undulating; the soil is fertile. Wheat, corn, and cattle are the chief products. It is intersected by a branch of the Kansas Pacific R. R. Capital, Clay Centre. Pop. 2942.

Clay, a county in the S. E. of Kentucky. Area, 600 square miles. It is intersected by the South Fork of the Kentucky River. The surface is mountainous. Coal and iron are found here, and salt is produced from salt-wells. Wool, corn, and tobacco are staple products. Capital, Manchester. Pop. 8297.

Clay, a county of Minnesota, bordering on Dakota. Area, about 900 square miles. It is bounded on the W. by the Red River of the North, and also drained by Buffalo River. The surface is nearly level; the soil is based on limestone, and is fertile. This county contains extensive prairies. It is intersected by the Northern Pacific R. R. Pop. 92.

Clay, a county in the W. N. W. of Missouri. Area, 415 square miles. It is bounded on the S. by the Missouri River. The surface is undulating; the soil is fertile. Grain, flour, wool, and tobacco are staple products. Limestone and sandstone occur here as surface-rocks. It is intersected by the Kansas City branch of the Hannibal and St. Joseph R. R., also by the St. Louis Kansas City and Northern R. R. Capital, Liberty. Pop. 15,564.

Clay, a county in the S. E. of Nebraska. Area, 576 square miles. It is drained by the Little Blue River and the West Fork of Big Blue. The surface is undulating; the soil fertile. Limestone abounds here. It is intersected by the Burlington and Missouri River R. R. in Nebraska. Capital, Sutton. Pop. 54.

Clay, a county in the W. of North Carolina. Area, 200 square miles. It is drained by the Hiawassee River. The surface is hilly. Corn, tobacco, and wool are the chief products. Capital, Hayesville. Pop. 2461.

Clay, a county of Tennessee, bordering on Kentucky. It is intersected by the Cumberland River. The surface is undulating; the soil fertile. It is a good region for grazing, as well as for grain crops. It was organized since the census of 1870. Capital, Celina.

Clay, a county in the N. of Texas. Area, 1100 square miles. It is bounded on the N. by the Red River, and intersected by the Little Wichita. It is a stock-raising region, but is adapted to grain. The bottom-lands are well timbered. The surface is rough and broken. Capital, Henrietta. Returned as having no population in the U. S. census of 1870.

Clay, a county of the central part of West Virginia. Area, 400 square miles. It is intersected by the Elk River, and contains large amounts of cannel and bituminous coal, with iron and salt. The surface is broken, the soil good and well timbered. Grain, cattle, and tobacco are raised. Capital, Marshall or Clay Court-house. Pop. 2196.

Clay, a township of Bradley co., Ark. Pop. 630.

Clay, a township of Columbia co., Ark. Pop. 357.

Clay, a township of Izard co., Ark. Pop. 275.

Clay, a township of White co., Ark. Pop. 517.

Clay, a township of Bartholomew co., Ind. Pop. 778.

Clay, a township of Carroll co., Ind. Pop. 949.

Clay, a township of Cass co., Ind. Pop. 814.

Clay, a township of Dearborn co., Ind. Pop, 1269.

Clay, a township of Decatur co., Ind. Pop. 2065.

Clay, a township of Hamilton co., Ind. Pop. 1413.

Clay, a township of Hendricks co., Ind. Pop. 1571.

Clay, a township of Howard co., Ind. Pop. 1350.

Clay, a township of Kosciusko co., Ind. Pop. 1973.

Clay, a township of La Grange co., Ind. Pop. 1248.

Clay, a township of Miami co., Ind. Pop. 972.

Clay, a township of Morgan co., Ind. Pop. 1234.

Clay, a township of Owen co., Ind. Pop. 1284.

Clay, a township of Pike co., Ind. Pop. 747.

Clay, a township of Spencer co., Ind. Pop. 1385.

Clay, a township of St. Joseph co., Ind. Pop. 1442.

Clay, a township of Wayne co., Ind. Pop. 1094.

Clay, a township of Clay co., Ia. Pop. 310.

Clay, a township of Grundy co., Ia. Pop. 329.

Clay, a township of Hardin co., Ia. Pop. 1394.

Clay, a township of Harrison co., Ia. Pop. 456.

Clay, a township of Jones co., Ia. Pop. 925.

Clay, a township of Marion co., Ia. Pop. 1372.

Clay, a township of Shelby co., Ia. Pop. 129.

Clay, a post-township of Washington co., Ia. P. 788.

Clay, a township of Wayne co., Ia. Pop. 473.

Clay, a township and village of St. Clair co., Mich. The village is on the St. Clair River, 30 miles N. E. of Detroit. Pop. 1475.

Clay, a township of Adair co., Mo. Pop. 1340.

Clay, a township of Atchison co., Mo. Pop. 1673.

Clay, a post-township of Clarke co., Mo. Pop. 1119.

Clay, a township of Douglas co., Mo. Pop. 333.

Clay, a township of Dunklin co., Mo. Pop. 1426.

Clay, a township of Greene co., Mo. Pop. 840.

Clay, a township of Harrison co., Mo. Pop. 911.

Clay, a township of Holt co., Mo. Pop. 887.

Clay, a township of La Fayette co., Mo. Pop. 3508.

Clay, a township of Huntingdon co., Pa. Pop. 814.

Clay, a township of Lancaster co., Pa. Pop. 1440.

Clay, a township of Hanover co., Va. Pop. 3085.

Clay, a township of Braxton co., West Va. Pop. 2164.

Clay, a township of Hancock co., West Va. Pop. 1507.

Clay, a township of Harrison co., West Va. Pop. 1574.

Clay, a township of Marshall co., West Va. Pop. 1005.

Clay, a township of Monongalia co., West Va. Pop. 1972.

Clay, a township of Randolph co., West Va. Pop. 540.

Clay, a township of Ritchie co., West Va. Pop. 2746.

Clay, a township of Taylor co., West Va. Pop. 738.

Clay, a township of Wirt co., West Va. Pop. 533.

Clay, a township of Wood co., West Va. Pop. 1108.

Clay (Cassius Marcellus), an American statesman, born in Madison co., Ky., Oct. 19, 1810. He graduated at Yale in 1832. He opposed the annexation of Texas to the Union, advocated the abolition of slavery, and made speeches in the Northern States in 1844 in support of Henry Clay as a candidate for the presidency. In 1845 he became the editor of the "True American," an anti-slavery paper issued at Lexington, Ky. He was attacked by mobs, against which he defended himself bravely in several bloody conflicts. He served as a captain in the Mexican war (1846–47), supported Abraham Lincoln in 1860, and became a brigadier-general in 1861. He was minister to Russia 1862–69.

Clay (Clement Comer, Jr.), born in Madison co., Ala., in 1819, is the son of C. C. Clay (1789–1866), who was for many years a prominent official of the U. S. and of Alabama. The younger Clay became a lawyer in 1840, a judge in 1844, was U. S. Senator from Alabama from 1853 to 1861, in which latter year he entered the Confederate Senate. After the war he was accused of complicity in the murder of President Lincoln, but after a short imprisonment was fully acquitted.

Clay (Henry), an American lawyer, orator, legislator, and statesman, thrice a candidate for President, and once very nearly elected, was born near "The Slashes" in Hanover county, not far from Richmond, Va., April 12, 1777. His father was a poor Baptist preacher, who died in 1782; his mother—a woman of noble character and fervid piety—married again ten years afterwards, and migrated to Kentucky, leaving this son (the fifth of seven children) a clerk in a retail store in Richmond, which he soon left for employment as a copyist in the office of Mr. Peter Tinsley, clerk of the high court of chancery, whom he served four years, passing thence to the office of Mr. Robert Brooke, then attorney-general, afterwards governor. Licensed as a lawyer in 1797, though not yet of age, he followed his mother to Kentucky, opened a law-office at Lexington, and soon achieved a lucrative practice. Kentucky, separating from her parent, Virginia, soon called a convention to frame a State constitution, and young Clay publicly besought her to provide therein for a gradual abolition of slavery, but was sternly overruled, as he was half a century later, when, in the fulness of his fame, he renewed this counsel on the revision of the State constitution in 1849–50.

Kentucky strongly sympathized with her mother State in its opposition to John Adams's administration, with its Alien and Sedition acts, and idolized Mr. Jefferson, Virginia's oracle, for whom she cast her first presidential vote in 1800. Young Clay was one of her favorite orators in that excited canvass, and was first chosen to represent his county (Fayette) in the legislature of 1803–04. Late in 1806, when scarcely eligible, he was chosen by the legislature of his State to fill a vacancy in the U. S. Senate caused by the resignation of General John Adair. His term expired with his first session, but he had already made his mark as a champion of the policy of internal improvement by the construction of roads, bridges, etc. He was again chosen to the legislature in 1807, and elected Speaker of the House. He now proposed that each member should clothe himself wholly in American fabrics, which was stigmatized by Mr. Humphrey Marshall as the project of a demagogue—language which led to a duel wherein both parties were slightly wounded. At the session of 1809, Mr. Clay was again chosen to fill a vacancy in the U. S. Senate—this time for two years. In Aug., 1811, he was elected to the House, and on the first day of his service was chosen its Speaker—an extraordinary proof of his ability and popularity. This Congress, in June, 1812, declared war against Great Britain, Mr. Clay being one of its foremost advocates, as he remained throughout the struggle, until despatched to Europe by President Madison as one of the negotiators of peace—a service which he rendered at Ghent with eminent ability. Returning to his country in Sept., 1815, he was received as a victor, and, having been re-elected to the House in his absence, he was rechosen Speaker without opposition. He had been conspicuous in defeating the recharter of the first bank of the U. S. in 1811; he was equally active and influential in promoting the charter of the second in 1816. He was now, as he had been, a champion of protection to home industry, and of national internal improvements; and he was foremost in effecting the compromise whereby Missouri was admitted as a slave State, on condition that all Federal territory north of latitude 36° 30′ should be consecrated to free labor. Having favored, in 1816, an increase of the pay of members of Congress from eight dollars per day to fifteen hundred dollars per annum, Mr. Clay was formidably opposed in his next canvass by John Pope, afterwards Jackson's governor of Arkansas Territory, but saved his seat by a vigorous effort.

In 1824 five candidates were started for President—William H. Crawford of Georgia, who had the caucus nomination; John Quincy Adams of Massachusetts, then President Monroe's secretary of state; General Andrew Jackson of Tennessee, then a U. S. Senator; John C. Calhoun of South Carolina, then secretary of war; and Henry Clay of Kentucky, then Speaker of the House. Mr. Calhoun soon withdrew, and was made Vice-President by pretty general consent, while Jackson, Adams, and Crawford (no one having a majority) were the three highest on the electoral vote, which compelled the House to choose between them. Mr. Clay, having received the votes of Kentucky,

Ohio, and Missouri only, with four of those cast from New York, was four votes behind Mr. Crawford, and so could not be voted for in the House. He and his friends cast their votes for Mr. Adams, electing him by the vote of thirteen States, to seven for Jackson and four for Crawford. Mr. Adams made Mr. Clay his secretary of state; whereupon a cry of "Bargain!" was raised, and General Jackson was at once proposed for next President. He was elected over Mr. Adams, Mr. Calhoun being again chosen Vice-President. At the next choice of President (1832) Mr. Clay was run against General Jackson, and was badly defeated by him. He had just been returned to the U. S. Senate, in which he played a leading part for many years ensuing, especially in the tariff compromise of 1833, whereby a conflict with South Carolina was averted, and in resistance to the new financial policy propounded by Mr. Van Buren in 1837, whereby the treasury was to be divorced from all connection with banks and their notes. Mr. Clay was again a candidate for President, before the first Whig national convention held at Harrisburg in Dec., 1839, but General Harrison was nominated and triumphantly chosen. His death and Tyler's course brought Mr. Clay forward as the unanimous choice of his party in 1844, when a desperate effort was made to elect him, but without success, James K. Polk of Tennessee carrying both the great States of New York and Pennsylvania by a handful of votes, when New York alone would have elected Clay. The annexation of Texas and the resulting war with Mexico were fruits of this election.

Mr. Clay's name was once more, and for the last time, presented to the Whig national convention of 1848, but General Taylor was nominated over him and elected. Mr. Clay had in 1842 bidden farewell to the Senate, but was persuaded to return to it after 1844, and bore a leading part in effecting the slavery compromise of 1850. He returned to Washington from Kentucky for the last time near the close of 1851, and was soon prostrated by disease, under which he gradually sank until his death, June 29, 1852, in the seventy-sixth year of his age.

Though not successful as an aspirant to the presidency, he was a gallant party chief, an admirable orator, a skilful legislator, wielding unequalled influence, not only over his friends, but even over those of his political antagonists who were subjected to the magic of his conversation and manners. HORACE GREELEY.

Clay (HENRY, JR.), son of the distinguished orator and statesman of the same name, an American officer and lawyer, born April 10, 1811, in Ashland, Ky., graduated at West Point 1831; resigned Nov. 1, 1831. Counsellor-at-law 1833–46; member of the Kentucky house of representatives 1835–37; and lieutenant-colonel Second Kentucky Volunteers in the war with Mexico 1846–47, engaged at Buena Vista, where, while gallantly leading a charge of his regiment, he was mortally wounded, and in that condition lanced to death, Feb. 23, 1847, aged thirty-six.
GEORGE W. CULLUM, *U. S. Army.*

Clay (JAMES B.), brother of the preceding, born in Kentucky in 1817, chargé d'affaires to Lisbon 1849, elected to represent his father's district in Congress 1857; espoused the Confederate cause, and died in Montreal, Canada, Jan. 26, 1864. G. C. SIMMONS, *Clerk Board of Eng'rs.*

Clay Banks, a post-township of Oceana co., Mich. Pop. 462.

Clay Banks, a post-township of Door co., Wis. Pop. 319.

Clay'burg, a post-village of Black Brook and Saranac townships, Clinton co., N. Y., has valuable iron-mines.

Clay Cen'tre, a post-village, the capital of Clay co., Kan., on the Republican River, about 125 miles W. of Leavenworth. It has one weekly newspaper. Pop. of the township, 1134.

Clay Cit'y, a post-village of Clay co., Ill., on the Little Wabash River and on the Ohio and Mississippi R. R., 102 miles E. of St. Louis. Pop. 594; of Clay City township, 1364.

Clay Court-house, or **Marshall,** a post-village, capital of Clay co., West Va., on the Elk River, 50 miles E. N. E. of Charleston.

Clay'mont, a post-village of New Castle co., Del., on the Philadelphia Wilmington and Baltimore R. R., 8 miles N. E. of Wilmington.

Clay'more [from the Gaelic *claidheamhmor*, a "broadsword"], sometimes spelled **Claymore,** the Gaelic name of a kind of broadsword which is not much used at present. It had a double-edged blade about forty-two inches long and two inches wide. The handle was often twelve inches long.

Clay Slate. See SLATE.

Clays'ville, a post-township of Marshall co., Ala. Pop. 827.

Claysville, a post-village of Donegal township, Washington co., Pa. Pop. 284.

Clay'ton, a county in N. W. Central Georgia. It is drained by the Flint River, which rises in or near it. The soil is partly fertile. Cotton and corn are the staple crops. It is intersected by the Macon and Western R. R. Capital, Jonesborough. Pop. 5477.

Clayton, a county in the E. N. E. of Iowa. Area, 760 square miles. It is bounded on the E. by the Mississippi River, and intersected by the Turkey River. The surface is diversified by undulating prairies and woodlands; the soil is fertile. Hay, grain, wool, butter, and cattle are extensively produced. Lead is found here. The manufactures embrace flour, furniture, carriages, cooperage, lumber, etc. A branch of the Milwaukee and St. Paul R. R. passes through this county. The Chicago Dubuque and Minnesota R. R. passes along the eastern border of the county. Capital, El Kader. Pop. 27,771.

Clayton, a post-village, capital of Barbour co., Ala., 75 miles S. E. of Montgomery, in a fruit and grain growing district. It has one weekly newspaper.
E. QUILLIN, ED. "COURIER."

Clayton, a post-village of Kenton and Duck Creek hundreds, Kent co., Del., 11 miles N. of Dover, at the junction of the Delaware and the Maryland and Delaware R. Rs. and the Smyrna branch. Pop. 124.

Clayton, a post-village, capital of Rabun co., Ga., about 100 miles N. E. of Atlanta. Pop. 70.

Clayton, a post-village and township of Adams co., Ill., on the Toledo Wabash and Western R. R., 28 miles E. N. E. of Quincy. It has one weekly newspaper. Pop. of Clayton township, 2063.

Clayton, a township of Woodford co., Ill. Pop. 1022.

Clayton, a township and village of Clayton co., Ia., on the Chicago Dubuque and Minnesota R. R., 45 miles N. W. of Dubuque. Pop. 954.

Clayton, a township of Taylor co., Ia. Pop. 530.

Clayton, a township and village of Genesee co., Mich., on the Port Huron and Lake Michigan R. R. Pop. 1047.

Clayton, a post-village of Lenawee co., Mich.

Clayton, a post-village and township of Gloucester co., N. J., on the West Jersey R. R., 21 miles S. of Camden. Total pop. 3674.

Clayton, a post-village of Jefferson co., N. Y., on the St. Lawrence River, by the Thousand Islands. It is a summer resort, and has a good harbor. Shipbuilding and rafting are carried on. It has one weekly newspaper. Pop. 1020; of township, 4082.
CLARK & CLARK, PUBS. CLAYTON "INDEPENDENT."

Clayton, a post-village and township of Johnston co., N. C., on the North Carolina R. R., 14 miles S. E. of Raleigh. Pop. 1534.

Clayton, a township of Perry co., O. Pop. 1195.

Clayton, a township of Crawford co., Wis. Pop. 1416.

Clayton, a township of Winnebago co., Wis. Pop. 1340.

Clay'ton (JOHN), an English botanist, born in Kent in 1686, emigrated to Virginia in 1705. He wrote on the natural history of Virginia. Linnæus and Gronovius published in 1739 a "Flora of Virginia, exhibiting the Plants which J. Clayton has collected." Died Dec. 15, 1773.

Clayton (JOHN MIDDLETON), LL. D., an American statesman, born in Sussex co., Del., July 24, 1796, graduated at Yale in 1815, studied law, which he practised in Delaware, and gained a high reputation. He was elected a Senator of the U. S. in 1829, joined the Whig party, and was re-elected to the Senate in 1835. In 1845 he was again chosen to represent Delaware in the national Senate, and in Mar., 1849, he became secretary of state in the cabinet of President Taylor. He negotiated with the British government the Clayton-Bulwer Treaty in 1850. Having resigned on the death of President Taylor in July, 1850, he was chosen a U. S. Senator for six years (1851–57). Died Nov. 9, 1856.

Clayton (POWELL), an American Senator, was before the late civil war a lawyer of Leavenworth, Kan. In 1861 he became colonel of the First Kansas Cavalry, and afterwards a brigadier-general, serving with ability, chiefly in Arkansas. He was governor of Arkansas 1866–71, and in the latter year was chosen U. S. Senator for six years.

Clayton (THOMAS), an American jurist, born in Delaware in 1778, was a Whig member of Congress from his native State (1813–17), and U. S. Senator (1823–26), and again (1837–47). He was for a time chief-justice of the

court of common pleas and of the supreme court of Delaware. Died Aug. 21, 1854.

Clayto'nia [named in honor of John Clayton, noticed above], or **Spring Beauty**, a well-known genus of American and Asiatic flowers of the order Portulaceæ. These beautiful flowers open in early spring, and are common in most of the U. S., one species being found in Alaska. The tubers of the *Claytonia tuberosa* are eaten in Siberia. Some of the species are naturalized in Europe.

Clay'tonville, a township and post-village of Brown co., Kan. The village is 18 miles N. W. of Atchison. Total pop. 2048.

Clay'ville, a post-village of Paris township, Oneida co., N. Y., has important and thriving manufactures. P. 944.

Clazom'enæ [Κλαζομεναί], an ancient Greek city of Ionia, was situated on a bay of the Ægean Sea, near Smyrna. It was the birthplace of the great philosopher Anaxagoras, who was born about 500 B. C. Its site is near the modern *Voorla*, on the S. side of the Gulf of Smyrna.

Clean'thes [Gr. Κλεάνθης], a Greek Stoic philosopher, born at Assos, in Asia Minor, about 300 B. C. He studied under Zeno at Athens, where at the same time he supported himself by manual labor. When Zeno died, about 260 B. C., Cleanthes succeeded him as the head of the Stoic school. He was solid and practical rather than speculative. His numerous works are lost except a hymn to Jupiter, which is commended as noble and elevated in sentiment. (See W. T. Krug, "Dissertatio de Cleanthe," 1819.)

Clear'ance, in mercantile language, is a certificate from the custom-house, the emigration officers, or both, signed before the departure of a ship, denoting that all the formalities have been observed and all dues paid. If a foreign vessel she must also be certified by the consul of the nation to which she belongs. The term "cleared" is usually applied to vessels which depart from a port with such a clearance.

Clear'chus [Gr. Κλέαρχος], a Spartan general who entered the service of Cyrus the Younger of Persia. He commanded a body of Greeks who fought for Cyrus against Artaxerxes, king of Persia, at Cunaxa, 401 B. C. After the defeat of Cyrus, Clearchus was captured by treachery, and was put to death by Artaxerxes in 400 B. C.

Clear Creek, a county in N. Central Colorado. It is drained by Clear Creek, an affluent of the South Platte River, and borders on the Middle Park. The surface is mountainous. Gray's Peak, near the border of this county, is over 14,000 feet high. Gold and silver are found here, the latter in great quantities. It is one of the chief silver-regions in Colorado. The soil of the valleys is very fertile. Capital, Georgetown. Pop. 1596.

Clear Creek, a township of Drew co., Ark. P. 776.

Clear Creek, a township of Hot Springs co., Ark. Pop. 231.

Clear Creek, a township of Sevier co., Ark. P. 238.

Clear Creek, a township of Washington co., Ark. Pop. 1199.

Clear Creek, a township and village of Alexander co., Ill. The village is on the E. bank of the Mississippi River, and 20 miles N. W. of Caledonia. Pop. of township, 1068.

Clear Creek, a township of Huntington co., Ind. Pop. 1273.

Clear Creek, a post-township of Monroe co., Ind. Pop. 1325.

Clear Creek, a township of Jasper co., Ia. P. 1125.

Clear Creek, a township of Johnson co., Ia. P. 728.

Clear Creek, a township of Keokuk co., Ia. Pop. 1118.

Clear Creek, a post-township of Nemaha co., Kan. Pop. 367.

Clear Creek, a township of Cooper co., Mo. Pop. 1198.

Clear Creek, a township of Vernon co., Mo. P. 445.

Clear Creek, a post-township of Mecklenburg co., N. C. Pop. 615.

Clear Creek, a township of Ashland co., O. P. 1198.

Clear Creek, a post-township of Fairfield co., O. Pop. 1743.

Clear Creek, a township of Warren co., O. P. 2605.

Clear'field, a county of W. Central Pennsylvania. Area, 1150 square miles. It is drained by the West Branch of the Susquehanna and by Clearfield Creek. Much of the surface is hilly, with fertile valleys. Cattle, grain, wool, and lumber are among the chief products. The manufacturing interests are varied. Semi-bituminous coal is found. The Clearfield branch of the Pennsylvania R. R. traverses the county. Capital, Clearfield. Pop. 25,741.

Clearfield, a post-village, capital of Clearfield co., Pa., on the West Branch of the Susquehanna River, which is crossed by two bridges, and on the Tyrone and Clearfield branch of the Pennsylvania R. R. It has two national and one other bank, two newspapers, a public park, an academy, a machine-shop, foundry, lumber manufactories, and brick-works. Pop. 1361.

G. B. Goodlander, Prop. Clearfield "Republican."

Clearfield, a township of Butler co., Pa. Pop. 847.

Clearfield, a township of Cambria co., Pa. Pop. 1531.

Clearfield, a township of Juneau co., Wis. Pop. 203.

Clear Fork, a township of Tazewell co., Va. Pop. 3415.

Clear Fork, a township of Raleigh co., West Va. Pop. 552.

Clear Fork, a township of Wyoming co., West Va. Pop. 529.

Clear'ing, a term used by bankers, denoting the exchanging of checks, drafts, and notes drawn upon each other, and the settlement of the balances resulting from the same.

Clearing-House, the place where the exchanges or clearings are made.

The New York Clearing-House.—The clearing-house system was first established in London about the beginning of the present century. It was introduced into this country by the banks of the city of New York, which established the New York Clearing-House by organizing an association and commencing operations on the 11th of Oct., 1853. At that time it consisted of fifty-two banks, five of which were soon closed by their inability to meet its requirements. They have since been established in the cities of Boston, Philadelphia, Chicago, and St. Louis. The cities of Hartford, Providence, Baltimore, and Cincinnati also employ a similar system, using a prominent bank as a clearing-house, settling the balances by checks upon it.

There are now (Oct. 15, 1873) in the city of New York seventy-five banks, with an aggregate capital of $87,501,300, many of them situated at remote distances from others. Each in its daily dealings receives large amounts of bills of, and checks on, other banks, so that at the close of the day's business every bank has in its drawers various sums thus due to it by other banks. It is in like manner itself the debtor of other banks, which have during the day received its bills and checks drawn upon it. Before the establishment of the clearing-house it was necessary for each bank every morning to make up its account with every other bank, and to send its porter to present the bills and checks so received to the debtor banks for payment. The balances of their indebtedness were adjusted by payments in gold, which became so laborious, dangerous, and complicated that the balances were settled only weekly, on Friday, instead of daily—a course that induced much evil. This was obviated by the clearing-house system, through which the settlements are so simultaneously and almost instantly effected that the transactions adjusted through it have amounted in one day to the enormous sum of $206,034,920.51, in adjusting which the exchanges were settled in the space of an hour. The establishment of the clearing-house system closed 2500 bank ledger accounts, with numerous daily entries in each; enabled the banks to settle every day with each other without delay or loss; and with comparatively little trouble brought each officer into intimate and friendly relations with the others, thus enabling them by united action to aid and strengthen each other in times of excitement and financial danger, and to exert by their combined power a salutary influence upon the banking business of the country at large.

It is doubtful if without the aid of the banks of the city of New York the U. S., upon the breaking out of the civil war in 1861, could have raised the loans necessary to carry on the war in time to have prevented the success of the enemies of the Union. It is certain that without the Clearing-House Association, the banks could not have furnished the funds which at once established the credit of the government, and enabled it, by the restoration of confidence, to negotiate its bonds to the enormous amount of over $2,000,000,000. During those exciting times the machinery of the Clearing-House worked with regularity and exactness; the banks, united as one, daily equalized their resources, and presented to the world a most important as well as practical proof that in "union is strength."

The panic of 1873 was only checked by similar action, the experience of the war enabling the banks to act with such promptness in combining their entire resources by the use of loan certificates to the extent of over $25,000,000,

as to sustain themselves against a panic, the serious results of which was greatly modified by their action.

The transactions of the Clearing-House to the 1st of Oct., 1873, a period of twenty years, shows the total transactions to amount to the sum of $387,587,804,028.49, an average of $63,000,000 per day for the entire period. The largest average daily transactions for any one year was for the year ending Oct. 1, 1869, amounting to $125,088,789.91. Of this vast business so exact and complete is the system that no difference of any kind exists in any of its books or accounts; neither has a loss occurred from its organization to the present time.

During the war the government issued "certificates of indebtedness" bearing interest, which were found to be desirable as a reserve for the banks. Accordingly, an arrangement was made for the issue of special certificates bearing interest, and available only to banks, members of the Clearing-House Association, and which were recognized in the national banking act of 1864 as part of the lawful reserve for a national bank. The principal of these certificates was made payable on demand, in legal-tender notes, at the office of the assistant treasurer of the U. S. in New York, and the interest to the manager of the Clearing-House and chairman of the Clearing-House committee jointly. This interest was payable semi-annually. The certificates were made available by a vote of the association for the settlement of balances at the Clearing-House, and were so used, thus changing daily the amounts held by each bank, and frequently (by the presentation of them by individual banks to the U. S. treasury for payment) changing the aggregate amount issued. The interest was collected and disbursed to the several banks by the Clearing-House regularly every six months, and each bank received the exact amount of interest due it, notwithstanding the amounts held by it for the whole period had changed daily.

The apparent intricacy of the calculations necessary to arrive at such results troubled some of the banks in other cities, who were desirous of availing themselves of the privileges offered by the use of these certificates; and in one or two instances committees were sent to New York to ascertain the process of computation in use, the simplicity of which, when explained, not only astonished them, but confirmed them in the opinion of the usefulness of an institution capable of adjusting with so much ease calculations which, at first sight, appeared so difficult. The largest amount of Clearing-House certificates in use in the city of New York at any one time was $36,000,000.

The Clearing-House is located at No. 48 Wall street. The clearing-room is provided with a continuous line of desks, sixty in number, in the form of an oval, one for each bank, each desk bearing the name and number of the bank by which it is occupied; the banks being numbered according to the date of their organization, the oldest (the Bank of New York) being No. 1, etc. etc. Each bank is represented every morning by two clerks—one a messenger, who brings with him the checks, drafts, etc. that his bank has received the day previous upon the other banks, which are called the "exchanges," and are assorted for each bank and placed in envelopes. On the outside of each envelope is a slip on which is listed the amounts of the various items which it contains. These envelopes are arranged in the same order as the desks for the several banks. The messengers, sixty in number, take their places in a line outside of the line of desks, each opposite the desk assigned to his bank, while on the other or inside of the desk is a clerk with a sheet containing the names of all the banks arranged in the same order, with the aggregate amounts his messenger has against each bank.

The hour for making the exchanges or general delivery is 10 o'clock A. M. Just previous to that time the manager takes his position at an elevated desk and calls the house to order. At a signal from a bell struck precisely at ten o'clock, each messenger moves forward to the desk next his own, and delivers the envelopes containing the checks, etc. for the bank represented by that desk to the clerk on the inside, together with a printed list of the banks in the same order, with the amount opposite each bank. The clerk receiving it signs and returns it to the messenger, who immediately passes to the next desk, delivering the exchange for the bank represented by that desk, and so on until he has made the circuit of the room and reached his own desk, the starting-point, having delivered to each bank the exchanges he had for it, and consequently delivering his entire exchanges for all the banks. Every other messenger does the like, the whole moving on at the same time. In other words, each messenger has visited every bank and delivered to each, everything his bank has received the day previous from it, taking a receipt for the same, consequently the entire exchanges are delivered; while each clerk upon the inside has of course received from every other bank the amounts each had against his bank. This operation occupies exactly ten minutes, and accomplishes what could not otherwise be done in less than six or eight hours.

Besides the saving of time gained by this method, each bank is enabled to know the exact balance for or against it at once, as the clerks, after receiving the envelopes containing the checks, etc., immediately enter from the slips, upon their own sheets, the aggregate amount from each bank; the difference between the total amount they have received and the total amount brought by them being the balance either due to or from the Clearing-House to each bank.

The messengers then receive from their several clerks the various envelopes containing the exchanges, and return to their banks, reporting their condition, debtor or creditor as the case may be. The clerks then report to the assistant manager the amount they have received, they having reported the amount each brought upon first entering the room. These amounts are entered in separate columns on what is termed a "proof sheet," and if no errors have been made the manager, finding that both columns agree, announces that the "proof is made," and the clerks return to their respective banks. If, however, any error has been made by any of the sixty clerks, it is indicated on the proof sheet, and the clerks are then required to revise and examine their work; and not until every error has been discovered and corrected are the clerks allowed to leave.

The clerks are allowed thirty-five minutes after the delivery of the exchanges to enter, report, and prove their work. If any errors are discovered after that time, fines are imposed for each error, which are collected monthly by drafts on the banks fined.

Various and ingenious methods are resorted to for discovering errors, and the manager, from long experience, generally is enabled to anticipate the nature of the error, whether in entry, footing, or transposition, and thereby facilitate its discovery by applying at once the best method of examination. When it is remembered that there are sixty sheets, each containing 120 entries, in all 7200 entries, the difficulty in discovering where the error is in the shortest possible time is apparent.

The entire business of the morning is usually accomplished in one hour. The debit banks are required to pay to the manager in legal-tender notes or coin, previous to half-past one o'clock the same day, and the credit banks receive immediately after that hour, the amounts due by or to them respectively, thus by one process settling exactly the entire transactions of all the banks of the day previous.

A record is kept of the daily transactions of each bank, and a statement of the loans, specie, legal tenders, deposits, and circulation made weekly to the manager of the Clearing-House, so that the movement of each bank can be determined and its condition pretty accurately estimated.

WILLIAM A. CAMP, *Manager of N. Y. Clearing-House.*

Clear'ing-nut, the seed of *Strychnos potatorum*, a small tree of the same genus with that producing the nux-vomica, abundant in India, and much used for clearing water. These seeds being rubbed on the inside of a vessel, any muddy water put into it very quickly becomes clear, all impurities settling to the bottom. The tree has ovate, pointed leaves, and a shining, black, edible, pulpy fruit, with one seed. The wood is very hard.

Clear Lake, in Lake co., Cal., is 112 miles N. of San Francisco, and is nearly 24 miles long. The width varies from 2 to 6 miles. It is surrounded by a picturesque region, which is frequented by tourists and hunters. Deer, bears, panthers, and foxes abound here. Fish of various kinds are found in this lake.

Clear Lake, a township of Mississippi co., Ark. Pop. 126.

Clear Lake, a township of Pulaski co., Ark. Pop. 378.

Clear Lake, a township of Sangamon co., Ill. Pop. 1566.

Clear Lake, a township of Steuben co., Ind. Pop. 455.

Clear Lake, a post-village of Cerro Gordo co., Ia., on the E. shore of Clear Lake and on a branch of the Milwaukie and St. Paul R. R., 10 miles W. of Mason. It is a summer resort, and has one weekly newspaper. The lake is about 6 miles long, and has two steamboats. Pop. 775.

ED. CLEAR LAKE "OBSERVER."

Clear Lake, a township of Cerro Gordo co., Ia. Pop. 175.

Clear Lake, a township of Hamilton co., Ia. Pop. 131.

Clear Lake, a post-township and village of Sherburne co., Minn., on a branch of the St. Paul and Pacific R. R., 60 miles N. W. of St. Paul. Pop. 137.

Clear Lake, township of Sibley co., Minn. P. 156.

Clear Spring, tp. of Lagrange co., Ind. Pop. 1223.

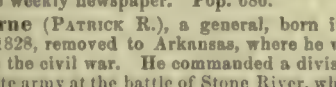
Clear Spring, post-tp. of Washington co., Md. P. 2763.

Clear'story, or **Clerestory,** in churches, the uppermost arcade, with side openings, interposed between the roof of the centre aisle and the roof of the side aisles. The lateral arcades constitute the triforium, or blindstory.

Clear Water, post-tp. of Wright co., Minn. P. 552.

Cleaveland (PARKER), LL.D., an American mineralogist and chemist, born in Rowley, Mass., Jan. 15, 1780. In 1805 he was chosen professor in Bowdoin College, and in all the fifty-three years of his connection with the institution missed on his own account only three recitations. His admirable work on "Mineralogy and Geology," which earned for him the title of "father of American mineralogy," was published in two volumes in 1816, and passed to a second edition in 1822. D. in Brunswick, Me., Oct. 15, 1858.

Cleaveland. See CLEVELAND.



Cleav'ers, or **Cli'vers** (*Galium Aparine*), a popular name of a plant of the order Rubiaceæ, an annual, with whorls of eight leaves, stem and leaves rough with bristles, the fruit hispid, and ready to adhere to one's clothing; a common weed in Europe, naturalized in the U. S.

Cle'burne, a county of Alabama, bordering on Georgia. Area, 500 sq. m. It is intersected by the Tallapoosa River. The soil is generally fertile, and produces corn, wool, tobacco, wheat, and cotton. C. Edwardsville. P. 8017.

Cleburne, a post-village, capital of Johnson co., Tex. It has one weekly newspaper. Pop. 686.

Cleburne (PATRICK R.), a general, born in Ireland Mar. 17, 1828, removed to Arkansas, where he was a lawyer before the civil war. He commanded a division of the Confederate army at the battle of Stone River, which ended Jan. 2, 1863, and at Chickamauga in September of that year. He was killed at the battle of Franklin, Tenn., Nov. 30, 1864. He was a daring and popular officer.

Clef [a word originally French, from the Lat. *clavis,* a "key"], a character placed on the musical staff, by which the names of the notes are fixed. There are three clefs—viz. the G or *treble* clef (on the second line); the F or *bass* clef (on the fourth line); and the C clef, which is placed on the fourth line for the *tenor,* and on the third line for the *alto,* thus:

The C clef is often found in orchestral music, as well as in vocal scores, and also in treatises on musical science, where it sometimes appears on the *lowest* line. But on whatever line it is placed, a note on that line becomes middle C—*i. e.* the C midway between the F of the bass clef and the G of the treble clef, eleven degrees above gamut G, and the other notes, above and below, are named accordingly.

The G and F clefs are now in most general use, both in vocal and instrumental music. And though a tenor part with the G clef is really an octave out of place, yet this is understood by the singer, who naturally gives to each note its true pitch—viz. an octave below.

Clem'atis [Gr. κληματίς, from κλῆμα, a "shoot of the vine," so called from its resemblance to a vine], a genus of herbs and shrubs of the order Ranunculaceæ, having four colored sepals, no corolla, and for fruit numerous one-seeded achenia with long, persistent feathery styles. These render some species ornamental in fruit as well as in blossom. The white-flowered species, such as *Clematis flammula* of Europe and *C. Virginiana* of the U. S., have the popular name of virgin's bower. The very large-flowered blue and purple species, recently introduced into common cultivation, are varieties of *C. florida* and *C. patens,* natives of Japan. There are about twenty species indigenous to the U. S. The herbage abounds in the acrid and vesicant watery juice which is common in the family, and has been used as a rubefacient in rheumatism. Some species of the U. S., such as *C. viorna,* have very thick and leathery sepals, whence the name of "leather-flower." From its free growth and neat foliage, as well as handsome flowers, clematis is a favorite for arbors or for covering walls. It climbs by its leaf-stalks.

Clem'ens (Hon. JEREMIAH), an American politician, born at Huntsville, Ala., Dec. 28, 1814, became a lawyer in 1834, distinguished himself in State politics and in the affairs of Texas in 1842. He served with distinction in the Mexican war, and was rapidly promoted in the army, and became colonel in 1848. He was U. S. Senator from Alabama (1849–53). He held office under the Confederacy, though not a warm friend of that cause. He advocated the re-election of Lincoln in 1864. Died at his native town in 1865. Col. Clemens was an eminent lawyer and the author of several works of fiction.

Clemens (SAMUEL LANGHORNE), better known as MARK TWAIN, an American humorist, born in Monroe co., Mo., Nov. 30, 1835. He became a journalist at Virginia, Nev., in 1862, and subsequently followed the same profession at San Francisco and at Buffalo, N. Y. He has published "The Jumping Frog" (1867), "The Innocents Abroad" (1869), "Roughing It" (1872), etc.

Clemens Romanus. See CLEMENT I.

Clem'ent [Lat. *Titus Flavius Clemens* or *Clemens Alexandrinus*] **of Alexandria,** an eminent Father of the Christian Church, is supposed to have been a native of Athens, and originally a pagan. He passed the greater part of his life at Alexandria, where he became a disciple of Pantænus, a Christian philosopher. He was ordained a presbyter, and in 202 A. D. retired to Palestine to escape persecution. About 206 he returned to Alexandria, and was a teacher of catechumens. He succeeded Pantænus at the death of the latter, and acquired a high reputation for wisdom and virtue. Origen was one of his pupils. Clement was more addicted to speculative philosophy than most of the Fathers of the Church. Among his extant works (written in Greek) are "Pædagogus" and "Stromata" (Gr. Στρωματεῖς), which is a medley of religious thoughts, anecdotes, and maxims of philosophy. Died about 220 A. D. (See KAYE, "Account of the Writings, etc. of Clement of Alexandria," 1835: REINKENS, "De Clemente Presbytero Alexandrino," 1851.)

Clem'ent I. (or **Cle'mens Roma'nus**), the earliest of the Apostolic Fathers, a bishop, accounted by Roman Catholic writers as fourth in the order of succession at Rome. Origen (254) identifies him with the Clement of Phil. iv. 3, but this may be only a conjecture. Irenæus (202) makes him the third after the apostles Peter and Paul, Linus being the first and Cletus (or Anacletus) the second. Eusebius says he died in the third year of Trajan, "having for nine years superintended the preaching of the Divine word." Accordingly, he presided over the Church from 91 or 92 to 100 or 101 A. D. His Epistle to the Corinthians, written about 96 or 97 A. D., consists of fifty-nine short chapters, and in bulk is about one-third larger than Saint Paul's First Epistle to the Corinthians. It used to be read in many ancient churches, but was not included in any of the ancient lists of authoritative books. Other writings ascribed to Clement are not his. (See CLEMENTINES.)—CLEMENT II., a native of Saxony, was elected pope in 1046. He crowned the emperor Henry III., and died in 1047. He was the first of the six German popes.—CLEMENT III., a native of Rome, was elected pope in 1187. He promoted the third crusade against the Saracens. Died in 1191. There was also an anti-pope of this title, who died in 1100. —CLEMENT IV. (GUY FOULQUES) was born in France. He succeeded Pope Urban IV. in 1265, and died in 1268.—CLEMENT V., POPE, was a Frenchman named BERTRAND DE GÔT. He was chosen pope in 1305, as successor to Benedict XI. To gratify Philippe le Bel, king of France, he resided at Avignon, which became the capital of the popedom. This innovation gave much offence, and caused a long schism in the Church. He suppressed, in 1311, the order of Templars. He died in 1314, and was succeeded by John XXII.—CLEMENT VI. (PIERRE ROGER), born at Limousin, in France, succeeded Benedict XII. as pope in 1342. He reigned at Avignon, the sovereignty of which he purchased from Joanna of Naples. He died in 1352, and was succeeded by Innocent VI.—CLEMENT VII. (ROBERT COUNT OF GENEVA), ANTIPOPE, was bishop of Cambray when in 1378 he was elected antipope in the time of Urban VI. With him began the great Western schism. Died in 1394.—CLEMENT VII. (GIULIO DE' MEDICI), a cousin of Leo X., succeeded Adrian VI. as pope in Nov., 1523. He joined Francis I. of France and the Venetians in a league against Charles V., whose army, commanded by Constable Bourbon, took Rome by assault in 1527. The pope then became a prisoner for several months. He refused to gratify Henry VIII. of England by granting him a divorce from Queen Catharine, and issued a famous bull against him in 1534. He died in the same year, and was succeeded by Paul III.—CLEMENT VIII. (IPPOLITO ALDOBRANDINI), POPE, a native of Fano, in Italy, was chosen in place of Innocent IX. in 1592. He annexed the duchy of Ferrara to the Papal States. He died in 1605, and was succeeded by Leo XI.—CLEMENT VIII. (EGIDIO MUÑOZ), ANTIPOPE, was canon at Barcelona, and was in 1424, after the death of Benedict XIII., elected pope by three cardinals. His resignation in 1429 ended the great schism of the West.—CLEMENT IX. was born at Pistoja in 1600, and was chosen pope in June, 1667, as the successor of Alexander VII. He died in Dec., 1669, and was succeeded by Clement X.—

Clement X. (Emilio Altieri) was a native of Italy. He was nearly eighty years old when he became pope in 1670. He died in 1676, and was succeeded by Innocent XI.—Clement XI. (Giovanni Francesco Albani) was born at Pesaro, in Italy, in 1649. He succeeded Innocent XII. in 1700. In 1713 he issued the famous bull *Unigenitus*, which condemned 101 propositions of Quesnel's work on Grace and Predestination. This bull was approved by the Jesuits and opposed by the Jansenists. Clement aided the Pretender in his effort to seize the British crown in 1715. Died in 1721. Innocent XIII. was his successor. (See Lafitau, "Vie de Clément XI.," 1752.)—Clement XII. (Lorenzo Corsini) was born at Florence in 1652. He became pope in 1730, as the successor of Benedict XIII. He died in 1740, and was succeeded by Benedict XIV.—Clement XIII. (Carlo Rezzonico) was born in Venice in 1693, and succeeded Benedict XIV. as pope in 1758. He offended the French and Spanish monarchs by impolitic attempts to assert his prerogative. He issued a bull in favor of the Jesuits, who had been expelled in 1767 from France and Spain. He died in 1769, and was succeeded by Clement XIV.—Clement XIV. (Giovanni Vincenzo Antonio Ganganelli), an eminent and learned pope, was born near Rimini in 1705. He succeeded Clement XIII. in 1769. He took measures to conciliate several Catholic powers which Clement XIII. had offended. He was more liberal than many of the popes, and had a good reputation for ability and virtue. Among the important events of his pontificate was the suppression of the order of the Jesuits, which he formally decreed in July, 1773. He founded the Clementine Museum in Rome. Died in Sept., 1774. (See Caraccioli, "Vie de Clément XIV.," 1775; Theiner, "Geschichte des Pontificats Clements XIV.," 3 vols., 1853.)

Clemen'ti (Muzio), an excellent Italian pianist and composer, born at Rome in 1752. He was patronized by Mr. Beckford, who took him to England about 1765. At the age of eighteen he composed his "Opera 2," which is regarded as the basis on which the whole fabric of modern sonatas for the piano has been founded. He composed numerous sonatas, and wrote "Gradus ad Parnassum." Died Mar. 10, 1832.

Clem'entines, or Pseu'do-Clem'entines, a name given to two writings, the "Homilies" and the "Recognitions," falsely ascribed to Clement of Rome. They originated in Rome about the middle of the second century. They were edited by Schwegler (1847) and others.

The name Clementines is also applied to that part of the canon law which was collected and published by Pope Clement V. (1305–14).

Clem'monsville, a township of Davidson co., N. C. Pop. 978.

Clenden'nin, a township of Mason co., West Va. Pop. 1657.

Cleobu'lus [Gr. Κλεόβουλος], one of the Seven Wise Men of Greece, was king of Lindus, in Rhodes, in the sixth century B. C. His favorite maxim was Ἄριστον μέτρον, which inculcates the advantages of moderation.

Cleom'brotus [Gr. Κλεόμβροτος], a Spartan general, was a brother of Leonidas, who fell at Thermopylæ. He commanded the army in 480 B. C., after the death of Leonidas. He was the father of Pausanias, who defeated the Persians at Platæa.

Cleombrotus I., king of Sparta, a grandson of the preceding, began to reign in 380 B. C. He commanded the Spartans at Leuctra, where he was defeated by Epaminondas and killed in 371 B. C. He left two sons, Agesipolis II. and Cleomenes II.

Cleome'des [Gr. Κλεομήδης], an ancient Greek astronomer whose native place and period are unknown. He wrote a remarkable treatise on astronomy entitled "The Circular Theory of the Heavenly Bodies," which is extant and has been printed. This contains several scientific truths, as the spherical figure of the earth and the revolution of the moon about the earth. The refraction of light was noticed by him.

Cleom'enes, an Athenian sculptor of whom little is known. He is mentioned by Pliny as the author of a group of Muses possessed by Pollio in Rome. His name also appears on the famous statue of Venus de' Medici.

Cleomenes, or Kleomenes [Gr. Κλεομένης], **I.,** king of Sparta, succeeded his father, Anaxandrides, about 518 B. C. He liberated Athens from the domination of the Pisistratidæ in 510, but he afterwards attempted to restore Hippias. He procured the dethronement of Demaratus, who had reigned jointly with himself. He died in 489 B. C., and was succeeded by his half-brother, the heroic Leonidas.

Cleomenes III., king of Sparta, of the Agidæ line, was a son of Leonidas II. He began to reign in 236 B. C., and resolved to restore the ancient Spartan virtue and discipline. He declared war against the Achæan League, and defeated Aratus at Megalopolis in 226 B. C. He put to death all the ephori except Agesilaus (who escaped), made a new division of land, and restored the old social system. Antigonus, king of Macedon, who was an ally of the Achæans, defeated Cleomenes at Sellasia in 222 B. C. Cleomenes fled to Egypt, and killed himself in 220 B. C. (See Plutarch, "Cleomenes" and "Aratus.")

Cle'on, or Kleon [Gr. Κλέων], an Athenian demagogue distinguished for his insolence and venality, was a tanner in his youth. He is first mentioned in history about 428 B. C. He was a leader of the democracy or lower classes. In 425 B. C., Cleon and Demosthenes conducted a successful expedition against Sphacteria. He was elated with this victory, which increased his credit so much that he obtained the command of an army which was sent against the Spartan general Brasidas in 422 B. C. Cleon and Brasidas were both killed in the battle of Amphipolis, where the Athenians were defeated.

Cle'on, a township of Manistee co., Mich. Pop. 85.

Cleo'na, a township of Scott co., Ia. Pop. 847.

Cleopa'tra [Gr. Κλεοπάτρα], a daughter of Philip of Macedon, was a sister of Alexander the Great. She was married in 336 B. C. to Alexander, king of Epirus, who was her mother's brother. After the death of her brother she was assassinated by the order of Antigonus.

Cleopatra [Gr. Κλεοπάτρα], a celebrated and fascinating queen of Egypt, born in 69 B. C., was a daughter of Ptolemy Auletes. She was distinguished for her personal charms, was richly endowed with mental gifts, and was mistress of the Greek and other languages. Her father, dying in the year 51, left the throne to her in partnership with her brother Ptolemy. The latter deprived her of royal power, but Julius Cæsar interposed in 48 B. C., and restored her to the throne after her brother Ptolemy had been killed in battle. She captivated the affection of Cæsar, and accompanied him to Rome in the year 46. After he had been killed in 44 B. C., she returned to Egypt. Soon after the battle of Philippi (42 B. C.) she was summoned by Antony to appear before him in Cilicia. He was fascinated by her charms, and became so infatuated that he neglected his interests and public affairs, and spent much time with her in Alexandria. Her fleet fought against Augustus at the naval battle of Actium, at which she was present, 31 B. C. She was the first to order a retreat on this occasion, and was eventually taken prisoner by Augustus, who intended to exhibit her in a triumphal procession in Rome. To frustrate this design, she killed herself by the poison of an asp in 30 B. C.

Clep'sydra, or Clepsy'dra [Gr. κλέπτω, to "steal," and ὕδωρ, "water," because the water seems to steal away imperceptibly], an instrument for measuring time by the gradual flow of water through a small orifice. Two kinds have been used—one wherein the fluid is allowed to escape through the orifice; the other, in which uniformity of flow is secured by maintaining the fluid at a constant level. The clepsydra is supposed to have been used among the Chaldæans. The Greeks and Romans employed it extensively. In modern times the invention of pendulum clocks has superseded it, though it is still used in China. It anciently had in some instances a musical attachment by which attention was called to the hour, as by the stroke of a bell in our clocks.

Clerc (Laurent), a celebrated deaf-mute, born at La Balme, near Lyons, France, Dec. 26, 1785. When one year of age he lost his hearing in consequence of a severe burn. At the age of twelve he became a pupil of the abbé Sicard at Paris, and in 1805 was a teacher of deaf-mutes under that eminent instructor. He came to the U. S. in 1816 with Gallaudet, and was one of the founders of the Hartford asylum for the deaf and dumb, which was opened in 1817. He was a laborious and successful teacher of deaf-mutes. Died at Hartford, Conn., July 18, 1869.

Cler'gy [from the Gr. κλῆρος, originally meaning an "inheritance;" Lat. *clerus*], a collective term applied to the ministers of the Christian religion in contradistinction to the laity. This use of the term is ancient, and gradually became prevalent as the ministers of religion more and more exclusively were regarded as God's "heritage." In the Church of Rome the distinction between the clergy and the laity became more marked through the multiplication of titles among the priesthood, the ascription to them of peculiar privileges, their assumption of peculiar official insignia, and the doctrine of celibacy. In harmony with this distinction is that of an indelible character derived from ordination, so that a renunciation of the clerical office is either viewed as an impossibility or apostasy. In the Protestant churches the distinction between clergy and

laity is less wide. Among the rights asserted by the clergy in the Middle Ages, and which caused much dispute, was exemption from lay jurisdiction, even in cases of felony. The clergy were distinguished into the *higher clergy* and the *lower clergy*, the latter including janitors, acolytes, exorcists, etc. The term *secular clergy* is the designation of priests of the Church of Rome who are not of any religious order, but have the care of parishes. Monks who are in holy orders are designated regular clergy, because they obey a monastic rule (*regula*).

Cler'gyman, an ordained minister, authorized to preach and to administer the ordinances according to the rules of some denomination of Christians; in England the term is popularly restricted to ministers of the Established Church. (See CLERGY.)

Clerk [Lat. *clericus;* Fr. *clerc*]. This word formerly signified a clergyman, an educated man, a scholar. In modern usage it is applied to a scribe, secretary, writer, or accountant; a person who is employed in writing in a public office, bank, or counting-house.

Clerk (JOHN), a Scottish naval tactician, born at Eldin about 1730. He is said to be the inventor of the manœuvre in naval tactics called "breaking the line." This plan was first tried by Lord Rodney in April, 1782, when he gained a victory over the French admiral de Grasse. Clerk published in 1782 an "Essay on Naval Tactics." Died May 10, 1812.

Clerk to the Signet. See WRITER TO THE SIGNET.

Clermont, a city of France, capital of the department of Puy-de-Dôme, is finely situated on an eminence 208 miles S. by E. from Paris, with which it is connected by a railway. It is near a range of extinct volcanoes, and is surrounded by remarkable scenery. It has some manufactures, and a considerable trade with Paris in the products of the surrounding country. It has a Gothic cathedral of the thirteenth century, a college, a public library of 1600 volumes, a theatre, a normal school, and a botanic garden. Clermont occupies the site of the ancient capital of the Arverni, which was originally called *Nemosus*, and afterwards *Augustonemetum*. It became a bishop's see about 250 A. D. The great council in which the Crusades originated was held here by Pope Urban II. in 1095. Clermont was the capital of Auvergne for several centuries. Pop. 37,690.

Clermont, a town of France, department of Oise, on the Railway du Nord, about 50 miles N. of Paris. It has a college and a public library. Pop. 5743.

Cler'mont, a county in the S. W. of Ohio. Area, 462 square miles. It is bounded on the S. W. by the Ohio River and on the W. by the Little Miami. The surface is partly hilly; the soil is fertile. Grain, wool, tobacco, and dairy products are extensively raised. The manufacturing interests are various and quite extensive, including lumber, furniture, cooperage, saddlery, flour, clothing, carriages, etc. Blue limestone abounds here. Capital, Batavia. P. 34,268.

Clermont, a township and post-village of Fayette co., Ia. The village is on Turkey River, 100 miles N. of Iowa City. It has one weekly newspaper. Pop. 1263.

Clermont, a township and post-village of Columbia co., N. Y., on the Hudson River R. R., 12 miles S. S. W. of Hudson. Pop. 1021.

Clermont-l'Hérault, a town of France, department of Hérault, 25 miles W. of Montpellier. It has a communal college and an old ruined castle; also manufactures of woollen cloth. Pop. 6050.

Cle'thra [Gr. κλήθρα, an "alder"], a genus of trees and shrubs of the order Ericaceæ. The *Clethra alnifolia* occurs from Maine to Florida, and westward. Its racemes of fragrant white flowers are mentioned in one of Whittier's poems. The *Clethra acuminata* is a small tree of Virginia and North Carolina.

Cleveland, a wild mountainous district, with some picturesque and fertile valleys, forming the E. part of the North Riding of Yorkshire, England. It includes Guisborough, Stokesley, and the Moors. It is 30 miles long from E. to W. and 15 miles wide from N. to S. It gives the title of duke to the Vane family.

Cleveland, a county of North Carolina, bordering on South Carolina. Area, 500 square miles. It is drained by the First Broad River. The surface is hilly; the soil productive. Grain and wool are the chief products. Alum and copperas are produced. It is intersected by the Wilmington Charlotte and Rutherford R. R. Capital, Shelby. Pop. 12,696.

Cleveland, a post-village, capital of White co., Ga., about 85 miles N. N. E. of Atlanta. Pop. 145.

Cleveland, a township of Elkhart co., Ind. Pop. 549.

Cleveland, a township of Whitley co., Ind. Pop. 2041.

Cleveland, a post-township of Le Sueur co., Minn. Pop. 1052.

Cleveland, an incorporated post-village of Oswego co., N. Y., on the N. shore of Oneida Lake, and on the New York and Oswego Midland R. R., 41 miles S. E. of Oswego, has 2 glass-factories, 1 large tannery, 3 saw-mills, 1 grist-mill, 2 boatyards, and 2 printing-offices. Pop. 895.

CHARLES R. KING, PUB. "LAKE SIDE PRESS."

Cleveland, the second city of Ohio in extent and population, is situated upon the S. shore of Lake Erie, at the mouth of the Cuyahoga River, in lat. 41° 30′ 5″ N., and lon. 81° 42′ 6″ W., and constitutes the seat of government for Cuyahoga co. Its railroad distance from Columbus, the capital of the State, is 138 miles. Its area exceeds 25 square miles, more than 16,000 acres of territory being included within its limits. It was founded in 1796, a survey being completed in October of that year by Gen. Moses Cleaveland, one of the directors of the Connecticut Land Company, in whose honor the city was named. No permanent settlement was accomplished earlier than 1800, although several attempts were made to establish a colony upon what was at that time considered the site of a future city. Dec. 23, 1814, an act was passed by the legislature incorporating the village of Cleveland, the limited government being vested in a president, recorder, and three trustees. In 1836 a city charter was obtained and the first mayor elected. In 1855 a union was effected with Ohio City, which had sustained a separate existence upon the W. side of Cuyahoga River, at the expense of many jealousies and disputes, requiring the intervention of the courts.

The history of Cleveland for each decade exhibits a remarkable increase in population, as well as in material wealth and prosperity. The number of inhabitants in 1810 was 57; in 1820, 350; in 1830, 1000; in 1840, 6071; in 1850, 17,034; in 1860, 43,417; in 1870, 93,018; and with the acquisition of the populous territories of what were formerly known as East Cleveland and Newburg, and the rapid increase since the last U. S. census, its population at the present time may be safely estimated at 150,000. With railroads converging from all directions except the north; with the chain of great lakes opening communication with the rich iron and copper mines of Lake Superior, and affording cheap transportation for merchandise and products of all descriptions; with the Ohio Canal traversing the interior of the State, connecting Lake Erie with the Ohio River at Portsmouth, opening a passage to all the principal markets of the South, and, with its tributary, the Ohio and Pennsylvania Canal, penetrating the extensive coal-fields of Ohio and Pennsylvania,—the commercial facilities of Cleveland are second to no city in the West. Its harbor is considered the most commodious and safe of any upon Lake Erie. It consists of two piers, each extending from the mouth of Cuyahoga River 1200 feet into the lake, between which is a channel 200 feet wide, and of sufficient depth for the safe entry of the largest vessels.

The number and tonnage of vessels of all kinds owned in Cleveland and enrolled during the year 1873 was—propellers 28, tonnage 83,223; steamers 2, tonnage 259; tugs 26, tonnage 962; barques 3, tonnage 1269; steambarges 2, tonnage 144; schooners 66, tonnage 25,282; scows 23, tonnage 2302; barges 1, tonnage 86; yachts 1, tonnage 6; canal-boats 50. Plans are prepared and surveys have been made with the view of constructing a harbor of refuge at this point for the protection of shipping upon the S. shore of the lake, the estimated cost of the work being $2,000,000. The most vital elements in the growth and prosperity of Cleveland are to be found in her manufactories. The number of distinct manufacturing establishments is 325, the amount of capital invested being about $20,000,000. Of this number, 82 are largely engaged in the manufacture of iron, with $5,000,000 invested as capital and 9000 men engaged as laborers; the gross amount of wages paid in 1873 being $7,475,650; the amount of iron produced in the same year by 12 of the principal establishments being 238,500 tons. During the year 1872 the petroleum refining interests were consolidated. The present number of refineries is 6, with an aggregate capital of $2,600,000. During the year 1873 more than 2,000,000 barrels of crude oil were consumed, producing 1,500,000 barrels of refined, valued at $12,000,000, and giving employment to 2000 men. In the same year 50,000 sewing-machines were manufactured by one firm.

The assessed valuation of the city, Jan. 1, 1873, was $65,000,000. The total bonded and floating debt at the commencement of 1873 was $3,209,000, the property owned by the city being valued at $6,015,400.75, including a sinking fund of $1,551,106.41. The disbursements by the city government during 1872 were $853,942.13. It has six national banks.

The house of correction and workhouse was first occupied in Mar., 1871, being built at a cost of $171,000. Its inmates are furnished by the police court, court of common pleas, and probate court. The total number of prisoners received from its opening to Sept. 10, 1873, was 2472, the average number in confinement being 260. The other prisons of the city are the central police station, five precinct stations, and the county jail.

The Cleveland Medical College was established in 1843. Its faculty is composed of 15 professors; its alumni number 1211; average attendance of students is 125; cost of tuition, $40; graduation, $30; its library contains 2000 volumes, and its museum several hundred anatomical and pathological preparations, models, and drawings; the Cleveland Eye, Ear, and Throat Institute is conducted under its sanction. The Cleveland Homœopathic College was founded in 1850. Its faculty numbers 17 professors; its alumni are 650; average attendance, 100; cost of tuition, $75; library, 1000 volumes; its museum is stored with extensive collections pertaining to the science. The medical department of the University of Wooster was established in Cleveland in 1866. Its faculty is composed of 14 professors; the average number of students in attendance is 80; alumni, 600; cost of tuition, $65. Its library is well selected, and it possesses a museum of great value. The Ohio State and Union Law College was opened in Cleveland in 1858. The public schools of the city are 32 in number, organized in accordance with the provisions of the State law. The number of teachers is 234; amount of salaries paid annually, $169,000; number of pupils, 10,300. There are also 3 high schools, with 15 teachers and 454 scholars. The Catholic parochial schools are 15 in number; 68 teachers, 6200 pupils; convent, 10 teachers. Three industrial schools, with an average attendance of 200 pupils, are supported by appropriations from the city treasury and donations from citizens for the benefit of destitute children. The Cleveland Public Library was opened on Feb. 18, 1869, with 6300 volumes, the present number being 17,000. It is supported by a tax of one-tenth of a mill on the assessed valuation of the city. Its income is about $6500; increase, nearly $500 annually. The Cleveland Library Association, chartered in 1848, and subsequently united with the Mercantile Library, enjoys an endowment of $23,000, and its library contains 10,500 volumes. The Cleveland Law Library was established in 1870 by a joint-stock company; capital stock, $20,000, every person purchasing two shares at $25 each being a member. It contains 2000 volumes, with an annual increase of 300. It is supported by dues from members and an income of $500 per year derived from fines assessed by the police court on State cases. In addition to these are the libraries of the Western Reserve Historical Society, Kirtland Society, and Bethel Free Reading-rooms. There are 4 English and 2 German daily papers, 1 German, 3 English tri-weeklies, and 35 miscellaneous weekly and monthly publications.

The churches of Cleveland are 102 in number: Evangelical Protestant, 3; Disciples, 2; Hebrew, 2; Christian, 2; Free-Will Baptist, 1; Society of Friends, 1; Spiritualists, 1; Swedenborgian, 1; Unitarian, 1; United Brethren, 1; Universalist, 1; Reformed, 5; Methodist Episcopal, 18; Protestant Episcopal, 11; Roman Catholic, 15; Presbyterian, 8; Baptist, 8; Congregational, 4; Evangelical Association, 4; United Evangelical, 3; Evangelical, 4; Evangelical Lutheran, 2; miscellaneous, 4.

Charity (St. Vincent's) Hospital was opened in the year 1866, and was built by general subscription and donations. It has capacity for 200 patients, the average number being 60; the total number admitted to Sept. 1, 1873, 3500. It is supported by donations and the revenue derived from paying patients. The City Infirmary is maintained at an annual cost of about $14,000. The total number of inmates received during the nine months ending Jan. 1, 1873, was 439; maximum weekly number, 180; minimum, 126; average, 150. In connection with the infirmary is a farm, the total products of which in 1872 amounted to $11,900.82; an out-door relief is organized for the purpose of rendering assistance to the needy outside of the infirmary. The Cleveland City Hospital, to which the first patient was admitted July 23, 1866, has no endowment, but enjoys an annual income of $7000, derived from the rental of beds to railroad companies and individuals, and donations from the charitable. The average number of inmates is 175, and the total number of names upon the register Sept. 10, 1873, was 577. The Foundling Hospital, established in Jan., 1873, has an average of 20 inmates. It has no endowment, and is supported by donations. The Lying-in Hospital was also established in Jan., 1873, and is managed in connection with Charity Hospital. The average number of inmates is 14, and the total number admitted to Sept. 15, 1873, was 24. The Homœopathic Hospital was founded in 1868 by the faculty of the Cleveland Homœopathic College; average number of patients is 20; total admitted, 550. The U. S. Marine Hospital was opened in 1852 for the benefit of sailors, and is supported by appropriations from Congress and a tax of forty cents per annum on all sailors in the Cleveland district. It has a capacity for 50 inmates, the average number being 20, and the total number admitted since April 1, 1865, 2331.

The benevolent institutions are four in number. The Home for the Aged Poor was founded in 1870 by the "Little Sisters of the Poor." It has no endowment, but is supported by donations and solicited charity. The average number of inmates is 90, their ages ranging from sixty to ninety-five years, and the total number received since the opening of the Home is 125. The Home for Workingwomen was opened in Nov., 1869, and enlarged in 1872. It has no endowment, but its buildings and lot, valued at $40,000, were presented by a benevolent gentleman of the city to the Woman's Charitable Association, by which it is conducted. Its income in 1873 was about $5000, derived from boarders, and its average number of inmates during the same year was 35. The Retreat, supported by the Woman's Christian Association, was founded in July, 1869. It has no endowment; its inmates average 9, and the total number admitted to Sept. 15, 1873, was 175. Trinity Church Home is supported by the congregation of Trinity Episcopal Church. The Cleveland Protestant Orphan Asylum was organized Feb. 22, 1852, and chartered Feb. 22, 1853. It enjoys an endowment of $50,000, its income being about $5000 per annum. The total number of children to whom its benefits have been extended is 1900, the average number in the asylum 60. St. Mary's Female Orphan Asylum was founded in 1851, with a slight endowment. Its benefits are extended to female orphans from five to eighteen years of age. The average number of inmates is 100, the total number admitted being 400. St. Joseph's Female Orphan Asylum is tributary to St. Mary's, and is devoted to the care of the younger class of orphans. It was founded in 1859, is without endowment, and has an average of 70 inmates. St. Vincent's Male Orphan Asylum was founded in 1852, without endowment, and is supported by fairs held throughout the diocese and by contributions. Its average number of inmates is 150. The Jewish Orphan Asylum was founded in 1868, without endowment. It is supported by the order of I. O. B. B., districts Nos. 26 and 27, private subscriptions, and donations. Its average number of inmates is 170, and the total number to whom assistance had been rendered to Sept. 1, 1873, is 295. The Bethel Home for the Destitute has for its purpose the providing of a home, food, and temporary shelter for the needy who are sailors, residents of the city, or strangers. It is provided with substantial buildings, and it is impossible to measure its charity by numbers. The Children's Aid Society was established in 1857, and its primary object is to co-operate with the city council in promoting the interests of the Cleveland industrial schools. During the sixteen years of its existence it has secured homes for 1100 children, and extended its provident care to more than 5000.

The city is well provided with public parks. The Public Square, containing ten acres and centrally located, is beautifully laid out with fountains, lawns, walks, rustic houses, and numerous shade trees, and its centre is ornamented with an elegant marble monument to Commodore Perry, in commemoration of his victory on Lake Erie in 1813.

The railroads centering in the city are—the Atlantic and Great Western, the Cleveland Columbus Cincinnati and Indianapolis, the Cleveland and Mahoning Valley, the Cleveland and Pittsburgh, the Lake Shore and Michigan Southern, the Lake Shore and Tuscarawas Valley, the Rocky River, the Valley, and the Cleveland and Newburg. The city railroads are five in number; the Kinsman Street, or Woodland Avenue, length 3¾ miles, track double, capital $250,000, cost (including paving, buildings, etc.) $200,000, income $90,000 per annum, passengers carried 2,000,000; the East Cleveland and Garden Street Branch, length of double track 4½, and single track 2½ miles, authorized capital $300,000, paid in $180,000, cost about $150,000, annual receipts $84,000, passengers carried 1,800,000; the St. Clair Street, length of double track 3 miles, capital, $200,000, $113,000 paid in, total cost (including paving, running stock, etc.) about $100,000, annual receipts exceed $50,000, passengers carried over 1,200,000; the Detroit Street, length 3 miles, single track, capital $80,000; the Brooklyn Extension, capital $35,000, length 3 miles, single track (the two operated by lessees), $75,000 invested in running stock, receipts about $70,000 per annum, passengers carried 1,300,000; the Collamer and St. Clair Street, 2½ miles in length.

The gas-works are two in number, owned by private corporations, with a united capacity of 800,000 cubic feet

per day. The city is supplied with pure water from Lake Erie by extensive waterworks, upon which had been expended to Jan. 1, 1873, $1,340,104.20, there being in use at that time 68 miles 1292 feet of pipes. To avoid the impurities imparted to the water by the drainage of the city, a tunnel, extending 1¼ miles into the lake, has been constructed, at a cost of $550,000, rendering the total amount expended upon works, pipes, etc. at the completion of the tunnel about $1,900,000. There are in use 80 miles of gas-pipe, 43 miles of sewering, 14 miles of stone and 12 miles of wooden paving.

F. H. Bradner, Commercial Ed. "Cleveland Leader."

Cleveland, a township of Greenville co., S. C. Pop. 814.

Cleveland, a post-village, capital of Bradley co., Tenn., on the East Tennessee and Virginia R. R., 29 miles E. by N. from Chattanooga. It has three newspapers. A branch railroad 27 miles long connects it with Dalton, Ga. It has a national bank and a female institute. Pop. 1658; of township, 1734. Ed. Cleveland "Banner."

Cleveland (Charles Dexter), LL.D., an American scholar and writer, born at Salem, Mass., Dec. 3, 1802, graduated at Dartmouth in 1827. He was appointed professor of Latin and Greek in Dickinson College, Pa., in 1830, and of Latin in the University of New York in 1832. He opened in 1834 a seminary for young ladies in Philadelphia. He published, besides other works, a "Compendium of English Literature from Sir John Mandeville to William Cowper" (1850), a "Compendium of American Literature" (1858), and a "Compendium of Classical Literature" (1861). Died Aug. 18, 1869.

Cleveland (Chauncey F.), LL.D., an American lawyer, born at Hampton, Conn., in 1799. He was admitted to the bar in 1819, soon became distinguished in State politics, was governor of Connecticut in 1842 and 1843, and member of Congress (1849–53).

Cleveland (John Fitch), born at French Creek, Chautauqua co., N. Y., Feb. 4, 1819; received a common-school education, and passed his early life in agricultural pursuits; was connected with the "New York Tribune" 1843–76, on which he held the important position of financial editor; was for many years compiler of the "Tribune Almanac;" from 1862 to 1870 held the office of assessor of internal revenue. Died in New York Oct. 9, 1876.

Clev'enger (Shobal Vail), an American sculptor, born at Middleton, O., in 1812. He worked for some time in Boston, and afterwards visited Italy, where he passed several years. Among his works are statues of Daniel Webster and Henry Clay and a bust of Edward Everett. He died at sea as he was returning from Italy in 1843.

Cleves, a town of Rhenish Prussia, 3 miles S. W. of the Rhine and 50 miles N. W. of Düsseldorf, was formerly the capital of the duchy of Cleves. It is built in the Dutch style, and has a fine old castle, a Protestant gymnasium, and a collegiate church of the fourteenth century; also manufactures of cotton, silk, and woollen fabrics, hosiery, etc. Pop. in 1871, 9038.

Clew, or **Clue** [Anglo-Saxon, *cleow*], originally a ball of thread; also the thread which guides a person in a labyrinth, and hence that which serves as a guide in anything of an uncertain or intricate nature; in nautical language, the lower corner of a square sail. To clew up is to haul up the clew of a sail. Clew-lines are small ropes used to draw the sail up to the yard. Clew-garnets are the same as clew-lines, but the term is only applied in connection with the courses or lower sails.

Clichy, a town of France, department of Seine, is 4½ miles N. W. of Paris, of which it is a suburb. It has manufactures of chemical products and white lead. P. 13,666.

Clif'den, Viscounts (1781), Barons Clifden (Ireland, 1776), Barons Mendip (Great Britain, 1794), Barons Dover (United Kingdom, 1831).—Henry George Agar Ellis, fourth viscount, born Sept. 2, 1863, succeeded his father Feb. 20, 1866.

Cli'ent [Lat. *cliens*], in ancient history, a Roman citizen whose relation to his patron was in many respects similar to that of a serf to his feudal lord. It was the duty of a patron to watch over the interests of his clients and protect them, and to defend them in lawsuits. He also frequently made them grants of land on lease. In return, the client was bound to defend his patron, and contribute towards any extraordinary expenses he might be subject to. He might not appear as accuser or witness against him in judicial proceedings—a prohibition which was reciprocal. The body of clients was increased by the institution by which foreigners, who, as allies of Rome, had a share in its franchise, might choose themselves patrons on their coming to settle in the city. The obligations of clients were hereditary, and could not be shaken off unless through the decay of the family of the patron. The clients have by some been regarded as plebeians who of their own will entered into certain relations with the patrician families. The term client has been appropriated in modern times to one whose cause is prosecuted or defended, and his person or interests represented, either by an attorney or by an advocate. The custom of practising gratuitously as advocates long prevailed among the Roman patricians; and from it the usage was derived, which still prevails in Great Britain, of considering the fee of a counsel as a gratuity which cannot be legally claimed. At present the etiquette of the bar appears to be this: that a lawyer cannot refuse without reasonable excuse to plead gratuitously the cause of a client who sues regularly *in formâ pauperis*, or to defend a prisoner if called on to do so by the court.

Clif'ford, a post-township of Susquehanna co., Pa. Pop. 1532.

Clifford (John Henry), LL.D., an American lawyer, born at Providence, R. I., Jan. 16, 1809, graduated at Brown University in 1827, was governor of Massachusetts (1853–54), and attorney-general of that State (1849–53 and 1854–58). Died in New Bedford, Mass., Jan. 2, 1876.

Clifford (Nathan), an American jurist, born at Rumney, N. H., Aug. 18, 1803, became a citizen of Maine in 1827, member of Congress (1839–43), U. S. attorney-general (1846–47), was subsequently U. S. minister to Mexico. He became a justice of the U. S. Supreme Court in 1858, and is the author of two volumes of "U. S. Circuit Court Reports" (1869).

Clifford (Thomas), Lord, an English politician, born in 1630. He entered Parliament in 1660, and was appointed a commissioner of the treasury in 1668. In 1671 he became a member of the notorious cabinet called the Cabal (which see). He obtained the title of baron in 1672. Died in 1673.

Clif'ton, a beautiful town and fashionable watering-place of England, in Gloucestershire, is a western suburb of Bristol. It is built on the sides and top of a steep carboniferous limestone hill 308 feet high, which commands picturesque views, and is separated from a similar cliff by a deep chasm, crossed by a fine bridge, beneath which flows the navigable Avon. Here are tepid springs which contain carbonic acid and salts of magnesia, and have a temperature of 73° F. Pop. 20,701.

Clifton, a post-village of Stamford township, Welland co., Ontario (Canada), on the Niagara River at the suspension bridge, 1 mile below the Niagara Falls. It is the E. terminus of the Great Western Railway, and is on the Erie and Niagara Railway. It has a very large export trade to the U. S. and a large museum. Pop. about 3500.

Clifton, a post-village and township of Wilcox co., Ala. Pop. 1696. The village is about 80 miles S. W. of Montgomery.

Clifton, a post-village of Columbus City township, Louisa co., Ia. Pop. 200.

Clifton, a post-township of Washington co., Kan. Pop. 713.

Clifton, a township of Wilson co., Kan. Pop. 918.

Clifton, a post-township of Penobscot co., Me. P. 348.

Clifton, a township of Keweenaw co., Mich. Pop. 615.

Clifton, a post-village of Passaic co., N. J., on the Erie R. R., 3 miles S. E. by S. of Paterson. It contains many fine residences, and is well known for its picturesque scenery.

Clifton, a post-village of Chili township, Monroe co., N. Y., on Mill Creek, has a number of manufacturing establishments.

Clifton, a village of Southfield township, Richmond co., N. Y., is the seat of a "Seamen's Retreat," and a "Mariners' Family Asylum." It is in the S. E. part of Staten Island.

Clifton (Clarksboro' post-office), a township of St. Lawrence co., N. Y., has extensive beds of magnetic iron ores, furnaces for iron and steel, and a railroad track to De Kalb. Pop. 221.

Clifton, a post-village of Miami township, Greene co., O. Pop. 253.

Clifton, a township of Alleghany co., Va. Pop. 1018.

Clifton, a post-village of Mason co., West Va. It has one weekly newspaper. Pop. 693.

Clifton, a township of Grant co., Wis. Pop. 1076.

Clifton, a post-township of Monroe co., Wis. P. 501.

Clifton, a township of Pierce co., Wis. Pop. 615.

Clifton Factory, a township and village of St. Mary's co., Md. The village is 55 miles S. E. of Washington. Pop. 3001.

Clifto'nia, a genus of evergreen trees and shrubs of the order Cyrillaceæ. The *Cliftonia ligustrina*, a small tree or shrub, popularly called "titi," or buckwheat tree, grows in the Gulf States. Its fragrant white blossoms appear in early spring.

Clifton Park, a post-village and township of Saratoga co., N. Y., 15 miles N. of Albany. The township contains six churches, several villages, and has an academy at Jonesville. Pop. 2657.

Clifton Springs, a post-village of Manchester and Phelps townships, Ontario co., N. Y., on the Auburn branch of the New York Central R. R., 10 miles E. N. E. of Canandaigua. It has four churches, a free union school, copious sulphur springs, and is the seat of "Clifton Springs Sanitarium." It has one weekly newspaper. Pop. 746.

Clif'ty, a township of Bartholomew co., Ind. P. 1133.

Climac'teric Year [from the Gr. κλιμακτερικός, from κλῖμαξ, a "ladder"], the name given to certain years in the life of man that were long supposed to have a peculiar significance to him, and to constitute, as it were, critical points in his health and fortune. The mystical number 7, multiplied into the odd numbers 3, 5, 7, and 9, produced the crises of this kind. The sixty-third year, called the "grand climacteric," was the most important, and was supposed to be fatal to most men, its influence being ascribed to the fact that it is the multiple of the two mystical numbers 7 and 9. Certain recent physiologists, while rejecting the theory of numerical influence, insist that there was a germ of truth in this old belief.

Cli'mate [from the Gr. κλίμα, "slope," "inclination," "exposure"], the condition of any place with respect to the temperature, the moistness or dryness, and the currents of the atmosphere, that vast ocean of air at the bottom of which we live. Enveloping both land and water, the atmosphere absorbs the heat and moisture generated on both by the rays of the sun. By the winds this most mobile of the elements carries from the sea to the parched lands invisible vapors and fertilizing rains. In this wonderful medium alone the highest forms of vegetable and animal life, and man himself, thrive and find the amount of oxygen, heat, and water which is indispensable to organic life. The atmosphere thus performs the part of a universal mediator between land and water, and between inorganic nature and living beings. These physical agencies, fostering life and acting through the atmosphere, constitute climate.

Heat and water are the two elements of which every plant and animal requires a certain share. The laws of the distribution of heat and rain are therefore the most important topics of the science of climate. To them we must add the course of the winds, which play a prominent part in both. The temperature may be considered as the most fundamental of the phenomena of climate, for the winds are essentially due to differences of temperature, and the rains are regulated both by changes of temperature and the course of the winds. The distribution of heat, the course of the winds, and the distribution of rains, therefore, is the order in which they have to be considered.

Distribution of Heat.—All heat available for the purposes of organic life comes from the sun. Its distribution over the globe, however, depends upon both *astronomical* and *physical* causes. Though this mighty orb pours its life-giving rays in a uniform and uninterrupted stream upon the face of the earth, the spherical form of our planet, and its movements of daily rotation on its axis and annual revolution around the sun, establish permanent differences of temperature in every latitude between the poles and the equator, and periodical ones between day and night and the various parts of the year. The first give the great zones of climate, torrid, temperate, and frigid; the other, the daily periods and the seasons. To these causes we have to trace the groundwork of climate and its fundamental laws, which are summed up under the name of "astronomical climate." These laws, again, are variously and often greatly modified by physical agencies, such as the different absorbing power of land and water for heat, the action of the winds and marine currents, and the elevation above the level of the sea. The astronomical climate, modified by these secondary causes, is the "physical climate," which is in fact the actual climate.

Astronomical Climate.—The most general law in the distribution of heat is its gradual decrease from a maximum at the equator to a minimum at the poles. The cause of this inequality, so fruitful in consequences, is the spherical form of the earth. The rays of the sun fall most thickly and produce their full effect when perpendicular, as in the equatorial regions; less thickly and with diminished intensity when slanting, as in the intermediate latitudes; when tangent, as at the poles, they lose their heating power. Each day testifies to this fact. The horizontal rays of the rising and setting sun have but little heating power; the heat increases with the ascending sun; it is greatest at noon, when the sun is highest. The torrid, temperate, and frigid zones correspond to the noon, the declining, and the setting sun of the day. It is, therefore, to the geographical form of our globe that we must trace those permanent differences of temperature which carry with them corresponding differences in the systems of winds and rains that characterize the great climatic zones.

The Seasons.—Again, while the sun shines, the earth receives more heat than it emits by radiation; during the night it loses more than it receives. When the days and nights are of equal length, the gain and loss correspond to each other, and the average temperature is constant. But long days and short nights give a season of accumulated heat higher than the annual average, or the summer; long nights and short days a season of cold below the average temperature, or the winter.

If the axis of the earth were perpendicular on the plane of its orbit, the sun would always be opposite the equator, and the line separating the lighted from the shaded hemisphere pass through the poles, cutting all parallels into two equal parts. The days and nights being then equal at all times on all parallels, no annual seasons of heat and cold would exist. But the axis being inclined 23½°, and always remaining parallel to itself while the earth revolves around the sun, an ever-varying inequality of days and nights and of temperature is the consequence. Only twice a year, on the 20th of March and the 22d of September, is the sun opposite the equator. It is then the time of the equinoxes and average temperature. On the 21st of June, the north pole being inclined 23½° towards the sun, the sun's rays fall perpendicular on the Tropic of Cancer, and the border of the lighted hemisphere reaches the opposite side of the Arctic Circle, 23½° beyond the pole. This is the time of the solstice, or of the longest day and shortest night and of the highest sun in all the northern hemisphere. It is therefore the summer season, while the southern hemisphere has the shortest day, the longest night, the lowest sun, and the winter season. On the other solstice, the 21st of December, the reverse takes place.

The following table, giving the duration of the longest day and shortest night on the 21st of June, with their differences in various latitudes of the northern hemisphere, shows the increasing inequality of days and nights from the equator to the poles. The fractions are decimals of an hour:

Table of the Longest Days in Various Latitudes.

Latitude.	Longest Day. Hours.	Shortest Night. Hours.	Difference. Hours.
Equator	12.0	12.0	0.0
10°	12.7	11.3	1.4
20°	13.3	10.7	2.6
North Tropic	13.5	10.5	3.0
30°	14.0	10.0	4.0
35°	14.5	9.5	5.0
40°	15.0	9.0	6.0
45°	15.6	8.4	7.2
50°	16.3	7.7	8.6
55°	17.3	6.7	10.6
60°	18.7	5.3	13.4
Arctic Circle	24.0	0.0	24.0
67.5	1 month	0.0	No night.
69.5	2 "	0.0	
73.3	3 "	0.0	
78.3	4 "	0.0	
84.	5 "	0.0	
North Pole	6 "	0.0	

From this table we see that the difference in the length of days and nights increases very slowly in the tropical regions, then more and more rapidly to the Arctic Circle, where the sun does not set on the 21st of June.

Beyond that limit to the pole the sun makes the circuit of the horizon without disappearing for months in succession, and at the pole the year is divided into one day and one night of six months each. The reverse again occurs in the opposite season.

Thus in the tropical regions the temperature is nearly constant throughout the year, while the increasing inequality of days and nights towards the pole causes an increasing difference between the temperature of summer and winter.

The length of the days, however, in the high latitudes compensates for the diminished intensity of the sun's rays, and so it happens that the accumulated heat of a long summer day in the temperate regions may be equal to, or greater than, that of a day in the tropical regions. A summer day in Labrador or St. Petersburg may be as warm as a day under the equator, but these northern latitudes have only a few such days in the year.

Towards the equator the number of warm days gradually increases. Thus the polar regions have short summers and long winters, passing rapidly from one to the other with great differences of temperature. In the temperate regions summer and winter are about of equal length, with long transition seasons of spring and autumn and variable

Entered according to Act of Congress in the Year 1874 by A. Guyot in the office of the Librarian of Congress at Washington

temperature. An everlasting summer with constant heat reigns in the tropical regions. Though the intensity of the sun's rays is greatest at the time of the solstice, their full effect is produced only somewhat later, and the atmosphere attains its highest temperature in July. It is the same with the daily periods; the highest temperature is felt not at noon, but about two o'clock, and the lowest a little before sunrise.

Physical Climate.—According to the laws of astronomical climate, we should expect the same average temperature and the same periodic changes in all places situated on the same parallel of latitude, but thermometric observations prove it to be quite otherwise. On the western side of the Atlantic Ocean, Labrador has a frozen and treeless climate, while on the other side, in the same latitude, we are greeted by the mild atmosphere, rich verdure, and fertile fields of the British Isles. New York with its icy winter is in the same latitude as Naples with its orange groves. On the western coast of our continent, San Francisco, with its mild, snowless winters and cool summers, is on the parallel of Washington, with a frozen Potomac in the cold season and a burning summer sun.

Isothermal Lines.—To render visible to the eye the actual distribution of heat, as given by observations of the thermometer, Humboldt introduced the *isothermal lines*, or lines which connect together all places having the same mean temperature, either of the year, of a season, or of any particular month. The annual isothermal lines show the average amount of heat belonging to each place; the monthly and season isothermals, its distribution throughout the year. A glance at Map No. VI. will teach us many important laws of this distribution.

To read the map aright, let us remember that when the lines in either hemisphere bend away from the equator towards the poles, they indicate a heating influence; when they bend from the poles towards the equator, they indicate a cooling influence. It is evident, again, that the greater the difference between the isothermal lines and the parallels, the greater also the deviation from the astronomical temperature arising from physical causes. To eliminate the local influence of the elevation, the temperatures have been reduced to what they would be at the level of the sea in the same place.

The principal facts that we note in this review are the following:

On the whole, the greater disturbances occur in the northern hemisphere, which has the most land; the isothermal lines are far more uniform in the southern hemisphere, which has most water.

The greatest deviations are found on the opposite coasts of the Atlantic Ocean. The isothermal line of 50° Fahrenheit of temperature, which passes near New York in the fortieth degree of latitude, reaches Ireland and London, on the other side of the Atlantic, eleven degrees of latitude farther north. The isothermal of 40°, which passes through Central Canada and Nova Scotia about the forty-sixth degree of latitude, touches the southern part of Iceland and the coast of Norway in the sixty-fourth degree of latitude, or eighteen degrees farther north. The isothermal of 30° passes through Central Labrador, and Cape North in Europe, though their latitudes differ by twenty-one degrees. In higher latitudes the difference is still greater.

From these remarkable deviations of the isothermal lines, we see that not only Western Europe is a great deal warmer than Eastern America in the same latitude, but that the difference increases more and more towards the pole. It is also evident from the bending of the lines that the heating influences bear towards the north-east.

Similar modifications of the annual isothermal lines take place in the North Pacific. Here also the eastern (or Asiatic) is colder than the American coast, and the climate of California and Oregon much milder than that of a corresponding latitude in Asia; but all these differences are reduced to nearly one-half of what they are on the opposite coasts of the Atlantic.

It can thus be accepted as a law that in the two great land masses of the northern hemisphere the western coasts are warmer than the eastern coasts. Moreover, while the average temperature of the oceans is higher, the bending of the lines southward in the interior of these continents shows a lower temperature than that due to their latitude.

In the southern hemisphere the law of the temperature of the opposite coasts seems to be reversed. In America and in Africa the western is colder than the eastern coast, and in this hemisphere the average temperature of the continents is rather higher than that of the ocean.

Climatic Zones.—There are four parallels, usually made prominent in globes and maps, which are peculiar limits in the distribution of light on the surface of the earth. Two are traced at the distance of about 23½° on each side of the equator, and are called on the north the *Tropic of Cancer*, and on the south the *Tropic of Capricorn*. The other two, 23½° from either pole, are the *North Polar* and the *South Polar Circles*, also called the *Arctic* and *Antarctic Circles*. The two tropics mark the extreme limits of the central region where the sun, in its yearly course, can be seen vertical, the sun being vertical on these parallels on the longest days of the year—viz. the 21st of June in the northern, and the 21st of December in the southern hemisphere. The polar circles are the parallels on which the longest day is twenty-four hours, and mark the limits of the circular area around the poles within which the summer sun does not set every day. The globe is thus divided into six bands, or *zones*, in three groups, which, from the general character of their temperature, are termed the warm or *torrid*, the *temperate*, and the *frigid* zones. The portion of the earth's surface occupied by each of the zones is very unequal. Their comparative area, in English square miles, is as follows:

North tropical zone	39,109,628	Warm regions	78,219,256
South tropical "	39,109,628		
North temperate zone	51,110,763	Temperate regions	102,221,526
South temperate "	51,110,763		
North polar "	8,229,748	Cold regions	16,459,496
South polar "	8,229,748		

The whole globe.....196,900,278 English square miles.

It is thus seen that, by a wise arrangement of Providence, the temperate regions, most favorable to man's development, are the most extensive; next are the warm regions; while the frigid zones, unfit for man's progress, cover but an inconsiderable portion of the earth's surface.

True Zones of Climate.—It is evident that the astronomical zones of climate, whose limits are determined by the distribution of light, do not coincide with the zones of actual temperature. Taking as the limits of the true tropical zone the isothermal lines of 70° on both sides of the equator, which nearly coincide with the boundaries of climate, plants, and animals characterizing the tropical regions, and for those of the frigid zone the isothermal line of 30° in both hemispheres, we obtain zones of irregular shape, which are marked on the map by different colors.

The tropical zone is broadest in Africa, the north temperate in Europe, and we can judge at a glance that Africa is the warmest of the tropical, and of all the continents of the globe, and Europe the warmest of the temperate continents. The highest and lowest temperatures are found in the largest continents—the warmest in Central Africa, the coldest in Northern Asia.

The maps of the isothermal lines of January and July, representing the extreme winter and summer temperatures, show how much greater are the variations in the interior than on the coast. While in January the lines in the interior indicate a lower temperature, those of July, strongly bent northward, betoken a much higher temperature than in the shore region.

Thus, as a rule, the coast of the continent has more equable, the interior more excessive, season temperatures.

This wide departure of the actual from the astronomical temperature is a most striking fact, the principal causes of which are to be found in the different manner in which land and water are affected by the solar rays and in the action of the great currents of the atmosphere and the sea.

Land and Sea Climates.—Water has a great capacity for heat, but a feeble conducting power; it grows warm slowly in the rays of the sun, and never rises to a high temperature. It is the same in cooling; it gives up its heat slowly, and the surface layer growing cool falls lower by its weight, and gives place to the warmer molecules of the inferior strata. Thus the heating and cooling are slow, and do not reach extremes. Land rapidly absorbs the solar rays; the surface layer is quickly heated and soon attains a high temperature, but loses it by radiation with equal rapidity. It reaches, therefore, great extremes of heat and cold. The *sea* or *oceanic climate*, therefore, is characterized by equableness, without extremes of temperature; the *land* or *continental*, by great extremes; it is excessive. This is clearly shown by a few examples, in which the temperatures of the coldest and the warmest months are compared in places situated in the same latitude, but more or less under the influence of the sea or of land:

Differences of Temperature between the Coldest and Warmest Months in Similar Latitudes.

Name of places.	Lat.	Jan. Fahr.	July. Fahr.	Difference. Fahr.
Faroe Islands	62°	39.0	61.7	22.7
Bergen, Norway	60°	34.9	60.3	25.4
St. Petersburg, Russia	60°	15.6	62.6	47.0
Yakutsk, Siberia	62°	— 43.8	62.2	106.0
Penzance, S. W. Eng.	50°	42.6	62.0	19.4
Barnaul, Siberia	53°	— 4.7	67.1	71.8
Eastport, Me.	45°	22.5	62.4	39.9
Fort Snelling, Minn.	45°	13.1	73.4	60.3
Bermudas, Atlantic	32°	62.6	84.2	21.6
Natchez, Miss.	32°	52.2	81.3	29.1
Madeira, Africa	32°	63.5	73.8	10.3
Cairo, Egypt	30°	56.3	86.6	30.3

We see by the rapid increase of the differences how the variations augment as we advance from the sea into the interior of the continents. The absolute extremes of temperature differ even more. The highest degree of heat ever observed at the Faroe Islands is only 56° 3′ F., and it freezes but little there, while the meteorological annals of St. Petersburg indicate heats of 92°, and cold of 40° below zero F., or extremes of 132° F. apart. It is at once the cold of the poles and the heat of the tropics. At Yakutsk the mercury often remains frozen for weeks, implying a continued cold of at least 40° F. below zero. Further south and near the tropics the differences between the seasons become naturally less, but the influence of the ocean and of the continent is always very marked. The difference between the extreme temperatures, which at Madeira is only from 20° to 27°, reaches in Egypt 56° F. In the Sahara ice has been known to form by the intensity of radiation, and heat to rise to the enormous height of 140°.

The course of the isothermal lines of January and July is thus easily explained: while the interior, overheated by rapid absorption during the long summer days, is warmer than the coast, it is colder in winter by more rapid radiation. All this shows how great is the influence of the sea upon the distribution of temperature in the different seasons of the year. It tends to bring the extremes together, and to maintain at all times that equability of temperature which, with the abundant moisture, is the distinctive quality of the sea climate.

This difference in the land and sea climates tells even upon the average temperature of the whole earth.

Owing to a great preponderance of land, the northern hemisphere has a warm summer, while the southern hemisphere, having more water, has a mild winter, giving together a high average. In the opposite season the northern hemisphere has a cold winter, and the southern hemisphere a moderate summer, giving a low average. Prof. Dove has calculated that the average temperature of the whole earth in July, during the northern summer, is 62°.4 F., while in January, during the southern summer, it is only 54°.3, or 8°.1 lower than in July.

But if the action of the solar rays on land and water explains some season changes of temperature, other causes are required to account for the permanent deviations of the annual isothermal lines.

Influence of Winds and Marine Currents.—Our daily experience in northern latitudes teaches us that most of the changes not due to the declination of the sun are connected with changes of the wind. Equatorial winds from the south bring us a share of heat from the tropics; polar winds, the chilling breath of a northern atmosphere. If, from any cause, one of these great currents becomes prevailing throughout the year in a particular region, a certain amount of heat or cold is added to or subtracted from the solar heat, considerably modifying the astronomical temperature. The great marine currents perform the same functions, carrying tropical and polar temperatures far into the middle latitudes. Thus it is that the south-westerly winds, which blow almost two-thirds of the year over Western Europe, and the constant flow of the warm waters of the Gulf Stream, greatly increase the average temperature of that continent, and strongly deflect the course of its isothermal lines. (See articles WINDS and CURRENTS, MARINE.) ARNOLD GUYOT.

Cli'max [Gr. κλῖμαξ, a "staircase"], a Latin term used in rhetoric to denote a figure by which several propositions or several objects are presented in such an order that the proposition or object adapted to produce the least impression shall strike the mind first, and the others rise by successive gradations of impressiveness. A sentence in which the order is reversed is called an *anti-climax*.

Climax, a township of Kalamazoo co., Mich. P. 1389.

Climbers (in ornithology). See SCANSORES.

Climbing Fern (*Lygodium palmatum*), a rare species of fern of the sub-order Osmundineæ, is remarkable for its habit of climbing or twining upon shrubs and weeds. It occurs in the U. S. from Massachusetts to Florida and westward.

Climbing Perch. See ANABASIDÆ.

Climbing Plants, or **Climbers,** the popular term for those plants which seek support from other objects in order to ascend from the earth, as the vine, etc. This end is accomplished in different ways. Some climb by means of rootlets growing from the stem, as the ivy; some by the coiling of their petioles or leafstalks, as *Clematis* and *Nasturtium;* some by means of tendrils, as the grapevine and passion-flower; and some tendrils, instead of taking hold by their coiling tips, adhere by expanded disks, as the Virginia creeper. In twiners the stem itself coils around the support, either from right to left (against the sun), as in the pole-bean, or from left to right, as the hop-vine. Tendrils are sometimes of the nature of leaves or parts of leaves; more commonly they are transformed branches. It is only recently that the movements through which plants climb in these various ways have come to be understood. (For a clear explanation of the subject, see DARWIN on "Climbing Plants," and GRAY, "How Plants Behave.")

Clinch, a county in the S. of Georgia. Area, 800 square miles. It is bounded on the W. by the Allapaha River. The surface is level. Rice, corn, oats, and some cotton are raised. It is intersected by the Atlantic and Gulf R. R. Capital, Homerville. Pop. 3945.

Clinch (DUNCAN L.), an American general, born about 1798 in North Carolina, entered the army as first lieutenant in 1808, and rapidly rose by promotion. He was especially distinguished in the Florida war (1835–36), but resigned his commission in the latter year. He was a member of Congress from Georgia (1843–45), and died Nov. 27, 1849.

Clinch'er-Built, Clink'er-Built, or **Lap-Jointed,** a term applied by shipwrights to vessels when the lower edges of the side planks overlap the row beneath, like slates or shingles on the roof of a house. If the planks are all smooth, meeting edge to edge, the construction is called *carvel-built* or *jump-jointed*. Carvel-building requires that the seams should be very close and calked with oakum.

Clinch River rises in the S. W. part of Virginia, flows south-westward, and enters East Tennessee. Pursuing the same general direction between two ridges called Clinch Mountain and Powell Mountain, it unites with the Holston at Kingston to form the Tennessee River. The whole length is estimated at 300 miles.

Clines, a township of Catawba co., N. C. Pop. 1904.

Cling'man (THOMAS LANIER), b. in Surrey co., N. C.: graduated at the University of North Carolina, 1832; served in both branches of the State legislature; was sent to Congress in 1843, and six times re-elected; twice chosen U. S. Senator; entered the Confederate service as colonel, and for three years held the rank of brigadier-general; has given much attention to geology, mineralogy, the height of mountains, and other scientific subjects.

Clingman's Dome, in Jackson co., N. C., is the highest peak of the Great Smoky Mountains, between North Carolina and Tennessee. It rises to 6660 feet above the sea, and is the second in height in the Appalachians. It was named after Thomas L. Clingman, who ascended it in 1858.

Clin'ic, or **Clin'ical** [from the Gr. κλίνη, a "bed"], belonging to a bed; and hence performed (or pursued) at the bedside, as CLINICAL MEDICINE (which see). (For CLINIC (as a noun) see CLINIQUE.)

Clin'ic, or **Clinical Baptism** [for etymology, see preceding article], an ordinance in the ancient Church administered on a sick bed or death bed.

Clin'ical Med'icine, that branch of the science of medicine which is occupied with the investigation of diseases at the bedside. (See CLINIQUE.)

Clinique, or **Clin'ic** [for etymology, see CLINIC], a French term (used for *école clinique*, or "clinical school") applied to a school in which medicine is studied and instruction is given at the bedside, or in which the patients are examined by the medical teacher in the presence of the students. It is often Anglicized as CLINIC, particularly in the U. S.

Clink'stone is a felspathic rock of a grayish-green color, having so remarkable a tendency to lamination that it sometimes furnishes tiles for roofing. It is a compact, homogeneous rock, passing gradually into gray basalt. The slab gives a metallic ring or "clink" when struck with a hammer, whence its name. It is found in volcanic districts.

Clinom'eter [from the Gr. κλίνω, to "lean," and μέτρον, a "measure"], an instrument used by geologists to determine and measure the dip of a stratum. It consists of a compass furnished with a small spirit-level, and on the lid—which can be fixed at right angles to the compass-box—there is a graduated quadrant and plumb-line.

Clin'ton, a county in S. Central Illinois. Area, 480 square miles. It is intersected by the Kaskaskia River and by Shoal Creek. The surface is nearly level; the soil fertile. Corn, wheat, wool, and tobacco are raised. Coal is found here. The most numerous manufactories are those of flour and of carriages. The Ohio and Mississippi R. R. passes through it. Capital, Carlyle. Pop. 16,285.

Clinton, a county in N. W. Central Indiana. Area, 432 square miles. It is drained by the South Fork of Wildcat River. The surface is nearly level; the soil is productive. Corn, wheat, butter, tobacco, and wool are largely

produced. It contains a large prairie. Lumber, carriages, and flour are manufactured. It is intersected by the Logansport Crawfordsville and South-western and the Indianapolis Cincinnati and Lafayette R. Rs. Capital, Frankfort. Pop. 17,330.

Clinton, a county in the E. of Iowa. Area, 696 square miles. It is bounded on the E. by the Mississippi River and on the S. by the Wapsipinicon. The surface is finely diversified by undulating prairies and woodlands; the soil is fertile. Corn, wheat, oats, wool, and butter are produced extensively. Flour and carriages are manufactured in this county. It is intersected by the Iowa division of the Chicago and North-western and by several other railroads. Capital, Clinton. Pop. 35,357.

Clinton, a county in the S. of Kentucky. Area, 250 square miles. The Cumberland River flows near its northern border. The surface is hilly; the soil is mostly fertile. Tobacco, corn, and wool are staple products. Coal is found here. Capital, Albany. Pop. 6497.

Clinton, a county in Central Michigan. Area, 576 square miles. It is drained by the Maple and Looking-glass rivers, affluents of Grand River, which touches the south-western part of the county. The surface is level, and partly covered with forests of sugar-maple; the soil is fertile. Grain, timber, wool, butter, and potatoes are largely produced. It is intersected by the Detroit and Milwaukee and other railroads. Capital, St. John. Pop. 22,845.

Clinton, a county in N. W. Missouri. Area, 460 square miles. It is drained by several small affluents of Platte River. The surface is nearly level: the soil is fertile. Corn, cattle, wool, and tobacco are largely raised. Limestone is abundant here. It is intersected by the Hannibal and St. Joseph and several other railroads. Capital, Plattsburg. Pop. 14,063.

Clinton, a county which forms the N. E. extremity of New York. Area, 1092 square miles. It is bounded on the E. by Lake Champlain, and is drained by the Au Sable, Chazy, and Saranac rivers. The surface is partly mountainous; the soil near the lake is fertile. Potatoes, oats, hay, and wool are the chief crops. Cattle are raised extensively. Leather, lumber, starch, brick, and iron are manufactured. Iron-ore abounds here. The county is traversed by the Ogdensburg and Lake Champlain, the Montreal and Plattsburg, and the Whitehall and Plattsburg R. Rs. Capital, Plattsburg. Pop. 47,947.

Clinton, a county in S. W. Ohio. Area, 467 square miles. It is drained by the East Fork of the Little Miami and by Todd's Creek. The surface is undulating; the soil is fertile. Grain, tobacco, hay, wool, and dairy products are largely raised. It is intersected by the Cincinnati and Muskingum Valley R. R. and the Marietta and Cincinnati R. R. Capital, Wilmington. Pop. 21,914.

Clinton, a county in N. Central Pennsylvania. Area, 1000 square miles. It is intersected by the West Branch of the Susquehanna River. The surface is partly occupied by the Alleghany Mountains; the soil of the valleys is fertile. Lumber, flour, grain, tobacco, and wool are largely produced. Coal and iron abound here. This county is traversed by the Philadelphia and Erie R. R. and the Bald Eagle division of the Pennsylvania R. R. Capital, Lockhaven. Pop. 23,211.

Clinton, a post-village of Huron co., Ontario (Canada), on the Buffalo and Goderich branch of the Grand Trunk Railway, 13 miles from Goderich. It has extensive trade and manufactures and one weekly paper. Here are valuable salt-wells, and a vein of rock-salt twenty feet thick. Pop. about 2000.

Clinton, a township and post-village of Greene co., Ala., about 75 miles N. W. of Selma. Pop. 2224.

Clinton, a post-village, capital of Van Buren co., Ark., on the Little Red River, about 65 miles N. by W. from Little Rock.

Clinton, a township and post-village of Middlesex co., Conn. The village is on the New Haven New London and Stonington R. R., 23 miles E. of New Haven. It has one national bank. Pop. 1404.

Clinton, a post-village, capital of Jones co., Ga., about 15 miles N. E. of Macon. Pop. 362.

Clinton, a township of De Kalb co., Ill. Pop. 1004.

Clinton, the capital of De Witt co., Ill., on the Central R. R., 23 miles S. of Bloomington. It has one national bank and two weekly newspapers. Pop. 1800.

Clinton, a township of Boone co., Ind. Pop. 1220.

Clinton, a township of Cass co., Ind. Pop. 1021.

Clinton, a township of Decatur co., Ind. Pop. 828.

Clinton, a township of Elkhart co., Ind. Pop. 2099.

Clinton, a township of La Porte co., Ind. Pop. 797.

Clinton, a township of Putnam co., Ind. Pop. 1036.

Clinton, a township and post-village of Vermilion co., Ind., on the Wabash River, about 16 miles N. of Terre Haute. Pop. of village, 564; of township, 2223.

Clinton, a city, capital of Clinton co., Ia., on the Mississippi River, 42 miles above Davenport, and 138 miles by railroad W. of Chicago. The river is here crossed by an iron bridge which is about 4000 feet long, and cost $600,000. The cars of the Chicago and North-western R. R. pass over this bridge. Clinton contains three banks, the repair-shops of the railroad company, foundries, sash-and-blind factories, a paper-mill, eight saw-mills, etc.; in all twenty-five manufactories, paying out $65,000 monthly as wages. Four newspapers are published here, one of them daily. It is the eastern terminus of the Iowa Midland, and the southern terminus of the Chicago Clinton and Dubuque R. Rs. Pop. 6129; of Clinton township, exclusive of the town, 1841. ED. "HERALD."

Clinton, a township of Franklin co., Ia. Pop. 475.

Clinton, a township of Linn co., Ia. Pop. 1205.

Clinton, a township of Pocahontas co., Ia. Pop. 55.

Clinton, a township of Ringgold co., Ia. Pop. 341.

Clinton, a township of Wayne co., Ia. Pop. 643.

Clinton, a post-village of Douglas co., Kan., 11 miles W. S. W. of Lawrence. Pop. of Clinton township, 1030.

Clinton, a post-village, capital of Hickman co., Ky., about 300 miles W. S. W. of Frankfort, is on the Mobile and Ohio R. R. Pop. 272.

Clinton, a post-village, capital of East Feliciana parish, La., 32 miles N. of Baton Rouge. A railroad 25 miles long connects it with Port Hudson on the Mississippi. It has good female schools. The parish ships yearly 30,000 bales of cotton. It has one weekly newspaper. Pop. 930. S. LAMBERT, ED. "PATRIOT DEMOCRAT."

Clinton, a post-village and twp. of Kennebec co., Me., is on the Me. Central R.R., 46 miles W. S. W. of Bangor. P. 1766.

Clinton, a manufacturing town of Worcester co., Mass., on the Nashua River, and on the Worcester and Nashua R. R. where it crosses the Boston Clinton and Fitchburg R. R., 45 miles W. by N. from Boston and 16 miles N. E. of Worcester. It has five churches, one national bank, one newspaper, and manufactures of ginghams, combs, Brussels and Wilton carpets, wire-cloth, machinery, etc. The Lancaster mills of this place employ about 1200 hands, operating on 950 looms, and producing annually nearly 7,000,000 yards of ginghams and plaids. P. including Clinton township, 5429. ED. "COURANT."

Clinton, a post-village and township of Lenawee co., Mich., on the Raisin River, and on the Jackson branch of the Lake Shore and Michigan Southern R. R., 42 miles N. W. of Toledo, O. Pop. 752; of township, 1356.

Clinton, a township and village of Macomb co., Mich., 20 miles N. E. of Detroit. Total pop. 3590.

Clinton, a post-village of Hinds co., Miss., 10 miles W. of Jackson, on the Vicksburg and Meridian R. R. It is the seat of Mississippi College.

Clinton, a post-village, capital of Henry co., Mo., on the Missouri Kansas and Texas R. R., 40 miles S. W. of Sedalia, at the junction of the Clinton and Memphis and Clinton and Kansas City branches. It is called the "model town" of Western Missouri. It has one national bank and two weekly newspapers. Pop. 840.

Clinton, a township of Texas co., Mo. Pop. 721.

Clinton, a township of Essex co., N. J. Pop. 2240.

Clinton, post-bor. and tp. of Hunterdon co., N. J., on the S. branch of the Raritan River, and near the New Jersey Central and Easton and Amboy R. Rs., about 10 miles N. of Flemington. It has four churches, a national bank, one newspaper, carriage manufactories, and a large trade. Iron and manganese mines have been opened in the neighborhood. Pop. 785; of township, 3919. J. CARPENTER, JR., PUB. CLINTON "DEMOCRAT."

Clinton, a township of Clinton co., N. Y. It contains much white Potsdam sandstone. Pop. 2206.

Clinton, a township of Dutchess co., N. Y. Pop. 1708.

Clinton, a post-village of Kirkland township, Oneida co., N. Y., on the Utica division of the Midland R. R., at the junction of the Rome branch, 9 miles W. by S. of Utica, and on the Erie Canal. It has six churches, a weekly and a monthly periodical, one seminary for boys, and four for young ladies. It is also the seat of Hamilton College. In the vicinity are large quarries of good building-stone. There are also various manufactures. Pop. 1640.

Clinton, a post-village, capital of Sampson co., N. C., 35 miles E. of Fayetteville. Pop. of Clinton township, 2777.

Clinton, a township of Franklin co., O. Pop: 1800.

Clinton, a township of Fulton co., O. Pop. 3235.

Clinton, a township of Knox co., O. Pop. 984.

Clinton, a township of Seneca co., O. Pop. 1526.

Clinton, a township of Shelby co., O. Pop. 3591.

Clinton, a township of Vinton co., O. Pop. 1724.

Clinton, a township and village of Wayne co., O. The village is on the Pittsburg Fort Wayne and Chicago R. R., 10 miles S. W. of Wooster. Pop. 1502.

Clinton, a township of Butler co., Pa. Pop. 1132.

Clinton, a township of Lycoming co., Pa. Pop. 1315.

Clinton, a township of Venango co., Pa. Pop. 901.

Clinton, a township of Wayne co., Pa. Pop. 1178.

Clinton, a township of Wyoming co., Pa. Pop. 834.

Clinton, a post-village of Laurens co., S. C. It has one monthly newspaper.

Clinton, a post-village, capital of Anderson co., Tenn., on Clinch River, 18 miles N. W. of Knoxville, on the Knoxville and Ohio R. R. Pop. 325.

Clinton, a post-village, capital of De Witt co., Tex., is on the Guadalupe River, about 95 miles S. by E. from Austin. Pop. 217.

Clinton, a township of Monongalia co., West Va. Pop. 1900.

Clinton, a post-village and township of Rock co., Wis., on the Chicago and North-western R. R. where it crosses the Western Union R. R., 78 miles N. W. of Chicago. It has three or more churches, and some manufactures. Pop. of Clinton township, 1943.

Clinton, a township of Vernon co., Wis. Pop. 823.

Clinton (Charles), the father of George Clinton (1739–1812), was born in Longford co., Ireland, in 1690, of English stock. In 1729 he emigrated to America, but the passengers were starved and robbed by the ship's master, who landed them on Cape Cod, where many of them died. Clinton settled in Ulster co., N. Y., became a judge, and a lieutenant-colonel in the French and Indian wars, and was the founder of the distinguished Clinton family of New York State. Died Nov. 19, 1773.

Clinton (De Witt), an eminent American statesman, born at Little Britain, Orange co., N. Y., Mar. 2, 1769, was a son of General James Clinton, and a nephew of Governor George Clinton. His mother's name was Mary de Witt. Having graduated at Columbia College, N. Y., in 1786, he studied law, and became in 1790 private secretary to his uncle, then governor of New York. He was a man of ardent temperament, dignified manners, inclined to reserve, and of noble personal appearance. He married about 1796 Maria Franklin of New York City. He entered public life as a Republican or Anti-Federalist, and was elected a member of the lower house of the State legislature in 1797, and of the State senate in 1798. He took an active part in political movements, and soon became the most influential leader of his party in the State of New York; he also devoted much attention to natural sciences. In 1801 he was elected a Senator of the U. S., in which capacity he distinguished himself as an eloquent debater. Prof. Renwick states that "he was on all sides looked up to as the most rising man in the Union" when he was appointed, in 1803, mayor of the city of New York. This officer was then appointed by the governor and council, and had more extensive powers than the mayor has at the present time. Having been reappointed, he held the office of mayor for nearly eleven years, and rendered important services to the city. He also served as lieutenant-governor of New York for two years (1811–13), and was one of the commissioners appointed in 1809 to examine and survey a route for a canal from the Hudson to Lake Erie. In 1812 he differed from President Madison in relation to the war against Great Britain, and became his competitor for the presidency. Mr. Clinton was nominated by the Republican members of the legislature of New York, and was supported by many Federalists. He received eighty-nine electoral votes, cast by Massachusetts, Connecticut, New Hampshire, Rhode Island, New York, New Jersey, Delaware, and Maryland, but was not elected. His course and policy at this period offended many of the Republicans (or Democrats), and appear to have impaired his popularity for a time. He was removed from the mayoralty about the end of 1814, and retired to private life, from which, however, he was soon raised by his sagacious foresight and successful efforts to promote the prosperity of the State. In 1815 he composed an able argument for the construction of the Erie Canal, of which great and beneficent enterprise he was the principal promoter. This argument was in the form of a memorial to the legislature of the State, which early in 1817 passed a bill authorizing the construction of that canal. He was elected governor of New York almost unanimously in 1817, but his former political opponents organized against him a party who were called "Bucktails," and who denounced the projected canal as visionary and impracticable. In 1820 he was re-elected governor, Daniel D. Tompkins being the defeated candidate. Governor Clinton was at the same time president of the board of canal commissioners. He distinguished himself by his liberal patronage of science and his efforts to promote the education of the people. In 1822 he declined to be a candidate for the office of governor. He was removed from the position of canal commissioner in 1824, and was again elected governor by a large majority in the same year. The Erie Canal was completed in 1825, and brought a great access of trade and prosperity to the city of New York and other portions of the State. When the opening of the canal was celebrated in October of that year, Governor Clinton was conveyed in a barge with triumphal demonstrations from Lake Erie to the city of New York. He was re-elected governor in 1826, and died at Albany before the expiration of his term of office, Feb. 11, 1828. His first wife died in 1818, and about two years later he married Catherine Jones. He left several sons and daughters. (See James Renwick, "Life of De Witt Clinton," 1840; William W. Campbell, "Life of De Witt Clinton," 1849; David Hosack, "Memoir of De Witt Clinton," 1829.)

Clinton (George), the fourth Vice-President of the U. S., born in Ulster co., N. Y., July 26, 1739. He was an uncle of De Witt Clinton. He practised law in his youth, and was elected in 1775 to the Continental Congress, in which he voted for the Declaration of Independence, but he was absent when it was signed, having been called to take command of a brigade of militia. He was chosen governor of New York in 1777, and continued in that office, by several re-elections, until 1795. In 1788 he presided over the State convention called to ratify the Federal Constitution, which instrument he disapproved, because it gave too much power to the central government. He was afterwards the principal leader of the Republican party in the State of New York, and was chosen governor of that State in 1801. In 1804 he was elected Vice-President of the U. S. by the Democrats, who elected Jefferson as President. He was re-elected Vice-President in 1808, when Mr. Madison became President. Died April 20, 1812.

Clinton (Sir Henry), an English general, a grandson of the earl of Lincoln, was born in 1738. He served as major-general at the battle of Bunker Hill, June, 1775, and was appointed commander of the British army in North America early in 1778. He evacuated Philadelphia in June, 1778, and moved his army by land to the city of New York. He conducted an expedition against Charleston, S. C., which he besieged and took in May, 1779. In Oct., 1781, he sailed from New York with about 7000 men to relieve Cornwallis, but the latter surrendered at Yorktown before the arrival of Clinton. He was superseded by General Carleton in 1781. Died at Gibraltar, Dec. 24, 1795.

Clinton (James), a general, born in Ulster co., N. Y., Aug. 9, 1736, was a son of Col. Charles Clinton, and the father of the statesman De Witt Clinton. He became a colonel in 1775, and served under Gen. Montgomery in Canada. He was raised to the rank of brigadier-general in 1777, and took part in Sullivan's operations against the Indians in New York in 1779. In Oct., 1781, he assisted at the siege of Yorktown. Died Dec. 22, 1812.

Clinton Falls, a post-township of Steel co., Minn. Pop. 338.

Clinton Gore, a township of Kennebec co., Me. Pop. 257.

Clinto'nia, a township of De Witt co., Ill. Pop. 2638.

Clinton Lake, a township of Sherburne co., Minn. Pop. 152.

Clinton State Prison, at Dannemora, in Clinton co., N. Y., 16 miles W. of Plattsburg, is built of dressed stone with slate roof. The main building is T-shaped, but there are several other buildings all enclosed in a stockade of 37 acres. There are usually about 500 convicts here, mostly employed in the iron and nail works. The iron ore has been in part mined upon the grounds, but is now obtained from various mines leased or owned by the State. Charcoal is employed in reducing the iron. It is furnished by woodlands measuring 17,500 acres, yielding annually 900,000 bushels. The prison lot has 250 acres. Besides mining, smelting, rolling, and nail-cutting, the convicts saw lumber, manufacture nail-kegs, and perform other kinds of labor. The prison was built in 1844–45.

Clin'tonville, a post-village of Au Sable township, Clinton co., N. Y., is the seat of the extensive works of the Peru Iron Company.

Clintonville, a village of Hartwick township, Otsego co., N. Y., has a cotton factory.

Cli'o [Gr. Κλειώ], one of the nine Muses, presided over history, and was represented as holding in one hand a half-opened roll or scroll, and in the other a cithara.

Clio, a genus of pteropodous mollusks, of the section

Clio borealis.

Gymnosomata. *Clio borealis* is a principal part of the food of whales, and is very abundant in the Arctic seas. It is scarcely an inch long: the head is furnished with six retractile tentacula; the organs of locomotion are two delicate fins, joined to the neck. It has no shell. Of these creatures the water is sometimes so full that a whale cannot open its mouth without engulfing them in great numbers. *Clio australis* is extremely abundant in the southern seas. Several other species are found in the Indian Ocean, etc.

Clip'per [from the verb *clip*, to "move fast"] is a name given to a ship built expressly with a view to speed. The commerce in merchandise of a perishable nature which rendered a quick passage desirable was probably among the first causes which directed especial attention to the form of vessels adapted to offer least resistance to the water. For many years fruit-clippers have been celebrated for their rapid passages, and the opium-clippers and slavers have attained an unenviable distinction for speed. The modifications of the old form of vessel have been gradual, the desideratum aimed at being the combination of the greatest carrying capacity with the form best adapted for speed. A clipper, as compared with an ordinary sailing-ship, is longer and narrower (though of late the tendency has been to increase the beam); very sharp at the bows, which are generally hollowed more or less below the water-line; gracefully tapering towards the stern, which is usually elliptical. The Americans have fully done their part in introducing swift clipper ships, and have perhaps been the most successful in the improvement of vessels of this class. It may be observed that clippers are much less used than they were a few years ago, quick freights being now despatched on fast steamers, and heavy goods being sent in vessels of larger carrying capacity.

Clis'thenes, or **Cleis'thenes** [Gr. Κλεισθένης], an Athenian statesman, the grand-uncle of Pericles, lived about 500 B. C. He increased the number of the tribes of Attica from four to ten, and made important changes in the constitution, which he rendered more democratic. He became very popular, and was the foremost Athenian statesman of his time.

Clith'eral, a post-township of Otter Tail co., Minn. Pop. 220.

Clitherall (Alexander B.) was a native of Alabama. In 1857 he was elected to the Senate, and returned in 1859. During the war he was appointed register of the Confederate treasury, and resided for some years in Richmond. He died in 1868.

Clith'eroe, a market-town of England, in Lancashire, on the river Ribble, 28 miles N. of Manchester, with which it is connected by railway. The houses are of stone. It is situated at the base of Pendle Hill, which is 1800 feet high, and near Pendle Forest, which is reputed to be the scene of the exploits of the Lancashire witches. It has the ruins of a castle built in the twelfth century. Here are manufactures of cotton fabrics. It returns one member to Parliament. Pop. in 1871, 8217.

Cli'tus, or **Cleitus** [Gr. Κλείτος], a Macedonian officer who took part in Alexander's expedition against Persia, and saved his life at the battle of the Granicus, in 334 B. C. He enjoyed the favor of Alexander, who appointed him satrap of Bactria in 328 B. C. In the same year a dispute occurred at a feast between them, and Alexander, who was excited with wine, killed Clitus with a spear.

Clitz (Henry B.), a son of the late Capt. John Clitz, U. S. A., born in New York, graduated at West Point in 1845, served with honor in the Mexican war as an infantry officer, was wounded at Yorktown, Va., and Gaines's Mill in 1862, and was taken prisoner in the latter engagement; served as commandant of cadets and instructor in tactics at West Point (1862–64), became lieutenant-colonel Sixth Infantry, and in 1869 colonel Tenth Infantry. In 1865 he was brevetted brigadier-general U. S. Army.

Clitz (John M. B.), U. S. N., born Mar. 10, 1823, in the State of New York, entered the navy as a midshipman in 1837, became a passed midshipman in 1843, a lieutenant in 1851, a commander in 1862, a captain in 1866, and a commodore in 1873. He was actively employed during the civil war in command of various vessels of the North Atlantic squadron, frequently in action with batteries on the James River while co-operating with the army, in both the Fort Fisher fights, and recommended for promotion by Rear-Admiral Porter in his commendatory despatch of Jan. 28, 1865. Foxhall A. Parker, U. S. N.

Clive (Robert), Lord, the founder of the British supremacy in India, was born at Styche, in Shropshire, Sept. 29, 1725. At school he showed little aptitude for learning and much propensity to mischief. He went to Madras in 1744, and became a clerk in the service of the East India Company, then a trading corporation possessing only a few acres of land. His work here was so uncongenial that he attempted to kill himself, but his pistol missed fire. War having broken out between the English and French, he entered the service as an ensign in 1747. In this field he found scope for his talents, and employment congenial to his audacious disposition. His military genius and resolute spirit procured his rapid promotion. In 1750 and 1751 he defeated the French at Arcot and other places. He made a voyage to England for his health in 1753, taking with him his wife, a sister of Maskelyne, the astronomer. In 1755 he returned to India as governor of Fort St. David. He waged war with success against the nabob Surajah Dowlah, and took Calcutta in 1757. In June of that year, with 3000 men, he gained a decisive victory over the nabob's army of 60,000 men at the battle of Plassey. For this service he was rewarded with the office of governor of Bengal. He had become immensely rich when he returned to England in 1760, and he was raised in 1761 to the Irish peerage as baron of Plassey. In 1764 he was again sent to India, with authority to rectify the disorders which prevailed after his departure from that region. He proved himself an able administrator, and restored discipline. He returned to England in 1767. His enemies in Parliament accused him of having enriched himself by a tyrannical abuse of power, and a committee was appointed in 1773 to investigate his conduct. This inquest resulted in his acquittal. He became addicted to the excessive use of opium, and committed suicide in London Nov. 22, 1774. (See Sir John Malcolm, "Life of Lord Clive," 3 vols., 1836.)

Cloa'ca [a Latin word signifying a "sewer;" Fr. *cloaque*], a name applied to the anal orifice of birds, which also serves for the escape of urine, and is the external organ of reproduction. A similar anatomical arrangement is found in one order of mammals, the Monotremata, in all reptiles, and in many fishes.

Cloa'ca Max'ima [a Latin phrase meaning the "largest sewer"], a subterranean passage through which a great part of the sewage of ancient Rome was conveyed to the Tiber. Drains from the parts of the city around the Forum were commenced by Tarquinius Priscus, but the construction of the Cloaca Maxima is attributed to Tar-

Mouth of Cloaca Maxima at Rome.

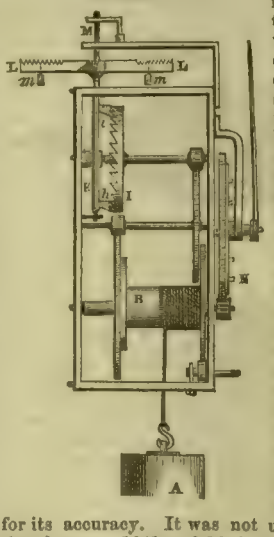
quinius Superbus. Niebuhr expresses the opinion that it was at first designed to drain the valley of the Forum, but it appears to have been afterwards extended. Passing

from the Forum by the temple of Vesta, it terminated in the Tiber, where the mouth of it is still to be seen. It consists of three large arches, one within the other. The innermost vault is more than thirteen feet in width. The arches were built of large blocks of tufa, about five feet five inches long and three feet high, fixed together without cement. The sewer was kept clear by a stream of water from the aqueducts. Large portions of this and of other cloacæ remain in some places visible, but they are generally at a considerable depth below the present level of the streets. The surveillance of the Roman cloacæ was one of the duties performed by the censors. Notwithstanding its great age, the Cloaca Maxima is in admirable preservation.

Clocks. From the earliest period of human history men have sought for means to measure time. This was not a matter of such extraordinary importance to the savage as to the civilized man, for upon the former there was no pressure to accomplish any work or employment within a given space of time. To him, therefore, the divisions of time by the sun's rising, setting, and nooning were sufficient, when he could see them. But very early men began to divide the day into several portions, and soon the night also. At first, these divisions were of about three or four hours each. After a time the division of the night and the day into twelve hours each was found to be more convenient, and then there came the necessity for means of measuring these divisions of time. The first in use was the dial, which by its shadow on a horizontal plate marked the passage of the hours by the progress of the sun. But as this could only be of service in the daytime, and when the skies were not obscured by clouds, something else was necessary. The hour-glass, which measured time by the flowing of sand through a narrow passage from one spherical vessel into another, and which was so graduated that all the sand would run out from the upper glass in just an hour, was a very good instrument to measure the lapse of an hour, but it could not be depended upon to give the time of day, and required watchfulness to turn it as soon as the sands had all run down. King Alfred's device of twelve candles, graduated so as to burn two hours each, was not much better, and in some respects even more inconvenient. The clepsydra was a step in advance of these. It was a water-jar containing several gallons of water, which ran out from a small graduated orifice in the bottom of the jar at such a rate that the quantity of water in the jar would be lowered to a certain marked point each hour, and the jars being filled at sunrise every day, marked off the hours with tolerable regularity. As glass was not then used for the jars, the only way of determining the time was by looking into the jar or measuring the depth of the water by a graduated stick. We do not know just when or by whom these clepsydræ were invented, though they are credited to Greece. They were introduced at Rome about 158 B. C. by Scipio Nasica. Eighteen years later they were improved by Ctesibius, by the addition of a toothed wheel and index driven by the water which flowed from the bottom of the jar. Thus improved, these water-clocks have been in use in the East for about two thousand years. In the more enlightened west of Europe, however, there was a demand for further improvements.

The first of these, which possibly came from the Saracens, and perhaps from their Western empire in Spain, was the substitution of a weight for the water to turn the toothed wheel. It may have been introduced at a still earlier date than this, for Archimedes had discovered the advantage of weights in the turning of small machines some centuries earlier. But after this substitution there still remained the difficulty that the weight was not so regulated as to cause the index to pass over equal spaces of the dial in equal times. How this difficulty was obviated during the Dark Ages we have no means of knowing. There is a record of a clock of very elaborate workmanship having been sent by Pope Paul I. to King Pepin of France in 760, and of another being invented by Pacificus, archdeacon of Genoa, in the ninth century. The invention of an escapement of some kind is attributed to Gerbert about A. D. 1000. Though rude, it probably answered the purpose, for within the next 380 years tower-clocks of great size were set up in Canterbury cathedral (1292), in the abbey of St. Albans (1326), at Genoa (1353), and one which struck the hours at Westminster in 1368. The clock whose construction is best known, and which was undoubtedly the best timekeeper of any of that period, was that made by Henry de Vick, a German, and set up in Paris for Charles V. in 1379. We have deemed the movement of this clock worthy of a pictorial illustration, as showing what were the methods of constructing a balance and escapement at that time. The toothed or crown-wheel I is the escapement-wheel; the pallets or levers *i k* having bevelled edges, and projecting from the suspended upright spindle or vertical axis K M, on which is fixed the regulator or balance L L, give it a vibratory motion, as the motion induced by the weight A in uncoiling the cord and causing the cylinder B to revolve is communicated to the various toothed or cog-wheels, and finally to the crown or escapement-wheel, causes them alternately to strike the teeth of that wheel. There would still be an irregularity in these motions, and a consequent defect in the clock as a timekeeper, were it not for the weights *m m*, placed on the balance or regulator, and which, by the distance they are removed from the spindle, increase or diminish the resistance of the pallets to the escapement-wheel. This was the principle on which all clocks were made for the next 270 years, but the English do not seem to have been successful in making good timekeepers till 1540, when one set up at Hampton Court by an unknown maker became celebrated for its accuracy. It was not until a century later (some time between 1641 and 1658) that either an English clockmaker named Harris, or the Dutch philosopher Huyghens, adapted Galileo's discovery of the substantial isochronism of the pendulum beats to the marking of time by making the escapement or crown-wheel horizontal, instead of vertical, and attaching the pallets to the pendulum-rod. Subsequent improvements were made in the escapement, especially the substituting the anchor escapement for that of Huyghens by Dr. Hooke, 1666–80, and the further improvement of this in the dead-beat escapement of George Graham, invented in 1700, in which the arms of the escapement are set at right angles, and the outer surface of the pallet B and the inner surface of the pallet C are arcs of circles, of which A, the point of attachment to the pendulum-rod, is the centre. This ensured great accuracy as timekeepers. Other escapements, as the duplex, detached, pin-wheel, gravity, etc., have been devised, but have not come into very general use, and are not, perhaps, preferable in all respects to Graham's. Other improvements have been attempted in the pendulum itself. These have been mainly in the matter of compensation for the expansion and contraction of the pendulum-rod by heat and cold. Graham's mercurial compensation pendulum, invented in 1715, in which a tube or ball having mercury in it was substituted for the bob of the pendulum, and the gridiron pendulum of Harrison, invented in 1726, composed of five rods of steel and four of brass, which, expanding differently, compensated by their action for the changes induced by heat or cold, were the principal of these.

Fig. 1.



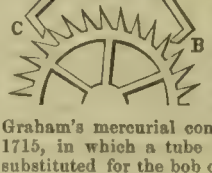


Fig. 2.

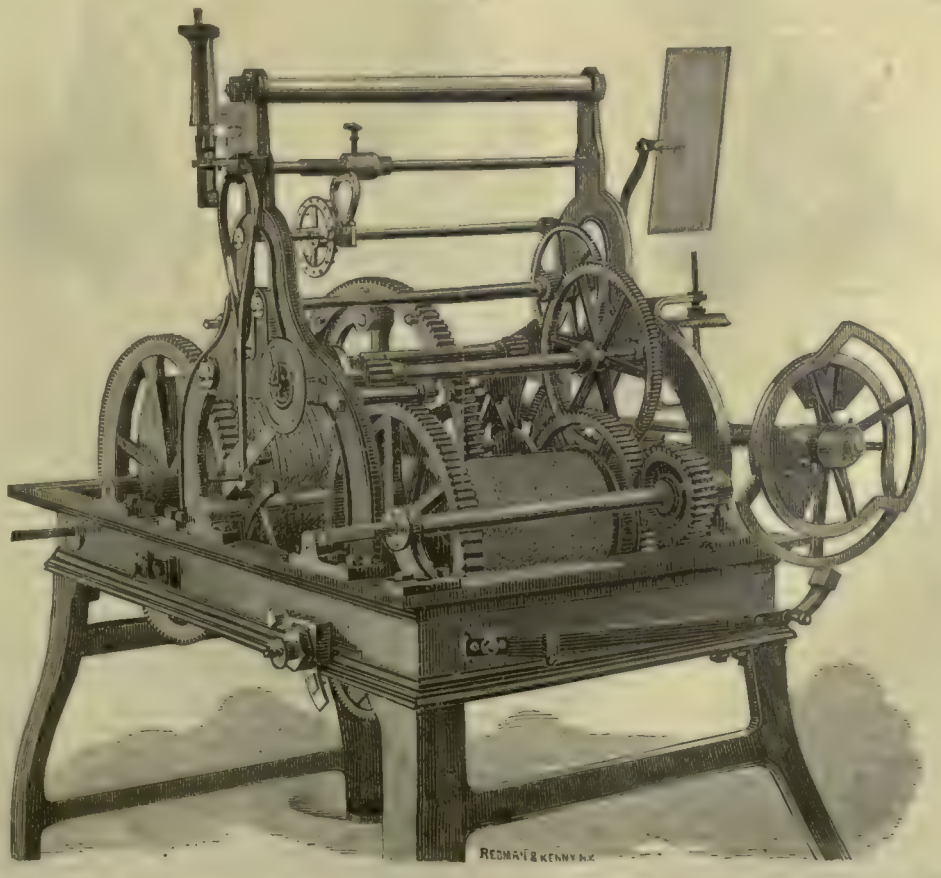
The American clockmakers, retaining the dead-beat escapement, made the pendulum-rod of wood and covered it with gold-leaf; and this has been found to be as effectual a contrivance as either the mercurial or gridiron pendulum. In the cheaper clocks, where absolute accuracy is not so important, they have obtained substantial accuracy by turning a screw thread upon the lower end of the pendulum-rod, and putting upon this a nut, which, while it holds the sliding pendulum-bob in place, can by one or two turns regulate it in accordance with the temperature of the season. To accommodate what is known as the cycloidal curve in the arc described by the pendulum, its attachment to the pinion moved by the weights, or afterward by the spring, was made by hammering its upper end into a thin slip of steel which passed into a slit in the pinion, and was held in place by two little cheeks or projections at the top. While the workmanship was gradually perfected, the principles on which clocks were made in England, France, and Germany have not changed, except in a single particular—that of a substitution of steel springs for weights—from the beginning of the eighteenth century to the present time. Even now, very considerable numbers of these brass-wheel clocks, with weights, and standing in a case six feet high, are still made, and some of them are still exported to the U. S. The manufacture of this description of clocks was introduced into this country before the Rev-

olutionary war, but comparatively few were made, though of good workmanship.



About 1792, Eli Terry, then residing in Norwich, Conn., but subsequently engaged in clockmaking at Plymouth, Conn., made, it is believed, the first clock with wooden wheels ever made in this country or elsewhere. Mr. Terry had learned his trade from Thomas Harland, an English clockmaker who had established himself at Norwich in 1773. In 1793 Mr. Terry commenced the manufacture of both wooden and brass-wheel clocks at Plymouth, and continued the business there and in Naugatuck for many years. The wooden-wheel clocks were good timekeepers, and were generally preferred to the brass-wheel clocks. They were sold in large quantities by peddlers in all parts of the country, and generally without the case, which was a separate expense, being made by the cabinetmaker. From 1806 to 1815 the number of clockmakers largely increased (Messrs. Seth Thomas, Silas Hoadley, Herman Clark, Asa Hopkins, and others engaging in the business), and many thousands were made. In 1814, Mr. Terry invented what was known as the "short shelf-clock," in which, by a change of arrangement and smaller weights, the pendulum being brought forward and greatly shortened, and the weights being carried and run on each side, the whole was reduced to a more compact form, and clock and case were sold together for a moderate price. This modification was adopted by other manufacturers, and soon became general. These clocks were made with wooden wheels, but after the introduction of rolled brass into the market, machinery was invented by which the blank wheels of the clock could be struck out of the rolled brass with a die, and the teeth afterwards cut by machinery, and the brass-wheel clocks could be made cheaper than wooden ones.

The next improvement was the substitution of coiled steel springs for the weights, thus assimilating the clock to the watch. This has been done in Europe for two hundred years, but only with the most costly parlor clocks, and the springs used were equal in quality to the best watch-springs. Of course, this would not answer for cheap clocks for the million, and various experiments were tried with cheap springs. Coiled brass springs were used, but these soon lost what little temper they had, and so did their purchasers. An elliptic steel spring connected with a fusee was tried, but with no better success. Finally, a new and completely successful process of making a superior steel spring was invented in this country; and the springs thus produced have for many years been sold at a price compatible with their use in cheap clocks. This, together with the cheapening by machine-labor of the production of all parts of the clocks, has led to their very general introduction, and to the reduction of the size of clocks, till now twenty-four of the smallest sized pendulum clocks can be packed in a box of one cubic foot in dimensions. One result of this reduction in the size and price of clocks was an enormous increase in the demand for them, both in this and foreign countries. Clocks to run thirty hours were made which sold in quantities at nine dollars the dozen, and a fair eight-day clock at forty-eight dollars the dozen.

In 1852 there were thirty-one clock companies in existence, of which nine failed, four were burned out, and five closed their business as unprofitable within the next five years. But these companies in 1853 and 1854 made immense sales, the Jerome Manufacturing Company alone shipping 440,000 clocks per annum. Since the reorganization of the business there are only fifteen or sixteen firms engaged in it, all but two or three of them in Connecticut; the number of clocks made is about 1,200,000, and their value not less than $3,500,000. They are exported very largely to all the countries of Europe, to China and Japan, to India, Western Asia, Egypt, South Africa, and to Mexico and most of the South American states. But while American manufacturers have thus supplied the world with cheap but serviceable clocks, they have not, until within a few years past, been able to compete successfully with European manufacturers in the finer and high-priced grades.

Tower clocks, which until within the past twenty years were imported, are now made of excellent quality by A. S. Hotchkiss for the Seth Thomas Clock Company, the Howard Watch and Clock Company, Charles Fasold, and by several other firms. Cut No. 3 represents the movement of one of the Hotchkiss tower clocks erected in Steu-

Fig. 3.

benville, O., and a similar one is on the City Hall, New York. The clocks are remarkable for their accuracy and the perfection of their mechanism, and have proved admirable timekeepers. They have the pin-wheel escapement (very clearly delineated on the second and third crossbars), the pins having an ingenious contrivance of a shoul-

der to keep the oil upon them; and also a very remarkable arrangement (at the right of the figure) for regulating automatically the gas-jets which illumine the face of the clock, so that they may burn any required number of hours. Regulators, formerly imported in all cases, are now made of the best quality by the Howard Watch and Clock Company of Boston. Regulator clocks are also made by the Seth Thomas Clock Company of Thomaston, Conn., the William L. Gilbert Clock Company of Winsted, the Waterbury Clock Company, and Welch, Spring & Co. The wooden pendulum-rod, covered with gold-leaf, which is one of the characteristics of these regulator clocks, is, we believe, an invention of Mr. Silas B. Terry, a son of the pioneer in American clockmaking, and himself for forty-five years in the business. The French parlor or mantel clock, a costly and beautiful ornament to the homes of the wealthy, had so long been imported that it was considered hopeless to attempt to compete with it; but since 1866 Messrs. Seth Thomas' Sons & Co. have been engaged in the manufacture of these articles, and have produced clocks which in the perfection of their workmanship, their accuracy as timekeepers, and the elegance and variety of their patterns, as well as in their moderate price, compete so favorably with the foreign parlor clock that they have well-nigh driven it from the market. The illustrations show some of the styles of these clocks in bronze; the marble

Fig. 5.

Fig. 4.

Fig. 6.

Fig. 8.

Fig. 7.

Fig. 9.

styles are equally tasteful and attractive. The Terry Clock Company at Waterbury have also commenced the manufacture of a neat parlor clock. Of other special kinds of clocks we may name the calendar clock, first successfully made for the general market in this country, which gives the day of the week and month, and sometimes the changes of the moon; the marine clock, a watch on a large scale, which, properly made, is an excellent timekeeper; the railroad clock, which is of similar but somewhat more delicate construction, and with a compensating arrangement for the jar to which it is exposed, etc., etc. The electric or magnetic clock belongs properly to the departments of astronomy and telegraphy. The mechanism for striking the hours or half or quarter hours, in most clocks, is complicated and not readily understood without careful drawings. (For the facts relative to American clockmaking we are indebted to Henry Terry, Esq., of the Terry Clock Company of Waterbury, Conn., and Seth E. Thomas, Esq., of Seth Thomas' Sons & Co. and the Seth Thomas Clock Company of New York.)

L. P. Brockett.

Clock'ville, a post-village of Lenox township, Madison co., N. Y., has a woollen mill and other manufactories.

Clo'dius (Publius), surnamed Pulcher (*i. e.* "handsome"), a profligate Roman tribune and patrician, was a brother of Appius Claudius Pulcher. (See Claudius.) In 62 B. C. he committed sacrilege by intruding himself, disguised as a woman, into the mysteries of Bona Dea. At his trial for this offence he attempted to prove that he was not in Rome at that time, but Cicero testified that he saw Clodius in Rome on that day, and thus incurred his enmity. Clodius was acquitted by means of bribery, and was elected tribune of the people in 59 B. C. He persecuted Cicero by the enactment of a law that he should be interdicted from fire and water. He was killed in an encounter with Milo, his political enemy, in 52 B. C.

Clois'ter [from the Lat. *claustrum*, an "enclosure;" Fr. *cloitre;* Ger. *Kloster*], a term which originally denoted a covered ambulatory running round certain portions of monastic and collegiate buildings, but it was subsequently often applied to any monastic establishment. The cloisters usually ran along three sides of a quadrangle, called the *garth*. The roof, often vaulted, was supported by pillars and arches. The portions of these arches above the mullions were often glazed, and sometimes the whole arches, so that they became windows. Cloisters were used for exercise and recreation. Often, when glazed, they had stalls for study, and frequently a stone bench, on the inner side.

Clonmel', a parliamentary borough of Ireland, is on both sides of the river Suir, 14 miles S. S. E. of Cashel. It is mostly in the county of Tipperary, and partly in that of Waterford. The Suir is here crossed by several bridges, one of which has twenty arches. It has a church of the twelfth century. There is a trade in grain, cattle, and butter, also manufactures of cotton. In 1650 Cromwell demolished the castle. Pop. in 1871, 9484.

Clonmel, Earls of (1793), Viscounts Clonmel (1789), and Barons Earlsfort (Ireland, 1784).—John Henry Reginald Scott, fourth earl, born Mar. 2, 1839, succeeded his father in Feb., 1866.

Clontarf', a town and bathing-place of Ireland, on the sea 3 miles E. N. E. of Dublin. Here, in 1014, Brian Boru gained a great victory over the Danes. Near this town is Clontarf Castle, the residence of the Vernon family. Pop. 7814.

Clootz (Jean Baptiste), Baron, a visionary character of the French revolution, born near Cleves, Prussia, June 24, 1755. Taking the name of Anacharsis, he traversed Europe, proclaiming the brotherhood of the human race. He contributed large sums to the French republican cause, to which he looked for the fulfilment of his hopes of universal freedom. He was expelled from the Jacobin Club at the instigation of Robespierre, and guillotined for a fictitious offence Mar. 23, 1794.

Clop'tin, a post-township of Dale co., Ala. Pop. 800.

Close-Hauled, in navigation, is the mode in which the sails are arranged in order to make the ship move in a direction the nearest possible towards that point of the compass from which the wind blows. In the thorough attainment of this result, much, of course, depends upon the shape of the vessel.

Clos'ter, a thriving post-village of Harrington township, Bergen co., N. J., on the Northern R. R. of New Jersey, 19½ miles N. of Jersey City.

Clot. See Blood and Coagulation.

Clothaire I., born in 497 A. D., was the fourth son of Clovis, king of the Franks. He became king of Soissons in 511, when the dominions of Clovis were divided among his sons. By murdering two of his nephews he obtained the sovereignty of Austrasia and Orleans, and reigned at Paris over all the former dominions of Clovis. He died in 561 A. D., leaving four sons—Caribert, Gontran, Sigebert, and Chilperic I., who divided the realm between them.

Clothaire II., a son of Chilperic I., was a minor when he inherited the kingdom of Soissons in 584 A. D. His mother Frédégonde was regent until 597. He put to death Brunehaut, queen of Austrasia, and usurped the throne of that country in 613 A. D. He thus became sovereign of all France. Died in 628 A. D. He was one of the Merovingian dynasty.

Clothes-Moth. See Moth.

Clo'tho, in classic mythology, one of the Parcæ (which see).

Clotho, an asteroid discovered by Tempel in 1868.

Clotho (a serpent). See Puff Adder.

Clotil'da, Saint, queen of France, was a daughter of Chilperic, king of Burgundy. She was married in 493 A. D. to Clovis I., whom she induced to profess the Christian religion in 496. She opposed Arianism. Died in 545 A. D.

Cloud, a county in the N. of Kansas. Area, 720 square miles. It is intersected by the Republican River. The surface is nearly level or undulating. Grain, tobacco, and wool are raised. Capital, Concordia. Pop. 2323.

Clouds [Lat. *nubes*] are collections of extremely minute particles of water suspended in the atmosphere. These particles are often, in consequence of the great elevation at which they float, in a frozen state, even in summer. It is now known that when masses of air fully charged with aqueous vapor, but at different temperatures, come in contact with each other and mix, the space occupied by the resulting mass will be overcharged, and the vapor, which was invisible so long as completely mingled with the air, becomes precipitated, so to speak, in the form of water-dust, and then takes the appearance of fog or cloud. Why these minute particles remain suspended in the atmosphere, and do not descend as similar particles of earth would do, has not yet been satisfactorily explained. Some have conjectured that the watery particles are hollow, like soap-bubbles. But this—supposing it to be true, of which there is no proof—would not account for their suspension unless they were filled with a gas lighter than the surrounding air. It is not improbable that electricity, which appears to exert so great an influence in giving the different kinds of clouds their form and character, may be the principal agency by which these various collections of water-dust are kept suspended at different elevations, according to the character of the cloud. The only difference between fog and cloud is that while the latter remains high in the atmosphere, the former seems to rest upon the earth; in other words, fog is simply cloud close at hand. Hence, when a cloud high up in the air strikes against the side of a mountain, to a person at that point on the mountain it appears precisely like fog.

To clouds in their infinitely varied forms we are indebted for some of the most glorious scenes that nature ever presents to the eye of man: and a landscape, however beautiful, seems incomplete unless the accompaniment of clouds is added to the picture. (For a particular account of the different kinds of clouds, and their connection with the changes of the weather, the reader is referred to Meteorology.)

Clough (Arthur Hugh), an English poet, born at Liverpool Jan. 1, 1819, was educated at Rugby. He was one of Dr. Arnold's favorite pupils. His distinguished schoolfellow, Arthur Penrhyn Stanley, who has written a valuable notice of Clough, says that "over the career of none of his pupils did Arnold watch with a livelier interest or a more sanguine hope." From Rugby he passed to Oxford, where "he carried away the Balliol scholarship with a renown beyond that of any of his predecessors." From Balliol he was elected to a fellowship at Oriel, and he remained at Oxford until 1848, when a sense that he had done his work there, and that he was a little too alien in speculative and in practical thought from the tone of the university to be of further use or to find a fit abode there—that he might honorably seek a more unshackled career without—led Clough to withdraw from Oriel. In 1848 appeared his first published poem, "The Bothie of Tober-na-Vuolich: a Long-Vacation Pastoral," which was quickly recognized as a work of remarkable power and beauty. But it was something besides a successful literary venture. If it has been called Clough's "Farewell to Oxford," it is because it is revolutionary; it shows that the thought of his time had awakened strong echoes in his nature; that if he had not broken with the ancient past—which he had not, and which he never could—he at least was ready to go forth with hearty confidence to meet the present, and to take an active part in the real business of life. "A sense of fresh, healthy manliness; a scorn of base and selfish motives; a frank admiration for common life; a love of earth, not only for its earthly sake, but for the divine and the eternal interfused in it—such, and other such," says Palgrave, "are the impressions left." The poem is written in English hexameters, which have a certain wild flavor that is very stimulating. "Viewed critically, Clough's work is wanting in art; the language and the thought are often unequal and incomplete; the poetical fusion into a harmonious whole imperfect. It is poetry, however, which belongs to a very uncommon class: it should be judged by the thoughts awakened, rather than by the mode of expressing them." After his withdrawal from Oxford in 1848, Clough spent a year or two in travel on the Continent, going as far as the Italian lakes. On his return he published in 1849 a series of poems of which the earliest date back to 1840, under the title of "Ambarvalia." This collection contains many striking pieces, revealing the depth and earnestness of Clough's nature, with much of that tenderness which his friends declare to have been so notable a characteristic of his, and also a strong tendency, by no means incompatible with this, toward sarcasm.

His tutorship at Oxford relinquished, he passed from one employment to another: was warden of University Hall, London; came to America, and resided here for a few months in 1852; returned to England to accept an appointment in the education department of the privy council office; went to France and Vienna in 1856 on duties connected with the secretaryship to the commission of report on military education; and in leisure hours gradually completed the long revision of Dryden's translation of Plutarch begun in America, comparing that inaccurate though spirited text throughout with the original, and retouching it with a skill and taste in which his careful study of Chaucer and our early literature gave him a special mastery.

Meanwhile, with his usual energetic sympathy for all that touched the welfare of the poor and the wretched, he undertook much anxious work to assist his wife's cousin, Florence Nightingale, in her own arduous labors. His health, never very robust, gave way, and by the advice of his physicians he went on a journey to Greece and Constantinople, and returned much benefited. A second journey to Auvergne and the Pyrenees, and then to Italy in company with Mr. and Mrs. Alfred Tennyson, undertaken with the hope of completing the good work of the former, was not so fortunate. Near the Italian lakes he was struck by the malaria, and pushed on with difficulty to Florence, where fever carried him off, Nov. 13, 1861. Clough contributed several papers of value to the "North American Review," and to the "Atlantic Monthly" one of his best poems, "Amours de Voyage." While here he made one of an intimate circle of the most cultivated scholars and men of letters in Boston and Cambridge. He was beloved here, as at home, for the noble beauty of his character, as well as respected for the range and thoroughness of his attainments. He is come to be reckoned one of the chief names of the time in poetry; his reputation has steadily risen, and Emerson's words in 1848 are like to be justified: "He will make Tennyson look to his laurels." Clarence Cook.

Clove Bark. See Culilawan Bark.

Clo'ver [from a root akin to *cleave*, *cloven*, because the leaves are parted or cleft], or **Tre'foil** (*i. e.* "having three leaves"), (*Trifolium*), a genus of plants of the order Leguminosæ, containing many species, some of them very important in agriculture. The name is popularly extended

to plants not included in this genus, but belonging to the same order, and having the leaves formed of three leaflets. The true clovers (*Trifolium*) have herbaceous, not twining stems, roundish heads or oblong spikes of small flowers, the pod containing one or two, rarely three or four, seeds. Twenty native or naturalized species belong to Great Britain, and more than twelve species to the U. S., most of them natives. The most important is the common red clover (*Trifolium pratense*), a native of Europe, growing in meadows and pastures. Its heads of flowers are nearly globular, very compact, about an inch in diameter, purplish-crimson, flesh-colored, or whitish. The leaflets have often a whitish horseshoe mark in the centre. The zigzag clover (*Trifolium medium*) resembles the common red clover, but is distinguished by the smooth tube of the calyx, and by the broader, less membranaceous, and acuminated stipules. The stems are more rigid than in *Trifolium pratense;* the heads of flowers larger, more nearly globose, and of a deeper purple color; and the leaflets have no white spot. It is common in Europe, and grows in the U. S. White clover (*Trifolium repens*) is a common native of Europe and also of North America. Alsike clover (*Trifolium hybridum*), a perennial, regarded by some as intermediate between the common red and the white clover, has of late attained a very high reputation. It was introduced from the south of Sweden. Crimson or Italian clover (*Trifolium incarnatum*), an annual, native of the south of Europe, with oblong spikes of rich crimson flowers, is much cultivated in Europe, producing a heavy crop. Egyptian clover (*Trifolium Alexandrinum*), an annual species, a native of Egypt, where it is the principal fodder for cattle, is supposed to be one of the best kinds of clover. It has oval heads of pale-yellow or whitish flowers. Yellow clover, or hop trefoil (*Trifolium procumbens*), is common on dry gravelly soils in Great Britain and the U. S., but not much esteemed. The *Trifolium reflexum*, or buffalo clover of the U. S., deserves the attention of agriculturists.

Clover is now very frequently cultivated in alternation with grain crops. The kinds most generally sown are the common red, white, and alsike. The common red clover is the finest and most valuable. It frequently grows well on sandy loams, though sown every alternate year on the same land. But in some places the land becomes "clover-sick" when sown too frequently with this crop. From ten to twenty pounds of seed are usually sown upon an acre. Red clover is much valued for hay. When it grows well, it bears to be cut more than once in a year. White clover is esteemed for pasture; it grows short and thick on the ground, and throws out stems and flowers during the most of the growing season. Alsike clover has been recently introduced; it rises much higher than white clover, and promises to be a useful addition to our pasture-plants. White and alsike clovers are valuable for bee-pasture. Clovers perform an important part in restoring fertility to exhausted land. They are often ploughed under when green, and thus greatly benefit worn-out soils. Their leaves gather food from the atmosphere, which they store up in their roots and stems, and these on decomposing afford food for crops which are more dependent on the soil itself. The chief profit in raising clover is in the increased value of the manures it yields, which are highly nitrogenous.

Clover, a township of Henry co., Ill. Pop. 1695.

Clover, a township of Jefferson co., Pa. Pop. 868.

Clo'verdale, a post-township of Sonoma co., Cal. Pop. 612.

Cloverdale, a township and post-village of Putnam co., Ind., on the Louisville New Albany and Chicago R. R., 11 miles S. S. E. of Greencastle. Pop. 1740.

Clover Hill, a township and village of Appomattox co., Va., 2 miles N. E. of Appomattox. Pop. 3840.

Clover Hill, a township and village of Chesterfield co., Va. The village is on a branch of the Richmond Fredericksburg and Potomac R. R., 8 miles W. of Chesterfield. Pop. 3210.

Clo'verport, a post-village of Breckinridge co., Ky., 110 miles below Louisville, on the Ohio. Coal is found in the vicinity. It has one weekly newspaper. Pop. 849.

Clover Valley, a township of Elko co., Nev. Pop. 80.

Cloves [from the Sp. *clavo, i. e.* a "nail," so called from its resemblance to a nail], the smoked and dried flower-buds of the clove tree (*Caryophyllus aromaticus*), of the order Myrtaceæ. The tree is from fifteen to forty feet high, with a beautiful pyramidal head. The leaves are large, ovate-oblong, and evergreen: the flowers are produced in great profusion. Leaves, flowers, and bark have an aromatic odor. The fruit sometimes appears in commerce in a dried state under the name of "mother cloves;" it has an odor and flavor similar to cloves, but weaker. The flower-buds are gathered, and are dried by the smoke of wood-fires, and afterwards by the sun, or by the latter alone. The clove tree is a native of the Moluccas, and the Bencoolen and Amboyna cloves are the best; but they are now cultivated in Sumatra, Zanzibar, Mauritius, the West Indies, Brazil, and Guiana. The Dutch, to secure to their colonists a monopoly of this spice, once destroyed the trees in the other Molucca Islands, and confined the cultivation to the isle of Ternate. Before the discovery of the Spice Islands merchants brought them from Arabia, Persia, and Egypt to the Mediterranean.

Their aromatic qualities depend on two essential oils, which together form one-seventh of the weight of the cloves. The oil is obtained by repeatedly distilling with water, when two oils pass over—one of which is lighter and the other is heavier than water. The oil has a hot, acrid taste, is of a light yellow color when pure, and brown when not carefully prepared. It is a mixture of eugenic acid ($H.C_{10}H_{11}O_2$) and a hydrocarbon ($C_{10}H_{16}$), isomeric with oil of turpentine. It is soluble in ether, alcohol, and the fixed oils. It is useful in medicine to check nausea and griping caused by the administration of purgatives, and as a remedy for toothache.

REVISED BY C. F. CHANDLER.

Clo'vis [Lat. *Clodovæus*] **I.,** called also **Chlodwig** (probably allied to the German *Ludwig*, "Lewis"), king of the Franks, was born in 465 A. D. He was the son and successor of Childeric, who reigned at Tournay and died in 481. By a victory over the Romans and Gauls in 486 A. D., Clovis obtained possession of Soissons, which then became his capital. He married in 493 Clotilda, a Christian princess, and about three years later, through her influence, was converted to the new faith and baptized. In 507 he defeated Alaric, king of the Visigoths, in a great battle near Poitiers. By this victory he added Aquitaine to his dominions. He chose Paris as his capital in 507. He died in 511 A. D., and France was then divided among his four sons—Thierri, Clodomir, Childeric, and Clothaire. His descendants are called Merovingians, from Merovig, the grandfather of Clovis. (See VIALLON, "Clovis, le grand premier Roi Chrétien," 3 vols., 1788.)

Clowes (TIMOTHY), LL.D., an American Episcopalian divine and scholar, graduated at Columbia College in 1808. He was distinguished as a mathematician. In 1823 he became president of Washington College, Md., and was for many years a prominent educator of youth. Died at Hempstead, Long Island, in 1847.

Clown [from the Lat. *colonus*, a "husbandman"], a term originally applied to a rustic, now quite generally designates a professional jester or buffoon. In dramatic literature it is frequently the title of a prince's jester or court-fool (Ger. *Hofnarr;* Fr. *fou;* Sp. *gracioso;* It. *buffo*), a privileged character at European courts in former times.

Club [etymology uncertain], an association of persons for some common purpose, as of politics, literature, etc., denoting especially a body meeting for social purposes, and consisting of members belonging for the most part to some one class. Club-life in London had its origin in the days of Elizabeth, when the Mermaid tavern, in Fleet street, enlivened by Shakspeare, Raleigh, Ben Jonson, Beaumont, and Fletcher, became the home of a sort of club. Jonson afterwards founded a club at the Devil tavern, Fleet street. These were informal social meetings to which all were welcome who could bring humor or wit. In the last century clubs named after the proprietors of the houses in which the meetings were held were established by politicians in England.

After the close of the great European war in 1815 many officers, no longer needed for war, were placed upon half-pay; and this pay was insufficient to support them without careful economy. If they could dine at a club, it would be cheaper than if each maintained a separate establishment. Hence arose the United Service Club; and the success of this speedily led to others for different classes and for persons of different political opinions. At the present time there are in London sixty-eight great clubs. Each club comprises a definite number of members; and this number cannot be exceeded. The members pay a sum of money on entrance and an annual subscription. The clubs usually comprise news-rooms, libraries, dining-rooms, and drawing-rooms. There are arrangements for the members to sleep at certain establishments called club-chambers, which, however, are not properly clubs. Some of the clubs are furnished with bath, billiard, and smoking rooms. The restaurant is usually very complete; everything is of the best, and is supplied to members nearly at cost. In nearly all hard drinking is discouraged. Some of the club-houses rank among the most elegant buildings in London. Somewhat similar organizations exist in the larger cities of the U. S., especially in New York, but their extent and influence are much smaller than in England. The clubs which

sprang up in France after 1789 were not clubs in the English sense of the word, but meetings of the great political parties.

Club-Foot (*Talipes*). This deformity is mostly congenital, and usually affects both sides. The inner margin of the foot is elevated, the external one depressed and touches the ground. The middle and anterior portions of the foot are retarded in their growth, and its joints become immovable (ankylotic). The deformity becomes more pronounced when the child begins to walk, sometimes to such an extent that the upper part of the foot takes the place of the sole. At the same time the muscles of the leg become emaciated, and lose their muscular texture altogether. The cause has been sought for in diseases of the brain or spinal cord contracted before birth, or by continued pressure in the womb. But a more rational explanation is yielded by the consideration of the early condition of the fœtus. The lower extremities are first formed (about the end of the first month of pregnancy) on the anterior aspect of the abdomen of the fœtus, under the skin, in such a manner that the knee-pit is looking towards the abdomen. In order to assume its normal shape the whole extremity, including the foot, has to turn round its axis. When this process, as far as the foot is concerned, remains incomplete, club-foot is the result. A mild degree of club-foot is perceptible in every fœtus about the fourth or fifth month of pregnancy. Some cases are the result of an abnormal obliquity of the small bones of the tarsus (posterior portion) of the foot, and a primary shortness of the gastrocnemius muscle of the leg. Club-foot, when acquired after birth, results from paralysis of the extensors of the foot. In that case the action of the flexors results in the same deformity. Mild cases require but little treatment. Manual stretching of the foot, proper bandaging, the application of a splint or plaster of Paris, are often sufficient. More serious cases require the cutting of one or more of the flexors (tendo achillis, plantar aponeurosis, anterior tibial muscles), with bandaging or the wearing of an appropriate apparatus (Scarpa's shoe). A. Jacobi.

Club-Mosses, or Ground-Pines (Lycopodiaceæ), a natural order of cryptogamous plants (acrogens), in some species resembling the Coniferæ in general aspect, but frequently having something of the habit of the mosses. They also approach the ferns through *Ophioglossum*, in their reproduction. The genera are few, the living species quite numerous. The genus *Lycopodium* yields the drug lycopodium, a fine inflammable powder consisting of the sporules of the plant. This article is much used in pharmacy and in pyrotechnics. Many of the tropical species have active poisonous properties, and some have been used in medicine. Many of our native species are very beautiful, and are much used in Christmas decoration. The fossil plants of this order were often mighty trees (*Lepidodendron*), and seem to have furnished much material for the oldest coal deposits. At the other extreme must be placed the curious grass-like quill-worts (*Isoëtes*), which are mostly small aquatic plants of singular habit. C. W. Greene.

Clu'niacs, or Congregation of Clugny, a reformed Benedictine congregation, founded in 909 at Cluny in France. It rapidly spread, and at one time had more than 2000 convents, with immense wealth. It began to decay in the thirteenth century. It was finally suppressed in 1790 by the French Constituent Assembly.

Cluny, formerly **Clugny** (anc. *Cluniacum*), a town of France, department of Saône-et-Loire, on the Grône, here crossed by two stone bridges, 14 miles N. W. of Mâcon. Here are the remains of a rich and famous Benedictine abbey, founded in 910 A. D. Cluny has manufactures of gloves, lace, linen, paper, and pottery. Pop. in 1866, 4253.

Cluny, Hôtel de. See Appendix.

Clupe'idæ [from *Clupea* (herring), perhaps the most important of its genera], a family of malacopterous fishes allied to the Salmonidæ, and distinguished from them chiefly by the absence of an adipose fin. The scales are easily detached. The fins are without spinous rays. The gill-openings are very large; the teeth small and generally numerous; the maxillary bones of three pieces easily separated; the body generally long; the air-bladder is always large; the roe consists of a vast number of eggs. A few of the fishes of this family ascend rivers, the rest are exclusively marine. They generally appear in shoals, and some of them periodically visit certain coasts in great numbers. They are found in many parts of the world, some species especially having a wide geographic range. To this family with its widest limits belong the herring, shad, pilchard, anchovy, sardine, etc., but the latest authorities divide it into several families.

Cluseret (Gustave Paul), a French revolutionist, born June 13, 1823, resigned in 1858 his place as captain in the French army because he had adopted the principles of Mazzini. In 1859 he served under Garibaldi, and in 1861 entered the volunteer army of the U. S., in which he became in 1862 a brigadier-general. In 1864 he published in New York the "New Nation," to urge the nomination of Fremont for the presidency. His attempts, in 1870, to proclaim in Lyons and Marseilles the "Red Republic" failed. In Mar., 1871, the Communists of Paris appointed him chief of the war department; on May 1 he was deposed, arrested, and impeached, but after a few days set free, and fled to England.

Clu'sia [so called in honor of the botanist Lécluse or Clusius], the name of a genus of small tropical trees and shrubs of the order Clusiaceæ. Some of them are called balsam trees, from their resinous or balsamic products. They are often epiphytes, growing on larger trees, over the bark of which they send their roots in search of decayed parts from which they may extract nourishment; sometimes a root is sent to the ground, and becomes a kind of stem. According to good authorities, they are sometimes parasitical. *Clusia rosea*, a native of the West Indies and tropical America, yields an abundant resin, which is used in medicine and for covering boats instead of pitch. A resin which exudes in large quantities from the disk of the flowers of *Clusia insignis*, known as the wax-flower of Demerara, is used to make a gently-stimulating and soothing plaster. *Clusia flava*, or yellow balsam tree, grows in Southern Florida and the West Indies. It abounds in a yellow resin or balsam, which has medicinal qualities, and is largely used in the West Indies instead of pitch.

Clus'tered Col'umns, or Compound Piers, form one of the richest features in Gothic ecclesiastical architecture. The columns or shafts are sometimes attached to each other throughout their whole length, sometimes only at the base and the capital. When surrounded by floriated fillets they are compared by Sir Walter Scott to "bundles of lances that garlands have bound."

Clutts'ville, a township of Madison co., Ala. P. 1311.

Clu'ver (Philip), a learned geographer, born at Dantzic in 1580. He published an "Introduction to Universal Geography, Ancient and Modern" (1629; best ed. Amsterdam, 1729), "Germania Antiqua," and "Italia Antiqua" (1624). Died in 1623.

Clyde, the principal river on the W. coast of Scotland, celebrated for the beauty of its scenery, rises in the Lowther and Moffat Hills. It drains the counties of Lanark, Renfrew, and Dumbarton, and flows generally in a N. W. direction. Near the town of Lanark occur the Falls of the Clyde, a series of cascades and rapids. The river descends 230 feet in a course of six miles over old red sandstone rocks, amid very picturesque scenery. The highest of these cascades is Corra Linn, forming three distinct leaps, in all eighty-four feet high. At Glasgow the Clyde becomes navigable for large vessels, and at Greenock it is four miles wide. Below Greenock it flows southward, and expands into the Frith of Clyde, which is about thirty miles wide. Its length is 75 miles, not including the frith.

Clyde, a post-village of Cloud co., Kan. It is on the Republican River, and has one weekly newspaper.

Clyde, a township of Whiteside co., Ill. Pop. 1093.

Clyde, a township of Allegan co., Mich. Pop. 298.

Clyde, a township of St. Clair co., Mich. Pop. 1176.

Clyde, a post-village of Wayne co., N. Y., on the Erie Canal, and on the Clyde River where it is crossed by the Central R. R., 44 miles E. of Rochester. It has six churches, two banks, one newspaper, a manufactory of glass, and several malthouses. Pop. 2735. Ed. Clyde "Times."

Clyde, a post-village of Sandusky co., O., at the junction of the Lake Shore and Michigan Southern and the Cincinnati Sandusky and Cleveland R. Rs. It has a newspaper and various manufactures.

W. W. White, Ed. Clyde "Independent."

Clyde, a township of Iowa co., Wis. Pop. 1124.

Clyde, Lord. See Campbell (Colin).

Cly'man, a township and post-village of Dodge co., Wis. The village is on the Chicago and North-western R. R., 8 miles N. of Watertown and 138 miles N. W. of Chicago. Pop. of township, 1426.

Cly'mer, a township and post-village of Chautauqua co., N. Y. The village is on the Buffalo Corry and Pittsburg R. R., 83 miles S. W. of Buffalo. Pop. of township, 1486.

Clymer, a township of Tioga co., Pa. Pop. 1079.

Clymer (George), an American statesman, born in Philadelphia in 1739. He was elected to the Continental Congress in 1776, and signed the Declaration of Independence. He was re-elected a member of Congress in 1780, and was a member of the convention which formed the

Federal Constitution in 1787. He was the founder of the Pennsylvania Agricultural Society. Died July 23, 1813.

Clytæmnes'tra, or Clytemnestra [Gr. Κλυταιμνήστρα], the wife of Agamemnon, king of Mycenæ, was a sister of Castor and of Helen. She became the paramour of Ægisthus, and murdered Agamemnon on his return from Troy. She was killed by her son Orestes.

Cni'cin, or Centau'rin ($C_{14}H_{18}O_5$?), the bitter principle of *Cnicus*, or *Centaurea benedictus*. It is in odorless, silky needles, having a pure bitter taste. (See BLESSED THISTLE.)

Cni'dus [Gr. Κνίδος], sometimes written **Gnidos**, an ancient Greek city of Caria, in Asia Minor, was on the Ægean Sea and on the promontory of Triopion. It was one of the six cities of the Doric league called *Hexapolis*, and had an extensive commerce. Here were several famous temples of Venus, one of which contained a celebrated marble statue of Venus by Praxiteles. Cnidus was partly built on a small island, connected by a causeway with the mainland. Conon the Athenian defeated the Spartan fleet near Cnidus in 394 B. C.

Coach. See CARRIAGES, etc., by L. P. BROCKETT, M. D.

Coadju'tor [from the Lat. *co* (for *con*), "together with," and *adjuvo*, *adjutum*, to "help"], an assistant; in ecclesiastical law, a term technically applied to one appointed to assist a bishop or other dignitary. Coadjutant bishops in the Roman Catholic Church are usually bishops of sees *in partibus*. In the Protestant Episcopal Church of the U. S. they are called assistant bishops.

Coagula'tion [from the Lat. *co* (for *con*), "together," and *ago*, to "drive," to "force"], the changing of a liquid to a semi-solid or curd-like consistency. Thus, the white of an egg becomes solidified on the application of heat. The caseine of milk is coagulated (curdled) by the action of rennet and by many acids. The fibrine in the blood, chyle, and lymph is coagulated after the removal of these fluids from the living animal. Great importance was formerly attached by physicians to the appearance of the blood-clot or coagulum after bleeding.

Coaho'ma, a county in the W. N. W. of Mississippi. Area, 575 square miles. It is bounded on the N. W. by the Mississippi River. The surface is level, low, and partly subject to inundation. The soil is fertile. Cotton and corn are largely raised. Capital, Friar's Point. Pop. 7144.

Coal, a general name given to several carbonaceous substances derived from vegetable tissue. It was formerly limited to what is now known as charcoal, the residual carbon of wood, from which the volatile constituents have been expelled by heat; but it is at present almost universally used to denote the various kinds of mineral fuel. As these have no definite composition, the vagueness of the term has given rise to much discussion in scientific books and courts of law. These substances form part of an unbroken series which begins with woody fibre and ends with graphite. They are all derived from the decomposition of vegetable tissue in the changes which it undergoes when buried under water, earth, or rock. The different products of this progressive change, which is a sort of distillation, are peat, lignite, bituminous and anthracite coal, graphite, and asphaltum, which are solids; petroleum and water, which are liquids; carbonic acid, carburetted hydrogen, etc., which are gases. Of these, all the solids, excepting asphaltum, are residual products, while that substance and the liquids and gases are the evolved products or distillates. The first mineralized solid formed from vegetable tissue is called lignite, if derived from wood—peat, if from herbaceous vegetation. Neither of these substances has any definite formula of composition, as each individual specimen may represent a distinct stage of the process of bitumenization. The nature of the change which takes place in the formation of peat and lignite from vegetable tissue will be best understood by the comparison of typical examples of each given below:

Vegetable tissue.		Loss.	Peat.
Carbon	49.1	21.50	27.6
Hydrogen	6.3	3.50	2.8
Oxygen	44.6	29.10	15.5

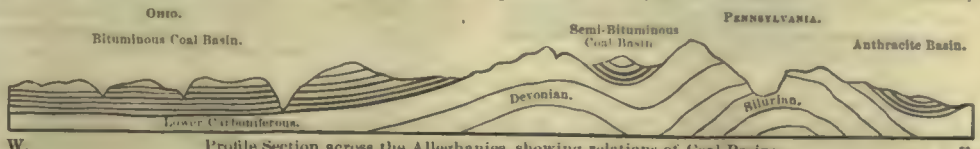
Wood.		Loss.	Lignite.
Carbon	49.1	18.65	30.45
Hydrogen	6.3	3.25	3.05
Oxygen	44.6	24.40	20.30

In this process the evolved products represented by the loss are water, carbonic acid, carburetted hydrogen, or petroleum. Where peat and lignite have been longer buried in the earth they have suffered still further loss and change, and are converted into what is termed bituminous coal, as will be seen in the following example:

Lignite.		Loss.	Bituminous coal.
Carbon	30.45	12.35	18.10
Hydrogen	3.05	1.85	1.20
Oxygen	20.20	18.13	2.07

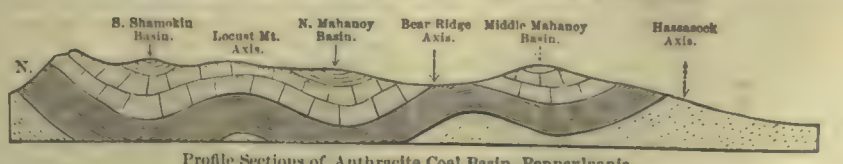
This is the condition in which we find most of the beds of peat and lignite which accumulated in what is called the carboniferous age millions of years ago, and which, deeply buried, have been subjected to a slow and general distillation, resulting in the formation of the different varieties of bituminous coal. Where exposed to peculiar influences, as to heat from volcanic eruptions, or in the elevation of mountain-chains where all the strata are baked and hardened, the volatile constituents of bituminous coal are partially or perfectly driven off, giving us, first, semi-bituminous coal, then anthracite, and finally graphite. The process by which anthracite and graphite are formed from ordinary coal is indicated in the succeeding formulæ:

Vegetation of the Coal Marshes.



Bituminous coal.		Loss.	Anthracite.
Carbon	18.10	3.57	14.53
Hydrogen	1.20	0.93	0.27
Oxygen	2.07	1.32	0.65
Anthracite.		**Loss.**	**Graphite.**
Carbon	14.53	1.42	13.11
Hydrogen	0.27	0.14	0.13
Oxygen	0.65	0.65	0.00

All the varieties of coal mentioned above shade into each other, and we have lignites which exhibit every degree of approach to bituminous coals, semi-bituminous coals intermediate between these latter and anthracite, and graphitic anthracites by which the anthracites are connected with the graphites.



The geological position of the different varieties of coal accords with the theory of their origin given above. For example, the oldest rocks known contain comparatively little carbonaceous matter, as they date from a period when the vegetation of the globe was scanty and mostly marine. Here we have only the residual products of the distillation of vegetable tissue, graphite and anthracite. In the carboniferous age the terrestrial vegetation was luxuriant over large areas, and conditions prevailed favorable to the formation of beds of peat. These, submerged and deeply buried under sediments which were deposited upon them, have, as a general rule, been changed to our beds of bituminous coal—to anthracite where local causes have carried the process of distillation further. In formations more modern than the carboniferous we find the accumulations of vegetable matter usually classed as lignites. These contain more water and oxygen, and are less valuable fuels, than the true coals, but shade into them imperceptibly. In the present period we see the formation of coal only in its initial stages—viz. the growth of vegetation and the accumulation of bitumenized vegetable tissue in marshes, where oxidation is prevented or retarded by water. By artificial processes we can, however, hasten the changes in vegetable tissue, and by properly conducted distillation produce lignite, bituminous coal, and anthracite. We find, too, that Nature is locally accelerating her processes, and by volcanic heat distilling lignites and bituminous coals to anthracite. Near Santa Fé, New Mexico, and on Queen Charlotte's Island, excellent anthracite has been produced by volcanic heat from cretaceous lignites. At Los Bronces, in Sonora, triassic coal is converted into anthracite by a similar cause. In Eastern America all the coal strata, except those of the small triassic basins of Virginia and North Carolina, are of carboniferous age. In the Valley of the Mississippi, where they have suffered no local metamorphosis, they are all of the bituminous class. In the Alleghanies the same strata, having been somewhat affected by the causes which resulted in the upheaval of the mountains, have lost a portion of their volatile matter, and have become what are known as semi-bituminous coals. To this group belong the coals of Blossburg, Broad Top, Frostburg, and a belt running down to Alabama. Still farther E. the carboniferous strata are more metamorphosed, and the coal which they contain is converted into anthracite. In Rhode Island a coal-basin of limited extent, and of the same age with those of Pennsylvania, seems to have been still nearer the focus of metamorphic action; and here the coal is partially converted into graphite, forming the variety known as graphitic anthracite.

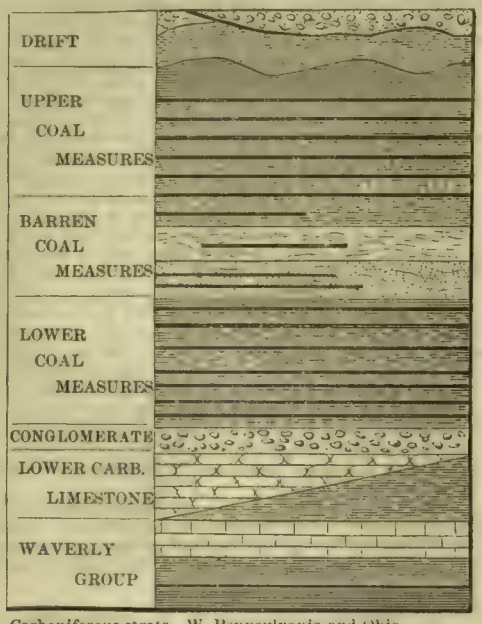
The value of coal in the economy of civilization is now so well understood and so fully appreciated that it requires no lengthy exposition. Coal may indeed be considered as the mainspring of our civilization. In its combustion the heat of the sun, absorbed in the growth of the plants from which it is derived, is all given out again, subject to human control; and, as heat is but another name for physical force, coal becomes the most important source of power at our command. The power developed in the combustion of a pound of coal is theoretically equal to 10,800,000 foot-pounds. But by our imperfect methods of utilization not more than 1,500,000 foot-pounds are made available for our purposes. This is about the amount of power exerted by a man of ordinary strength during a day of labor. Hence 300 pounds of coal will represent the labor of a man for a year. The annual production of coal in the British Islands in 1871 was 117,000,000 tons. Of this, aside from all exported or employed for heating, lighting, smelting, etc., it has been estimated that 20,000,000 tons are devoted to the development of motive-power, and that this is equivalent to the labor of 133,000,000 of men who are producers and not consumers. Hence, if we may suppose that the remainder of the coal product of the United Kingdom pays the expense of the entire production, we may estimate the contribution annually made to the wealth of the British Islands by their coal product to be greater than that of 100,000,000 of laborers industriously employed and requiring no food and no pay.

Such being the value of coal, its geographical distribution becomes of great interest and importance. Among the nations of Europe the English occupy a pre-eminent position, not only from the extent of their coal-fields, but

Profile Section across the Alleghanies, showing relations of Coal Basins.

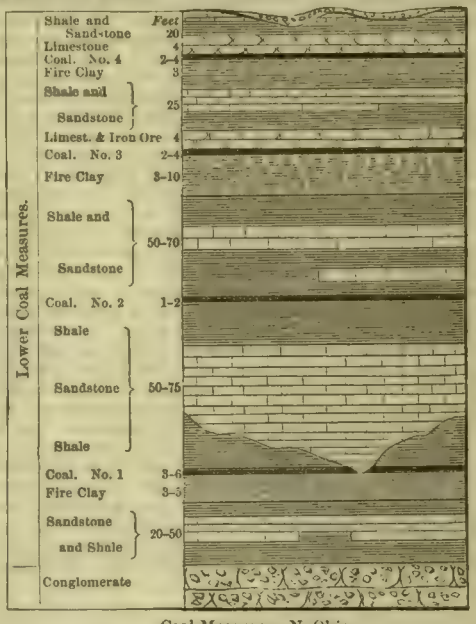
Profile Sections of Anthracite Coal Basin, Pennsylvania.

from the industries dependent upon them. The British coal area is estimated to be 11,859 square miles, and the coal production in 1871 was 117,352,028 tons. The coal area of France is about 2000 square miles, and the production in 1868 was 12,800,000 tons. Belgium has a coal area estimated at 500 square miles, and in 1871 produced 13,671,470 tons. In Prussia the coal area has been considerably increased by the cession of the Rhine provinces, and she now has probably 4000 square miles of very deep and valuable coal strata. The production of coal in Prussia and the other German states in 1869 was 26,774,368 tons. The coal area of Spain is not definitely known. Her coal-field in the province of Asturias is one of the most important on the continent of Europe, but as yet her coal production is small. Russia and Austria are less liberally supplied with coal than the other nations of Europe.



Coal also occurs in China, India, Australia, Japan, and Borneo. So far as known, it is all of mesozoic age, though in China and Japan anthracite and well-formed bituminous coals are found, and have been worked for centuries.

When we turn to the U. S., we find a coal area which throws all those which have been mentioned into insignificance. And yet it should be said that the coal-basins of the U. S. are shallow as compared with those of Europe, and the vertical thickness of coal they contain considerably less. Their importance cannot, therefore, be accurately measured by their superficial extent. Even with this qualification, however, the coal-fields of America are by far the most extensive and richest in the world. The coal area of the U. S. is divided into several distinct basins, of which the most important are the following: 1st, the Allegbany coal-field, bordering the Alleghany Mountains on the W. side, and reaching from the N. line of Pennsylvania to the middle of Alabama. Its area is computed at 58,737 square miles. 2d, the Illinois coal-field, which covers a large part of Illinois and portions of Indiana and Kentucky. Its area is estimated at 64,887 square miles. 3d, the Missouri coal-field, lying W. of the Mississippi in the States of Iowa, Kansas, Arkansas, Missouri, and Texas, and supposed to extend over 47,138 square miles. To these great expanses of coal territory must be added the anthracite basins of Pennsylvania and Rhode Island, the coal-fields of Virginia, Michigan, and North Carolina, and the numerous and extensive deposits of cretaceous and tertiary coals of the far West. Combining all these, the productive coal area of the U. S. will be seen to exceed 200,000 square miles. The production of coal in the U. S. was in 1870, 33,310,905 tons, of which Pennsylvania furnished 23,448,793 tons (15,648,437 tons anthracite, 7,800,356 tons bituminous coal). The product of the U. S. for 1872 was estimated at 40,000,000 tons. (See Map of North America in this work, for coal-fields.)



The different chemical and physical properties exhibited

by the various kinds of coal fit them for a wide range of uses in the arts. Coals are primarily divided into two great groups—the hard and soft, or the anthracite and bituminous coals—but each of these groups is capable of subdivision into several varieties. For example, we have at the base of the series—1, *Graphite*, which is a coal deprived of all its volatile matter, and consisting only of a portion of its carbon mingled with all its ash. This is practically incombustible, and is never used as a fuel nor classed as a coal. 2, *Graphitic anthracite*, containing 1 or 2 per cent. of gaseous matter, igniting with difficulty, and forming an inferior fuel. This is the prevailing variety of coal in the Rhode Island coal-basin. 3, *Anthracite*, containing from 3 to 10 per cent. of volatile matter, sometimes 95 per cent of carbon, igniting with some difficulty, but producing in combustion an intense local heat. When burning it gives off a little blue flame (carbonic oxide), is valueless for purposes of illumination, but the best of all fuels for smelting iron, and is extensively used for the generation of steam and for household purposes. 4, *Semi-bituminous coal*, containing from 15 to 20 per cent. of gaseous matter, but generally caking in the fire; of little value as an illuminator, but kindling readily, with high heating power. It is the most highly valued of all coals for the generation of steam. The semi-bituminous coals produce a dense and excellent coke, and in the raw state are preferred to all others for blacksmiths' use, as they form a hollow fire and produce intense heat in combustion. 5, *Bituminous coals*, which have been subjected to no local metamorphic action, but are the natural product of the

The following sections, general and local, will serve to give an idea of the mode of occurrence of coal in the carboniferous rocks, and of the nature of the associated strata.

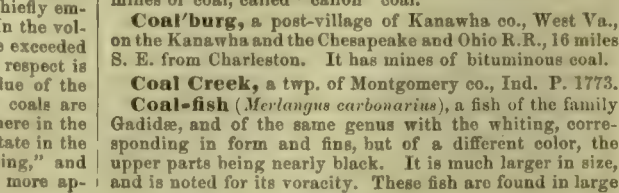
Coal Measures—N. Ohio.

slow and general distillation of vegetable tissue buried in the earth since the palæozoic ages. In bituminous coals the volatile matter varies in quantity from 30 to 50 per cent. of the mass. They are subdivided into *coking*, *furnace*, and *cannel* coals. Of these the coking coals melt and adhere in burning, and when the gaseous matter has escaped a mass of "coke" is left which has the properties of anthracite, but is cellular or spongy from the expansion of the gases. Most bituminous coals belong to this variety, of which the Pittsburg coal may be taken as a type. They are extensively employed for the generation of steam, as household fuels, and, when coked, for smelting the metals, their adhesive character preventing their being used for this purpose in the raw state. Caking coals which are sufficiently free from sulphur, their great contaminating ingredient, are termed "gas coals," as they are chiefly employed for the production of illuminating gas. In the volume and illuminating power of their gas they are exceeded by the cannel coals, but their deficiency in this respect is more than compensated for by the greater value of the coke which is derived from them. The furnace coals are those bituminous coals which do not melt or adhere in the fire, and can therefore be employed in the raw state in the blast furnace. These are termed "open-burning," and sometimes "splint coals," but the latter term is more appropriately applied to a kind of cannel coal which contains a large percentage of carbon, comparatively little gas, and has high heating power. The famous Brier Hill coal of Ohio and the Brazil coal of Indiana are typical furnace coals. The cannel coals have a more homogeneous texture, and are less pitchy and brilliant, than the other bituminous coals. They represent the carbonaceous mud which accumulated in the open lagoons of the coal marshes, while the surrounding mass of spongy vegetable tissue formed the cubical coal. The cannels are rich in gas, but have comparatively low heating power. They are favorite household fuels, are employed for the production of oil by distillation, but are nearly valueless for metallurgical purposes. Nearly all coal-fields contain more or less cannel, which is either interstratified with the cubical coal or gradually passes into it in one or another direction. As a general rule, the cannels contain more ash than the furnace or gas coals; and as the earthy matter increases in quantity, they shade off imperceptibly into bituminous shale. The most esteemed household fuel in our Atlantic cities is the English Wigan cannel, which is preferred to the American cannels, since it generally contains much less ash. (See ANTHRACITE, LIGNITE, and PEAT.) J. S. NEWBERRY.

Coal, a township of Northumberland co., Pa. P. 2920.



Coal, a township of Harrison co., West Va. Pop. 2058.

Coal Banks, a village of Fremont co., Col., on the Arkansas River, 12 miles below Cañon City, has productive mines of coal, called "cañon" coal.

Coal'burg, a post-village of Kanawha co., West Va., on the Kanawha and the Chesapeake and Ohio R.R., 16 miles S. E. from Charleston. It has mines of bituminous coal.

Coal Creek, a twp. of Montgomery co., Ind. P. 1773.

Coal-fish (*Merlangus carbonarius*), a fish of the family Gadidæ, and of the same genus with the whiting, corresponding in form and fins, but of a different color, the upper parts being nearly black. It is much larger in size, and is noted for its voracity. These fish are found in large

Coal-fish.

shoals, and when attracted by bait will keep near a boat till great numbers are taken. Although a coarse fish, the coal-fish is much used for food in northern parts. It is found in the most arctic regions, both on the European and

American sides of the Atlantic. The liver of the coal-fish abounds in oil, which is used for various purposes. This is one of the fishes known as pollock in the U. S.

Coal Gas. See GAS, by PROF. C. F. CHANDLER.

Coal-Mines, a post-village of Queen's co., N. B., on Salmon River, has rich mines of coal and large manufactures of lumber. Steamers run regularly in summer to St. John, 77 miles distant.

Coal-Mines, a township of Russell co., Kan. P. 156.

Coal Oil. See PETROLEUM, by PROF. C. F. CHANDLER.

Coal Tar. See TAR, by PROF. C. F. CHANDLER.

Coal'port, a village of Meigs co., O., 1 mile below Pomeroy, on the N. bank of the Ohio. It has extensive coal-mines.

Coalport, a village of Alleghany co., Pa., 7 miles below Pittsburg, on the left bank of the Ohio, at the terminus of a coal railroad.

Coal'ton, a post-village of Boyd co., Ky., near Ashland, with which it is connected by rail. It has mines of excellent block coal.

Coal Val'ley, a township and post-village of Rock Island co., Ill. The village is on the Peoria and Rock Island R. R., 12 miles S. E. of Rock Island. Pop. 2545.

Coal'ville, a post-village, capital of Summit co., Ut. It is the southern terminus of a branch railroad, 5 miles long, from Echo City on the Union Pacific R. R. It has beds of valuable cretaceous coal.

Coan' (TITUS), D. D., an American missionary, born at Killingworth, Conn., Feb. 1, 1801. He graduated at Auburn Seminary in 1833. In 1834 he sailed for the Sandwich Islands, where his success as a missionary was very great. He contributed important papers on volcanoes to the "American Journal of Sciences" (1840–70).

Coast-Guard, in Great Britain, a force posted along the coast, and originally intended to prevent smuggling merely, but now made to serve as a defensive force also. The organization was formerly in the employment of the customs department, but in 1856 the coast-guard was transferred to the admiralty. Under this arrangement the admiralty may from time to time issue orders for additions to the coast-guard, which must not, however, exceed 10,000 men in all. The coasts are divided into eleven districts, each of which is under a navy captain, who has a guard-ship at one of its ports. The able seamen, named on the ships' books, and employed on shore in coast-guard service, are in three classes—chief boatmen, commissioned boatmen, and boatmen. In time of war all of these men may be called upon to serve as regular sailors on board ship. The coast-guard are taught naval gunnery, gunboat exercise, and the serving of land-batteries. Besides the eleven district guard-ships there is a head-quarters' ship.

THE ROYAL NAVAL COAST VOLUNTEERS is a corps organized in connection with the coast-guard for the defence of the coasts of the United Kingdom. By an act of Parliament passed in 1853, the admiralty was empowered to raise a number, not to exceed 10,000, of coast volunteers for five years' service, and to be exercised twenty-eight days in each year, either on shipboard or on shore; not to be sent more than fifty leagues from the coast unless in cases of emergency, when the distance may be extended to one hundred leagues. In ordinary cases one year's active service entitles them to discharge. Their pay, allowance, and rank during exercise and active service are the same as those of able seamen.

Coasting-Trade, the trade which is carried on by sea between the different ports of the same country. Coasting vessels or vessels employed in this commerce are subject to certain rates and regulations differing from those relating to oversea traders, and the masters are required to keep books proving that their cargoes come strictly within the limits of coasting-trade. Formerly in Great Britain no goods or passengers were allowed to be carried from one port of the United Kingdom to another except in British vessels, but this restriction was repealed in 1854.

The coasting-trade of the U. S. is very extensive. Formerly, this trade was chiefly carried on by means of schooners and sloops, but of late years its character has much changed. Since the introduction of screw steamers for this service there is a prospect that they will to a great extent supersede the use of schooners on our coast.

Coast-Line is the name given to the line which bounds the coast of any country, island, or continent. Very important results follow from the degree to which a coast is indented by inlets, gulfs, or other natural interruptions of a straight line; and in proportion as a coast-line is longer as compared with the simplest possible line enclosing the same area, so is there generally facility of access, shelter for ships, and a capacity for commerce. The coast of Europe is very remarkable in this respect as compared with any other part of the world; for with an area of 3,816,400 square miles, one side of which is in contact with Asia, there is a length of coast of nearly 20,000 miles; while Africa, with an area of 11,600,000 square miles, has less than 15,000 miles of coast; and even Asia, whose area is 17,310,000 square miles, has only 30,000 miles. Of both North and South America, the Atlantic and Pacific coasts are very different, for the former presents in all upwards of 23,000 miles, and the latter only 15,500 miles of coast-line. The most important trading countries are, with few if any exceptions, always those with the longest coast-line.

Coast Range, or Coast Mountains, a range of mountains in California extending nearly parallel with the coast of the Pacific Ocean, from Oregon to the southern boundary of the State. San Bernardino, a peak of this range, rises 8500 feet above the level of the sea.

Coast Survey. An accurate acquaintance with the physical features of the coast that bounds its territory is an economical necessity to every nation largely engaged in commerce. The ocean being the great outlet of production, the highway over which the currents of commerce are constantly flowing to and fro, the diminution of its hazards is a matter of the greatest moment. Among the dangers to which the mariner is exposed, the most formidable are those which beset him when he approaches the land, arising out of his unacquaintance with the sea-bottom beneath him, with the currents that carry him out of his course, with the situation of reefs, shoals, or dangerous shores, and with the courses that would take him safely to his destination. Against these dangers no absolute security can be provided, but they can be very much diminished by supplying accurate charts of the coasts and their approaches, and by maintaining lighthouses and buoys to mark available channels or warn against hidden dangers. To supply this want the governments of all maritime nations have in modern times undertaken surveys of their coasts by the most exact geodetic and hydrographic methods, resulting in elaborate charts for the guidance of the navigator, and aiding in the selection of sites for lighthouses and the proper location of buoys. Such a survey of the coast of the U. S., carried on under the authority of the Federal government, has also for a number of years been in progress, and it is the object of this article to review the history, methods, and present condition of this important public work.

In the early part of this century the only charts of our coasts and harbors in existence were those made in the latter half of the last century by Des Barres, Roman, Gauld, and other surveyors, acting under the orders of the British admiralty. Respectable chiefly by the great extent of coast-line represented, their charts were the merest preliminary explorations, and fell far short of the wants of navigation. The necessity for a thorough survey was perceived very early in the history of the nation, and, upon the recommendation of President Jefferson, Congress in 1807 passed an act authorising the President to cause a survey to be made of the coasts of the U. S., in which were to be designated the islands, shoals, and places of anchorage within twenty leagues of the shores; and such other matter as might be deemed proper for completing an accurate chart of every part of the coast; it also authorized the survey of St. George's Bank and the soundings and currents beyond the limits aforesaid to the Gulf Stream.

The plan of survey adopted by government was submitted by Prof. F. R. Hassler, a native of Switzerland, who had gained experience in similar works abroad, and who was accordingly appointed to superintend its execution. It consists substantially of three operations: first that of *geodesy*, or the accurate determination of the geographical position of numerous points along the coast by astronomical and trigonometrical methods; second, that of *topography*, or the delineation of the coast-line and the characteristic features of the land; and third, the *hydrography*, or a nautical survey of the channels, shoals, and approaches to the shore, including observations of currents and tides. The geodesy furnishes the framework for the map, without which the accumulation of unavoidable inaccuracies in its topographic survey would soon attain objectionable proportions; but taking a fresh departure from each point that has been trigonometrically determined, the errors of the land-survey are checked and kept within bounds inappreciable on its scale of representation. The nautical survey, equally taking frequent points of reference supplied by the two preceding operations, cannot run into any material error of position.

To appreciate the necessity of a geodetic survey as the basis of a series of coast-charts, it must be borne in mind that the figure of the earth is a spheroid, and that conse-

quently methods of plane surveying, when extended over areas of large extent, would lead to intolerable errors of misrepresentation. Geodesy takes account of the true figure of the earth, determining with the greatest attainable accuracy the distances and bearings between the series of points by the processes of base-measurement and triangulation, and determining the curvature of the surface at suitably chosen points in the series by the determination of their differences of latitude and longitude. The geographical position of the intermediate points can then be computed with great precision, and the whole chain projected upon a suitable plan that enables us to preserve as nearly as possible their principal relative positions. The steps of the principal triangulation are made as large as possible, in order to avoid the accumulation of error, and the operations are checked at intervals by the lineal measurement of some of the distances, serving as a verification for the entire chain.

The delay naturally attending new enterprises, the necessity of procuring all the instruments from Europe, where they had to be specially constructed, the interruption caused by the war between England and the U. S., and the subsequent pressure upon the public finances, prevented active operations from being undertaken until 1817, when a commencement was made near the important harbor of New York. But the work had been hardly begun when the last-mentioned cause led to its abandonment by the failure of Congress to provide funds for its continuance. From 1817 to 1832 detached portions of the coast were surveyed by naval officers, some harbors were surveyed, and hydrographic reconnaissances made of the coast of some of the States; but no general survey was attempted, nor did these detached surveys yield more than the most indispensable information. On the repeated representations of Hon. S. L. Southard, secretary of the navy, and others, Congress in 1832 again made a small appropriation for carrying out the law of 1807, under which the operations of the Coast Survey passed anew under the charge of Hassler, who was authorized to employ, in the conduct of the work, such astronomers and other persons as he should judge proper, in addition to the officers in the military and naval service. Mr. Hassler continued to direct the work until his death, which occurred in the year 1843.

In reviewing the history of this early period it is proper to remember that the first years were necessarily years of organization and instruction. The superintendent had to systematize methods, to train up assistants, to cause the work to grow from a small beginning until it comprehended the various operations of a geodetic survey upon the land, and included the hydrography of the adjacent waters. When the results accumulated it was necessary to provide for their computation and reduction, and also for the preparation of maps and charts upon a plan suited to our extended coast, and for the engraving of the maps themselves. All these things were new in this country. The amount of knowledge, skill, and labor required to overcome these and other difficulties was hardly appreciated. The results show how large an amount of work had been done, and how the work was extending beneficially at the time of Mr. Hassler's death.

The condition of the work as Mr. Hassler left it will be made intelligible by the following brief statement: A base-line had been measured in the vicinity of New York, the commercial importance of which obviously indicated it as the proper point of beginning. The triangulation had extended eastward to Rhode Island and southward to the head of Chesapeake Bay, the primary triangulation crossing the neck of New Jersey and Delaware, while a secondary triangulation skirted the coast of New Jersey, meeting with another series which extended down Delaware Bay. The topography had kept pace with the triangulation, and the hydrography of New York bay and harbor, of Long Island Sound, of Delaware bay and river, and the off-shore soundings from Montauk Point to the capes of the Delaware were substantially completed. The triangulation covered an area of 9000 square miles, furnishing determinations of nearly 1200 stations for the delineation of 1600 miles of shore-line; 168 topographical maps had been surveyed and 142 hydrographic charts.

The progress thus sketched, although really very considerable and highly creditable to the late superintendent, was still felt to be inadequate to the pressing demands of commerce, and clamors arose in Congress against the administration of the survey, ascribing the slow progress to an unnecessary refinement in the processes employed, and claiming the results to be inadequate to the expenditure. An investigation was accordingly instituted in 1842 by a Congressional committee, which, after a severe and unfriendly scrutiny, practically resulted in a complete endorsement of the principles on which the survey had been conducted by Hassler, while at the same time a more efficient plan of organization was put in force. According to this plan the personnel consists of a superintendent, under whose general direction the work is carried on by assistants detailed from the army for the survey on land, and from the navy for the nautical work, so far as officers could be spared from the respective services; and in addition to these of a number of civil assistants, who form a more permanent nucleus, preserving unity of system and method. The responsibility of carrying into effect the provisions of the adopted plan, and of expanding the work to a scale commensurate with the growing demands of commerce, fell mainly upon Hassler's successor, Prof. A. D. Bache. His appointment was made upon the united representations of the colleges, learned societies, and men of science in the country, whose estimate of his merits has been abundantly justified by the brilliancy of his official career. Upon his recommendation Congress provided the means for carrying on the work independently in many places at once; each section having its own base and geographical determinations, but all designed to form, when completed, a continuous chain of triangulation and a homogeneous survey of the whole coast. In 1845, besides extending in both directions the former work, active operations were commenced on the coasts of Virginia and North Carolina, and of Alabama and Mississippi in the Gulf of Mexico; two years later they had been extended to the States of South Carolina, Georgia, Louisiana, and Texas; and two years later still the important survey of the reefs and keys of Florida was commenced. On the annexation of California the Pacific coast was at once included in the operations.

While the field-work was thus pushed with great vigor in every quarter, the publication of the charts and other results was made to keep pace as rapidly as possible. The annual reports of the superintendent, besides giving an account of the progress of the work, have been, since 1857, accompanied by an appendix which contains the maps, charts, and sketches produced during each year, and valuable contributions to knowledge in the form of scientific discussions of various subjects connected with the survey, such as tides, terrestrial magnetism, harbor hydraulics, and ocean physics, and of new methods of observation and computation employed by persons engaged in the work. These valuable volumes have been widely circulated by a wise liberality of Congress, and are to be found in most public libraries. The charts are, besides, printed in sheets for the use of mariners, and can be obtained at a low price in the principal seaports, where agencies for their sale have been established. In addition to the charts, printed sailing directions or "Coast Pilots" are issued in book-form, and tide-tables predicting the heights and times of high and low water for all ports of the U. S. are published annually.

Some estimate of the magnitude of the work may be formed by considering that the general coast-line of the Atlantic, including the large open bays, is 3030 miles, that of the Gulf of Mexico, 2160, and that of the Pacific coast (including Fuca Strait, but exclusive of Alaska), 1870 miles, making a total of 7060 miles. A measurement of the shore-line, including bays, sounds, islands, and rivers, made as nearly as practicable where the survey is not yet made, gives similarly for that of the Atlantic coast, 14,725 miles; of the Gulf of Mexico, 10,400 miles; and of the Pacific coast, 4250 miles. The proportion of this vast extent of coast-line that had been surveyed and mapped at the outbreaking of the civil war in 1861 may be stated at about three-fourths of the Atlantic, fully one-third of the Gulf, and nearly one-fourth of the Pacific coast. The war of 1861–65 seemed likely at first to put a stop to the Coast Survey, but it was soon perceived that by preserving its organization the information gathered in its archives and the experience and skill of its officers could be made more useful to the cause of the Union than the individual efforts of its members could possibly be when merged in general organization of the military forces. The great knowledge and judgment of the superintendent was brought into requisition for planning the details of the blockade and of naval attacks upon the ports in possession of the Confederacy. The military and naval officers engaged on the Survey at that time of course at once rejoined their proper corps. Some of the civil assistants were detailed to aid, by their special knowledge of localities, in guiding the operations of the squadrons on the Southern coasts, where all lighthouses and buoys had been removed, and no local pilots could be obtained; others joined various armies to aid in reconnaissances and surveys, while others, again, obtained leave of absence to enter the army, and served with distinction. The resources of the office were taxed to the utmost to produce charts for the blockading fleets, and to compile for the use of the armies maps of the country in which they were to operate. By a wise foresight, Prof. Bache had caused to be collected in the Coast Survey office all the extant geographical maps of the country, which enabled him to issue

a series of maps of the Southern States that proved of the greatest service in the movements of troops, and which remain to the present day the best maps of those regions.

The value of the services rendered by the Coast Survey and its officers was on all occasions freely acknowledged by the commanders of our forces and brought to the notice of the government. Accordingly, after the close of the war the work enjoyed the increased favor of Congress, and while the great military and naval establishments that the war had rendered necessary were reduced to their lowest possible limits, the regular operations of the Coast Survey were resumed on a moderate scale of expenditure, which has since been gradually increased. In 1866 the expenditure was $300,000, and in 1872, $720,000. During the latter years of the war Prof. Bache's health was impaired by the overtasking and anxieties of those trying times, and after a prolonged illness he died in Feb., 1867. Of his eminent services to science in America it is the province of his biographer to speak. In reference to his conduct of the great national work we are considering, his successor, Prof. Benjamin Peirce, the eminent mathematician and astronomer, says: "What the Coast Survey now is, he made it. It is his true and lasting monument. It will never cease to be the admiration of the scientific world. . . . It is only necessary, conscientiously and faithfully, to follow in his footsteps, imitate his example, and develop his plans in the administration of the survey."

Under the administration of Prof. Peirce the survey has resumed the extension it had before the war, and is now rapidly approaching completion. At the close of 1872 the field-parties consisted of five astronomical and twelve triangulation parties, thirteen topographical parties, and as many hydrographical parties, including one engaged in the exploration of the newly-acquired coasts of Alaska. In addition to these, continuous tidal observations were making at five stations on the Atlantic and four on the Pacific coast. With the exception of most of the coast E. of Penobscot Bay, and the ocean-coast of Florida between St. Augustine and Cape Florida, the survey presented a continuous whole from Quoddy Head to the Tortugas, wanting only a portion of the off-shore soundings, and the survey of some sounds and estuaries; again, from St. Mark's to the mouths of the Mississippi, and from Galveston to Corpus Christi Bay, the land survey was completed, and the hydrography nearly half done. On the Pacific coast the work had likewise made considerable progress, and an exploring party was surveying the most important harbors on the coast of Alaska. A survey of Lake Champlain, included in the work of the Coast Survey by a special provision of law, was more than three-fourths completed.

The plan of publication is as follows: the main series of charts gives a continuous representation of the coast on a scale of 1:80,000, or about three-quarters of an inch to a mile. On these charts are exhibited all natural and artificial features of the shore, such as streams, hills, houses, and roads, together with the depth of water and configuration of the sea-bottom, the channels and shoals, as also the lighthouses, buoys, and other aids to navigation. Besides being characterized by the greatest precision, which is the first and essential condition of their value, they also do honor to the country as works of art, being in point of execution surpassed by none that are produced by other nations. A series of 110 of these charts will comprise the whole coast from the north-eastern boundary to the Rio Grande, fifty-one of which have been completed, while a large number are partially drawn and engraved. The same range of coast is also covered by a series of sixteen other charts on a smaller scale, that of 1:400,000, of a more general character, known as "off-shore charts," and intended for use in sailing along or approaching the coast; of which seven sheets have been issued. Another still more general chart of the coast, on a scale of 1:1,200,000, and reaching farther out to sea, is published to serve the purpose of navigating on courses between distant points. In addition to the foregoing charts, there are published very numerous charts of separate harbors, bays, rivers, anchorages, passages, and dangers, on scales varying from 1:5000 to 1:60,000, according to the character of the subject and amount of detail to be represented. Of such charts more than 200 have already been published of places on the Atlantic and Gulf coasts, and over 100 on the Pacific coast.

When once a continuous survey of the whole coast has been obtained, there will still be a necessity of maintaining the organization of the Coast Survey for the purpose of watching the unceasing changes that take place in the channels leading to our harbors, which for the most part are barred by shifting sands. Such changes, produced by the action of the waves and tidal currents, often also by the encroachments on the harbor areas by wharves and docks, render necessary changes in buoys and beacons, and often call for works of protection or improvement, which can only be planned after minute surveys and a careful study of the physical causes that are at work. Most important service to commerce and navigation has already been rendered in this direction by the advisory boards, composed of the superintendent of the Coast Survey, the chief of engineers of the army, and an officer of the navy, in studying these problems for the principal harbors, and laying down for each the principles of preservation or improvement. The subject of physical hydrography has been made a special department in the Coast Survey, and the reports to the harbor commissioners of New York and Massachusetts contain discussions that may serve as models for all similar inquiries.

The gradual extension of at least the trigonometrical work of the Coast Survey over the entire area of our country to serve as a basis for better maps, and in future of detailed topographical surveys, is a proposition favorably viewed by many statesmen, and indeed inevitable in the development of the country. The main series of triangles following the Appalachian chain will already afford many bases of departure for the trigonometrical survey of the States through which it passes; and on the Pacific coast the primary triangulation will equally afford such facilities. The plan proposed by the present superintendent of connecting these two coast series by two other chains, a northern and southern one, has already received the sanction of Congress, with the additional provision that trigonometrical points may be determined from these main chains for such of the States as provide for a topographical and geological survey of their domain. The plan of a general geodetic survey of the whole country is thus happily inaugurated.

An account of the Coast Survey would be incomplete without a brief notice of the incidental contributions to science which have been made and are constantly being added to during the progress of the work. Its geodetic operations furnish important data for determining the figure of the earth. (See FIGURE OF THE EARTH and GEODESY.) In 1869 the primary triangulation extending from Passamaquoddy Bay in Maine to Cape Henry in Virginia, a distance of 750 miles, was connected with five measured base-lines distributed along the series. The length of any one of these base-lines, computed through the triangulation from another, did not differ more than at a rate of a quarter of an inch in a mile. The apparatus for measuring base-lines, constructed in the Coast Survey office, is extremely perfect, each measuring-bar consisting of two rods of different metal, so combined as to compensate the effect of temperature and preserve the lengths between the points of contact unchanged when exposed to varying temperatures. In the measurement the contacts of the agate ends are made by means of the lever of contact and level first used by Bessel in comparing standards of length, but here adapted to measurement at inclinations up to 4° with the same precision as on level ground. The necessity for the greatest attainable accuracy in such operations is apparent when we remember that an error in the base-line will affect the whole distance depending upon it by triangulation in the same ratio; thus, if the base-line were in error by but its ten-thousandth part, a distance of one hundred miles depending on it would be in error, from that source alone, by fifty-three feet. The angles of the primary triangulation have been measured by means of a theodolite having a circle of thirty inches diameter, graduated to five minutes of arc, and reading to single seconds by means of micrometer microscopes; about thirty measures of each angle are taken, the mean of which has generally no greater uncertainty than one-eighth of a second. The same instrument serves for determining the azimuths of many sides of the triangulation, or their direction in reference to the true north. Knowing thus the exact distance between any two points, and the direction of the line joining them, on the surface of the globe, we have only to ascertain their latitudes and difference of longitude in order to deduce the curvation of that portion of the globe which is occupied by our operations.

The latitudes are chiefly determined with an instrument called the *zenith telescope* or equal-altitude instrument, first applied to that purpose by Capt. A. Talcott of the U. S. army, and remodelled and specially adapted to the purpose in the Coast Survey. By the aid of this instrument, and the great accuracy which modern star-places have attained, the latitude of a station may readily be determined in three nights with such precision as to leave no greater uncertainty than one-tenth of a second. The comparisons of differences of latitude so observed at many stations with their differences deduced from the triangulation has developed the existence of small irregularities in the direction of

gravity, arising doubtless from local attractions, even in places where the outward conformation of the surface affords no such indication.

The accurate determination of the longitude of some point in the Coast Survey from the principal observatories in Europe has been one of the great problems of the work. All available methods have been resorted to—the observation of lunar occultations and eclipses, and of right ascensions of the moon; the transportation of chronometers; and finally the comparison of time by means of the electric telegraph. The latter method has yielded the most consistent results, which are also confirmed by the others within their limits of precision. The difference of time between the observatories of Greenwich and Cambridge has thus been determined within a limit of uncertainty no greater than one-twentieth of a second of time. The differences of longitude between Cambridge and other principal stations of the Survey are determined by the aid of the electric telegraph. A series of such determinations has been extended southward as far as Galveston and westward to San Francisco, fixing the geographical positions of many important places on the way. The method of recording observations of time on a chronographic register, by means of a galvanic circuit, known in Europe as the *American method*, originated in the Coast Survey with the first attempts to determine longitude by means of the electric telegraph. The idea of comparing the local time of different places by means of the electric telegraph is sufficiently obvious, but the refined methods by which the intervention of human senses and operations, and the consequent liabilities to error, are in the greatest possible degree avoided, and by which the time of transmission is measured and eliminated from the longitude, have been the result of careful study and long experience. By this perfect and admirable method we are able to measure arcs of longitude with the same degree of accuracy with which arcs of latitude have heretofore been measured, and a new element has thus been introduced into geodesy.

The variation of the compass being an important element in navigation, observations have been made at several hundred places along the coast, not only of the deviation of the magnetic needle, but also of its inclination and of the intensity of the earth's magnetism, these elements being necessary for a complete study of the distribution and changes of this subtle force. At many points these observations are from time to time repeated, and their discussion, in connection with the more ancient observations that have been collected, has largely added to our knowledge of the secular variation. A magnetical chart has been constructed, from which the surveyor can learn the variation of the needle at any place with considerable accuracy.

The subject of the tides has received great attention in the Coast Survey. Long-continued tidal registers are kept up at selected points on the coast, for the purpose of ascertaining, upon the basis of observation, the complicated laws governing the tides in the different seas that wash our shores. Self-registering tide-gauges are used, by which a continuous curve, representing the successive changes in the height of water, is traced on paper moved by clockwork by a pencil actuated by the rising and falling of a float in a vertical box to which the tide has free access. The discussion of these observations, made at different times by Prof. Bache, has already largely increased our knowledge of the laws to which they are subject, and has rendered possible the predictions of high and low water for all ports in the U. S., which are published annually in advance. But highly important results are yet to be obtained from the discussion of the observations when continued through a full lunar cycle of nineteen years. Such a series has been completed for Boston harbor, which has yielded, in addition to exact data for future predictions, an independent estimate of the moon's mass.

A hydrographic survey of our coast would be incomplete if it did not embrace the investigation of that remarkable ocean-current which sweeps along in the vicinity of our Atlantic coast. The method of exploring the Gulf Stream adopted by Prof. Bache was to determine the limits of the stream by the temperature of its water at all depths by means of deep-sea thermometers along lines crossing the stream at right angles at various points. Twenty-one such sections have been run, along which the temperature of the water at various depths has been determined, and also sections of the bottom wherever it has been possible to obtain soundings; over 3500 casts having been made for the purpose. It is necessary that the thermometers employed should be self-registering, and able to withstand the crushing pressure of the water without having their indication affected thereby. Until recently the metallic self-registering thermometers invented by Saxton were exclusively employed, being found best to fulfil the required conditions; latterly, the simpler Miller-Casella self-registering thermometer with protected bulb has also been employed. (See GULF STREAM for an account of the results of these explorations.)

In conclusion, it may be said that the U. S. Coast Survey is a national work of which Americans may justly be proud, it having been declared, by the most competent foreign scientific authorities, to stand in the very front rank of similar works of other nations, and to be one of the most perfect examples of applied science.

J. E. HILGARD, *U. S. Coast Survey Office.*

Coat'bridge, a town of Scotland, in the county of Lanark, on the Caledonian Railway, 8 or 9 miles E. of Glasgow. It has seven churches, two academies, and several banks; also eight malleable-iron works. It is the centre of a mineral district in which are numerous smelting-furnaces, and derives its prosperity from the manufacture of iron. It is a place of rapid growth. Pop. 10,501.

Coatesville, a post-borough of Chester co., Pa., on the Brandywine Creek, and on the Central R. R. where it crosses the Wilmington and Reading R. R., 39 miles W. of Philadelphia. It is in the rich and beautiful Chester Valley. It has a national bank, a newspaper, a banking-house, seven rolling-mills, woollen and paper mills, and water and gas works. Pop. 2025. WILLIAM J. KAUFFMAN,
PROP. CHESTER VALLEY "UNION."

Coa'ti [a word of Brazilian origin], the name of a genus (*Nasua*) of quadrupeds of the Ursidæ (the bear family), by some referred to Viverridæ (the civet family), although their plantigrade character allies them to the former. They are very nearly allied to the raccoons, and, like them, are exclusively American. They are remarkable for the long snout, which is a sort of flexible proboscis, and is employed in rooting up the earth to obtain worms and insects. They are often domesticated in South America.

The coati-mondi (*Nasua narica*) or solitary coati is considered by many naturalists to be the only species of the genus, while others reckon at least five species. The coati-mondi is a native of Brazil, Mexico, and the intermediate countries. It is often seen in menageries.

Coat'icook, a post-village and port of entry of Barnston township, Stanstead co., Quebec (Canada), on the Grand Trunk Railway, 26 miles N. of Island Pond, Vt. It has a weekly paper. Pop. about 2000.

Coat-of-Arms, in the Middle Ages, was a coat worn by princes and great barons over their armor. It was made of cloth of gold or silver, of fur or of velvet, and bore armorial insignia. The "coat-of-arms," as understood by heraldry in the present day, is nothing more than a relic of the ancient armorial insignia. (See HERALDRY, by REV. B. R. BETTS.)

Coat-of-Mail, in the armor of the Middle Ages, was a suit formed of metallic scales or rings linked to each other. (See ARMOR.)

Co'balt, a hard white metal of sp. gr. 8.5 to 8.9, with a granular fracture, quite malleable at red heat, attracted by the magnet, and even capable of receiving weak magnetic power when rubbed with a magnet, though arsenic destroys this property. It is unalterable in air and water at ordinary temperatures, though at red heat it decomposes water. The metal was first obtained in an impure state by Brandt in 1733, but the ores had already been used since the middle of the sixteenth century for imparting a blue color to glass. Their use was apparently known to the Greeks and Romans, as some of their pigments have been found to contain cobalt. The name is derived from the German word *Kobold*, an "evil-minded sprite," the miners believing that the presence of ores which were heavy and had a metallic lustre, but were, so far as they knew, of no value, containing no copper or silver, was due to his influence. Before their value was discovered the ores were used in Hesse for repairing roads.

Ores of cobalt are found in various parts of the world, though they are never very abundant. They are almost invariably associated with nickel compounds, and the metal is generally united with arsenic and sulphur. The principal supplies come from Schneeberg, Saxony, from Westphalia, Bohemia, Hesse, and Cornwall, England, though they occur in other localities. Mine La Motte, Mo., the Gap mine in Pennsylvania, Chatham, Conn., and mines on the N. shore of Lake Superior have furnished some cobalt.

The principal minerals in which cobalt occurs are *smaltite*, or smaltine, gray cobalt or tin-white cobalt, an arsenide of cobalt; *cobalt glance*, or cobaltine, the sulpharsenide; *cobalt bloom*, or erythrine, the hydrated arsenate; *earthy cobalt*, or asbolan, also called black oxide of cobalt, a combination of the oxide with iron and manganese oxides, found in several places in Europe, as well as in Missouri; *cobalt vitriol*, or bieberite, an impure sulphate

found in the rubbish of some old mines; *syepoorite*, the sulphide, occurring in North-western India, and used by the Indian jewellers to give a rose color to gold. The first two being the more common, are used for the manufacture of smalt and zaffre. Cobalt also occurs incidentally in some nickel minerals, in selenide of lead, cerite, and in Flemish coal. The metal is nowhere found native, except in some meteorites, some of which have been found to contain from 0.1 to 1 per cent.

The metal may be reduced from its oxide by heating in a current of hydrogen. If the heat has been too low, the cobalt is pyrophoric, and burns with a red flame when brought in contact with the air. It forms several oxides, of which the most important are the protoxide, CoO, and the sesquioxide, Co_2O_3, both of which give a series of salts. The highest oxide, CoO_2, has not yet been isolated. Cobalt combines with arsenic or antimony, giving brittle gray products. It also alloys with gold and silver, a small amount of cobalt rendering those metals quite brittle. In the case of gold one sixty-fifth part is sufficient to cause brittleness. With tin it gives a ductile alloy of a violet color. With mercury it forms an amalgam which is magnetic. The alloy with iron is extremely hard.

Cobalt salts are prepared by extracting the roasted ore with an acid, precipitating out the arsenic by means of sulphuretted hydrogen or by an iron salt, and then precipitating out the cobalt by means of chlorine water, which converts it into sesquioxide, or by the use of nitrite of potassa, filtering and dissolving. The chloride is used as a sympathetic ink. The writing, which is an extremely pale pink color, almost invisible, becomes blue when the water of hydration is removed by heat; but it gradually absorbs water and disappears again. The presence of nickel salts gives a greenish cast to the lines. In the arts the compounds of cobalt are applied for coloring either as pigments or enamels. The principal preparation is *smalt*, or azure blue, which is a double silicate of cobalt and potassium, prepared by fusing the roasted ore with carbonate of potassium and clean white quartz sand. The nickel, arsenic, and other impurities settle to the bottom, forming what is termed by the workmen a "speiss." The glass is poured off into water, then ground, and elutriated. The coarser qualities are called "blue sand," and contain some arsenic. The best quality contains little or no arsenic, and is known as "king's blue." The color is very intense, one part of oxide of cobalt being sufficient to give a decided color to 250 parts of glass. The presence of nickel seriously affects the color. It is stated that the manufacture of artificial ultramarine has nearly driven smalt from the market. Smalt is sometimes adulterated with ultramarine; the fraud may be detected by the addition of an acid to the article, which causes a change in the color of the ultramarine, and the development of sulphuretted hydrogen.

Zaffre, zaffer, or saffior is the roasted ore mixed with twice its weight of quartz sand. It is used for coloring glass, enamels, and pottery glaze. The well-known willow-pattern plates are colored by this substance. *Thénard's blue*, or cobalt ultramarine, is a pigment obtained by calcining phosphate or arseniate of cobalt with alumina. *Rinman's green*, or cobalt green, consists of the mixed and ignited oxides of zinc and cobalt; it is also used as a pigment. *Cobalt yellow*, another pigment not very generally used, is the yellow precipitate obtained by treating the solution of a cobalt salt with nitrite of potassa. A combination of the oxides of iron, cobalt, and manganese is also used to give a black coloration to glass.

In the laboratory cobalt is recognized by the brilliant blue color which it imparts to a bead of borax glass.

C. F. Chandler.

Cobalt-Bases, Ammoniacal, a series of bodies which contain the elements of ammonia, NH_3, united with cobalt or oxide of cobalt, and which form salts with salt radicals, Cl, Bi, I, and with acid radicals, SO_3, SO_4, CO_3, NO_3, CrO_3, etc. (See Watts' "Dictionary of Chemistry," i., 1057; "Journal pour Chemie," lxxii., 209; and a paper by Gibbs and Genth, published in the "Smithsonian Contributions to Knowledge," 1856.)

Coban', or **Ve'ra Paz,** a city of Central America, in Guatemala, is the capital of the department of Vera Paz, and on the Rio Dolce, 64 miles N. of Guatemala. It is situated on a hill in a fertile table-land. It is a Dominican mission, and was once the centre of their activity. On every street corner is a chapel with a crucifix. The chief church is very large, but falling into decay. Pop. 12,000.

Cobb, a county in the W. N. W. of Georgia. Area, 450 square miles. It is bounded on the S. E. by the Chattahoochee River. The surface is hilly. Kenesaw Mountain in this county rises 1828 feet above the level of the sea. Cotton, wool, corn, and wheat are raised. Gold, silver, copper, and granite are found here. It is intersected by the Western and Atlantic R. R. Cap., Marietta. P. 13,814.

Cobb (David), a soldier of the Revolution, born at Attleborough, Mass., Sept. 14, 1748, graduated at Harvard (1766), practised medicine for many years, was a lieutenant-colonel in the Continental army, member of Congress from Massachusetts (1793–95), was for many years a judge of common pleas, and lieutenant-governor in 1809; he resided for many years in Maine. Died April 17, 1830.

Cobb (Howell), an American lawyer and Methodist preacher, born in Georgia in 1795. He has written much, including a work on legal forms (1845) and a compilation of the penal laws of Georgia.

Cobb (Howell), an American Democratic politician, born in Jefferson co., Ga., Sept. 7, 1815. He was elected a member of Congress in 1843, 1845, and 1847. In 1849 he was chosen Speaker of the House of Representatives. He became governor of Georgia in 1851, and was appointed secretary of the treasury by President Buchanan in 1857. He resigned near the end of 1860, and was president of the Congress of secessionists which met in Feb., 1861. In the civil war he was a major-general of the Confederate army. Died suddenly in New York City Oct. 9, 1868.

Cobb (Joseph Beckham), a son of T. W. Cobb (see below), born in Oglethorpe co., Ga., April 11, 1819, was the author of novels and other works, among which are "The Creole" (1848) and "Leisure Hours" (1858). Died Sept. 15, 1858.

Cobb (Sylvanus), D. D., a Universalist minister, born in Norway, Me., in 1799, was the author of a "Commentary on the New Testament" and other works, and editor of a denominational newspaper for twenty years. Died in East Boston, Mass., Oct. 31, 1866.

Cobb (Sylvanus, Jr.), a son of the preceding, born in Waterville, Me., in 1823, has written many popular tales for the "New York Ledger" and other papers.

Cobb (Thomas R. R.), General, a brother of General Howell Cobb (see above), born in Jefferson co., Ga., in 1820, had a high reputation as a lawyer and author of legal works. He was a member of Congress and general of the army of the Confederate States, and was killed at the battle of Fredericksburg, Va., Dec. 13, 1862.

Cobb (Thomas W.), a lawyer, born in Columbia co., Ga., in 1784, was a member of Congress from Georgia (1817–21 and 1823–24), U. S. Senator (1824–28), and a State judge (1828–30). Died Feb. 1, 1830.

Cobb (Williamson R. W.) was born in Ray co., Tenn., in 1807. He began business as a peddler of clocks, but his political talents brought him in the House in 1844, and to Congress in 1847. In 1863 he was elected to the Confederate Congress, but did not take his seat. He died by accident Nov. 1, 1864.

Cobbe (Frances Power), a rationalistic writer, was born in Dublin in 1822. In early youth she was much troubled with religious doubts. "As she was one day musing on the great problem of existence, she said to herself that although she knew nothing of God or of any law beyond her own soul, she would at least be true to that, and merit the approbation of her own conscience. This resolution, we are told, brought almost immediately a renewed faith in God." She afterwards read with great interest the writings of Theodore Parker, whose views on all essential points she appears to have cordially adopted. Among her numerous works may be named "Intuitive Morals" (1855–57), "Broken Lights," and "Dawning Lights." She has also edited a complete edition of Parker's works.

Cob'bett (William) was born at Farnham, in Surrey, Mar. 9, 1762. He enlisted in the army, served eight years in America, and returned to England in 1791. Having obtained a discharge from the service, he emigrated to the U. S. in 1792, and settled in Philadelphia, where he edited a Federalist paper called "Peter Porcupine's Gazette." He returned to England in 1800, and began to issue in London, in 1802, "The Weekly Political Register," which was at first a Tory paper, but gradually changed and became a strenuous opponent of Pitt and an advocate of radicalism. He was prosecuted for libel, and sentenced in 1810 to imprisonment for two years. He continued to publish the "Register" until his death. Among his popular works are "Rural Rides," "Cottage Economy," and "Advice to Young Men and Women." In 1832 he was elected a member of Parliament for Oldham. Died June 18, 1835. He was a vigorous writer, and distinguished for his common sense. (See "Life of Cobbett," Philadelphia, 1823.)

Cob'bold (Thomas Spencer), M. D., F. R. S., F. L. S., an English scientist, born May 26, 1828, was educated at Edinburgh. He is distinguished for his original investigations in helminthology.

Cobbs (Nicholas H.), D. D., Protestant Episcopal bishop of Alabama, born in Virginia in 1796, was ordained

deacon in 1824, priest in 1825, and became bishop in 1844. Died Jan. 11, 1861.

Cob'den (RICHARD), an eminent English statesman, born at Dunford, near Midhurst, in Sussex, June 3, 1804, was a son of a poor farmer who owned a small estate. He learned mercantile business in the warehouse of his uncle in London, and became a partner of a firm of cotton manufacturers in Manchester. Between 1834 and 1838 he travelled in Egypt, Greece, France, and the U. S. In 1837 he offered himself as a candidate for Parliament in the borough of Stockport, but was not elected. He advocated free trade, and was the most prominent member and orator of the Anti-Corn-Law League, formed in 1839. In 1841 he was returned to Parliament for Stockport. He spoke against the corn laws in Parliament and in many public meetings. As a parliamentary orator he was distinguished for his extensive information and cogency of reasoning. He was a man of sound judgment and uncommon energy. After the corn laws had been repealed in 1846, Sir Robert Peel acknowledged that Mr. Cobden was entitled to more credit for this reform than any other man. In 1847 he was chosen to represent the West Riding of Yorkshire. He was one of the leaders of the Manchester party or school, which advocated electoral reform, a pacific foreign policy, and non-intervention in foreign quarrels. He was defeated in the election of 1857, because he opposed Lord Palmerston's Chinese policy. In 1857 he revisited the U. S., and was elected a member of Parliament for Rochdale. Lord Palmerston in that year offered him a seat in the cabinet as president of the board of trade, but he declined it, because he disapproved the foreign policy of Palmerston. He negotiated in 1860 an important commercial treaty with France in the interest of free trade, which increased the commerce between the British and French dominions. He was one of the few British statesmen who sympathized with the Union cause in the American civil war. Died April 2, 1865. (See J. GARNIER, "R. Cobden, les Ligueurs et la Ligue," 1846; J. MCGILCHRIST, "Life of Richard Cobden," 1865.)

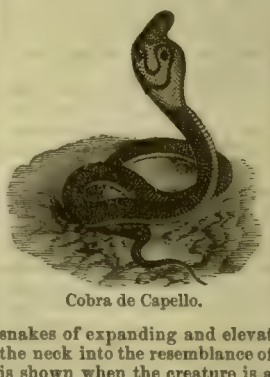
Cob'ham, a township and village of Surrey co., Va. Pop. 2110.

Cobi'ja, or **Puerto de la Mar** (*i. e.* the "seaport"), a town of Bolivia, in the department of Atacama, is on the Pacific Ocean; lat. 22° 34′ S., lon. 70° 21′ W. It is the only legal seaport of Bolivia, but it is a very small place, and has little trade, being cut off from the interior by the desert of Atacama. Pop. 2380.

Cob'leigh (NELSON EBENEZER), D. D., LL.D., a divine, educator, and journalist of the Methodist Episcopal Church, was born in Littleton, N. H., Nov. 24, 1814, graduated at the Wesleyan University, Conn., in 1843, was elected professor in McKendree College, Ill., 1853, professor at Lawrence University, Wis., 1854, president of McKendree College 1858, editor of "Zion's Herald," Boston, Mass., 1863, president of East Tennessee Wesleyan University, Athens, Tenn., 1867, and editor of the "Methodist Advocate," Atlanta, Ga., 1872. He is author of numerous and able reviews.

Cob'lentz (anc. *Confluentes* or *Confluentia*), a fortified city of Rhenish Prussia, is finely situated at the confluence (whence its name) of the Rhine and the Moselle, 50 miles S. S. E. of Cologne, with which it is connected by rail. The Rhine is crossed by a bridge of boats 485 yards long, and the Moselle is crossed by an iron railroad bridge and a stone bridge. Here are handsome churches, a gymnasium, a palace, and an old castle of the electors of Treves. The church of St. Castor was commenced about 836 A. D. Coblentz is a free port, and has an active trade in wine, grain, etc.; also manufactures of cotton and linen fabrics and japanned wares. On the opposite side of the Rhine is the strong fortress of Ehrenbreitstein. Coblentz is said to be the strongest place in the Prussian dominions. Pop. in 1871, inclusive of Ehrenbreitstein (2504) and the garrison (6331), 33,363.

Co'bles, a township of Alamance co., N. C. Pop. 875.



Cob'leskill, a post-village of Schoharie co., N. Y., on Cobleskill Creek and the Albany and Susquehanna R. R., 45 miles W. of Albany. It has a national bank and one weekly newspaper. Pop. 1030; of Cobleskill township, 2847.

Cob-Nut, the name given to different varieties of the cultivated hazel-nut. In the West Indies the name cob-nut, also called hog-nut, is given to the fruit of *Omphalea triandra*, a tree of the natural order Euphorbiaceæ. A white juice is obtained from the tree which turns black in drying, and in Guiana is used instead of ink. The fruit is a 3-celled capsule, each cell containing one nut, which, if the embryo is retained, has cathartic properties, but after its extraction is wholesome and palatable.

Cob'oconk, a post-village of Victoria co., Ontario (Canada), is the present N. terminus of the Toronto and Nipissing Railway, 87 miles N. by E. of Toronto.

Co'bourg, a port of entry and capital of Northumberland co., Ontario (Canada), on Lake Ontario and on the Grand Trunk Railway, 69 miles E. by N. of Toronto, and is the S. terminus of the Cobourg Peterborough and Marmora Railway. It has a good and commodious harbor, and has regular lines of steamers to many of the principal lake and river ports of Canada and the U. S. The town is finely laid out, well built, and lighted with gas. Among the finest buildings are Victoria Hall, owned by the county, and Victoria College (Wesleyan Methodist), connected with Victoria University. Cobourg has manufactures of woollen goods, railway carriages, castings, lumber, beer, etc., and exports lumber, provisions, flour, and iron ore. It has three weekly papers. Pop. in 1871, 4442.

Co'bra de Capel'lo [a Portuguese term signifying "hooded snake"], the name of a venomous serpent, sometimes applied to other species of the genus *Naja*, of the family Viperidæ, though it is more usually limited to the *Naja tripudians*, a native of the Indies, the most venomous of known reptiles. Other species of *Naja* are found in the warmer parts of Asia, Africa, and Australia, and in the East Indian Islands. The term cobra de capello is derived from a singular faculty possessed by these snakes of expanding and elevating the skin of the back of the neck into the resemblance of a hood. This phenomenon is shown when the creature is angry or excited, and is produced by the structure and action of the skeleton, as well as of the skin and muscles. The back of the hood is usually ornamented with two eye-like spots joined by a curved dark stripe, the whole resembling a pair of spectacles; hence it is often called the "spectacle snake." The color of the cobra is not uniform; some are brownish olive, having the spectacles white, edged with black. Another variety has cross-bands of black. Specimens without spectacles have been found in Java, Borneo, and other islands. The cobra attains a length of from three to five or more feet. It is sluggish in its habits, and easily destroyed. It feeds on lizards and other small animals. Its venom is secreted by two large glands in the head, and is extremely powerful, often causing death in two hours or less. This poison, though generally fatal if introduced through a wound, is said to be harmless when taken into the stomach. The only successful treatment is immediate excision or thorough cauterization of the wound, but Fayrer believes that artificial respiration will save many cases. The cobra, together with other serpents, is an object of worship among many of the Hindoos. It is asserted that thousands of people perish annually in British India from the bite of this reptile, and the government now pays a bounty for the destruction of this and other dangerous serpents.

Cobra de Capello.

Co'burg [Lat. *Melocabus*], a town of Central Germany, in the duchy of Saxe-Coburg-Gotha, is on the river Itz and on the railway from Dresden to Munich, 26 miles N. of Bamberg. It is one of the residences of the duke of Saxe-Coburg-Gotha, and is the seat of all the high courts of the duchy. It has a ducal palace with a library of 26,000 volumes, a theatre, an observatory, an evangelical gymnasium, and a large arsenal. On a hill 500 feet high is an old castle in which Luther was concealed in 1530. Here are manufactures of cotton, linen, and woollen fabrics, etc. Pop. in 1871, 12,819.

Co'ca, the leaves of a shrub (*Erythroxylon Coca*) of the order Erythroxylaceæ, a narcotic and stimulant used by the inhabitants of Peru, Brazil, and Bolivia, and especially by the Indians of Ecuador and of the Peruvian Andes. The leaves are chewed with a little unslaked lime or alkaline ashes. The effects resemble those of opium, although less narcotic; it dilates the pupil of the eye, while opium contracts it. It lessens the desire for food, and enables the person who uses it to endure greater and more protracted exertion than he otherwise could, and with less food. It possesses the remarkable property of preventing the difficulty of respiration common in the ascent of great elevations. Used in excess, it weakens the digestion, produces various disorders, and finally impairs both body and mind. It is supposed that about 30,000,000 pounds of the dried leaf are consumed in a year, about 10,000,000 of the human race habitually using it. Its

powers are believed principally to depend upon an active principle called cocaine.

Co'caine ($C_{16}H_{19}NO_4$?), an alkaloid extracted from coca leaves. It crystallizes in colorless, odorless prisms, having a slightly bitter taste, and resembling atropine in its properties.

Cocce'ius (Nerva), an eminent Roman jurist, was a grandfather of the emperor Nerva. He was elected consul in 22 A. D. His learning is highly extolled by Tacitus. Died about 33 A. D.

Cocce'jus, Cocceius, or **Cock** (Johann), an eminent German theologian, born at Bremen Aug. 9, 1603. He was professor of Hebrew at Francker from 1636 to 1650, when he became professor of theology at Leyden, where he died Nov. 5, 1669. He wrote commentaries of great learning and ability on nearly the whole of the Old Testament, but is best known as the founder of the so-called "Federal School" in theology. His doctrine of the covenants of works and grace is drawn out in the treatise "Summa Doctrinæ de Fœdere et Testamento Dei" (1648; 2d ed. 1653).

Coccejus (Samuel), Baron, a German statesman, son of Heinrich Coccejus, born at Heidelberg in 1679, became in 1727 Prussian minister of state, and in 1746 chancellor. He was the author of a new code of laws ("Codex Fridericianus," 1747–50). Died in 1755. (See Trendelenburg, "Friedrich der Grosse und sein Grosskanzler Samuel von Coccejus," 1863.)

Coc'cius (Ernst Adolf), a prominent German oculist, born Sept. 19, 1825, at Knauthain, near Leipsic, became in 1849 lecturer at the University of Leipsic; established in 1857 a clinical institution of eye-diseases, of which he was the director until 1867. He wrote numerous works, all of which are regarded as important contributions to opthalmological literature.

Coc'co Root is the product of plants of the nearly-allied genera *Colocasia* and *Caladium*, of the order Araceæ, cultivated in tropical countries for their flat corms, which abound in starch, and are used as food after being roasted or boiled to remove the acridity. The above names strictly belong to *Colocasia antiquorum*, a stemless plant with ovate leaves, and flowers enclosed in a cylindrical erect spathe. *Colocasia esculenta* is a much-cultivated plant of tropical America. *Colocasia macrorrhiza* is the taro of the South Sea Islands. *Colocasia Himalensis* forms the principal food of many of the inhabitants of the Himalaya Mountains.

Coccos'teus [from the Gr. *κόκκος*, a "berry," and *ὀστέον*, a "bone," alluding to the prominences on its bony armor], the name of a genus of fossil ganoid fishes of the Devonian measures. Eight species have been found in Scotland. It was allied to the *Cephalaspis*, but differed in having, in addition to the bony helmet of that genus, a cuirass covering the dorsal and ventral aspects of the body as far as the origin of the dorsal fin, from which to the tail—more than one-half the length of the animal—all seems to have been without the protection even of a scale.

Coc'culus In'dicus, the very poisonous seed of the *Anamirta Cocculus*, a beautiful climbing plant of the order Menispermaceæ. The seed is brought from the East Indies, and is sometimes used for medicinal purposes, and illegally in the preparation of malt liquors. It possesses acrid and intoxicating qualities. It is used for stupefying fish, that they may be taken by the hand; in some of the U. S. this practice is forbidden by law. An ointment made with it is very efficacious for ringworm. It contains a poisonous principle, called Picrotoxine (which see), while the pericarp contains another called menispermin, equally poisonous. It imparts to beer a bitter taste, and at the same time an apparent richness, but renders it very deleterious in its effects.

Coc'cus [from the Gr. *κόκκος*, a "berry," so called because some species of the insect were formerly supposed to be the seed of a plant], a genus of insects of the order Hemiptera, allied to the aphis family, although very distinct. The Coccidæ are sometimes called "scale insects" and gall insects, but they are not to be confounded with the gall-flies (Cynipidæ). They are very numerous, and are attached to plants, on the juices of which they feed, often producing much mischief by their punctures, and giving great trouble to gardeners. Various washes of soap, sulphur, tobacco, etc. are employed to destroy them, but moist heat, or as much exposure to steam as the plant can bear, has been found in many cases efficacious. The destructive coffee-bug belongs to this family. The male Coccidæ have only two wings, which shut horizontally upon the body; the abdomen is terminated by two threads. The females are wingless; they have a beak, which they insert into plants to suck their juices. This interesting family contains not only many troublesome species, but some which are of great value for the beautiful dyes which they yield. Among them are Cochineal (which see) and kermes. Other species produce lac and wax.

Cocentay'na, a Spanish town, in the province of Alicante, 30 miles N. of Alicante. It is ill built, but has considerable manufactures of cloths, taffetas, etc. Pop. 7369.

Cochabam'ba, a department of Bolivia, S. of Chuquisaca, in the centre of the republic. The climate is healthful and spring-like. The soil is exceedingly fertile and rich in manifold products. So abundantly do cereals grow that it has been called the granary of the republic. Area, 26,803 square miles. Cattle and horses are plenty. The noble metals are found, but in smaller quantities than elsewhere. Pop. 319,892.

Cochabamba, sometimes called **Orope'sa,** a city of Bolivia, capital of the department of Cochabamba, is about 150 miles N. N. W. of Chuquisaca, and 8440 feet above the level of the sea. The city was founded in 1565. The houses are mostly one story high, well built, and surrounded by gardens. The trade is large. It has fifteen churches, and some manufactures of cotton. Pop. 40,678.

Cochec'ton, a township and post-village of Sullivan co., N. Y. The village is on the Erie R. R., 106 miles S. E. of Owego. Pop. of township, 1490.

Co'chin, a rajahship of India, on the Malabar coast, is bounded on the S. W. by the ocean, and on several sides by Travancore and Malabar. It is in the presidency of Madras. Area, 1988 square miles. The climate is very wet. Here are extensive forests of teak and other trees. Rice, pepper, ginger, yams, and sweet potatoes are among the productions of the soil. Chief town, Cochin.

Cochin, a seaport-town of Hindostan, in the district of Malabar, was formerly the capital of the above country. It is situated at the entrance of an extensive backwater or lagoon, 80 miles S. S. E. of Calicut. The lagoon, which is nearly 120 miles long, and is navigable, affords valuable facilities for communicating with the interior. Cochin has great natural advantages for trade and shipbuilding. The Jews, of whom there are many both of the white and black castes, have a synagogue, almost the only one in India. It is also a Roman Catholic episcopal see. Here the Portuguese erected in 1503 their first fort in India. They were expelled from Cochin by the Dutch in 1663. The town was ceded to the British in 1814. The chief articles of export are teak-timber, cardamoms, coir, etc. Pop. 20,000.

Cochin-China. See Anam, by Prof. A. J. Schem.

Coch'ineal [Sp. *cochinilla*, originally the name of the coccus insect used in dyeing; see Kermes], a substance used in dyeing crimson and scarlet and in the preparation of the colors carmine and lake. It consists of the bodies of the females of the *Coccus cacti*, which feeds on plants of the cactus family, particularly on the cochineal plants (*Opuntia cochinillifera*, *Hernandezii*, and *Tuna*), nearly allied to the prickly pear. It is a native of the warm parts of America, and is cultivated for the sake of the valuable insect which feeds on it. This cultivation was practised by the Mexicans long before the country was known to Europeans. It is now carried on also in parts of the West Indies and Peru, and in the Canary Islands, where it forms a very important article of commerce with Europe and the U. S. The cochineal insect is very small, a pound of cochineal being calculated to contain not less than 70,000 in a dried state. The male is of a deep-red color and has white wings. The female is wingless, and of a deep-brown color, covered with a white powder, flat beneath, convex above. The cultivator procures branches laden with the insects, and keeping the branches till the mother-insects have laid their eggs, he places their bodies, with the eggs, in little nests formed of some cottony substance upon the cochineal plants, and the young insects, when hatched, soon spread over them. The gathering of the cochineal is very tedious, and is accomplished by brushing the branches with some soft brush, such as the tail of a squirrel. The insects are killed by boiling water, by heating in ovens, or by exposure to the sun. They must be quickly killed, to prevent them from laying their eggs, which diminishes their value. When killed and dried, they may be kept for almost any length of time without injury. The coloring principle of cochineal is carminic acid ($C_{14}H_{14}O_8$), known in an impure state as *carmine*, and combined with alumina as *carmine lake*. Cochineal is used for dyeing wool and silk scarlet and crimson. The colors are very brilliant, but not durable. They are easily spotted by water and alkalies. The mordants used are alum, cream of tartar, and tin salt. Revised by C. F. Chandler.

Cochit'uate Lake, of Massachusetts, in Middlesex co., about 18 miles W. by S. from Boston, is the principal source of the water by which that city is supplied. It is nearly three miles long, and has an area of 650 acres. It is connected with Sudbury River by an artificial channel,

through which, at low water, the supply for the city is increased.

Coch'ran (John Webster), an eminent inventor, born at Enfield, N. H., May 16, 1814, removed in 1832 to Boston, Mass., patented in 1833 a steam heating-apparatus, and in 1834 a revolving cannon, constructed on the principle afterwards used in the revolving pistol. He afterwards invented valuable machinery for the curvilinear sawing of timber. He resided in Europe many years, and afterwards returned to the U. S., having acquired wealth and fame by his inventions.

Cochran (William) was a Northern man of Irish descent who settled in Tuscaloosa, Ala., about 1837. He became a law-partner of Gen. Crabb, and acquired a great reputation.

Coch'rane (Sir Alexander Forester Inglis), an English admiral, born April 22, 1758, served with distinction in Egypt and the West Indies, and commanded the English fleet which assisted in taking Washington in Aug., 1814. Died at Paris Jan. 26, 1832.

Cochrane (John), General, born at Palatine, Montgomery co., N. Y., Aug. 27, 1813, graduated at Hamilton College, Clinton, N. Y., in 1831, became a lawyer and removed to New York City in 1846, was a Democratic member of Congress (1856–62), served as a brigadier-general of volunteers (1862–63), and in 1864 was nominated for Vice-President on the Fremont ticket.

Cochrane (John Dundas), Captain, a British naval officer, son of Admiral Sir Alexander Cochrane, called the "pedestrian traveller," was born about 1780. He purposed a journey round the globe, and traversed Russia and Siberia on foot. When he arrived in Kamtchatka he married, and abandoned his original project. He returned by way of Russia to England in 1823, and published a narrative of his travels. Died Aug. 12, 1825.

Coch'ranton, a post-borough of Crawford co., Pa. Pop. 459.

Cocin'ic Acid, or **Cocostearic Acid** ($HC_{13}H_{25}O_2$), the fatty acid of cocoanut oil.

Cock [Fr. *coq*], the male of the common domestic fowl.

Jungle Cock: *Gallus giganteus.*

The name is also applied to the males of many other kinds of birds. The ancients regarded the domestic cock as sacred to Mars. The cock is said to have been the emblem of the ancient Gauls, though the tradition does not rest on authority, and is supposed to have been a mere play of words between the Latin *gallus*, a "cock," and Gallus, a Gaul; the cock was placed, after the Revolution, on the ensigns of France. It is introduced by artists amongst the emblems of our Lord's passion, in allusion to Saint Peter's sin, and for the same reason it is Saint Peter's emblem, as the lion is the emblem of Saint Mark.

There is reason to believe that the domestic fowl is the descendant of more than one recognized species of the genus *Gallus*, all, however, of Asiatic origin. Among these are the *Gallus giganteus*, or Kulm fowl, a large bird of India and the Eastern Archipelago; *Gallus Sonneratii*, a spirited fowl of Hindostan; *Gallus æneus*, *furcatus*, and *bankiva* of the Archipelago, and others; but there is very good reason to believe that they are all of one stock, since the domestic fowl, like the pigeon, has a remarkable tendency to develop strongly marked varieties in breeding.

Cock (Thomas), M. D., a prominent physician of New York, born at Glen Cove, Long Island, in 1802. He distinguished himself by his courage and ability during the yellow-fever season in New York in 1822, and in the epidemic of cholera in 1832. He was a professor in the New York College of Physicians and Surgeons, and an active Christian philanthropist. Died June 14, 1869.

Cockade [Fr. *cocarde*], a ribbon or badge worn on the hat or cap by officers of the army or navy; an appendage to the headdress, worn as a military or naval distinction or as a badge of a party. During the revolution of 1789 the French people generally assumed the tricolored ribbon (red, white, and blue) as a badge of patriotism or the symbol of the new *régime*. The army also wore the tricolored cockade until the Restoration, when the legitimists adopted the white cockade. In England a white rose was the badge of the Stuarts, and became a favorite theme in Jacobite songs after the Stuarts had ceased to reign.

Cock'atoo' [a word derived from the cry of these birds], the name applied to several birds nearly allied to the parrots (of the family Psittacidæ), from which they are distinguished by the greater height of the bill and by the lengthened and rounded tail. In the genus *Plyctolophus* the head is large, and surmounted by a crest of long pointed feathers, with their tips directed forward, which can be expanded like a fan or depressed by the bird. The cockatoos are of generally whitish plumage, often finely mixed with red, orange, and other colors. The name cockatoo is also extended to allied genera, *Cacatua*, *Nestor*, *Calyptorhynchus*, and *Microglossum*. The genus *Microglossum*, to which belongs the giant cockatoo of New Guinea, is remarkable for the structure of the tongue, which is cylindrical, tubular, capable of being greatly protruded, and which terminates in a horny tip. The cockatoos are natives of Australasia

and the Malay Islands. They not only eat fruits and seeds, but the larvæ of insects. None of the cockatoos learn to

White-crested Cockatoo.

speak with fluency. The owl parrot (*Strigops*) and the hairy parrot (*Dasyptilus*) are kindred to the cockatoos.

Cock'atrice [called in Latin *basiliscus* and *cocatrix*], a fabulous monster or venomous serpent, which has been sometimes identified with the basilisk. It was said to be hatched from a cock's egg, and its breath and look were fatally poisonous. The word occurs in the English version of the Old Testament as the name of a venomous serpent.

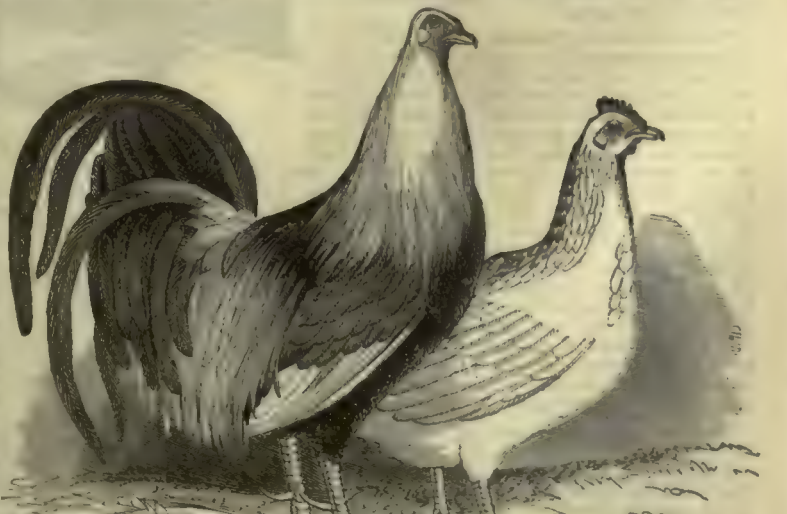
Cock'burn (Sir Alexander J. E.), Bart., an English judge, born in 1802. He was elected to Parliament as a liberal in 1847, and was appointed attorney general in 1851. In 1856 he became chief-justice of the court of common pleas, and in June, 1859, lord chief-justice of the court of queen's bench. He was selected by the British ministers to act as an arbitrator of the tribunal which was organized for the settlement of the "Alabama claims" at Geneva, in 1871–72.

Cockburn (Sir George), G. C. B., a British admiral, born April 22, 1772, entered the navy in 1781, assisted in the capture of Washington (D. C.) in 1814, and conveyed Napoleon to St. Helena in 1815. He was a lord of the admiralty from 1818 to 1828. Died at Leamington Aug. 19, 1853.

Cock'chafer, the common English name of the *Melolontha vulgaris*, a European coleopterous insect of the family Melolonthidæ, famous for the ravages which it commits, the winged beetle feeding on the leaves of fruit and forest trees, the grub devouring the roots of pasture-grasses and corn. The cockchafer is an inch in length, of a pitch-black color, with a whitish down, giving a powdered appearance; the grub is an inch and a half long, whitish, with a red head and six legs. The cockchafer does not live long in its perfect state, but it lives nearly four years in the larva form. The female deposits her eggs in the earth. The whole grass of a field has been destroyed in a short time by the grubs, and the beetles themselves strip the trees like locusts. The river Severn is said to have been so filled with their bodies in 1574 that the water-wheels of the mills were clogged; and in 1688 they were so abundant in some parts of Ireland that they hung in clusters on the trees like bees swarming, and the noise of their jaws at work was compared to that of the sawing of timber. This insect does not occur in the U. S., but others of the same family and of similar habits abound.

Cocke, a county of East Tennessee. Area, 250 square miles. It is drained by the French Broad River, and bounded on the S. E. by Iron or Smoky Mountain. The surface is hilly. Tobacco, wool, and grain are produced. It is intersected by the Cincinnati Cumberland Gap and Charleston R. R. Capital, Gorman's Dépôt. Pop. 12,458.

Cocke (John), General, born at Brunswick, Nottoway co., Va., in 1772, was a member of Congress from Tennessee (1819–27), major-general of volunteers in the Creek war (1813), and served as colonel at the battle of New Orleans (1815). Died in Granger co., Tenn., Feb. 16, 1854.



Cock'er, a small spaniel, similar to the Blenheim dog. The small size of the cocker fits it for ranging in coverts, and it is much employed by British sportsmen in pheasant and woodcock shooting; but it cannot easily be trained to wait for the sportsman. It is sometimes called the "cocking-dog," taking both its names from its behavior when game is discovered. It somewhat resembles the setter.

Cock'erill (John), an English engineer and well-known promoter of modern commerce, born in Lancashire Aug. 3, 1790. In 1802 he went to Belgium, where his father had long been employed as a machinist, and in 1816 established at Seraing, near Liége, a large machine-shop, the king of Holland being for a time in partnership with him. He also established coal-mines, iron-mines, and extensive factories in many parts of Europe. In 1839 he failed, and died in 1840.

Cock'ermouth, a town of England, in Cumberland, on the river Derwent, at the mouth of the Cocker, 24 miles S. W. of Carlisle. It is poorly built. Here are the ruins of a castle founded about 1100, and razed by the army of the Parliament in 1648. It has manufactures of cotton and woollen goods, hats, hosiery, and paper. Pop. 5388.

Cock'eysville, a post-village of Baltimore co., Md. It is a station on the Northern Central R. R., 15 miles N. of Baltimore.

Cock-Fighting, a barbarous sport which is said to have originated with the Athenians. It existed in the days of Thomas à Becket, and until the time of the Commonwealth it flourished, a pit at Whitehall having been erected and patronized by royalty. It was prohibited in 1654, but,

Grey Game Fowl.

though there have been other acts passed with the view of putting it down, it still exists both in England and the U. S. Cocks of the breeds known as game fowl are chosen. These birds often exhibit the highest degree of courage.

Much art is displayed in training and in trimming and preparing the cock for the combat; the fastening on of the

steel spurs or "gaffs" is a matter requiring considerable experience. Young cocks are called stags; two years is the best age. In fighting, a certain number of cocks on either side is agreed upon, and before the match the cocks are shown, and matched according to their weights. The cocks within an ounce of each other in weight are said to "fall in," and are matched for the "main." Those which do not fall in are matched to fight what are called "byes." The main is fought for a stake upon each battle, and so much for the main or the winner of the most battles in the main; while the byes have nothing to do with the main, and are fought for smaller sums. The nations of Spanish origin are especially fond of this sport, which has also been very popular in parts of the U. S.

Cock'le [Gr. κογχύλιον (from κόγχη, a "shell"); Lat. *conchylium*], a name given to various acephalous mollusks, chiefly of the genus *Cardium*. The *Cardium edule*, or common cockle, and other species, constitute an important supply of food in England and other European countries. The species are very numerous, and are chiefly tropical. *Cardium Junonis* is one of the finest species. Several species occur on the Atlantic and Pacific coasts of the U. S.

Cockle-shell: *Cardium Junonis.*

Cock'le, or **Corn-Cockle** [Fr. *coquelicot*], a common name of the *Lychnis Githago*, an annual plant of the order Caryophyllaceæ, a native of Europe. It often occurs as a weed in the wheat-fields of the U. S., and produces black seeds, which are injurious to the appearance and quality of wheat flour. The lobes of the calyx are linear, and longer than the corolla, which is purple-red.

Cock'ney. The origin of this term, applied to a native or citizen of London, is involved in obscurity. In 1517, Henry VIII. made an order with reference to the feast of the King of the Cockneys, held on Childermas Day. The term Cockney School was applied to a literary coterie sisting of Hazlitt, Keats, Leigh Hunt, Shelley, etc.

Cock'pit, in a ship of war, is a room near the after hatchway, under the lower gun-deck. It adjoins the surgeon's cabin and the surgery, contains the medicine-chests for all the crew, and is the place where the wounded men receive surgical treatment during an action.

Cock'roach, or **Roach,** a name of several orthopterous insects of the genus *Blatta* and allied genera, which have a flattened body, the head beneath the plate of the prothorax, and wings folded longitudinally. The elytra are parchment-like, and the wings sometimes imperfectly developed, particularly in the females. The eggs are in a sort of shell fixed to the abdomen of the mother, which at last she deposits in a suitable situation, attaching it by a glutinous secretion. The larvæ are similar in form to the perfect insects, and, like them, very voracious. Cockroaches are numerous in warm countries, and the common cockroach (*Blatta orientalis*) was imported from abroad, but its native country is uncertain. It devours both animal and vegetable substances, and a dark-colored fluid from its mouth gives a disgusting smell to everything that it passes over. The common cockroach is an inch long, but some tropical ones are much larger. The cockroaches are remarkably infested by parasitic insects and fungi. Borax, used freely, will generally drive them away.

Cocks'comb [named from the resemblance of its head of flowers to the comb of a cock], a name applied to various amaranths, but especially to the *Celosia cristata*, native of the East Indies, and a familiar inmate of conservatories, often also planted in borders. Its upright stem becomes flattened, expands, and forms a crest, bearing on its surface many very small and brilliant flowers, so crowded as to present a rich velvety appearance.

Cocoa. See Cacao and Theobroma.

Co'coa-Nut, the fruit of the *Cocos nucifera*, a tree of the order Palmaceæ, which is indigenous or cultivated in nearly all tropical countries. It has pinnate leaves, from twelve to twenty feet long. The trunk or stem is branchless, and grows to the height of sixty to ninety feet, bearing at its summit a crown of leaves. These trees prefer a sandy soil, and are seldom found growing far from the sea, unless they have been planted by man. The thick and hard shell of the nut is well adapted to preserve the seed when it is carried by the waves to some distant shore or sandbank; hence the cocoanut-palm is one of the first large plants that usually appear on a new island of coral formation as soon as sufficient soil has been collected there. It affords a large variety of useful products. The nut, which is an important article of food to the people of tropical countries, is eaten both ripe and unripe. The young unripe fruit contains a pleasant milky fluid, which is used as food and is prepared in various ways. The kernel yields about 70 per cent. of a fixed oil called *cocoanut oil*, which is an important article in the manufacture of stearine candles and marine soap. In tropical countries it is used as lamp oil and as an article of food. It can be separated by compression in the cold into a more liquid portion called oleine, and a more solid part termed cocostearine or cocosine. (See Cocinic Acid.)

The terminal bud (palm-cabbage) of *Cocos nucifera* is edible and is considered a delicacy, but its removal causes the death of the tree, which is sometimes cut down for its sake. The stem abounds in a saccharine sap called "toddy," which is esteemed as a pleasant beverage, either in the state in which it is drawn from the tree, or after fermentation, which takes place in a few hours. From the fermented sap (palm wine) a spirituous liquor called "arrack" is obtained by distillation. The dried leaves of the cocoanut-palm are useful for thatching houses, for making mats and baskets, and for other purposes. The wood of the lower part of the stem is very hard, takes a beautiful polish, is employed for a variety of purposes, and is imported for ornamental joinery under the name of porcupine-wood. The most important fibrous product of this tree is coir, the fibre of the husk of the immature nut. (See Coir.) The shell of the nut is made into cups, ladles, etc., and is often finely polished and elaborately ornamented by carving. The double cocoa-nut is the product of the *Lodoicea Seychellarum*, a palm growing in the Seychelle Islands.

Co'coa Plum, the edible fruit of the *Chrysobalanus Icaco*, a shrub of the order Rosaceæ, growing in the southern part of the U. S. and the West Indies. The fruit resembles a large plum, yellow, purple, or black in color.

Cocoon. See Silkworm and Chrysalis.

Cod (*Gadus morrhua*), a fish of great commercial importance, belonging to the family Gadidæ. The genus is distinguished by three dorsal and two anal fins and a barbule beneath the chin. The cod has been known to reach

Common Cod.

a weight of 100 pounds. The roe of the female is estimated to contain from four to nine millions of eggs, a reproductive power which seems intended to provide for the extensive fisheries which are carried on in the northern parts of the Atlantic and Pacific oceans and in the Arctic seas. The cod is not known in the Mediterranean. It occurs both on rocky coasts and on sandbanks, where the largest are usually caught in depths of from twenty-five to fifty fathoms. The productiveness of the banks of Newfoundland excels that of all other known regions, but the cod-fisheries near Holland, Norway, Iceland, and the north of Scotland are also productive. The cod-fisheries of Alaska promise to become very important. The Dutch and the English engaged in the cod-fishery in the fourteenth century, about the same period. More than 6000 European vessels are employed in it, besides boats along the shores. The fishery is carried on partly by long lines and partly by hand lines. One man has been known to catch from 400 to 550 fish on the banks of Newfoundland in ten hours, and eight men to take 1600 in a day on the Dogger Bank, near Holland. Small fishes, shell-fish, etc. are used for bait. The cod is used as food, either fresh, salted, or dried. Great quantities of dried cod are carried from Newfoundland to the West Indies and the south of Europe. Cod tongues and sounds (or air-bladders) are esteemed a delicacy, and are often salted and sent to market. Several varieties and species seem to be peculiar to the American coasts. The cod-fisheries of the U. S. are principally carried on from Massachusetts and Maine, though the fisheries on the Pacific coast are assuming considerable importance.

Cod'dington (William), born in Lincolnshire, England, in 1601, came to Salem, Mass., in 1630, was a merchant of Boston, and fled to R. I. in 1638 in consequence of his defence of Anne Hutchinson and others. He soon became a Quaker and an advocate of liberty of conscience, was elected a judge, and afterwards governor of R. I. (1640–47). In 1651 he was again appointed governor of the island by the Commonwealth of England, but resigned soon. He was again governor (1674–75). Died in Nov., 1678.

Code [Lat. *codex*], a collection of laws made by public authority. In modern law, it more commonly means a methodical arrangement of law, either customary or statutory, in chapters and sections. In a number of the American States the general statutes (see Statute) are arranged in this manner under the title of "Revised Laws," "Revised Statutes," or "Codes." How far it is practicable to accomplish useful results in the codification of customary or common law is a subject of much controversy among jurists. On the one hand, it is claimed that as law of this nature can be enunciated or stated, the statement can be reduced to writing in the form of general and particular propositions. It is added, as to the common law of England, that it has been for ages in writing, and that all that is now known of it is derived from written sources such as reports and treatises of recognized authority. The rules there found are susceptible of collation, analysis, and systematic arrangement. The materials thus obtained may be recast by the codifier, and moulded into the form of positive and authoritative statement in *his own language*. True, the judge in deciding a cause states a principle as applied to the particular cause before him; the codifier may seize upon the principle that underlies the specific case, and state it in a positive and precise form. From this mode of collecting and arranging legal propositions it is claimed that a number of benefits will be secured, such as reducing the labor of lawyers, decreasing the size of their libraries, introducing legal reforms by comprehensive legislation, and affording to the public increased opportunities to become acquainted with general rules of law. (See "Report of Civil Code for New York by Commissioners," Albany, A. D. 1855.) On the other hand, it is urged that a code, being inflexible in its character, prevents the true growth of law. Discussions in court will turn upon the construction of *words* used in the code, instead of there being an examination of legal principles. The interpretation of specific words is to the last degree attended with uncertainty. Leading inquiries concerning the great statute of frauds passed in the reign of Charles II. are still regarded in the courts as open to consideration. This objection is truly formidable. Where customary law prevails, little if any attention is paid in the decision of causes to the particular language in which the court in a former case cited as a precedent expressed its views. The principle of the decision is seized upon and stated in perhaps wholly different words. The arguments applied to the construction of statute or codified law must, from the nature of the case, be in the main textual criticism. There must be interpretation of particular words, reconciliation of discordant phrases, and minute consideration of mere forms of expression. While a rule of law is in process of formation discussions as to its true principle should be as free and unfettered as possible until, after a long interchange, and perhaps collision, of opinions, the true rule is evoked, with its various qualifications and limitations. This process, so beneficial in its character, could not be made available if the rule in its early stages had already been hardened into fixed forms of statute law. Mr. Austin, in his great work on jurisprudence, though from the bent of his mind inclined to favor codification, sees the great difficulties attending it in its more perfect forms, and suggests that the work can only be accomplished successfully, if at all, by lawyers of the very highest ability and most comprehensive views, for no others can see the full scope of the subject and draw the needful sections. It may be added that in a country like our own, where legislation is fluctuating and often inconsiderate, there would be great danger, even though a well-devised code of laws were once introduced, that its symmetry would shortly be marred and the coherence of its provisions broken up. No argument for a code in the modern sense can be derived from the work of Justinian on the Roman law. The "Pandects," the great body of the Roman law, is, in the main, a mere collection of extracts from distinguished writers in *their own language*, and which had already become settled law. The "Institutes" are substantially a bare reproduction of a well-known work of Gaius, a distinguished Roman jurist. Besides, the development of the Roman law was different in some respects from our own. In that system much was made of the opinions of text-writers, while nearly the whole development of English jurisprudence has taken place through the medium of adjudged cases or "case law." The true method of growth would seem to be that the courts should render decisions, while text-writers of ability should collect them, arrange the principles in a scientific manner, criticise them when faulty, and call the attention of the courts to needful improvement. By the work thus done law will make a steady progress, and adapt itself to the wants of the community. Radical changes must be produced by legislation. It is in vain to hope that a code will reduce libraries or make thorough study unnecessary. Jurisprudence will take on an historical form, for courts must apply the code to specific cases, and a body of case law will soon grow up, the roots of which will be sought in the past as heretofore, and its results modify the code itself, just as great masses of case law collect around an instrument so brief as the U. S. Constitution. (See also Austin "On Jurisprudence," vol. ii., p. 1129, and Pomeroy's "Introduction to Municipal Law," chap. iii., and the works of Savigny.)

Some of the leading codes may be referred to.

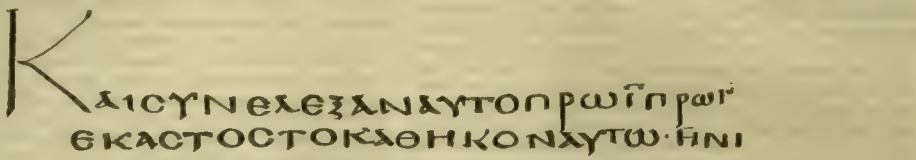
1. *Justinian's Code of Roman Law.*—The word *code* is used here as describing the whole mass of codified Roman law under the order of the emperor Justinian, including the "Code" of that system, the "Institutes," "Pandects," and "Novels." These, taken together, constitute the *corpus juris civilis*, or whole body of civil law. (These will be more fully considered under Law, Civil.) The Theodosian code of Roman law may also be referred to, which is of comparatively little interest. (See "Foreign Quarterly Review," vol. ix., 374.)

2. *French Codes.*—Of these there are five principal ones—the civil code, of civil procedure, of commerce, of criminal procedure, and of criminal law. There are also codes upon special subjects. French codification is largely due to the emperor Napoleon.

3. *Code of Louisiana*, based on the Code Napoleon, and principally prepared by Edward Livingston. It is divided into three books, and is concerned with the civil as distinguished from the criminal law. Mr. Livingston also prepared a draft of a penal code for the State, which was not adopted, as well as one for the U. S. (These are to be found, together with introductory reports explaining the grounds of them, in a work published by the National Prison Association, with an introduction by the late Chief-Justice S. P. Chase, A. D. 1873.)

4. *New York Code of Procedure.*—The object of this is to assimilate law and equity, and to have but one form of action. It assumes to regulate in a general way both pleadings and practice, and to state in a condensed form the general rules. A large body of case law has grown up in connection with the code regulations. The results of these decisions are collected in "Annotated Codes" or in works of practice. The system has been adopted in substance in a considerable number of the States. Commissioners in New York have also reported a political, a civil, and a penal code, which have not been adopted by the legislature.

Mention may also be made of various collections of maritime rules, such as the "Consolato del Mare," "Laws of the Hanse Towns," "Ordonnance de la Marine" (of the time of Louis XIV. of France), "Laws of Oléron," and the "Laws of Wisby," which will be noticed again in connection with maritime law, as well as of the Code of Prussia, etc.



T. W. Dwight.

Code'ia [from the Gr. κώδη, a "poppy-head"], ($C_{18}H_{21}NO_3 + H_2O$), one of the alkaloids to which opium owes its hypnotic powers. Its salts are sometimes administered in place of morphia salts. It is asserted that it possesses many of the valuable properties of that drug, without its disadvantages. The dose is much larger than that of morphia. (See Opium, by Prof. C. F. Chandler.)

Co'dex (plu. **Cod'ices**), [a Latin word signifying the "trunk" or "stem" of a tree; later it was applied to wooden tablets covered with wax, which were used for writing on]. In modern Latin, codex is a manuscript volume, and is especially applied to a manuscript copy of the Scriptures. *Codex rescriptus* is a synonym of Palimpsest (which see). Among the most ancient manuscripts of the New Testament are the *Codex Alexandrinus*, the *Codex Vaticanus*, and the *Codex Sinaiticus*.

Co'dex Alexandri'nus, the third in antiquity of the great uncial extant manuscripts of the Bible in the Greek language. (See Paleography.) It contains the Old Testament (in the Septuagint version), with some deficiencies in the Psalms, and all the books of the New Testament, with a few chasms where leaves are wanting. To these it adds the one genuine, and a fragment of the apocryphal, Epistle of Clement of Rome to the Corinthians. The Catholic Epistles follow the Acts; then come the Pauline Epistles, with that to the Hebrews before the Pastoral Epistles; the Apocalypse, which is rare in extant manuscripts, stands at the close of the New Testament.

This codex is now preserved in the British Museum, having been presented to Charles I. in 1628 by Cyril Lucar, patriarch of Constantinople, who had previously been patriarch of Alexandria, from which city he brought the manuscript. It is in quarto form, about thirteen inches high and ten broad, each page being divided into two columns of fifty lines each, having about twenty letters or upwards in a line. It is written on thin, fine, and very beautiful vellum, in uncial (or capital) letters of an elegant yet simple form, and without any space between the words. The punctuation, which is infrequent, consists merely of a point placed at the end of a sentence, usually on a level with the top of the preceding letter; and a vacant place follows the point at the end of a paragraph, the space being proportioned to the break in the sense. The black ink, in which the body of the codex was written, has turned to a yellowish-brown; but the vermilion, freely used in the initial lines of the different books, is still bright. The manuscript bears an ancient Arabic inscription on its margin, asserting that it was written by the martyr Thecla; Tregelles, however, explains the origin of this inscription by remarking that the New Testament in the codex as we have it commences with Matthew xxv. 6, this lesson (Matthew xxv. 1–13) being that appointed by the Greek Church for the festival of Saint Thecla. The Egyptian, therefore, who wrote this Arabic note, observing the name of Thecla on the now mutilated upper margin of the codex, where such *rubrical* notes are commonly placed by later hands, hastily concluded that she wrote the book. But though not by Thecla, it may be that the neat chirography of the codex is due to a female hand, for we know that women as well as men were employed as copyists at Alexandria.

Codex Alexandrinus (Exodus xvi. 21).

Καὶ συνέλεξαν αὐτὸ πρωῒ πρωΐ, ἕκαστος τὸ καθῆκον αὐτῷ· ἡνίκα δὲ διεθέρμενεν* ὁ ἥλιος, ἐτή-

The general consent of palæographers refers this manuscript to the beginning or middle of the fifth century of our era. In the general style of the writing and in the shape of the letters (especially those which furnish the best tests, as *a*, *δ*, *ε*, *π*, *σ*, *φ*, and *ω*), it holds a middle place between copies of the fourth and sixth centuries. There are no accents or breathings, and the contractions of words (as ΘC, IC, XC, ΠΗΡ, ΚC, etc., for Θεος, Ιησους, Χριστος, Πατηρ, Κυριος, etc.) are only such as are found in other manuscripts of the more ancient class. Of itacisms (as the interchange of *ι* and *ει*, *η* and *ι*, *ε* and *αι*) it contains no more than others of the same date. The references in the margin to the tables of parallel passages called the "Canons of Eusebius" (A. D. 268–340?), and the insertion, before the Psalms, of the epistle to Marcellinus by Athanasius, patriarch of Alexandria (A. D. 300?–373), prove that the manuscript was not written before the fourth century; while the absence of the so-called Euthalian divisions of the Acts and Epistles into chapters, which came into vogue very soon after 458, and the shortness and simplicity of the *subscriptions* at the end of the books, appear tolerably decisive (says Scrivener) against a later date than about 450. The insertion of the Epistles of Clement points to a period when the canon of Scripture was in some particulars a little unsettled, or about the age of the Synod of Laodicea (363). It appears from the table of contents that the manuscript formerly contained the apocryphal Psalms of Solomon, but these are separated from the other books in the list, as wholly different in kind. This separation conforms to the prohibition of such psalms, at the Synod (or, as it is sometimes called, Council) of Laodicea, from being read in churches.

This manuscript is of great importance to the critic, and exhibits a text more nearly approaching that found in later copies than is read in others of its high antiquity. It is designated, in critical editions, by the letter A. It has been published in elegant style, in *quasi* facsimile, uncial type, bearing a general resemblance to the written characters, having been cast for the purpose, and (what is more important) the edition exhibiting the manuscript page for page, line for line, and letter for letter. The handsome folio volume containing the New Testament appeared in 1786, edited by Charles Godfrey Woide; the four folio volumes containing the Old Testament were edited by Henry Hervey Baber, and published in 1816–28. An edition of the New Testament, in small letter, in which Woide's text has been corrected from the manuscript itself, was published in 1860, edited by B. H. Cowper. The Old Testament has been edited by Field. THOMAS CHASE.

Co'dex Be'zæ or **Cantabrigien'sis** (designation, D), an uncial manuscript, probably of the sixth century, containing the four Gospels and the book of Acts in Greek and Latin on opposite pages. It was presented to the University of Cambridge in 1581 by Theodore Beza, who obtained it during the French civil wars in 1562, when it was found in the monastery of Saint Irenæus at Lyons. This manuscript has several peculiar features. The Gospels stand Matthew, John, Luke, Mark, an order found also in some of the manuscripts of the Old Latin version. The peculiarities in the text are striking, consisting of interpolations, sentences recast, and occasional omissions. The interpolations had probably been introduced into some still older copy from the margin of another manuscript, where they had been subjoined by some who wished to *add* whatever they could obtain from various sources to make the narrative more full and complete. These additions would be very serious were this manuscript our only record of the original writings; but when they are removed the text which remains is valuable for comparative criticism, and is strongly corroborative of the other most ancient MSS.

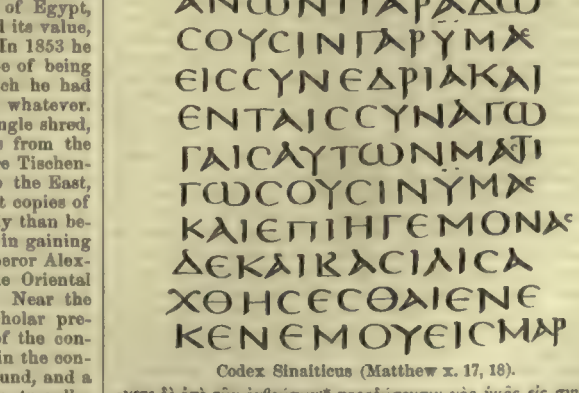
The text of this codex, both Greek and Latin, was published by Dr. Thomas Kipling at Cambridge in two handsome folio volumes in 1793, in type cast for the edition, and so wonderfully exact that it possesses nearly all the advantages of an actual facsimile. A more scholarly and accurate edition was brought out in 1864 by F. H. Scrivener. Whiston, who had an extravagant admiration of the manuscript, published an English translation of it in 1745. THOMAS CHASE.

Co'dex Ephrae'mi, or **Co'dex Ephrae'mi Sy'ri Rescrip'tus** (designation, C), an ancient and valuable palimpsest manuscript of portions of the Greek Bible, preserved in the great library in Paris called by turns National, Royal, and Imperial. It was brought from the East by Andrew John Lascar, a learned Greek patronized by Lorenzo de' Medici, and Catharine de' Medici carried it to Paris. The ancient writing is read with difficulty, having been erased about the twelfth century in order that the vellum might be used for transcribing some Greek works of the Syrian Father Ephraem. The treasure which lay below was first noticed by Peter Alix in the latter part of the seventeenth century. Several readings from the palimpsest were published by Küster in 1710, in his reprint of Mill's Greek Testament. In 1716, Bentley sent Wetstein to Paris to collate the whole manuscript. This work, for which fifty pounds were paid, was performed as far as was then possible. Wetstein told Bentley that it had cost him two hours to read one page. This collation Wetstein used in his own edition of the Greek Testament (1751–52). In 1834 a chemical preparation (*tinctura Giobertina*) was applied to the leaves in order to revivify the ancient writing. But although much that had been illegible was thus brought fully to light, every part of the manuscript was stained and discolored in the process, and some passages made more difficult to read than before. The conquest of all the difficulties which beset the deciphering of this codex is one of the greatest triumphs of Tischendorf. This enthusiastic, patient, keen-sighted, and skilful palæographer occupied himself from December, 1840, till September, 1841, in examining and copying the manuscript for publication, and has given the world the first complete transcript of it; the New Testament portion being published at Leipsic in 1843, the Old Testament in 1845.

Codex C is an uncial manuscript, about the size of Codex A, but written in characters a little larger (Tregelles) and somewhat more elaborate, and with but one column on a page. All its characteristics point to a date as early as the fifth century. Three correctors at least have left on it traces of their work; the earliest may have been of the sixth century, the second (who revised such portions only

* For διεθερμαινεν.

as were used for church lessons or other ecclesiastical purposes) perhaps of the ninth. By him and by the third hand (whose changes are few) small crosses were interpolated as stops, and there are marks of cantillation as guides in intoning. In critical authority Tregelles places this MS. next to the Sinaitic and the Vatican. T. CHASE.



Co'dex Sinait'icus (designated, ℵ *aleph*), the most recently discovered of the uncial manuscripts of the Greek Bible, and inferior to no other in antiquity, authority, and completeness.

In 1844, Constantine Tischendorf—who, although but twenty-nine years old, was already famous as an editor of the Greek Testament and as the decipherer of the Codex Ephraemi—in a journey undertaken in search of ancient manuscripts of Holy Writ, arrived at the ancient Greek convent of Saint Catharine on the range of Mount Sinai. Here he was shown a beautiful codex of the Gospels, the pride of the convent, written upon exquisite white parchment in letters of gold, and adorned with beautiful paintings of the four Evangelists, our Saviour, the Virgin Mary, and the apostle Peter, and said to have been the gift of Theodosius III. From the character of the writing it must date from the seventh or eighth century; but Tischendorf found it very inaccurate, and of slight critical value. Something much more precious than this costly codex had been thrown aside as worthless by the unintelligent guardians of the convent library. In a large basket filled with remains of torn and damaged manuscripts which stood in the middle of the room, Tischendorf found a considerable number of vellum leaves of a Greek manuscript of the Septuagint version of the Old Testament, which his practised eye at once recognized as one of the oldest in existence. The contents of the basket had been destined for the flames, two baskets full of similar materials having been already burned in the stove. Tischendorf easily obtained possession of forty-three sheets, about one-third of the number which he rescued, but was not permitted to take the other portions, nor even to copy more than a single leaf. Unfortunately, he had betrayed the value of the treasure of which the monks had before been so unconscious. Of the portion he obtained he published a lithographic facsimile in 1846, under the name of *Codex Friderico-Augustanus*, in honor of his patron, Friedrich August, the king of Saxony. Of course, Tischendorf was hoping all the time that he should at length obtain the rest of the manuscript. He made proposals for it through a friend whom he had found at the court of the viceroy of Egypt, but only to learn that the monks, having learned its value, would not part with it for any sum of money. In 1853 he visited the monastery a second time, in the hope of being permitted to copy those parts of the codex which he had left behind, but he could gain no tidings of them whatever. He found, however, one trace of the codex—a single shred, in a roll of parchment, containing eleven lines from the first book of Moses. But few years passed before Tischendorf felt impelled for a third time to journey to the East, in the hope of prosecuting his search for ancient copies of the sacred text over a wider field and more fully than before. To facilitate his researches, he succeeded in gaining the powerful patronage and protection of the emperor Alexander II. of Russia, the great champion of the Oriental Orthodox Church, and of his imperial consort. Near the beginning of the year 1859 the enthusiastic scholar presented himself for the third time at the gates of the convent. After repeated calls from below, a door in the convent wall was opened thirty feet above the ground, and a rope let down to receive the letters which the traveller brought. Ordinarily, guests are received through this same door, seating themselves on a cross-piece of wood at the end of the rope, and being then drawn up by the servants of the convent. Tischendorf's credentials procured him a more distinguished reception. In honor of his imperial commission the steward of the convent soon appeared in person, in the name of the prior, and conducted the guest, through a door seldom used, "into the still, friendly asylum." The luggage and the dragoman took the usual journey through the air.

After five days' tarriance, during which Tischendorf had carefully examined the treasures of the library, as well as ascended Mount Sinai, when he was preparing to take his departure, and had sent his Bedouins after the camels, as he was taking a walk with the steward, the conversation turned upon the text of the Old Testament. Returning at twilight to the convent, the steward invited him to partake of a luncheon in his cell, and while they were eating remarked that he had here a copy of the Septuagint, thereupon bringing out of a corner of the room a large manuscript, wrapped in a red cloth according to the Oriental custom, which he had brought to his own cell from the library of the σκευοφύλαξ, or keeper of the sacred utensils. Glancing at the pile of vellum, Tischendorf soon recognized it as belonging to the same codex of which he had rescued some leaves from the basket of fuel fifteen years before; and, eagerly turning over the different sheets, beheld, to his astonishment, in addition to a large part of the Old Testament, the beginning and the end of the New, and the Epistle of Barnabas. It appears that soon after the original discovery in the waste-basket the monks had found these sheets, and placed them with the fragments which Tischendorf rescued from destruction. The German guest, concealing his emotion, begged the privilege of taking the manuscript to his own chamber; to his unspeakable joy, he found that it contained the New Testament *entire*, whereas all the other manuscripts of the first class (as regards antiquity) are more or less imperfect; and he could not withhold an offering of praise and thanksgiving to that Divine Being who had suffered so valuable a boon for the Church of Christ to come into his hands. The first night he spent in transcribing the Epistle of Barnabas (now found for the first time entire in the original Greek), in spite of a dim lamp and the cold temperature; "indeed, it seemed impious to sleep."

Understanding the aversion of the monks to part with manuscripts in their possession, Tischendorf asked and obtained, after some opposition, permission to copy the whole codex at Cairo, where there were greater facilities for the work than at the convent. With the assistance of two of his own countrymen, with incessant toil he completed his transcript, but he was not able to give his copy that careful revision and comparison with the original without which it would be unfit for publication. At Tischendorf's suggestion the monks were at last persuaded to offer the whole codex as a gift to that great monarch whom they recognized as the shield and bulwark of the Eastern Church; and in a little less than eight months after his discovery of the treasure they committed it to his hands to be borne to St. Petersburg—to be held for a time, however, as a loan made simply to facilitate the publication of an accurate edition, until the confirmation of their new archbishop's election should enable him to present it formally to the emperor, as he afterwards did.

The Codex Sinaiticus is written upon vellum sheets of extreme fineness and beauty, the delicate skins of antelopes or of wild asses (probably the former). It consists of three

Codex Sinaiticus (Matthew x. 17, 18).

-χετε δὲ ἀπὸ τῶν ἀνθρώπων·* παραδώσουσιν γὰρ ὑμᾶς εἰς συνέδρια, καὶ ἐν ταῖς συναγωγαῖς αὐτῶν μαστιγώσουσιν ὑμᾶς· καὶ ἐπὶ ἡγεμόνας δὲ καὶ βασιλεῖς† ἀχθήσεσθαι ἕνεκεν ἐμοῦ, εἰς μαρ-‖

hundred and forty-six leaves, of which one hundred and ninety-nine contain twenty-two books of the Old Testament and Apocrypha in the Septuagint version, beginning

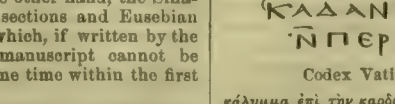
GOVERNORSANDKINGS
FORMYSAKEFORATES

at the first book of Chronicles; while the remaining one hundred and forty-seven present *the whole* of the New Testament, the Epistle of Barnabas, and a part of the Shepherd of Hermas. (To these should be added the forty-three leaves of the Codex Friderico-Augustanus.) It is written in uncial letters of exceeding beauty and simplicity of shape, approaching closely to the forms of the best papyri. Such testing characters as alpha, delta, epsilon, pi, and sigma are as unadorned as possible, without flourishes, knobs, or thickened points at their extremities—a proof of antiquity. It resembles the Vatican Codex in the absence of *initial* letters larger than the rest, which seem to have been regularly used after the beginning of the fifth century. It has but little punctuation, and that in the oldest manner. Its peculiarities of orthography and etymology belong to a period as early as the fourth century of our era. It is conspicuous for the brevity of its titles and subscriptions—*e. g.*, "According to Matthew," "Acts," "To (the) Romans." Longer titles, as "The Holy Gospel according to Matthew" (wrongly translated in our version "The Gospel according to St. Matthew"—*Horne's Introduction*, 3d ed., p. 410), were not introduced until a later date.

It has, moreover, certain other signs of antiquity peculiar to itself. It has always been regarded as one of the striking proofs of the remote age of the Vatican Codex that it is written in three columns on each page, presenting to the eye, when the book is open, six narrow columns at once, thereby the more closely resembling the appearance of the ancient *volumina* or papyrus-scrolls when extended for reading. Just as in the first books printed after the invention of printing many of the peculiarities of the manuscripts were carefully imitated, so when manuscripts began to be written on leaves instead of scrolls, it is natural to suppose that some of the peculiarities of the older form would be retained. A very few other manuscripts have been found with the same number of columns on a page as the Vatican. But the Sinaitic Codex stands *alone* among known manuscripts in presenting *four* narrow columns on a page, seldom exceeding two inches in breadth, and *eight columns* at once when the book is opened; so that its claims to the benefit of this argument for antiquity are the strongest. This fact, with certain other indications, renders it probable that this codex was copied directly from an old Egyptian papyrus manuscript. The remarkably large size and great beauty of the vellum sheets is another proof of high antiquity. In size, indeed, they are the largest known, "each page being even at present as large as thirteen and one-half inches in length by fourteen and seven-eighths inches high, although marginal notes have sometimes been partially cut off by the ancient binder." A single animal could contribute only two leaves, or one sheet, of such unusual size. As time went on, smaller and coarser sheets of parchment took the place of the exquisite vellum used in the oldest manuscripts. The peculiar order in which the books of the Bible follow each other corresponds with what Epiphanius, who flourished towards the end of the third century, testifies to as existing in some manuscripts of his day, and proves that the codex was written before our present order had become established; while the presence of the Epistle of Barnabas and the Shepherd of Hermas is a strong indication that it was written before the age of Cyril of Jerusalem and the so-called Council of Laodicea (about A. D. 363). Those divisions called "the larger chapters," with their corresponding summaries of contents, which appear in all the copies of the Gospels written from the fifth century downward, are wanting in the Sinaitic and Vatican manuscripts alone. On the other hand, the Sinaitic Codex exhibits the Ammonian sections and Eusebian canons in red ink in the margins; which, if written by the original copyist, prove that the manuscript cannot be ascribed to an *earlier* date than some time within the first half of the fourth century.



There is a striking agreement between the readings of this codex and those defended by Origen (186–253); while the marked coincidence of its text with certain readings known to have been approved by Eusebius, as well as the imperial beauty of the manuscript, renders it even possible that the Codex Sinaiticus was one of the fifty volumes of Holy Scripture which Eusebius himself, at the order of the emperor Constantine, caused to be prepared on beautiful skins by skilful calligraphists in the year 331, soon after the foundation of Constantinople. At any rate, we can assign it with moral certainty to the fourth century of our era, and with the highest probability to the first half of the same.

The publication of the original text of this and other ancient manuscripts is rendered difficult by the various *corrections* they have undergone in different ages. The Codex Sinaiticus abounds in such alterations, "brought in by at least ten different revisers, some of them systematically spread over every page, others occasional or limited to separate portions of the manuscript, many of them being contemporaneous with the first writer, far the greater part belonging to the sixth or seventh century, a few as recent as the twelfth." In many cases nothing short of the skill of a Tischendorf can identify with certainty the original writing under the alterations.

The Codex Sinaiticus has been published in a style worthy of its unique importance and value. The enlightened sovereign of Russia was easily persuaded to signalize the one-thousandth anniversary of the establishment of his empire, in 1862, by bringing out an edition of the manuscript—now properly characterized by the additional title of *Petropolitanus*—in a style surpassing in splendor and in accuracy of imitation any previous work of the kind. The text is printed in three folio volumes (ii.–iv.), the leaves of the shape and size of those in the manuscript itself; the first volume contains valuable introductory matter, and twenty-one admirable *facsimile* plates, representing chiefly pages of the manuscript, and two being covered with facsimile specimens of other important manuscripts for comparison. The work is "printed upon paper at once thick and fine, the ink being made to resemble that of the original in color, and the type being greatly varied, so as to imitate the various shapes and sizes of the letters employed by the scribe: the very spaces, too, between the letters have been carefully measured and represented with all faithfulness." But three hundred copies of this truly imperial edition were printed, two hundred of which were distributed by the emperor himself as presents to various public bodies and learned men; the rest were given to Tischendorf for sale, their price being fixed by him at two hundred and thirty Prussian thalers. Several of the foremost colleges and libraries in the United States possess this valuable work, in a few instances as a donation from its imperial patron. A cheap manual or popular edition, containing the New Testament and its appendages in ordinary Greek type, was published in 1863; and an octavo edition of the New Testament, together with the variations of the Vatican manuscript and of the Elzevir edition from the Sinaitic readings, appeared in 1865. English readers will be interested in examining the various readings of the three most celebrated manuscripts of the original Greek text as presented by Tischendorf in his edition of the authorized English version of the New Testament, which was published by Baron Tauchnitz in 1869 as the one thousandth volume of his "Collection of British Authors."

THOMAS CHASE.

Co'dex Vatica'nus (designation, B), a beautiful uncial manuscript of the Greek Bible in the Vatican Library, dating from the fourth century. Its marks of antiquity are similar to those of the Sinaitic codex: and indeed Tischendorf not only pronounces it as of precisely the same age, but is confident also that it was written by one of the four copyists to whom he ascribes that manuscript: it is, however, the copy evidently of a different exemplar, and cannot be considered as one of the fifty copies ordered by Constantine through Eusebius. It presents three narrow columns on a page, except in the poetical books of the Old Testament, which, as in the Codex Sinaiticus, are written stichometrically (in verses clause by clause, according to the sense) in two columns. It is written on fine, thin vellum, in a square, plain, and noble style of handwriting, being a close resemblance in shape to that of the Herculanean papyri. The manuscript contains the greater part of the Old Testament, and the New as far as Hebrews ix. 14. It appears to have belonged to the Vatican Library from the latter part of the fifteenth century. Its earlier history is unknown, but Tischendorf regards it as the work of an Alexandrian scribe. In critical authority it is inferior to no other manuscript.

Codex Vaticanus (2 Corinthians iii. 15, 16).

κάλυμμα ἐπὶ τὴν καρδίαν αὐτῶν κεῖται· ἡνίκα δ' ἂν ἐπιστρέψῃ πρὸς κύριον, περιαιρεῖται τὸ κά-*

This codex has always been difficult of access. Scholars all over the world rejoiced when it was announced that Cardinal Mai was preparing an edition of it. After a long delay, his edition appeared in the Christmas holidays of 1857, three years after his death; but it proved to have been so carelessly and inaccurately executed as to be of little value; a smaller edition, also prepared by the cardinal, appeared in 1859, avoiding some of the errors of the

* KN is a contraction for KYPION.

former, but introducing almost as many new ones. Mai's edition was reprinted in several places—in Berlin with corrections by Philip Buttmann. In 1867 the New Testament was published in Leipsic, in common cursive characters, by Tischendorf; but he had been allowed to collate the whole manuscript no farther than partly through the third Gospel, and only to consult it on difficult or doubtful passages beyond that point. While falling short of the *highest* character, on account of the restrictions placed upon his use of the manuscript, this edition will generally be held decisive on the disputed points on which its editor gives his deliberate judgment upon personal examination of the passage. The codex is now publishing by papal authority, in magnificent style, edited by Carlo Vercellone and Giuseppe Cozza. The size and shape of the manuscript are accurately represented, and it is copied line for line and letter for letter, in printed characters approaching facsimile, Tischendorf having lent for the purpose the type which had been cast for the imperial edition of the Sinaitic Codex, and the writing being astonishingly alike in the two manuscripts. The first volume to be published, but the fifth of the entire work, containing the New Testament, appeared in 1868. In some of the four subsequent volumes, containing the Old Testament, Vercellone is replaced by Caietano Sergio. THOMAS CHASE.

Cod'icil [Lat. *codicillus*, dimin. of *codex*], an addition or supplement to a will for the purpose of explaining, altering, or adding to its contents. Of codicils, as of wills, the last prevails where it contains provisions contradictory to those of a former will or codicil. (See WILLS AND TESTAMENTS, by PROF. T. W. DWIGHT, LL.D.)

Cod'lin, a name of several varieties of apples, some of which are highly esteemed in England, and are used chiefly for culinary purposes. The codlin ripens in summer or autumn, and cannot be kept long.

Codlin Moth (*Pyralis Pomona*). This moth is one of the Tortricidæ; it is small, with short and broad wings. It is very destructive in apple-orchards, laying its eggs in the eyes of the newly-formed fruit, within which the larva feeds, thus arresting the growth of the fruit, and causing it to die prematurely.

Cod-Liver Oil (*Oleum Morrhuæ*), an oil obtained from the liver of the cod, also from many allied species, as pollock, dorse, ling, hake, haddock, etc. In these fish, as in the shark tribe, the tissue containing oil is almost entirely confined to the liver. Cod-liver oil is prepared largely in Great Britain, Norway, Newfoundland, and the U. S. There are three varieties sold in commerce—pale, pale-brown, and dark-brown oil.

The oil is sometimes prepared by placing the livers in a tub upon a wooden strainer, and subjecting them to pressure, when the light-colored oil exudes, and is removed. As the livers partially putrefy, more oil escapes, which is darker, and constitutes the pale-brown oil; while finally the residue, boiled with water, parts with the remaining dark-brown oil. The pale oil thus resembles more nearly the oil present in the livers, while the other varieties are more or less impregnated with the products of putrefaction. The oil is often extracted by steaming, which produces the best oil and the largest yield. Various other methods are employed. Even the purest oil has a peculiar disagreeable fishy odor and taste. The darker varieties leave a very unpleasant nauseous sensation.

The constituents of cod-liver oil are oleic and other acids, in combination with glycerine, and holding in solution the constituents of the bile, acetic acid, phosphoric acid, iodine, bromine, chlorine, and a principle called gaduine.

As a remedial agent it is used in the treatment of scrofula, consumption, chronic rheumatism, and diseases of the bones and joints. Its virtues have been ascribed to iodine, bromine, and other specific ingredients, but its principal efficacy is probably due to its nourishing and fattening properties. For emaciated old people it is sometimes of great service in conjunction with other remedies. It is commonly taken in doses of from a dessert-spoonful to a table-spoonful three times a day.

Cod'man (JOHN), D. D., an American Congregational divine, born at Boston, Mass., Aug. 3, 1782, graduated at Harvard in 1802, studied in Edinburgh, and became pastor of a church at Dorchester, Mass., in 1808. He was a prominent advocate of clerical education. He published many sermons, etc. Died Dec. 23, 1847.

Codo'gno, a town of Italy, in the province of Milan, between the Adda and the Po, by rail 24 miles S. E. of Lodi. It is well built, and has manufactures of silks. It is noted as a market for cheese. Pop. 8917.

Cod'rington (Sir EDWARD), G. C. B., an English admiral, born in 1770. He served as captain at Trafalgar in 1805, and became a vice-admiral in 1821. He commanded the English, French, and Russian fleets which defeated the Turks at Navarino in 1827. Died in London April 28, 1851.

Codrington (Sir WILLIAM JOHN), G. C. B., a general, a son of the preceding, was born in 1800. He served at the Alma and Inkerman in 1854, and directed the attack on the Redan of Sebastopol in Sept., 1855. In November of the same year he became commander-in-chief of the army in the Crimea, a member of Parliament in 1857, and in 1859 governor of Gibraltar.

Co'drus [Gr. Κόδρος], the last king of Athens, is supposed to have reigned about 1060 B. C. According to tradition, he sacrificed his life for his country during a war between the Athenians and the Dorians. An oracle having predicted that the people whose king was slain by the enemy should be victorious, Codrus went in disguise to the Dorian camp, and provoked a quarrel in which he was killed. His son Medon was then chosen archon of Athens.

Codyville Plantation, a township of Washington co., Me. Pop. 62.

Coe, a township of Rock Island co., Ill. Pop. 1175.

Coe, a township of Isabella co., Mich. Pop. 987.

Coeffi'cient [from the Lat. *co* (for *con*), "with," and *efficio*, to "effect"], in algebra, one of two simple or compound factors whose product constitutes a term. Thus, in the term $2ab^2c$, $2ab^2$ is the coefficient of c, $2a$ of b^2c, and 2 of ab^2c. In the latter case, 2 is frequently called the "numerical coefficient" of the term, the others being distinguished as "literal coefficients." In an algebraical expression, and especially in quantities whose terms involve constant as well as variable factors, it is usual to restrict the term "coefficient" to the former, and to refer to the latter as "facients."

Coehorn, ko'horn, so named from Baron Coehorn, who invented it, is a small mortar, frequently a twenty-four-pounder. Coehorns, being easily moved and taking little powder, are found very useful in sieges, if grouped in great numbers. They are generally made of bronze.

Coehorn (Lieutenant-General MENNO, BARON COEHORN), colonel-proprietor of the superb regiment bearing his name, general of artillery, director-in-chief of the fortifications, and engineer-general of the United States or Provinces of Holland, styled by the distinguished Prussian engineer Zastrow "the prince of engineers," and by the French "the Dutch Vauban," was to Vauban himself exactly, in regard to recent fortifications, what Zwingli was to Luther, more restricted as to his stage, in prescience, originality, and soldiership. But even while saying this let it be considered no disparagement of Vauban. Most honest and generous of men, without envy he recognized Coehorn's merit as early as 1676, and did all he could to induce Louis XIV. to make any advances which could induce Coehorn to enter the French service. Sprung from a distinguished, noble, and military stock, originally Swedish, near Leeuwarden in Friesland, he was born in 1641, distinguished himself while yet a youth in mathematics, was appointed captain at the age of sixteen, became colonel at thirty-three, and with that rank, with his own regiment, "Nassau-Frise," defended Fort William, the key-point of Namur, against his rival Vauban, Louis XIV., and the great Luxemburg, until, wounded himself, he had only 150 effectives left. He had previously distinguished himself at the siege of Maestricht (1674) by his invention of the mortars which immortalize his name, first employed in that operation, and at the siege of Grave, where he won renown by devising means to transport a whole battalion at once across the wide and rapid Meuse, a daring operation, into the trench of a bastion to which the river served as a wet ditch, which decided the fate of the place. Coehorn already stood very high, not only as an engineer, but as a soldier, the last for conduct in the bloody battles of Senef, Cassel, and St. Denis. At Fleurus, 1st July, 1690, as brigadier-general, with eight battalions, he set at naught the efforts of the finest French cavalry, and covered the retreat of the prince of Waldeck's army, whereupon, the victorious Marshal Luxemburg declared, "the Dutch infantry at Fleurus had outdone the Spanish infantry at Rocroi." In 1695, Coehorn, having demanded full power to use his own methods, retook Namur, trebled in strength, though defended by Megrigny, second only to Vauban and Marshal Boufiers, unexcelled as a tenacious soldier: witness his subsequent defence of Lille in 1708. "Coehorn, the chief-engineer (his title was lieutenant-general of engineers) signalized himself so eminently that he was esteemed the greatest man of the age, and outdid even Vauban, who had gone far beyond his predecessors in the conduct of sieges." In Mar., 1696, Coehorn, lieutenant-general in the field in command of troops, by a daring, prompt, and skilful operation, made himself

master of Givet, and burned the immense magazines and stores of supplies accumulated there by the French. This stupendous blow paralyzed the French operations for the campaign, and until another harvest could be sown, grown, reaped, and garnered. Coehorn continued to increase his glory, fighting and fortifying until the last days of his life, destroying the French lines near Sluys, defended by Boufflers, in 1702, and capturing Bonn in 1703; bursting up the French lines at Hanuye, and accumulating stroke upon stroke of genius and daring until 17th Mar., 1704, at the age of sixty-three, a stroke of apoplexy—a disease which had been menacing him for some time—put an end to his existence and usefulness. His encomiums have been confined to no language; his praises have resounded from enemies even more than friends and countrymen. Montalembert, himself a first-class engineer, who alone suggested improvements to Coehorn's system, of which, pure and simple, Bergen-op-Zoom is the finest example, ranks himself among the most decided admirers of this "prince of engineers," whom he styles "a great man." According to the spirit of Straith's admissions, Coehorn possessed the merit of being able to contrive, equally well, defences for localities of any nature. Tyler (R. B. Engineers) says, "Coehorn, greatly to his credit, alone, of all modern engineers, established the one great truth in engineering—viz. that the same fortification cannot apply to places with wet as to those with dry ditches." Coehorn always held "it requires as much genius to defend a fortress well as it does to fortify it with ability," which Vauban corroborated by his observation that "amongst the multitude of the gallant and devoted officers of his day, he knew but few fitted to be governors of a besieged place." Coehorn fortified, defended, and took equally well.

Coehorn possessed a genius that would have made him the idol of the American people, whose making of war displays, as Rossel says, "all the exuberance of life inherent in a people seriously active, in the full force of youth, intelligent, and incapable of fear." Vauban was characterized by an economy of material and life at the expense of time; Coehorn economized neither, provided he attained his end by crushing out resistance. In Coehorn it was force substituted for industry, or rather industry employed to the utmost in multiplying the means of destruction. Coehorn's audacity and resources overwhelmed at once the enemy and the mind with wonder, and as an original thinker he ranks ahead of all the engineers who preceded him, and his works, like those of Shakspeare, are for all time.

No finer eulogy can be found of any man than that of Coehorn in the "Dictionnaire de la Conversation." This presents him as a truly disinterested patriot of ideal Roman simplicity and probity; as an unerring strategist; in fine, as one of those rare characters of whom we read in the annals of the remote past, whose record will not stand the close criticism and analysis applied in these practical days of unbelief as to everything but the absolute and tangible. One comparatively small matter demonstrates Coehorn's prescience. As the bayonet was first "seriously employed" by the French, according to their own writers, in the battle of Turin, 1692 (first bayonet charge in the battle of Spires in 1703), and as Coehorn had armed the Dutch infantry with it many years before, this is pretty good proof, in addition to the many others he has given, that he knew how to profit by improvements in military armament as quickly, or even more, considering the latter's favor and influence, than Vauban. Auguste Demmin, in his "History of Arms and Armor" (448), admits that the *fusil-musket* with socket-bayonet was the weapon "attributed to Vauban which Coehorn, his rival, introduced among the Dutch infantry about 1680."

J. Watts de Peyster.

Cœlestine. See Celestine.

Cœ'le-Syria [Gr. ἡ κοίλη Συρία, "the hollow Syria"], a beautiful valley of Syria between the mountain-ranges of Lebanon and Anti-Lebanon, is about 90 miles long, and has an average width of 7 miles, but in some parts its breadth is far greater. It is now called El Bukaa. It is intersected by the river Litany (anc. *Leontes*). The chief city of Cœle-Syria was Baalbec (*Heliopolis*).

Cœn'obites [from the Gr. κοινός, "common," and βίος, "life"], or **Synodites,** the name given to those monks who live in communities, in contradistinction to the anchorites or hermits, who withdraw from all society and live in absolute solitude. (See Monastery.)

Coesse, a post-village of Union township, Whitley co., Ind. It is on the Pittsburg Fort Wayne and Chicago R. R. Pop. 192.

Coeymans, quee'manz, a township and post-village of Albany co., N. Y. The village is on the Athens branch of the New York Central R. R., and on the Hudson River, 12 miles S. of Albany. It has a mineral spring, flagstone-quarries, and manufactures of brooms, straw-paper, soap, etc. It has two weekly newspapers. Pop. 3077.

Ed. "Herald."

Cof'fee [from the Arabic *kahwah;* Fr. *café;* It. *caffè;* Ger. *Kaffee*], the seeds of the tree *Coffæa Arabica*, of the order Rubiaceæ; also an infusion of these seeds used as a beverage. There are a number of species of *Coffæa*, but this one only is known to possess valuable properties. It is a native of Western Africa, Abyssinia, and perhaps of Arabia, but is now naturalized in many tropical countries. The coffee tree in a wild state attains a height of from twelve to twenty feet, and bears but few branches. In cultivation the tree is topped at from six to ten feet in height, and made to assume a pyramidal form, with branches almost from the ground. The leaves are oblong-ovate, and four or five inches long; they are evergreen, opposite, shining, and leathery. The flowers are small, snow-white, and very fragrant, and are clustered in the axils of the leaves. It has a succulent fruit of a dark-red color when ripe, in which are two cells lined with a cartilaginous membrane, each containing a single seed. The seeds are hard, semi-elliptical in shape, and are commonly called coffee-beans or coffee-berries.

Coffee-plantations are often laid out in quadrangles; the trees are pruned to the same height, and the ground is carefully weeded. Where the climate is dry, abundant irrigation is required, but the supply of water is cut off as the fruit begins to ripen, in order to improve its quality. The tree yields its first crop when it is three years old. The coffee tree blooms for eight months in the year, so that its fruits are at any time of very unequal ripeness; in the West Indies and Brazil three gatherings of coffee are made annually. The fruit is placed on mats or large floors adapted to the purpose, where it is dried by the sun's rays, being meanwhile frequently turned. The dried pulp of the fruit and the membrane which immediately encloses the seeds are removed by passing between heavy rollers, and the coffee is afterwards freed from impurities by winnowing. As it is not, however, prepared with the same care in all places where it is cultivated, there are great differences in quality and price.

The earlier history of coffee is involved in some obscurity. It was not known to the Greeks or Romans, but in Abyssinia and Ethiopia it has been used from time immemorial, and in Arabia it was in general use before the end of the fifteenth century, and over the rest of the East in the sixteenth century. In 1690 it was carried by the Dutch from Mocha to Java, where it was soon extensively raised, and young plants were afterwards sent to the botanical garden at Amsterdam, from which the Paris garden obtained a tree. A layer of this was carried in 1720 to Martinique, where it succeeded so well that in a few years all the West Indies could be supplied. The Dutch planted it in Surinam in 1718, and it was introduced into the Mascarene Islands in the same year.

The following are the most important varieties in commerce: Mocha coffee, which comes from Arabia, and is considered superior to every other; it is known by its small gray beans inclining to greenish; Java or East Indian coffee has large yellow beans; Jamaica coffee has beans somewhat smaller and greenish; Surinam coffee has the largest beans; Bourbon has beans yellow and whitish pale. Coffee is also imported from Brazil, Ceylon, Central America, Maracaibo, and Liberia. Leonhard Rauwolf, a German physician, appears to have been the first to make coffee known in Europe by the account of his travels (1573). Soon after the first introduction of coffee, Coffee-Houses (which see) arose almost everywhere. In Arabia and the East, coffee is usually drunk in the form of a thick decoction of the unroasted seeds; and for the sultan's coffee the pericarp, with the dried pulp roasted, is employed. The principal commercial supply is from Brazil, Java being second and Ceylon third on the list.

Chicory root, dandelion root, carrot, and the seeds of barley, buckwheat, Indian corn, and rye, are sometimes used as cheaper substitutes for coffee. They are prepared by roasting, like coffee. But they are all wanting in *caffeine*, the most important constituent in coffee, and are therefore very different from coffee in their qualities. Coffee is subject to a great adulteration, most of the articles specified as substitutes being employed for this purpose. But the principal material of mixture is chicory, the use of which for this purpose was legalized in England in 1853.

The leaves of the coffee tree are used by the natives of Sumatra instead of the seeds. They are prepared by drying, and are said to contain a larger proportion of caffeine than the coffee-beans. Coffee owes its peculiar properties to the presence of—1, *caffeine* or *theine* ($C_8H_{10}N_4O_2$), which occurs in the roasted bean to the extent of nearly one per cent., and which is also found in tea, the *Paullinia*, maté, etc.; 2, a volatile oil which, according to some authorities,

is not present in the raw bean, but is developed in roasting; 3, a form of tannic acid called caffeo-tannic and also caffeic acid. The following, according to Payen and others, is the average composition of unroasted coffee:

Free caffein	0.8
Legumin (vegetable casein)	10.0
Other nitrogenous matter	3.0
Dextrine, sugar, etc.	15.5
Caffeo-tannic and caffeic acids (with potash, caffein, etc.)	5.0
Fat and volatile oil	13.0
Cellulose	34.0
Earthy matter	6.7
Water (hygroscopic)	12.0
	100.0

with a small quantity of two aromatic principles—one oily, and the other soluble in water.

Coffee loses 16 per cent. in weight and gains 30 per cent. in bulk if roasted till it assumes a reddish-brown hue; when roasted till the beans become chestnut-brown, they lose 20 per cent. by weight and gain 50 per cent. in bulk. The percentage of caffeine is greatly reduced by roasting, but the aroma is much increased. The action of the bowels is not retarded by the use of coffee, as is sometimes the case with strong infusions of tea, because there is less tannic acid in coffee than in tea. Coffee is exhilarating, refreshing, and nourishing, and, according to some physicians, tends to lessen the normal or excessive waste of the animal frame. When used in excess coffee is very injurious to health, and on certain constitutions its effects seem to be always deleterious. CHARLES W. GREENE.

Cof'fee, a county in the S. of Alabama. Area, 700 square miles. It is intersected by Pea River. The surface is nearly level; the soil is mostly sandy. Cotton, rice, corn, tobacco, and wool are raised. Capital, Elba. Pop. 6171.

Coffee, a county in the S. of Georgia. Area, 1000 square miles. It is bounded on the N. by the Ocmulgee, and on the S. W. by the Allapaha River. The surface is nearly level; the soil is sandy. Cattle, rice, and wool are produced. It is intersected by the Brunswick and Albany R. R. Capital, Douglas. Pop. 3192.

Coffee, a county of Middle Tennessee. Area, 300 square miles. It is drained by Duck River, which rises in it. The surface is hilly; the soil fertile. Tobacco, wool, and grain are raised. It is intersected by the McMinnville and Manchester R. R. Capital, Manchester. Pop. 10,237.

Coffee, a township of Wabash co., Ill. Pop. 1502.

Coffee (JOHN), an American general, born in Nottoway co., Va., in 1772, was colonel and brigadier-general of Tennessee volunteers in 1812–13, served with distinction against the Creek Indians, wounded at Emuckfau, Jan. 22, 1814, participated in the attack on Pensacola, and was distinguished in the defence of New Orleans 1814–15; remained in service till June, 1815; was appointed surveyor of public lands Mar., 1817. Died near Florence, Ala., July, 1834.

Coffee-house [Fr. *café*], a house or saloon where coffee and other refreshments are served out to customers. Coffee-houses were established at Constantinople in 1554, in London in 1652, and at Paris in 1662. For many years the use of coffee and the frequenting of coffee-houses were assailed by various writers. Before the general introduction of newspapers, coffee-houses were, particularly in England, important centres or sources of information, where people assembled to learn the news and discuss politics.

Coffee-leaves are sometimes used as a substitute for tea. They contain 1.2 per cent. of caffeine and considerable caffetannic acid. When dried and treated with boiling water, they yield an infusion of a deep brown color, resembling in taste and odor a mixture of tea and coffee.

Cof'fee Town, a township of Jackson co., Ala. P. 640.

Coffeeville, a township and village of Clarke co., Ala., 1 mile E. of the Tombigbee River, and about 120 miles S. W. of Montgomery. Pop. 1200.

Coffeeville, a post-village, capital of Yalabusha co., Miss., on the Mississippi Central R. R., 131 miles N. by E. from Jackson. It has one weekly newspaper.

Coffeine. See CAFFEINE, by PROF. C. F. CHANDLER, PH. D., LL.D.

Cof'fer [Fr. *coffre*], a casket for keeping jewels, money, etc. In architecture this term is applied to the sunken panels in vaults and domes, or to deep panels in ceilings. In fortification, coffer is a particular kind of caponnière.

Cof'ferdam [from *coffer*, a "casket" or tight box, and *dam*], in civil engineering, the name of a watertight enclosure for laying the foundation of bridge-piers, dams, wharves, etc. Cofferdams are often constructed of piles in two rows, with clay packed between. When finished, the water is pumped out by steam-power. Where the water is too deep for cofferdams, various forms of the caisson are used; in which case the pier is sometimes gradually lowered to the bottom of the stream. (See FOUNDATION.)

Coffeyville, a post-village of Montgomery co., Kan. It is on the Verdigris River and the Leavenworth Lawrence and Galveston R. R., 141 miles S. by W. of Lawrence.

Coffey, a county in the S. E. of Kansas. Area, 576 square miles. It is intersected by the Neosho River. The surface is undulating; the soil fertile. Grain and wool are staple products. Coal and limestone abound here. The Missouri Kansas and Texas R. R. (Neosho division) passes through it. Capital, Burlington. Pop. 6201.

Cof'fin [from the Gr. κόφινος, a "basket," and allied to *coffer*, a "casket;" Fr. *cercueil;* Ger. *Sarg*], a box in which the dead are placed for burial. The customs both of burning and burying the dead prevailed among the ancient Greeks and Romans. (See FUNERAL.) Their coffins were composed of various materials, the most common being baked clay or earthenware. Some were narrow and triangular in form, the undermost side being much the broadest. The practice among the ancient Romans was to bury the dead, though previous to the recognition of Christianity burning became comparatively common. A kind of stone brought from Assos, in the Troad, was used for coffins; it was said to consume the body, except the teeth, in forty days, and from this circumstance was called SARCOPHAGUS (which see). Roman stone coffins have been found in England, some entirely above the ground, others so near the earth's surface that the lids were visible, and when within a church coffin-lids often formed part of the pavement. The Saxons used wooden coffins, though the common people were simply wrapped in cloth. Coffins of lead were used in the Middle Ages, as well as in more recent times. In our day, highly-ornamented caskets and coffins of elm or other wood are much used, but we have also so-called "burial cases" of iron, often covered with velvet or rich cloth.

Coffin (GEORGE W.), U. S. N., born Oct. 12, 1845, in Massachusetts, graduated at the Naval Academy in 1863. He served in the Ticonderoga at both the Fort Fisher fights, and led the seamen of that vessel in the assault upon the fort on Jan. 15, 1865, where he was wounded in the thigh. FOXHALL A. PARKER, U. S. N.

Coffin (Admiral Sir ISAAC), BART., born at Boston, Mass., of a Nantucket family, May 16, 1759. His father was a Tory, and collector of the port of Boston. Young Coffin entered the navy in 1773, serving against the U. S. in the Revolutionary war. He had, however, throughout life a strong regard for his native land. He was rapidly promoted, and attained in 1830 the rank of admiral of the white. In 1826 he visited Nantucket, where he founded and endowed the Coffin School. Died July 23, 1839.

Coffin (JAMES HENRY), LL.D., born at Northampton, Mass., Sept. 6, 1806, graduated at Amherst in 1838. He was professor of mathematics and astronomy in Williams College, Mass. (1838–43), and in Lafayette College, Easton, Pa. (1846–73). He was a distinguished scientist, and published a treatise on the "Winds of the Northern Hemisphere" (1851), "Solar and Lunar Eclipses," and other works. Died Feb. 7, 1873.

Coffin (JOHN H. C.), born at Wiscasset, Me., Sept. 15, 1815, graduated at Bowdoin College, and in 1836 was appointed professor of mathematics in the U. S. navy. He served at sea and in nautical surveys, was detailed in 1844 for duty at the Naval Observatory, and prepared descriptions and discussions of the work with the mural circle in the "Washington Observations" (1846–49), and a great part of those for 1845. He published also a discussion of the personal equation in bisecting a star by a micrometer thread ("Astronomical Journal," iii., p. 121). He was professor of mathematics or professor of astronomy and navigation in the U. S. Naval Academy (1853–65), and from 1866 to the present time has been in charge of the preparation of the "American Ephemeris and Nautical Almanac."

Coffin (JOSHUA), an American genealogist, born at Newbury, Mass., Oct. 12, 1792, graduated at Dartmouth in 1817, was a teacher of the poet Whittier, and published "The History of Ancient Newbury" (1845), and numerous papers, etc. upon family genealogies. Died June 24, 1864.

Coffin (TIMOTHY GARDNER), a lawyer, born at Nantucket, Mass., Nov. 1, 1788, was a sailor in youth, but having been disabled by a fall, he sought an education; graduated at Brown University in 1813, and as a lawyer attained the first rank. Died at New Bedford, Mass., Sept. 19, 1854.

Cof'fin's Grove, a township and village of Delaware co., Ia. The village is about 50 miles W. of Dubuque. Pop. of township, 1003.

Co'gan House, a post-twp. of Lycoming co., Pa. P. 599.

Coghet'ti (FRANCESCO), an Italian painter, born Oct. 4, 1804, has produced powerful fresco-paintings for several Roman palaces. He made a long study of Raphael, and founded an excellent school, marked by a serious study of the masters.

Cognac (anc. *Condate;* modern Lat. *Conacum*), a town of France, department of Charente, on the river Charente, 24 miles W. of Angoulême. It has an old castle, in which Francis I. was born. In 1526 an alliance of France, England, the pope, Milan, and Venice, against Charles V., was concluded here. Brandy of excellent quality is made here, and is the chief article of export. About 6000 butts of Cognac brandy (see BRANDY, by PROF. C. F. CHANDLER) are produced annually. Pop. in 1866, 9412.

Cogniard (HIPPOLYTE), French comic writer, long director of the Varieties Theatre, born Nov. 20, 1807, was instrumental in substituting the opéra bouffe on the French stage for the old vaudevilles. He wrote, mostly in collaboration with his brother THÉODORE (born April 30, 1806), a vast number of vaudevilles.

Coguiet (LEON), a French historical painter, was born Aug. 29, 1794. His paintings represent scenes of terror, as the "Massacre of the Innocents," "Tintoretto painting his Daughter's Corpse," etc. He had many scholars.

Cog'nizance [Old Fr. *cognizance;* modern Fr. *connaissance;* It. *cognoscenza;* from the Lat. *cognosco*, to "know"], knowledge or notice; jurisdiction or right to try and determine causes; a badge worn by a retainer or dependant to indicate the party or person to which he belongs. In law, an acknowledgment or confession; also the power which a court has to hear and determine a particular species of suit. In heraldry, cognizance is a crest, coat-of-arms, or similar badge of distinction.

Cogno'men, a Latin word signifying a surname; the last of the three names usually borne by ancient Romans of good family. Cicero, for example, was the *cognomen* of the great orator, Marcus Tullius Cicero. It served to designate the family (*familia*) to which he belonged, as the other two names—viz. the *prænomen* and the *nomen*—served respectively to denote the individual and the class (*gens*) to which his family belonged.

Cogno'vit Actio'nem [Lat., "he has recognized the action"], in law, is a confession of a defendant subscribed by him, and giving authority to a plaintiff to enter up judgment against him. It is executed after an action has been commenced, and is supposed to be given in court. The subject in England is regulated by statutes prescribing at what time in the progress of the case it may be given as a means of protecting the defendant from imposition, and the forms of law with which it should be accompanied, such as proof of the time of its execution and a mode of filing it or a copy of it. Statute law in some of the American States provides a convenient substitute for a *cognovit*. Thus, in New York, and in other States following its code, a defendant may offer in writing to the plaintiff to allow him to take judgment for a specified sum or otherwise; and on the acceptance in writing of the offer judgment may be entered accordingly. It is also provided that should the offer not be accepted in the prescribed manner, it shall be deemed in law to be withdrawn and the litigation may continue.

Cogre'dients [from *co* (for *con*), "together," and *gradior*, to "go"], "[things] meeting together or agreeing." In mathematics, two set of facients or variables, each set containing the same number, are said to be cogredient if on replacing the variables of the first set by certain linear functions of themselves, those of the second set become also replaced by the same linear functions of themselves.

Cogs'well (JONATHAN), D. D., a Calvinistic divine, born Sept. 3, 1782, graduated at Harvard in 1806, was a tutor in Bowdoin College, professor of ecclesiastical history in the Theological Institution at East Windsor, Conn. (1834–44). He published "The Hebrew Theocracy" (1848), "Calvary and Sinai" (1852), and other works. Died at New Brunswick, N. J., Aug. 1, 1864.

Cogswell (JOSEPH GREEN), LL.D., an American *littérateur*, born at Ipswich, Mass., Sept. 27, 1786, graduated at Harvard in 1806, visited the East Indies, after his return studied law, and became a tutor in Harvard in 1814. He afterwards studied in Europe, and became a librarian and professor of mineralogy at Harvard (1820–23). With the historian Bancroft he founded the celebrated Round Hill School at Northampton, Mass. He was many years superintendent of the Astor Library. He contributed much excellent matter to periodical literature, and enriched the botanical and mineralogical collections at Harvard University with thousands of European specimens. Died at Cambridge, Mass., Nov. 26, 1871.

Cogswell (MASON FITCH), M. D., born at Canterbury, Conn., in 1761, graduated at Yale in 1780, became an eminent surgeon of Hartford, Conn., and was one of the founders of the asylums at Hartford for the deaf and dumb and for the insane. Died in Dec., 1830.—His son, M. F. COGSWELL, JR., M. D. (born Nov. 10, 1809, died Jan. 21, 1865), was also an eminent physician.

Cogswell (WILLIAM), D. D., a Congregational divine, born at Atkinson, N. H., June 5, 1787, graduated at Dartmouth in 1811, became general agent of the American Education Society in 1829, professor of history at Dartmouth (1841), professor of theology and president of Gilmanton Theological Seminary in New Hampshire (1844), and was the author of works on theology, etc. Died April 18, 1850.

Cohahui'la, a state in the N. part of Mexico, bordering on Texas, is bounded on the N. and E. by the Rio Grande del Norte. Area, estimated at 57,977 square miles. The surface is hilly; the soil in some parts is sterile, and other parts produce pasture. It has several silver-mines. Capital, Saltillo. Pop. in 1871, 95,397.

Cohas'set, a township and post-village of Norfolk co., Mass., on the South Shore R. R., 21½ miles S. E. of Boston. Mackerel-fishing is one of the chief industries of this place. The township is detached from the rest of the county. It has a savings bank and two insurance companies. Minot's Ledge Lighthouse is on its coast, in lat. 42° 16′ 9″ N., lon. 70° 45′ 14″ W. Pop. 2130.

Cohe'sion [from the Lat. *cohæreo, cohæsum*, to "hold together"], in natural philosophy, is the force by which the particles of homogeneous bodies are kept attached to each other, and with which they resist separation. Adhesion denotes the attractive force existing between two different bodies brought into contact, as a drop of water on a plate of glass; or between two bodies of the same matter, as two lumps of lead when their smooth surfaces have been pressed together. The three different forms which matter assumes—solid, liquid, and gaseous—are determined by the degree of cohesive force existing among the elementary particles. In solids this force is greatest, and is that which causes solidity; in liquids it is less powerful; and in aëriform fluids it may be regarded as negative, the particles having a tendency to repel each other.

Cohoc'tah, a township and post-village of Livingston co., Mich., about 45 miles S. of Saginaw. Pop. 1176.

Cohoc'ton, a post-twp. of Steuben co., N. Y. P. 2710.

Cohoes, ko-hōz′, or **Cahoes,** a city of Albany co., N. Y., on the right bank of the Mohawk River, at its junction with the Hudson River, on the Erie and Champlain Canals and Rensselaer and Saratoga and Troy and Schenectady branch of the New York Central and Hudson River R. R., is 9 miles N. of Albany. It has 2 newspaper-offices, 1 national and 1 State bank, 2 axe-factories, the Harmony Manufacturing Company's cotton-mills (five in number, one of which is one of the largest, if not the largest and most complete cotton-mill in the world), 20 knitting-mills, 1 pin-factory, 1 rolling-mill, and 1 horse-railroad, connecting with the city of Troy, 3 miles S. The city receives its supply of water for all purposes from the Mohawk River. The Cohoes Falls are in the city limits. Pop. 15,357. ED. "CATARACT."

Co'hort [Lat. *cohors;* Fr. *cohorte*], in the armies of ancient Rome, was the tenth part of a legion, and consisted usually of 600 men. The prætorian cohort was a body of picked troops who attended the commander of the army, and at a later period formed the guard of the emperor.

The term "cohort" is applied by some botanists to groups or assemblages of natural orders.

Coif [Fr. *coiffe*], an ancient name for a head-dress of any kind; at present especially applied in Great Britain to a cap worn by serjeants-at-law. Hence the serjeantcy is called by Blackstone the "degree of the coif."

Coimba'toor' a district of British India, presidency of Madras, S. of Mysore, has an area of 8392 square miles. It is a flat region, producing cotton, grain, tobacco, cattle, and sheep. The climate is mild. In the W. the ox is worshipped. Capital, Coimbatoor. Pop. 1,227,208.

Coimbatoor, a city of India, capital of the above district, is on the Noyel River, near lat. 11° N. and lon. 77° E., and 1483 feet above the level of the sea. The climate is healthy, but the water is brackish. Pop. 20,000.

Coim'bra, a city of Portugal, capital of the province of Beira, on the river Mondego, here crossed by a stone bridge, 115 miles N. N. E. of Lisbon. It is on the railway from Lisbon to Oporto. Built around a conical hill rising abruptly from the river, with many towers, and surrounded by groves of orange and olive trees, it presents a very picturesque external appearance, but the streets are narrow and steep. It is the seat of a Catholic bishop. Coimbra derives its importance from its university, the only one in Portugal, with 1200 students and an old library of 30,000 vols. It was founded in 1307. There are several fine churches; also manufactures of linen and woollen fabrics. Coimbra was founded by the Goths, and afterwards occupied by the Moors, from whom it was taken by Ferdinand I. of Castile in 1064. It became the capital of Portugal in 1139. Pop. 18,147.

Coin', a town of Spain, in the province of Malaga, about 22 miles W. of Malaga. It has an episcopal palace and several convents; also fine public walks and gardens in the environs. Here are manufactures of linen and woollen fabrics, paper, and soap. Pop. 10,200.

Coin'age [Fr. *coin*, a "stamp" or "die," remotely from the Lat. *cuneus*, a "wedge"]. The precious metals were first employed as currency in the form of unstamped bullion, and values and amounts were then determined and expressed by weight; hence the origin of the terms "pound," "livre," "mark," etc. But the commercial character of society and the gradual advance of civilization soon led to the invention of coins, the first step in this direction being the employment of stamped pieces of bullion of indefinite size and form. The finished appearance of the coins issued by existing commercial nations indicates artistic taste and skill of a character which pertains to a highly advanced civilization.

A coin is money consisting of a piece of metal of known weight and composition, possessing real exchangeable worth, its denomination and value being stamped upon its face and guaranteed by the government. Its value is not —except in the case of smaller denominations, such as copper and other minor coins—merely representative (like that of a promissory note), but absolute and intrinsic. The coin-standard of a nation is, with very rare exceptions, the basis of its currency, whatever the character of the latter may be. "Men in their bargains," says Locke, "contract not for denominations or sounds, but for the intrinsic value, which is the quantity of silver (or gold), by public authority, warranted to be in pieces of such denominations."

Gold and silver are peculiarly adapted for coinage, possessing all the necessary qualities. They are capable of exact mechanical subdivision and reunion with comparative ease and without waste; they are durable, readily identified, of perfect sameness, and comparatively indestructible. They possess, moreover, values in the market less fluctuating (at least at the present time) than that of any other available commodity, and a relation between their respective weights, specific gravities, and values which ensures a convenient bulk and the greatest facility for transportation.

There has not always been assigned by law to given quantities of the precious metals the same nominal value as now. Thus, in England, a pound troy of pure gold about the year 1363 was required by law to be coined into fifteen pounds sterling; whilst the same weight of standard gold (eleven-twelfths fine) at the present day is rated at £46 14*s.* 6*d.* A troy pound of silver at the former period was coined into twenty-five shillings, but of late years the same weight of standard silver is coined into sixty-two shillings. The market values of gold and silver relative to each other have also undergone great change, the relative value of equal weights of each, now (in 1873) about as 15½ to 1, having been in the early part of the twelfth century as 9 to 1 only.

There is reason to believe that the cost of production of the precious metals will hereafter be less disturbed and uncertain than prior to the comparatively recent discoveries of extensive gold-fields in California and Australia, and, consequently, that their market values will be less subject to sudden fluctuations. Within the past sixty years the value of gold has fluctuated from 15⅛ to 15⅞ times that of silver (averaging about 15½ times), and never falling so low as that of 15 times such value.

Until within comparatively few years the money of account of nearly all European nations, as well as of the U. S., was based either upon a silver standard, or upon one of gold and silver both. Experience has shown that it is preferable that gold be the sole standard, and that the disadvantages attending the application of any other standard are great and inherent. The standard coin which is to be legal tender in payment of unlimited amounts should be made of the heavier and more valuable of the two metals. Silver is about 15½ times as heavy, and about 28½ times as bulky, as gold of equivalent value. Again, a double standard, based upon the assumption that the relative value of gold and silver is invariable, must be imperfect, resting, as it does, upon a false basis. Whenever the relative market value differs appreciably from the arbitrarily fixed coin standard (assumed invariable), the relatively dearer metal (whether gold or silver) is driven from circulation.

It is desirable where a system of specie payment obtains, or where the precious metals enter largely into financial transactions, that both gold and silver should be in simultaneous circulation. This can only be accomplished by making gold the standard of account and legal tender of payment in all amounts, and by so fixing the relation of silver to gold that the silver shall be relatively *overvalued*, and admitted as legal tender of payment only in limited amounts.

An accurate knowledge of the relative market values of gold and silver is desirable in order that it may be possible to so fix the relative quantity of metal in the coins of like denominations as to ensure the overvaluing of the silver. For this purpose the weight of the silver coins of the standard fineness should be fixed relatively to gold, at a point somewhat lower than that demanded by their nominal values; without, however, permitting the divergence to be so wide as, by the inducement of a large profit, to encourage their fraudulent or unauthorized manufacture by private parties. The ratio of 15 to 1 to represent the relative value of equal weights of gold and silver, respectively, is therefore a desirable one for purposes of coinage, being at once a simple ratio, and near, but sufficiently below, the mean market ratio to ensure the overvaluing of the silver. (See NUMISMATICS.)

The monetary systems of the different nations are in general heterogeneous in their character, and their relations to each other not unfrequently exceedingly complex. That the metallic money of the several commercial countries should differ in any respect is an inconvenience, but the interruption to the freedom of international exchange is greatly augmented when this difference is such as to involve troublesome fractional operations in the process of reduction from the currency of one country to that of another. This want of harmony has for many years, and especially of late, attracted public and merited attention, and earnest attempts are being made to establish an international coinage system on a comprehensive and simple basis. There seems to be no difference of opinion as to the immense advantages to be derived from the establishment of a simple correlated system of international coinage, and the view is rapidly gaining ground that such correlated system should be based on a gold standard—silver to be subsidiary—and that the standard units of the system should possess simple numerical relations as to weight with the metric unit of weight—the gramme—the only unit of weight which promises to be generally accepted in facilitating the international exchange of commodities. It is also important to adopt a standard fineness of a decimal character. The generally approved standard of fineness of coins for international uses is that of nine parts pure metal (gold or silver, as the case may be) to one part of copper alloy.

A memorial of the American Statistical Association, addressed to the Congress of the U. S. in the year 1868, calls attention to certain principles which it urges should govern in the establishment of a system of international coinage. It recommended that our coinage should have simple relations as to weight with the unit of weight of the metric system—the gramme; that the standard as to fineness of our coinage—whether of gold or silver—should continue to be nine-tenths of fine metal to one-tenth of alloy; that the weight in grammes and the fineness of the coins hereafter to be issued should be legibly stamped thereon; that, in pursuance of the foregoing, the gold dollar should contain one and a half grammes of fine gold, or its equivalent, one and two-thirds grammes of standard gold, nine-tenths fine, and that other gold coins should be in proportion; that the silver half dollar and smaller silver coins should contain of fine silver at the rate of twenty-two and a half grammes to the dollar, or their equivalent, twenty-five grammes of standard silver, nine-tenths fine; that the gold coinage, as above described, should be made legal tender in payment of sums in all amounts; and that the silver coin should be made subsidiary, and admitted as legal tender in amounts not exceeding ten dollars in any one payment.

The Association calls attention to the fact that to reduce our gold and our subsidiary silver to these proposed standards, respectively, only insignificant changes—to wit, a reduction of three-tenths of 1 per cent. in the weight of the gold coins, and an increase of five-tenths of 1 per cent. in the weight of the silver coins of the then existing standards —were required. The proposed reduction in the weight of the smaller gold coins is considerably less than the deviation now allowed to the mint. The change above proposed with regard to the subsidiary silver has already been accomplished by act of Congress approved Feb. 12, 1873, and said silver coins are continued as legal tender in amounts not exceeding five dollars in any one payment.

It will be observed that the weight of the silver coins is precisely 15 times the proposed weight of the gold coins of like denomination, but as the value of the gold relatively to silver is sensibly in excess of this ratio, the silver is overvalued, as, according to the experience of commercial nations, it should be.

At a meeting of the American Association for the Advancement of Science, held at Burlington, Vt., in 1867, a resolution was adopted deprecating the establishment of an international system of coinage of which the units should have other than simple relations to the metric unit of weight; and at Salem, in Aug., 1869, the same Associa-

TABLE I.—The Existing Coinage of the United States.

TABLE *showing the standard weights, expressed both in troy and metric units, of the several coins (gold, silver, nickel, and bronze) of the U. S., now issued under authority of law approved Feb. 12, 1873; together with the standard proportions of fine metal and alloy of each description of coin; also, the tolerance—or rate of deviation from the standard allowed by law—in the weight, both of single pieces and of large numbers when delivered together, and the tolerance as to fineness; also, the extent to which the several descriptions of coins are made legal tender in payment of debt.*

‡ Tin and zinc, five per cent.: copper, ninety-five per cent.

tion expressed, also by resolution, their approval of "the proposed adaptation of the American coinage to the metric system, by making the value of the dollar precisely that of one and a half grammes of fine gold; seeing in this a new step towards the promotion of fraternity among nations by the unification of weights, measures, and coinage, inasmuch as all monetary units which have simple relations to the gramme must have simple relations to each other."

No action on the subject of the change of the weight of the gold coinage has yet been taken by Congress, although it is now (June, 1873) believed that such action in the direction of these recommendations will not be long delayed.

The leading simple metrical systems of gold units proposed may be classed under three heads: *First.* The dollar, florin, franc, and penny units, based upon tergrammes of gold nine-tenths fine (the term tergramme denoting the third part of a gramme). *Second.* Systems having for their basis the decagramme of gold of nine-tenths fineness, which unit has been advocated by Chevalier, Dr. Farr, and other European political economists. (See Report of Dr. Farr to the International Statistical Congress, held at The Hague in 1869.) *Third.* Systems based upon the decagramme of pure gold as the unit.

These three systems, by reason of each bearing a simple relation to the metric unit of weight—the gramme—must of necessity possess simple relations to each other, and may be regarded, essentially, as different phases of one and the same system.

According to certain lately published estimates and statements, by a careful investigator, relative to the four principal existing coin standards, it appears that the British sovereign is used by 35,000,000 people; the franc, by 77,000,000; that the gold dollar unit is used in countries having an aggregate population of 80,000,000; and that the domain of the silver dollar has about 552,000,000 inhabitants.

The first of the three accompanying tables shows, with reference to the existing system of coinage in the U. S., the weight and fineness of the standard coins now authorized to be manufactured and issued from the mint, and the "tolerance," or deviation from the standard, allowed in the coining, both as to weight and fineness. (See p. 1014.) The second table compares the existing system of U. S. coinage with a proposed system on a simplified and strictly metric basis. The third table compares with each other the weights of the coin-representatives of the units of account of several countries, as now existing, and also modifications proposed on the basis of a simplified and strictly metric system.

As tending to facilitate in Great Britain the transition from the sterling to the metric basis, it may prove interesting to note the fact that the payment of a sterling half-crown a month is almost exactly equivalent to that of a metric penny a day, the average number of days in a calendar month being 30½, the same as the number of metric pence in a sterling half-crown.

Tables IV. and V., prepared by the director of the mint, to accompany his Annual Report, in pursuance of the act of Feb. 21, 1857, show the weight, fineness, and value of foreign gold and silver coins. The third column expresses the weight of a single piece in decimal fractions of the troy ounce. The fourth column expresses the fineness in thousandths. In the fifth column of Table IV. is shown the value as compared with the standard amount of fine gold in the gold coin of the U. S. In the sixth column of Table IV. is shown the value as paid in the mint, after the uniform deduction of one-half of 1 per cent. The former is the value for any other purposes than recoinage, and especially for the purpose of comparison; the latter is the value in exchange for coins of the U. S. at the mint. The values in the fifth column of Table V. have been calculated on the assumption that the price of silver of the U. S. standard as to fineness (nine-tenths) is 122½ cents per ounce troy.

It is worthy of remark that Japan is, as yet, the only country in which the coins which represent the standard units of account are of gold of the fineness of nine-tenths, and possessing as to weight simple relations to the gramme, the metric unit.

E. B. ELLIOTT,
U. S. Treasury Dept., Washington, D. C.

Coir is the fibre of the cocoanut and other palms. It is a valuable material for ropes, mats, etc. The husks are steeped in water in pits for six months or more, and then beaten with a stick till the fibre readily separates. Coir is one of the best materials for cables on account of its lightness, elasticity, and strength. Large quantities of coir rope are made in the Laccadive Islands by the hand, without the aid of machinery. Coir is produced from the fibre of various trees, especially the GOMUTI PALM (which see). It is largely produced in the Malay Islands.

Coit (THOMAS WINTHROP), D. D., LL.D., an Episcopalian divine, born at New London, Conn., June 28, 1803, graduated at Yale in 1821, was president of Transylvania University, Lexington, Ky., and became a professor at Trinity College, Hartford, Conn., in 1849. He published a "Theological Commonplace Book" (1832), "Puritanism" (1844), and other works.

Coits'ville, a township and post-village of Mahoning co., O., about 21 miles S. E. of Warren. Pop. 1161.

Cojutepec', a thriving, well-built town of Central America, in the state of San Salvador, 15 miles S. of old San Salvador. Pop. about 15,000.

Coka'to, a township and village of Wright co., Minn., on the St. Paul and Pacific R. R., 61 miles W. N. W. of St. Paul. Pop. 452.

Coke [probably allied to the verb "cook"], the charcoal obtained from bituminous coal by distillation or by heating with an almost entire exclusion of air. The former, called gas-coke, is abundantly produced in gas-works; the latter process is conducted in heaps or in ovens. Coking in heaps (the Meiler method) consists in placing the coal in ridges with wooden stakes driven within, which are afterwards removed for the introduction of lighted coal. During the process of heating much smoke and vapor are thrown out, consisting mostly of tar, water, and coal-gas. When the smoke ceases to be evolved, the air is excluded and combustion extinguished by covering the mound of hot cinder with fine coal-dust. Where this business is large, chimneys of firebrick are erected, around which the coal is placed, the larger masses in the centre, the whole being finally covered with fine coal or dross. Firebrick ovens are also used for coking, and are more economical. In these the coal is introduced through the top, and a little air is admitted by openings. When the smoke has ceased the openings are closed for from twelve to twenty-four hours; the coal is then raked through a door, and water thrown upon it to stop combustion. Caking coal is the most suitable for making coke; even when small it may be used, and a little water sprinkled over it greatly assists the coking operation. The weight of coke usually amounts to between 60 and 70 per cent. of the coal employed; at the same time the coal increases in bulk about one-fourth. It will sometimes absorb moisture from the air to the extent of 30 per cent., and contains an amount of ash ranging from ½ to 15 per cent. Coke is largely employed in the smelting of metallic ores, etc. where great heat is required.

Coke (Sir EDWARD), an eminent English jurist and judge, born at Milcham, in Norfolk, Feb. 1, 1552. He graduated at Cambridge, studied law in the Inner Temple, and was called to the bar in 1578. His legal learning and tact in conducting causes soon procured for him a large practice. He was appointed recorder of Norwich in 1586, recorder of London in 1592, and solicitor-general the same year. He became Speaker of the House of Commons in 1593, and attorney-general in 1594. In 1606 he was appointed chief-justice of common pleas, in which position he resolutely opposed illegal encroachments of the Crown at a time when the subserviency of justice to royalty was general. To still his unwelcome decisions the court made him chief-justice of the king's bench, but found him no less independent and freedom-loving than before. Among other bold judicial acts, he decided that the king had no right to stay proceedings in a court of law; for which he was deprived of the justiceship in 1616. He sided with the popular party in Parliament, and for his intrepid course was imprisoned in the Tower in 1622. He had a principal part in framing the Bill of Rights, and in carrying it through Parliament. Sir Edward Coke's legal learning was various and profound. His "Reports" far excelled any that had preceded them. "Coke upon Lyttleton, or the First Institute," is still a standard upon matters of municipal and constitutional law in England. He wrote, besides a second, third, and fourth book of "Institutes," the "Complete Copyholder" and "Reading on Fines." Died Sept. 3, 1633.

Coke (THOMAS), D. D., LL.D., the first bishop of the Methodist Episcopal Church, born at Brecon, Wales, Sept. 9, 1747, was educated at Oxford, and became a minister of the Church of England, but subsequently joined Wesley, and became a most laborious and faithful itinerant. He was made a bishop for America by Wesley in 1784, but did not confine his labors to this country. He traversed Great Britain and Ireland frequently, and crossed the Atlantic eighteen times. He founded the Wesleyan missions in the East and West Indies, and expended nearly all his large fortune in the undertaking. He died May 2, 1814, on a voyage to India, and was buried at sea. He was a volu-

minous writer, and left, among numerous other works, a "Commentary on the Holy Scriptures" (6 vols., 1803–07), and a "History of the West Indies" (1808). (See STEVENS'S "History of Methodism," and "History of the Methodist Episcopal Church.")

Cokesbury, a township and post-village of Abbeville co., S. C. The village is on the Greenville and Columbia R. R., 48 miles S. S. E. of Greenville. Pop. 700; of township, 2179.

Col [from the Lat. *collum*, a "neck"], a French word signifying "neck," is applied to several passes of the Alps, as Col de Balme, Col de Tenda, etc.

Co'la, or **Kola-Nut,** the seed of the tree *Cola acuminata*, of the natural order Sterculiaceæ, a native of the western tropical parts of Africa, and cultivated in other warm countries. The natives of Guinea believe that to eat a portion of one of these seeds before their meals improves the flavor of whatever they may eat, and that when sucked or chewed they will render even putrid water agreeable to the palate. They are about the size of a pigeon's egg, of a brownish color and bitter taste. They are said to possess properties analogous to Peruvian bark.

Col'berg, a fortified seaport-town of Prussia, in Pomerania, on the river Persante near its entrance into the Baltic, about 143 miles N. E. of Berlin, with which it is connected by a railway. It has a handsome rathhaus, an old cathedral, salmon and lamprey fisheries, commerce, and salt-works. It is partly surrounded with swamps which can be readily covered with water. It has sustained several protracted sieges. Pop. in 1871, 13,130.

Col'bert, a county in the N. W. of Alabama. Area, 750 square miles. It is bounded on the N. by the Tennessee River. The surface is hilly or undulating; the soil is fertile. Cotton, corn, and wool are produced. It is intersected by the Memphis and Charleston R. R. Capital, Tuscumbia. Pop. 12,537.

Colbert (JEAN BAPTISTE), a French statesman and financier, was born at Rheims Aug. 29, 1619. He entered the service of Cardinal Mazarin in 1648, and became secretary to the queen in 1654. Mazarin at his death recommended Colbert to the king, who in 1661 appointed him controller-general of the finances, which were then in a ruinous condition. The annual revenue exacted from the people in 1660 was about 84,000,000 livres, but only 32,000,000 were received into the treasury, the rest being kept by the farmers of the revenue. Colbert reformed the financial system, and established order and economy in the government. In the course of twenty years he raised the gross revenue to 115,000,000, while the expense of collecting it was reduced to about 30,000,000. He promoted commerce and manufactures, opened canals and roads, and founded colonies in America. He also made reforms in the department of marine, of which he was appointed minister in 1669. No minister perhaps ever contributed so much to the prosperity of France. He was a liberal patron of literary and scientific men, and was the founder of the Academy of Inscriptions and Academy of Sciences. His influence at court was undermined by Louvois, and his efforts to dissuade Louis XIV. from his ruinous wars and extravagant expenses were unavailing; but he retained the office of controller-general until his death. Died in Paris Sept. 6, 1683. (See PIERRE CLÉMENT, "Histoire de Colbert," 1846; A. DE SERVIEZ, "Histoire de Colbert," 1842; GOURDAULT, "Colbert, Ministre de Louis XIV.," 1870.)

Col'borne, a post-village of Cramahe township, Northumberland co., Ontario (Canada), on the Grand Trunk Railway, 15 miles E. of Cobourg, has manufactures of flour, leather, lumber, furniture, and iron castings, and one weekly paper. Pop. about 1500.

Col'bourne, a township of Worcester co., Md. P. 861.

Col'burn (WARREN), a mathematician, born at Dedham, Mass., Mar. 1, 1793, taught school in Boston. He published in 1821 a "Mental Arithmetic," which had an extensive circulation. Died at Lowell Sept. 13, 1833.

Colburn (Rev. ZERAH), born at Cabot, Vt., Sept. 1, 1804. In early life he had a wonderful faculty of computation, which failed him as he came to maturity. He became a Methodist preacher (1825), and professor of languages at Norwich University (1835). Died at Norwich, Vt., Mar. 2, 1840.

Col'by Univer'sity, a Baptist college, incorporated by the legislature of Massachusetts in 1813 as "The Maine Literary and Theological Institution," was first established near Bangor, but subsequently (1818) transferred to Waterville, Me. In 1820 it was chartered by the State of Maine as "Waterville College," which name it bore till 1867, when, having been munificently endowed by Gardner Colby, Esq., a merchant of Boston, the name was changed to that of Colby University. Number of instructors in 1872, 7; pupils, 52.

Colcha'gua, a province of Chili, is bounded on the N. by the province of Santiago, on the E. by the Andes, on the S. by the province of Curico, and on the W. by the Pacific Ocean. Area, 3516 square miles. The province is traversed by the rivers Rapel, Mataquito, and Tinguirica. The climate is better than in any other province, and the soil is very fertile. Gold and copper are found, especially in the mountains in the interior. Pop. in 1869, 149,747. Chief town, San Fernando.

Col'chester (anc. *Camalodunum*), a parliamentary borough and river-port of England, in Essex, on the river Colne, 12 miles from the sea, and on the Eastern Union Railway, 51 miles N. N. E. of London. It is well built on the sides and summit of an eminence, and has imposing remains of a castle built soon after the Norman Conquest. Great quantities of Roman remains have been found here, including bushels of coins of Roman emperors, vases, urns, lamps, etc. It has eight parish churches, some of which are antique structures, several hospitals, a theatre, and a custom-house. There are manufactures of silk and a valuable oyster-fishery. It returns two members to Parliament. Pop. in 1871, 26,361.

Colchester, a county in the central part of Nova Scotia, bordering an inlet of the sea and the Bay of Fundy. It is intersected by the Nova Scotia Railway. Capital, Truro. Pop. in 1871, 23,331.

Colchester, a post-village of New London co., Conn., 28 miles S. E. of Hartford. It has manufactures of India-rubber and paper, and is the seat of Bacon Academy. Pop. 1321; of Colchester township, 3383.

Colchester, a post-township of Delaware co., N. Y. Pop. 2652.

Colchester, a township and post-village of Chittenden co., Vt. The village is on the Vermont and Canada R. R., 4 miles N. of Burlington. The township contains the important village of WINOOSKI (which see). Pop. 3911.

Colchiç'eine ($C_{35}H_{47}N_3O_{11}$), an alkaloid prepared from colchicine by the action of acids.

Col'chicine ($C_{37}H_{30}N_3O_{11}$?), a very powerful alkaloid extracted from all parts of *Colchicum autumnale* (meadow saffron). It produces, even in very small doses, violent vomiting and purging.

Col'chicum, a drug much valued in the treatment of neuralgic gout and rheumatism and some other diseases. It is the seed and root of *Colchicum autumnale*, or meadow saffron, a European herb of the order Melanthaceæ. It has sedative, diuretic, cathartic, and diaphoretic properties, and when given in an overdose is a dangerous poison.

Col'chis [Gr. Κολχίς], an ancient province of Asia, was bounded on the N. by the Caucasus, on the S. by Armenia, and on the W. by the Pontus Euxinus (Black Sea). It was celebrated in ancient fable and poetry as the place to which the Argonauts sailed for the golden fleece, and as the home of Medea. It was noted for its wine and fruits, and was the native country of the pheasant, which derived its name from Phasis, a river of Colchis. It is now part of the Russian dominions.

Col'cothar Vitri'oli, or **Cro'cus Mar'tis,** a brownish-red sesquioxide of iron, obtained by the calcination of copperas (sulphate of iron) in the manufacture of Nordhausen sulphuric acid. It is used as a polishing powder.

Cold [Lat. *frigus*; Ger. *Kälte*], the absence or want of heat. It is scarcely necessary to observe that the distinction between heat and cold is merely relative. Thus, if air or any substance coming in contact with the human body is of a lower temperature than the body, it absorbs heat from the latter, producing the sensation of cold; if of a higher temperature, it imparts a feeling of heat or warmth. The same substance at the same time may give the sensation of cold to one person and that of warmth to another, in case the temperature of the one is much lower than that of the other person. Water at a certain temperature will often feel warm to one's hand in winter, while water of the same temperature will in summer cause the sensation of cold, because in the former case it is warmer, and in the latter cooler, than the surface of the body to which it is applied. But since gases are found to expand $\frac{1}{491}$th of their volume for every increase of one degree F., it has been inferred that if this law holds good at very low temperatures, the temperature of −458 F., or −273 C., is an absolute zero, because at that temperature there would be no gaseous tension, and no possibility of detecting any further decrease of heat. The lowest temperature yet recorded is −220 F.

All warm-blooded animals have a power of maintaining the proper temperature of the body in defiance of external

cold, believed to be mainly due to a process analogous to combustion, in which carbon and hydrogen taken in food unite with oxygen derived from the air by respiration. If the combustible materials are not furnished, or if the supply of oxygen be deficient, there must be a depression of temperature. Now, if the temperature of a bird or mammal (except in the case of hibernating animals) be lowered about 30° below its normal standard (which in birds ranges from 108° to 112°, and in mammals from 98° to 102°), the death of the animal is the result. The symptoms following a great depression of the temperature of the body are, retardation of the circulation of the blood, causing lividity of the skin, followed by pallor; a peculiar torpor of the muscular and nervous systems manifests itself in an indisposition to make any exertion, and in extreme drowsiness. The respiratory movements become slower, and the loss of heat goes on with increasing rapidity till death supervenes.

In hibernating animals the power of generating heat within their own bodies is slight, their temperature nearly approximating that of the external air, so that it may be brought down nearly to the freezing-point. At this temperature the vital functions are scarcely perceptible, but when the temperature is again raised vital activity returns. The respirations in marmots fall from 500 to 14 in an hour, and are performed without apparent movement of the chest walls; the pulse sinks from 150 to 15 beats in a minute; and the animal can with difficulty be aroused from torpor.

Cold is a powerfully depressing agent, and in certain conditions is a fruitful cause of disease and death. Its most obvious effects occur in the freezing of parts of the body. In such cases the restoration to a normal temperature must be very gradual, or the frozen part may become affected by gangrene. It is often beneficial to place the frozen part in water near the freezing-point. It is said to be usual in Russia to rub the part affected with snow. The effects of cold upon the general system may result in bronchitis, pneumonia, or other serious diseases.

Cold Bath, a township of Clarke co., Ark. Pop. 645.

Cold Brook, a township of Warren co., Ill. P. 1256.

Cold Brook, a post-village of Russia township, Herkimer co., N. Y., has several manufactories. Pop. 170.

Cold Creek, or **Hume,** a post-village of Hume township, Allegany co., N. Y. Pop. 254.

Col de la Seigne (sāñ), an Alpine pass leading from Savoy into the Val d'Aosta in Piedmont, is 7 miles W. S. W. of Mont Blanc. Height, 8422 feet. (See Col.)

Col'den, a township and post-village of Erie co., N. Y. The village is 20 miles S. E. of Buffalo. Pop. 1472.

Colden (Cadwallader), lieutenant-governor of the province of New York from 1761 to 1775, repeatedly acting as governor in the absence of the chief executive, born in Scotland in 1688, emigrated about 1708 to Pennsylvania, where he practised medicine, invited to New York in 1718 by Gov. Hunter, was the first surveyor-general of the colonies. Died in 1776, of grief, it is said, at witnessing the destruction caused by the great fire of that year. Among his works are numerous essays on medical subjects, and others on natural philosophy, natural history, and the mathematics. He carried on a long correspondence with Linnæus, to whom he sent great numbers of American plants. His memoir upon them, entitled "Plantæ Coldenshamiæ," etc., was published by Linnæus in the "Acta of the Upsala Academy of Science," and is perhaps the earliest botanical treatise written in North America. Linnæus gave the name *Coldenia* to an East Indian plant.

Colden (Cadwallader David), an American lawyer, born in Queen's co., Long Island, April 4, 1769, became mayor of New York in 1818, and a member of Congress in 1822. He wrote a "Life of Robert Fulton." Died Feb. 7, 1834.

Cold Harbor, a locality in Hanover co., Va., about 10 miles N. E. of Richmond.

In May, 1864, Gen. Grant, continuing his movement from Spottsylvania, had successfully crossed the Fifth, Sixth, and Second corps over the North Anna River at Jericho Ford and at Chesterfield Bridge, above and below Lee's army. An attempt to cross direct in his front proved unsuccessful, and it being discovered that Lee's position was one of remarkable strength, from which he could be dislodged only by a loss incommensurate with the advantage to be thus gained, Gen. Grant determined to withdraw to the N. bank, which was skilfully accomplished on the night of the 26th of May, and another flank movement was commenced. The advance was led by two divisions of cavalry under Gen. Sheridan, and the Sixth corps, Gen. Wright. Considerable severe fighting was done on the 28th, 29th, and 30th, resulting in the success of the national arms; and on the 31st, Sheridan, with his two divisions, occupied Cold Harbor, driving the Confederates from the place, and maintaining his position until relieved, June 1, by the Sixth corps and the Eighteenth corps (Gen. W. F. Smith), which latter had just arrived (*viâ* White House) from Butler's army on the James River. At 5 P. M. both Wright and Smith attacked Lee, carrying a good part of his first line; but subsequent attempts to force him from his second line were unsuccessful, and the effort was abandoned after a loss of 2000 men. The portion of the army not engaged in the main attack received repeated assaults, all of which were repulsed with great loss to the enemy. Ineffectual attempts were made by the Confederates during the night to regain the ground lost during the day. The 2d of June was devoted to the redisposition of the army. The Second corps (Hancock) was moved forward, and placed on the left of the Sixth, which was resting on the left of the Eighteenth; the Ninth corps (Burnside) was drawn in to Bethesda Church, and the Fifth corps (Warren) extended to the left, to connect with Smith. In executing this operation both Warren and Burnside sustained attacks, which were repulsed, with the loss of some prisoners, however.

The morning of June 3d opened with rain, but at 4 A. M., the Second, Sixth, and Eighteenth corps furiously assaulted the Confederates in their intrenchments. Barlow's and Gibbons' divisions of the Second corps carried a portion of the enemy's line, but were compelled to withdraw before reinforcements could reach them. An equally gallant and vigorous assault, though less sanguinary, was also made by the Sixth and Eighteenth corps, but without success. Warren, whose line was much extended, was engaged only with his artillery, while Burnside failed to move at the time arranged upon, and a later movement, which promised success, on the left of Lee's line, was recalled, owing to the failure of the attack on the right; and the army intrenched themselves in their position close to the Confederates' main line of works. The attack lasted but about half an hour, yet in that short time Grant's loss was not less than 7000, while Lee's loss did not probably exceed 3000. At a later hour in the day an order was given to renew the attack, but the order was subsequently withdrawn. An attack was made on Gibbons' division about 9 P. M., which was repulsed. The total Federal loss at and around Cold Harbor was upwards of 13,000.

The two armies remained confronting each other till June 12, when Grant, moving rapidly, crossed the Chickahominy at the lower crossings, reaching the James River on the 15th, which was also successfully crossed on pontoons and ferry-boats.

Cold Spring, a township and post-village of Shelby co., Ill. The village is 50 miles S. E. of Springfield. Pop. of township, 1656.

Cold Spring, a township of Phelps co., Mo. P. 964.

Cold Spring, a township of Cattaraugus co., N. Y., has manufactures of lumber, shingles, hubs, spokes, etc. Pop. 835.

Cold Spring, a post-village of Putnam co., N. Y., on the E. bank of the Hudson and on the Hudson River R. R., 52 miles N. of New York. It is pleasantly situated among the Highlands, one mile above West Point. It has five churches, a library, three public schools, a furnace, and manufactures of cannon, machinery, brass castings, etc. It has one weekly newspaper. P. 3086. Ed. "Recorder."

Cold Spring, a village of Huntingdon township, Suffolk co., N. Y., on the E. side of Cold Spring Harbor, has some manufactures and shipbuilding, and formerly was a whaling port, but that business is now pursued on only a small scale. Pop. 750.

Cold Spring, a township of Lebanon co., Pa. P. 80.

Cold Spring, a post-village, capital of San Jacinto co., Tex.

Cold Spring, a post-township of Jefferson co., Wis. Pop. 740.

Cold'stream, a border-town of Scotland, in Berwickshire, on the left bank of the Tweed, 15 miles S. W. of Berwick. The river is here crossed by a bridge. Near this place is the famous ford where the English and Scottish armies formerly crossed the Tweed. Here General Monk raised the regiment still known as the Coldstream Guards (which see). Pop. in 1861, 1834.

Coldstream Guards, a regiment in the Foot Guards or Household Brigade, is the oldest corps in the British army except the First Foot. It was raised at Coldstream in 1660 by General Monk, and was first called Monk's regiment.

Cold Water, a township of Butler co., Ia. Pop. 461.

Cold'water, a city, capital of Branch co., Mich., on the Coldwater Creek and on the Michigan Southern and Mansfield Coldwater and Lake Michigan R. Rs., midway

between Detroit and Chicago. It has seven churches, two national banks, two newspapers, and manufactures of iron, wood, oil, flour, etc. There is a park, two libraries, and a high school. The State school for pauper children is in Coldwater. Pop. 4381; of Coldwater township, 1525.

A. J. Aldrich, Ed. Coldwater "Republican."

Cold Water, a township of Isabella co., Mich. Pop. 151.

Cold Water, a township of Cass co., Mo. Pop. 439.

Cole, a county near the centre of Missouri. Area, 410 square miles. It is bounded on the N. E. by the Missouri River, and on the S. E. by the Osage. The surface is hilly; the soil of the river-bottoms is fertile. It is intersected by the Missouri Pacific R. R. Grain, tobacco, and wool are raised. Coal is found, and limestone is abundant. Jefferson City is the county-town and the capital of the State. Pop. 10,292.

Cole, a township of Sebastian co., Ark. Pop. 527.

Cole, a township of Benton co., Mo. Pop. 865.

Cole (Thomas), a landscape-painter, born in Lancashire, England, Feb. 1, 1801, was taken to Ohio by his parents when he was a child. He visited Italy about 1831, and returned to New York in 1832 with several Italian landscapes. He painted a number of fine views of the Catskill Mountains. Among his other works are four allegorical pictures of the "Voyage of Life," a series called "The Course of Empire," a "View of Mount Etna," and a "Dream of Arcadia." Died at Catskill, N. Y., Feb. 11, 1848. (See his "Life" by L. L. Noble, 1855.)

Colebrook, a township and post-village of Litchfield co., Conn. The village is 28 miles N. W. of Hartford. Pop. 1141.

Colebrook, a township and post-village of Coos co., N. H. The village is about 50 miles N. of Mount Washington. It has three churches, school and academy, a newspaper, five carriage manufactories, and a woollen factory, besides manufactures of starch, lumber, leather, etc. P. 1372. Albert Barker, Pub. "Northern Sentinel."

Colebrook, a post-tp. of Ashtabula co., O. Pop. 800.

Colebrook, a township of Clinton co., Pa. Pop. 332.

Colebrookdale, a township and post-village of Berks co., Pa. The village is about 15 miles E. of Reading. Pop. of township, 1660.

Colebrooke, or **Grand Falls,** a post-village and port of entry of Victoria co., N. B., near the Great Falls of the river St. John, which are 180 feet high and very imposing. Steamers ply between Colebrooke and St. John (202 miles) during high water. There is a fine suspension bridge over the falls. Pop. about 700.

Colebrooke (Henry Thomas), an English Orientalist, born June 15, 1765, went to India in 1782, and was employed in the civil service of the East India Company. He became professor of Sanscrit in the College of Fort William. He published a "Sanscrit Grammar" (1805), a "Dictionary of the Sanscrit Language" (1808), "Miscellaneous Essays" (2 vols., 1837), "On the Sacred Books of the Hindoos" and "Algebra of the Hindoos." His works display sound critical judgment and great learning. Died in London Mar. 10, 1837.

Cole Hill, a township of Chesterfield co., S. C. P. 710.

Coleman, a county in W. Central Texas. Area, 1000 square miles. It is bounded on the S. by Colorado River. The surface is broken and rocky. Wood and water are scarce, and grazing is the chief pursuit. Capital, Camp Colorado. Pop. 347.

Coleman (Leighton). See Appendix.

Coleman (Lyman), D.D., an eminent American scholar, teacher, and author, born at Middlefield, Mass., June 14, 1796, has traveled and studied in Europe and the East, has been connected with several literary institutions, and is now (1873) professor in Lafayette College, Easton, Pa. He has published "Antiquities of the Christian Church" (1841), "Ancient Christianity" (1852), "Historical Text-Book and Atlas of Biblical Geography" (1854), "Prelacy and Ritualism" (1869), and other works.

Coleman's, a township and village of Edgefield co., S. C. The village is about 22 miles N. E. of Edgefield and 4 miles S. of the Greenville and Columbia R. R. Pop. 2243.

Colen'so (John William), D.D., an English theologian, born Jan. 24, 1814, graduated at Cambridge in 1836. He was appointed bishop of Natal in South Africa in 1854. Among his works is "The Pentateuch and Book of Joshua Critically Examined" (1862), which was condemned by the Houses of Convocation. He maintains that some books of the Old Testament are not divinely inspired. He was declared deposed from his see by his metropolitan, an act whose validity was denied by the privy council. He has acquired some distinction as a mathematician.

Coleop'tera [from the Gr. κολεός, a "sheath," and πτερόν, a "wing"], the name of an extensive order of insects, including all those popularly termed beetles, having four wings; the first pair, of a horny consistency, serve as defensive coverings to the second pair, which are larger in size and folded transversely beneath the elytra or wing-covers when the beetle is at rest. In some species the membranous wings are wanting, but the elytra are always present. The head supports two antennæ of various forms, but nearly always consisting of eleven joints. Coleoptera have two compound eyes, but no ocelli. The mouth is fitted for gnawing, tearing, or chewing, and exhibits in great perfection the complicated structure which belongs to the mouth of all the masticating or mandibulated insects. The anterior segment of the thorax greatly surpasses in extent the two other segments; the abdomen is united to the trunk by a great part of its breadth. The Coleoptera and their larvæ are very voracious, feeding on both animal and vegetable substances. This is a very numerous order, being estimated to contain 80,000 species or more.

Colepeper. See Culpeper.

Colerain', a post-township of Franklin co., Mass. It has three churches, three cotton-factories, manufactures of carriages, boxes, castings, chair-stuff, lumber, etc. It is on the unfinished Deerfield River R. R. Pop. 1742.

Colerain, a township and post-village of Bertie co., N. C. The village is on the E. bank of Chowan River, and 100 miles N. of Beaufort. Pop. 1968.

Colerain, a township and post-village of Belmont co., O. The village is 8 miles N. of the Ohio Central R. R. and 20 miles S. W. of Steubenville. Pop. 1308.

Colerain, a township of Hamilton co., O., 42 miles S. W. of Dayton. Pop. 3689.

Colerain, a township of Ross co., O. Pop. 1635.

Colerain, a township of Bedford co., Pa. Pop. 1204.

Colerain, a post-township of Lancaster co., Pa. Pop. 1655.

Coleraine, a seaport-town of Ireland, in the county of Londonderry, is on the river Bann, 4 miles from its mouth, and 47 miles N. N. W. of Belfast. Vessels of 200 tons can come up to the town, and steamers ply regularly between it and Liverpool and Glasgow. It has a court-house and a custom-house; also manufactures of fine linen fabrics called "colerains," and of paper, soap, etc. Pop. in 1871, 6236.

Coleridge (Hartley), an English poet, son of Samuel T. Coleridge, was born near Bristol Sept. 14, 1796. He was a dreamy, wayward, and eccentric genius. He became a fellow of Oriel College in 1818, but he soon lost his fellowship by his intemperance. He published a volume of admired poems in 1833. Among his other works is "The Worthies of Yorkshire and Lancashire" (1835). He had marvellous conversational powers. Died Jan. 6, 1849.

Coleridge (Henry Nelson), a cousin of the above, was born in 1800. He was called to the bar in 1826. He published, besides other works, an "Introduction to the Study of the Greek Classic Poets" (1830) and "The Table-Talk of Samuel T. Coleridge" (1835). He edited several works of his uncle. Died Jan. 26, 1843.

Coleridge (Right Honorable Sir John Taylor), D. C. L., an English jurist, a nephew of S. T. Coleridge, born at Tiverton in 1790, educated at Oxford and the Middle Temple, was called to the bar in 1819, became a serjeant in 1832, judge of the king's bench in 1835, and privy councillor in 1858. His reputation as a lawyer and literary critic is high. D. Feb. 11, 1876.

Coleridge (Samuel Taylor), an English poet and critic, born at Ottery St. Mary, in Devonshire, Oct. 21, 1772, was a son of the vicar of that parish. In 1791 he entered Jesus College, Cambridge, where he attained great proficiency in classical learning. He abruptly quitted Cambridge in 1792, and enlisted in a regiment of dragoons under the assumed name of Silas Tomken Comberbatch. His relatives soon procured his discharge from the army. He visited Bristol in 1794, and became an associate of Robert Southey and other young men who, like himself, had adopted democratic and revolutionary ideas. They formed a project to emigrate to the banks of the Susquehanna and to found a "pantisocracy," in which they proposed to enjoy a community of goods. As they could not raise money enough for the outfit, they were compelled to abandon the enterprise. His friend and patron, Joseph Cottle of Bristol, paid him thirty guineas in advance for a volume of poems (published in 1796). In 1795 he married Sarah Fricker, a sister of Southey's wife, and became a resident of Nether Stowey (Somersetshire), where he asso-

ciated with the poet Wordsworth, and remained nearly three years. During this period he composed the "Ancient Mariner" and other poems. Coleridge and Wordsworth wrote in parternership a collection of "Lyrical Ballads." He held Socinian views in this early part of his mature life, and began to preach in the Unitarian churches, but his success as a preacher was hindered by his instability and want of punctuality. In 1798 he visited Germany with Wordsworth, and studied at Göttingen. He removed to Keswick, in the Lake country, in 1800, and resided with Southey and Wordsworth. The unfriendly critics of the Reviews applied to these three friends the appellation of "Lake Poets," in reference to their local habitation. In 1808 he lectured on poetry and the fine arts in London, and in 1809 commenced the publication of the "Friend," a periodical. His wife and family remained at Keswick, dependent on Southey, while Coleridge led a wandering life, and formed many speculative and literary projects, which he failed to realize. His natural infirmities of character were increased by the use of opium. He passed many of his later years in the house of Mr. Gillman at Highgate, near London, where he began to reside in 1816. Among his works are "Christabel" (1816), "Biographia Literaria" (1817), "Zapolya," a drama (1818), "Aids to Reflection" (1825), and "Literary Remains" (1836). "Osorio, a Tragedy" (first printed in 1873), was the original drama from which his "Remorse" was adapted. He died at Highgate July 25, 1834. (See GILLMAN, "Life of S. T. Coleridge," 1838; COTTLE, "Reminiscences of Coleridge and Southey," 1847.)

Coleridge (SARA HENRY), only daughter of the preceding, was born at Keswick Dec. 22, 1802. She passed many of her early years in the house of her uncle, Robert Southey, and was married in 1829 to her cousin, Henry N. Coleridge. She edited several works of her father, and wrote an admired imaginative tale called "Phantasmion" (1837). Died May 3, 1852. Her memoirs and letters, edited by her daughter, were published in 2 vols., 1873.

Coles, a county in S. E. Central Illinois. Area, 550 square miles. It is intersected by the Kaskaskia and Embarras rivers. The surface is nearly level; the soil is fertile. Cattle, grain, tobacco, and wool are raised. It has manufactures of lumber, carriages, etc. The greater part of the county is prairie. It is traversed by the Illinois Central and the St. Louis Alton and Terre Haute R. Rs. Capital, Charleston. Pop. 25,235.

Cole's, a township of Prince William co., Va. P. 1279.

Coles (EDWARD), an American statesman, born in Albemarle co., Va., Dec. 15, 1786, was private secretary to President Madison (1810–16) and minister to Russia (1817–18). Soon after his return he set free his slaves. He was governor of Illinois (1823–26). Died at Philadelphia, then his residence, July 7, 1868. He published a "History of the Ordinance of 1787."

Colesville, a post-village and township of Broome co., N. Y., on the Susquehanna River and the Albany and Susquehanna R. R. The township has ten churches, numerous villages, and some manufactures of leather, etc. Pop. 3400.

Col'fax, a county in the E. of Mississippi. Area, about 360 square miles. It is partly bounded on the E. by the Tombigbee River, and is intersected by the Mobile and Ohio R. R. It is in one of the finest cotton-regions of the South. This county was organized since the census of 1870. Capital, West Point.

Colfax, a county in the E. of Nebraska. Area, 400 square miles. It is bounded on the S. by the Platte River, and intersected by Shell Creek and other streams. The soil is fertile, producing grain, vegetables, and fruit. Grazing is excellent and water-power abundant. It is traversed by the Union Pacific R. R. Capital, Schuyler. Pop. 1424.

Colfax, a county in the N. E. of New Mexico. Area, 3700 square miles. It is drained by the Canadian River, which rises in it. The Rocky Mountains extend along the western border. The valleys are fertile. Wool is raised. Capital, Cimarron. Pop. 1992.

Colfax, a post-village of Placer co., Cal., on the Central Pacific R. R., 54 miles N. E. of Sacramento. It has gold-mines in the vicinity.

Colfax, a post-village of Fremont co., Col., 50 miles S. of Cañon City. It is in Wet Mountain Park in a fine farming region. It was settled by a colony of Germans in 1870. Pop. of colony in 1870, 230.

Colfax, a township of Champaign co., Ill. Pop. 633.

Colfax, a post-village of Clinton co., Ind., at the junction of the Indianapolis Bloomington and Western and Logansport Crawfordsville and South-western R. Rs. P. 187.

Colfax, a township of Dallas co., Ia. Pop. 582.

Colfax, a township of Grundy co., Ia. Pop. 278.

Colfax, a post-village, capital of Grant parish, La., on Red River about 25 miles N. W. of Alexandria. Pop. 40.

Colfax, a township of Benzie co., Mich. Pop. 71.

Colfax, a township of Huron co., Mich. Pop. 91.

Colfax, a township of Mecosta co., Mich. Pop. 146.

Colfax, a township of Oceana co., Mich. Pop. 77.

Colfax, a township of Wexford co., Mich. Pop. 172.

Colfax, a township of Daviess co., Mo. Pop. 584.

Colfax, a township of De Kalb co., Mo. Pop. 796.

Colfax, a township of Rutherford co., N. C. Pop. 964.

Colfax, a township of Darlington co., S. C. Pop. 1418.

Colfax, a post-village, cap. of Whitman co., Wash. Ter.

Colfax, a township of Dunn co., Wis. Pop. 233.

Colfax (SCHUYLER), an American statesman, born in the city of New York Mar. 23, 1823, was a grandson of Gen. William Colfax, who commanded Washington's life-guards. In 1836 he removed with his mother, who was then a widow, to Northern Indiana. He settled at South Bend, and studied law, and became in 1845 editor of the "St. Joseph Valley Register," a Whig paper issued at South Bend. In 1850 he was a member of the convention which formed a new constitution for Indiana, and he opposed the clause that prohibited colored men from settling in that State. As a Whig candidate for Congress he was defeated in 1851, but was elected in 1854, was six times re-elected, and continued to represent that district until 1869. In 1856 he made an eloquent speech in Congress on the subject of the conflict in Kansas. He was chosen Speaker of the House of Representatives in Dec., 1863. During the civil war he was a friend and confidential adviser of President Lincoln. He performed a journey across the continent to California in 1865, and was again elected Speaker of the House about the end of that year. He gained a high reputation as a presiding officer, and was the most popular Speaker of the House since Henry Clay. In 1867 he was chosen Speaker for the third time. In May, 1868, he was nominated as candidate for the office of Vice-President of the U. S. by the Republicans, who at the same time nominated Gen. Grant for the presidency. They were elected in Nov., 1868, receiving 214 electoral votes out of 294, which was the whole number.

Colhoun' (EDMUND R.), U. S. N., born May 6, 1821, in Pennsylvania. Entered the navy as a midshipman April 1, 1839, became a passed midshipman in 1845, a lieutenant in 1861, a commander in 1862, and a captain in 1869. He served on the E. coast of Mexico during the Mexican war, commanded the steamer Hunchback at the capture of Roanoke Island and Newbern, N. C., in the spring of 1862, and was in several engagements with batteries on Black Water River, Va., during the fall of that year. In reference to the fight at Roanoke Island, Commander Murray in his official report of Feb. 8, 1862, says: "The Hunchback, Acting-Lieutenant Colhoun, took a position very near the batteries, and sustained considerable damage from the fire of the enemy, which she is now repairing. During the whole of the engagement, and in spite of her injuries, she maintained her proximity to the enemy, to his great apparent embarrassment and to the admiration of the other ships." And in his report to Rear-Admiral Lee of the heavy fighting on the Black Water, Lieutenant-Commander Flusser writes: "I was well supported. Colhoun and French both did their duty." He commanded the monitor Weehawken during the summer and fall of 1863 in her various engagements with the forts and batteries of Charleston harbor. On the 7th of Sept., 1863, while going into action, the Weehawken grounded, and in this perilous situation remained for twenty-four hours, exposed to the fire of Fort Moultrie. Captain Colhoun's conduct on this occasion is thus highly commended by Rear-Admiral Dahlgren in his report of Sept. 8, 1863: "Captain Colhoun has, in my opinion, more than compensated for the misfortune of getting aground by the handsome manner in which he has retorted upon the enemy, and defended the glorious flag that floats above him. At 11.30 A. M. I telegraphed to him, 'Well done, Weehawken! Don't give up the ship.' His vessel is now off, and the crews of the other monitors cheered spontaneously as he passed. I commend Captain Colhoun, his officers, and men to the notice of the department." Captain Colhoun was in both the Fort Fisher fights, and for "his energy, bravery, and untiring zeal" was recommended for promotion by Rear-Admiral Porter in his "commendatory despatch" of Jan. 28, 1865.

FOXHALL A. PARKER, U. S. N.

Col'ic [Lat. *colica;* Fr. *colique;* from the Gr. κωλικός, "pertaining to the colon"], a term applied to diseases attended with severe pain of the abdomen; its supposed particular connection with the large intestine is not always certain. The disease, anciently called the "colic passion" (Latin, *colica passio*), is now generally believed to be spas-

modic in character, and to be caused, at least in part, by irregular contractions of the muscular coat of the intestines. This complaint arises from various causes and exhibits different symptoms. It is sometimes attended with constipation, and ceases when the regular action of the bowels is restored. A good remedy in such cases is a dose of castor oil (about one ounce for an adult), with thirty or thirty-five drops of laudanum. Warm baths and fomentations are often necessary. When colic resists mild and simple remedies, medical assistance should be procured, for colic is closely allied, as a symptom, to several severe and dangerous diseases. Painters' colic arises from the absorption of lead into the system, and therefore attacks persons employed in lead-mines or using preparations in which lead is used. This latter disease is often called *colica Pictonum*, or "colic of the Pictones," the latter being the ancient name of the inhabitants of Poitou, where this disease was once common. REVISED BY WILLARD PARKER.

Coligny, de (GASPARD), an eminent French admiral and Huguenot, was born at Châtillon-sur-Loing Feb. 16, 1517. He served with distinction at the battle of Cérisoles in 1544, and became admiral of France in 1552. In 1557 he was taken prisoner by the Spaniards at Saint-Quentin. He was the second in command of the Protestant army in the civil war which began in 1562, and when the prince of Condé was killed at Jarnac in 1569 he succeeded him as commander-in-chief. The war was suspended in 1570 by a treaty of peace, in which the court acted a treacherous part. Coligny went to Paris to attend the marriage of Henry of Navarre in Aug., 1572, and was received with feigned kindness by Charles IX. He was wounded in the street by a partisan of the duke of Guise, and was killed, two days later (Aug. 24), in the general massacre of St. Bartholomew. (See PÉRAULT, "Vie de Coligni;" BRANTÔME, "Discours sur l'Amiral de Châtillon;" DUFEY, "Coligny, Histoire Française," 4 vols., 1824.)

Coli'ma, a state of the Mexican republic, on the western coast. Area, 2392 square miles. The interior is mountainous, the volcano Pico de Colima being the highest point (10,800 feet); the plains are fertile, and produce sugar, rice, cacao, cotton, and tobacco. Capital, Colima. Pop. in 1871, 48,649.

Colima, a town of the Mexican republic, capital of the state of Colima, is about 250 miles W. of Mexico. It is situated in a fertile plain. Its port is on the Pacific Ocean, about 30 miles S. W. of Colima. Pop. 31,000.

Colise'um, or **Colosse'um** [supposed to have taken its name from a colossal statue of Nero which stood near the Flavian Amphitheatre], a name of the Flavian Amphitheatre in Rome, now one of the most magnificent ruins in the world. (See AMPHITHEATRE.)

Col'lamer (JACOB), LL.D., an American lawyer and Senator, born at Troy, N. Y., in 1792. He emigrated to Vermont in his youth, graduated in 1810 at the University of Vermont, was admitted to the bar in 1812, and became eminent in his profession. He was a judge of the supreme court of Vermont from 1833 to 1841, was elected a member of Congress in 1843, 1844, and 1846, and was appointed postmaster-general by President Taylor in Mar., 1849. In July, 1850, he resigned in consequence of the death of Taylor. He was elected a U. S. Senator in 1854, and re-elected in 1860. Died Nov. 9, 1865.

Collarino. See ASTRAGAL.

Collat'eral Security, an additional and separate security given for the repayment of borrowed money or for the performance of an obligation. A person who borrows money often gives a promissory note signed by himself, and deposits in the hands of the lender a note or notes signed by another party, or other property, such as stocks of corporations, or even tangible chattels. These collateral notes or other items of property are to be returned if the loan is repaid.

Colla'tion [from the Lat. *confero, collatum*, to "bring together"]. This is a doctrine of the civil or Roman law whereby an heir returns property that he has already received to the estate under which he claims to receive his share, so as to make it a part of the fund for distribution, or, in technical language, of the succession. It resembles the doctrine of advancement as applied in the common law of England in case of intestacy. An important rule is that an heir is not bound to make collation if he does not choose to share in the estate. The doctrine of collation is not applied to the case of purchases by an heir for a valuable consideration, but simply to that portion of the estate which he has received in advance of his share.

Collea'ta, a post-township of Clay co., Ala. Pop. 411.

Col'lect [Lat. *collecta*], a term applied to certain short prayers in church liturgies adapted to particular days or occasions, perhaps because of the brevity of such prayers, the matter of the epistle and gospel being *collected* into the collect of the day. The word is thought by some to have originated from an ancient practice of the minister collecting the previous devotions into a brief prayer at the end of the service; accordingly, one of the service-books of the ancient Catholic Church was called "Collectarium." According to others, all Christian assemblies were once called *collecta*, which term came to be limited to the prayers offered up in such meetings. Some of the collects used in the Anglican Church are taken from the old Roman Missal, and were probably, to a very considerable extent, the composition of Saint Jerome.

Col'lege [Lat. *collegium*, an "association," from *collega*, a "partner;" akin to the word *colligo*, to "collect"]. A college was originally any association of men for some common purpose. In ancient Rome there were colleges of tribunes, of quæstors, and of other officials for political purposes; of various classes of priests for religious objects; and of craftsmen in the several departments of industry for their common advantage. In modern nations the term college has been applied to organizations for a great variety of purposes. The most familiar use of the word, aside from its connection with educational institutions, is in the phrases "College of Cardinals" at Rome, and "College of Electors" for President and Vice-President of the U. S.

But for several centuries the name college has been given almost exclusively to institutions for promoting the higher education. A distinguished writer thus explains this use of the name: "A college, in the modern sense of that word, was an institution which arose within a university—probably within that of Paris or Oxford first—being intended either as a kind of boarding-school or for the support of scholars destitute of means, who were here to live under particular supervision. By degrees it became more and more the custom that teachers should be attached to these establishments. And as they grew in favor they were resorted to by persons of means who paid for their board; and this to such a degree that at one time the colleges included nearly all the members of the University of Paris. In the English universities the college may have been first established by a master, who gathered pupils around him, for whose board and instruction he provided. As his scholars grew in number, he associated with himself other teachers, who thus acquired the name of *fellows*. Thus it naturally happened that the government of colleges, even of those which were founded by the benevolence of pious persons, was in the hands of a principal called by various names, such as rector, president, provost, or master, and of fellows, all of whom were resident within the walls of the same edifices where the students lived. When charitable munificence went so far as to provide for the support of a greater number of fellows than was needed, some of them were entrusted, as tutors, with the instruction of the undergraduates, while others performed various services within the college or passed a life of learned leisure."

The two great universities of England are now composed of several colleges, each of which has an organization very similar to that above described. Every college has its separate government, and all are united in the common government of the university. Nearly all the students of the university connect themselves with some college, and most of the instruction is provided by the colleges, but all degrees are conferred by the university. The original idea of the college was a community where students should *live together in common*, and the provision for their instruction was, in many cases at least, a later addition.

When the early settlers of New England founded the first college in the New World, they took as their model the institution with which many of them had become familiar during their university-life at Oxford or Cambridge. They fixed the period of study at four years, and prescribed a uniform course of studies. A president, a board of fellows, and a bursar (*i. e.* treasurer) were to reside at the college, and to be charged with its government and management. In the course of time the board of president and fellows came to exercise government without instruction, and the fellows ceased to be resident at the college. In this way, probably, the term "fellow" came to have its peculiar and inappropriate meaning in connection with the government of a college.

In the external organization of American colleges there is a general adherence to one controlling idea. An incorporation, usually organized under a special charter, is entrusted with the control of the college property, and is authorized to appoint all instructors, to make laws and regulations for the government of the college, and to confer degrees. The members of the corporation are variously styled fellows, trustees, regents, or managers. In some cases the board is self-perpetuating, the members being authorized to select their own associates and successors. In other cases particularly in the State universities, the

appointing power is vested in some branch of the State government. In others, still, the graduates of the college elect some fixed portion of the corporation. In many instances the governor and other State officials are *ex-officio* members of the corporation.

The distinction between a college and a university has always been maintained in England and elsewhere in Europe, but in the U. S. this distinction has been generally disregarded, and the more comprehensive name university has frequently been given to an institution hardly worthy to be called a college. Most of the so-called universities in this country are in no respect different from colleges, while some colleges might properly claim the appellation university.

Many of the American colleges, including most of those founded before the present century, were designed especially to train men for the ministry. The motto of Harvard University clearly shows this design. The course of study in the earlier colleges was arranged with reference to this leading purpose. A century ago the studies pursued were Latin (which was required to be the *spoken* language among the students), the Greek Testament, and mathematics of very limited range; while logic, metaphysics, rhetoric, oratory, and divinity received special attention in the latter part of the course. In the earlier part of the eighteenth century this last-mentioned class of studies occupied the largest portion of the student's time. Towards the close of that century increasing attention was given to natural philosophy and astronomy. Modern languages and physical and political sciences had no place in the curriculum until several years of the present century had passed, and history has been quite recently introduced. Until about the year 1840, Greek, Latin, and mathematics formed the principal part of what was termed a liberal education. Chemistry, mineralogy, and geology had gained a recognition, but were kept chiefly in the background. About the time referred to there became manifest a growing dissatisfaction with the established routine of studies, and many began to inquire whether some improvement upon that routine was not both desirable and practicable. All students, whatever might be the variety in their tastes, their acquirements, or their abilities, were required to pursue the same unvarying course, and to advance by fixed classes at a uniform rate of progress. The question began to be asked whether some variation from the prescribed routine might not profitably be introduced, and whether it was expedient for all to pursue the same course, without regard to their proposed future occupations. The development of the physical sciences, and the increasing demand for engineers and for men able to apply science to the affairs of practical life, induced many to seek a different kind of education from that given in the existing colleges. The studies long pursued were represented as too abstract, too little connected with the requirements of the present age.

Various methods were proposed for meeting the evident demands of the times. Some favored the transformation of the existing colleges by substituting new kinds of studies for those so long pursued. Some proposed to add new studies to the old in the same institutions. Others would have parallel courses of study, with liberty to each student to select from these courses that which most accorded with his tastes or his proposed occupation. Still others would have new colleges founded expressly and exclusively for the "new education." Each of these methods except the first has been practically tried. In no case has the old curriculum been cast aside. It meets the wants of a very large class of students, and its utility has been too long and too thoroughly tested. And yet it was no longer sufficient. New subjects of interesting and profitable study had risen to notice; new sciences had been created within a half century. There was no good reason why these should not have a recognized place in the arrangements for the higher education. Young men were interested in them, and saw them to be useful and profitable. The change was inevitable, and it has come forward with increasing power during the last thirty years.

The change first proposed was that of introducing elective studies. The student was to choose among certain studies such as he preferred. This selection was liable to disregard *system*, and the studies chosen in this way could hardly constitute a *course* of study. Much knowledge of the chosen branches might be acquired, but it would hardly constitute a thorough or liberal education. This kind of elective system, instead of elevating a college, tended rather to depress the standard of learning within it, and to render it less useful to the community, and practically it did not attract an increasing number of students, as was anticipated. A system not unlike this was established in the University of Virginia when it was opened to students in 1825. This entire freedom in the choice of studies was a favorite idea of Thomas Jefferson, and the last years of his life were devoted to the establishment of that university, in which his idea should be practically tested. Each student pursues the studies of one or more of the "schools" of the university, and continues to do so as long and as far as he chooses. Degrees are given in each school separately to those only who pass the prescribed examination. Comparatively few of the large number of students take any degree. The amount of knowledge imparted is doubtless large, but much of it is in studies which at some colleges are considered preparatory.

Another method of promoting variety and comprehensiveness in college studies has been that of arranging several *courses* of study in the same institution, and permitting each pupil, after due consideration and with the best attainable advice, to select that course which is adapted to his tastes and purposes. It is claimed for this method that it allows each to study that in which he is interested, and for which he expects soon to have some practical use, and that this greater interest and immediate utility will ensure earnestness and thoroughness of study. At the same time, as the choice is to be made from among several *courses* of study, and not from isolated studies, the education thus attained is claimed to have a good degree of unity and of completeness in the chosen department of knowledge. This method may be regarded as an application to education of the principle of the division of labor. One essential difference between the so-called "old" and "new" educations is that the former lays the principal stress on mental development, culture, and discipline, which may afterwards be directed into such course of active life as shall be chosen, while the latter undertakes the immediate preparation of the student for his intended occupation, and makes the acquirement of mental discipline and culture merely an incidental result of the studies proposed. The old way proposed first to discipline the mind, then to teach it to use its powers; the new way proposes to do both at once—to acquire the discipline while learning to do, and actually beginning to do, that which is to occupy the life. This latter way accords with the natural desire of young men to enter early into the activities and excitements of life. In the restless onward movement of this New World this way of preparation for life-work will inevitably attract large numbers. In the newer States, especially, the impulse is to *do*, rather than to spend years in *learning* to do. Most of those States have established State universities, the general government having given to them large tracts of land for their endowment. But few of these institutions have as yet become prominent, though their prospective resources, growth, and influence are full of promise. In these universities there are usually several projected courses of study, with the design of providing for all the various educational wants of the commonwealth. As the institutions are still young and undeveloped, they have not yet shown how much they will be able to do. Each of them adopts its own method of classification and instruction, but all agree in the endeavor to include a very wide range of studies. This kind of "university system" has slight resemblance to the systems pursued in the universities of England and Germany. It has grown out of the peculiarities and necessities of the American people, and has been adopted because it is believed to be suited to their needs. No well-adapted system can be transferred, ready made, from one country or age to another. All American colleges are modifications of the first college at Cambridge, but all of them differ from that and from each other. And so the many young universities endeavor to suit their instructions to the present wants of those who resort to them. The chief of those wants is a speedy and economical preparation for some active employment. This implies an almost exclusive attention to what pertains to that employment. He who proposes to be an engineer studies engineering, but wastes no time upon Latin or Greek. He who is to be engaged in mining acquaints himself with chemistry, geology, mineralogy, and metallurgy. This attention to some particular department of knowledge is one of the present peculiarities of technical and scientific education in this country. As no man can acquire all knowledge, each becomes a specialist in his own department, and no one "takes all knowledge for his province." Not only in the newer States, but in the older ones also, this method is pursued. The older colleges—even the oldest of all—are swerved from their former courses by this powerful impulse of the times. The past four years (since 1869) have witnessed the introduction of extended elective courses into the ancient university at Cambridge. Nearly all the older colleges have long given their students a limited range of elective studies during the last half of their course. But this recent innovation at Harvard extends the elective element through three-fourths of the whole term of study. What the effect will be upon the future

career and influence of that venerable institution it is yet too soon to affirm. This movement for giving change and variety to college studies has even reached that very ancient and conservative institution, the University of Oxford in England. For generations and centuries classic learning—*i. e.* Latin and Greek—has there reigned supreme, but this supremacy of the long past has at length been broken. Early in 1872 the statutes of the university respecting examinations were amended by the proper authority in such a manner as to include mathematics, natural science, jurisprudence, modern history, and theology among the branches in which candidates for honors and degrees shall be examined, and to give the candidates a wide range of both subjects and authors in which they may propose to pass examination. The latitude of election is even greater than in most American institutions.

Besides the introduction of elective courses of study into many of the colleges and universities of the U. S., there have been established other colleges for exclusively scientific and practical studies. Some of these have been organized as separate departments of existing colleges; others are wholly distinct from other institutions. Of the first class, the Sheffield Scientific School, connected with Yale College, is by common consent the foremost. Of the second, the agricultural and industrial colleges endowed by Congressional grants, and established since 1862, are the most important.

The changes in collegiate studies within thirty years past are due very largely to the rapid development of the physical sciences. Material things, their qualities, properties, and relations, have been studied more thoroughly and effectively by the present generation than by all that had gone before. In former times science has been employed largely upon speculative or purely intellectual subjects. But the science of nature, as distinct from the science of man or of mind, now claims the chief attention. And yet the older science has never been abandoned. Vast as is the domain which invites the examination of the physical scientist, and widely as he may extend his investigations, there is another domain which they cannot touch. The new education has asserted its right to recognition, and that right has been conceded; but the old education has not been abandoned, and never can be, for the material world is but a part of that with which human knowledge is concerned. For the time, physical sciences are most conspicuous, and they may even appear to supersede all other branches of knowledge. New colleges and universities may give them pre-eminence, and may set aside old themes of thought and study as obsolete. Relatively, these sciences will undoubtedly continue to be more important than in former ages; but the spirit of adaptation to the changing wants of successive periods, which is now evident in the oldest and most conservative universities, will unquestionably adhere to the colleges of the future. No man can presume to say what developments of knowledge are yet to appear, but whatever they shall be, the educated men of coming generations will modify their views of education in accordance with them. When the States now young shall have become older, it is reasonable to believe that increase of wealth and leisure will bring increased desire for thoroughness and completeness of knowledge, and that the colleges and universities of those States will provide for that more perfect education. Times and opinions will change, and colleges will change with them. There will be hereafter distinctively American universities. They will be unlike those of any former time or country, but will be of and for the American people.

The necessity which now compels scholars to resort to Europe to complete their studies will not always continue. The beginning has already been made of post-graduate courses of study, in which students shall be encouraged to perfect themselves in their education, taking the requisite time therefor, instead of hastening to put their half-acquired education to practical use and pecuniary profit, and contenting themselves with a superficial knowledge of that which time and study would enable them to acquire thoroughly. The establishment of fellowships for the support of post-graduate students through a prolonged and thorough course of study has in it the promise of rich results to American scholarship in future generations.

There have been very marked changes in the government and discipline of colleges since the beginning was made at Cambridge in 1636. At first, as was inevitable, the mode of governing them was an exact imitation of that prevailing in the English universities at the beginning of the seventeenth century. This mode was but slightly modified till the Revolution. When the colonies became States, the change was felt through all their institutions. Until the spirit of liberty animated the colonists to shake off their dependency the fines, the tasks, the bondage of the lower classes to the higher, and the corporal punishments of English colleges were retained. The students were doubtless younger, on the average, in those early times than now, but the sentiment of authority was also stronger, and the practice of severity far more common. It was not uncommon for an offending student to be condemned to have his ears boxed by the president! The change in this respect is certainly an improvement. Regularity of attendance is still secured generally by a system of monitorships for marking or recording the presence or absence of students at public exercises. In the so-called university system attempts are now made to dispense with all such records of attendance, and to leave each one to follow his own choice in this matter, on the assumption that a willingness to be present will control all who have any desire for learning. The voluntary systems of the Old-World universities are appealed to as proof that compulsory attendance is unnecessary. Whether the altered conditions involved in the difference of age and mental discipline do not render this appeal inappropriate, experience will determine.

The custom of recording the degree of merit in each recitation of every student prevails generally in American colleges. One of the youngest of the so-called universities announces its utter rejection of this custom, and its reliance upon the love of learning rather than the spirit of emulation, or the desire for college rank and honors, as the leading motive for scholarship. This, too, is an innovation, the excellence or defect of which must be decided by experience. College examinations, from that of candidates for admission till the final trial of those about to graduate, are now conducted usually in writing, the same test being applied to an entire class at the same time. The justice of this method is so obvious that the admissibility of any other can hardly be considered. And yet the first examination of this kind in an American college was held not far from 1850.

The question whether women shall not be admitted to all the privileges of the long-established colleges has of late excited much interest. That they should have an opportunity for as thorough and extensive education as the other sex is now very generally conceded. That they have mental ability fully equal no teacher of children can doubt. The establishment of colleges expressly for them, where they are trained in the highest studies that men pursue, is proof that their claims to this highest education are practically admitted. But the question is, Shall they be admitted into the same colleges with men? The original theory of a college, as a place where students should live together in common as one family, necessarily excluded them. But since the present idea of a college is essentially different from the original one, there is now a possibility of so modifying the old colleges as to admit women to their privileges. The State universities, and some other colleges of recent origin, provide for their admission. The same instructors, library, and apparatus can serve for both classes of students as well as for one. There is a claim of *justice* upon the State universities not to limit their benefits to one half of the people, where all have equal rights. When colleges were monkish institutions they were necessarily for men alone. But men and women are associated in all other periods of life; why not, therefore, while they are receiving their education? There must be some differences, for women cannot be expected to build railroads or to manage coal or iron mines, but the principal part of education may be the same for both sexes. The knowledge to be acquired is the same; the difference is only in certain uses or applications of it.

The number of students in American colleges, and the number of institutions to which that name may properly be given, it is not easy to ascertain. Below is given a carefully prepared list of colleges. A perfectly accurate list has been repeatedly attempted, but never secured. The number of students in some colleges includes those in preparatory departments, who are not properly college students. The number who propose to receive the degree of Bachelor of Arts, according to the usage of former times, is relatively smaller than it was a generation or two ago. The changes in the studies and the objects of study within a few years—of which this article has given a brief outline—explains this admitted fact. The students have chosen a different course, because the times have demanded it. They have done what was set before them to be done. There is no less devotion to learning now than in former times, but a different kind of learning is required of many. Knowledge is wider and deeper and more various than in any previous age, and is destined to grasp truths and principles yet unthought of. American colleges will hold fast all old truths, and will welcome and appropriate and utilize all that is new as fast and as far as it is proved to be truth. *All kinds* of truth will be accepted, for all truths in their foundation and their origin are one.

JOHN G. BAIRD *Asst. Sec. Conn. Board of Education.*

F. A. P. BARNARD.

Col'lege, a township of Linn co., Ia. Pop. 1468.

College, a township of Knox co., O. Pop. 926.

College Corner, a post-village of Oxford township, Butler co., O., on the Cincinnati and Indianapolis Junction R.R., 19 miles N. W. of Hamilton, has one weekly newspaper.

College Hill, a post-village of Hamilton co., O., 6

miles N. of Cincinnati. It is the seat of Farmers' College and the Ohio Female College.

College Mound, a post-village of Chariton township, Macon co., Mo. It is the seat of McGee College. Pop. 183.

College Point, a post-village of Flushing township, Queens co., N. Y., has manufactures of India-rubber goods, etc. It is on Long Island Sound and on the Flushing and North Side R. R., 11 miles E. of New York. Pop. 3652.

Colle'giants, a sect of Christians in Holland, so called from their assemblies, which they called "colleges." They rejected all creeds, had no regular ministry, and no form of church government. Their communion was open to all. The name *Rhynsbergers* is sometimes given them, from the town of Rhynsberg, where they had annual meetings.

Col'leton, a county of South Carolina, bordering on the Atlantic. Area, 1550 square miles. It is intersected by the Edisto River, and bounded on the S. W. by the Combahee. The surface is a level, alluvial plain; the soil is mostly fertile. Cotton, rice, and corn are staple crops. It is intersected by the South Carolina R. R. and the Charleston and Savannah R. R. Cap., Walterborough. P. 25,410.

Colleton (James), governor and landgrave of South Carolina (1686–90), called a colonial parliament in 1687, and proposed radical alterations of the laws. He became exceedingly unpopular with the High-Church party, and was impeached and removed from office in 1690, and driven from the province.

Collet'ta (Pietro), an Italian historian and general, born at Naples Jan. 23, 1775. He was a general in the army of Murat (1812–14), and was minister of war at Naples in 1320, but became an exile in 1821. He wrote a "History of the Kingdom of Naples from 1734 to 1825" (1834). Died at Florence Nov. 11, 1833.

Col'ley, a post-township of Sullivan co., Pa. Pop. 336.

Col'lidine ($C_8H_{11}N$), an alkaloid found with many others in the products of the destructive distillation of bones and other animal substances, of coal, of quinine, and of cinchonine. It is a colorless oily liquid, having an aromatic odor.

Col'lier (Henry Watkins), an American judge, born in Lunenburg co., Va., Jan. 17, 1801, became judge of the Alabama circuit (1827–37), chief-justice for Alabama (1837–49), and governor (1849–53). Died Aug. 28, 1855.

Collier (Jeremy), an English non-juring bishop, born in Cambridgeshire Sept. 23, 1650. He graduated at Cambridge in 1676, and was ordained a priest in 1677. He was a zealous Jacobite, and wrote several works against the government of William III. In 1696 he gave absolution to Freind and Parkins, who were condemned to death for treason. A sentence of outlawry was passed against him, after he had fled to escape prosecution. His chief works are a "Short View of the Profaneness and Immorality of the English Stage" (1698), which caused a great commotion, and "Essays on Several Moral Subjects" (3 vols., 1697–1705). The "Short View" provoked replies from Congreve, Vanbrugh, and Dr. Filmer, but the playwrights were worsted in the contest, and the bellicose tract of the sturdy moralist shamed the English stage out of its grossness. Died April 26, 1726.

Collier (John Payne), an English critic and antiquary, born in London Jan. 11, 1789. He published in 1820 "The Poetical Decameron," and in 1831 a "History of English Dramatic Poetry to the Time of Shakspeare, and Annals of the Stage to the Restoration" (3 vols.), which is commended. He also produced an edition of Shakspeare's works (1844), and "Notes and Emendations to the Text of Shakspeare's Plays, from Early Manuscript Corrections in a Copy of the Folio of 1632" (1852).

Collieries. See Mines and Mining, by Prof. F. L. Vinton, E. M.

Collima'tion [from the Lat. *collimo*, to "aim"], **Line of,** a term used in astronomy to denote the line which joins the optical centre of the object-glass of the telescope with the spider-line, which is designed to mark the middle of the field of view in the focus of the eye-glass. The line of collimation gives the direction of the point in the heavens at which the telescope aims, and of which the position is recorded by the observer from the readings of the circles of the instrument. Adjustment for collimation is the process by which the spider-line in the focus, or (if there are several) the central line of the system, is brought truly to the optical axis of the instrument. As there are usually two systems of lines, collimation may be either vertical or horizontal.

Col'limators, fixed telescopes, often employed in observatories to assist in collimating the principal or working instrument. They are so situated that the working telescope may look directly down the axis ("down the throat") of the collimator, the spider-lines of the latter being the objects observed in the process of collimation.

Collin, a county in the N. of Texas. Area, 870 square miles. The surface is two-thirds prairie, the rest timberland, and nearly all very fertile and well watered. Cotton, wool, grain, and tobacco are raised. It is traversed by the Houston and Texas Central R. R. Capital, McKinney. Pop. 14,013.

Collin d'Harleville (John François), a French dramatist and poet of much merit, whose works still survive on the stage, was born May 30, 1755, at Mervoisen, near Chartres. His first work was a comedy, "The Inconstant," performed in 1786. He afterwards produced "The Optimist," "Castles in Spain," "The Old Bachelor," "The Governess," and many other plays, besides several poems—one of them entitled "Melpomene and Thalia," an allegory. His collected dramatic works form four volumes in 8vo, first published in 1805. Died at Paris Feb. 24, 1806.

Collin'ear [from the Lat. *col* (for *con*), "with," and *linea*, a "line"]. Two or more figures or systems of points are collinear when the relation between them is such that to any point in either system corresponds but one point in the other or others, while to the several points of a right line in either system correspond those of a right line in the others. In establishing such a relation between two plane figures, four pairs of corresponding points may be chosen arbitrarily; this being done, all other pairs are defined. It is always possible to give the planes of two collinear figures such a position that the one figure shall be the projection of the other with respect to some centre of projection in space. The term collinear appears to have originated with Möbius, in whose "Baryecentric Calculus" the nature of this relation is thoroughly examined. It includes the relations of affinity and similarity, and is identical with the "homographic" relation as defined by Chasles.

Col'lingwood, a port of Lake Huron, on the S. shore of Georgian Bay, in Nottawasaga township, Simcoe co., Ontario (Canada). It has large manufactures of lumber, leather, flour, beer, and other commodities; has good schools, two weekly newspapers, a lighthouse, and a large trade. Collingwood is the N. terminus of the Northern Railway, 94 miles N. by W. of Toronto, and has regular lines of steamers to various lake ports. Pop. 2829.

Col'lingwood (Cuthbert), Lord, an English admiral, born at Newcastle-upon-Tyne Sept. 26, 1750, entered the navy in 1761. He was an intimate friend of Lord Nelson, and was distinguished as a naval tactician; followed Admiral Graves to America (1774), and was made lieutenant after the battle of Bunker Hill (1775). In 1780 he became a post-captain. He took part in the naval victory which Lord Howe gained over the French in June, 1794, and rendered important services at the battle off Cape St. Vincent in Feb., 1797. In 1799 he gained the rank of rear-admiral; in 1804, that of admiral. He was the second in command at the battle of Trafalgar, Oct., 1805, and the chief command devolved on him before the end of the action in consequence of the death of Nelson. For his part in this victory he was raised to the peerage. Died at sea near Minorca Mar. 7, 1810.

Collin'ic Aç'id ($H.C_8H_3O$), an aromatic acid produced by the action of oxidizing agents on gelatine and similar bodies.

Col'lins, a township of Fayette co., Ala. P. 1173.

Collins, a township of Jackson co., Ala. P. 1520.

Collins, a township of Drew co., Ark. Pop. 463.

Collins, a township of Story co., Ia. Pop. 611.

Collins, a township of McLeod co., Minn. P. 191.

Collins, a township of Erie co., N. Y. At Versailles, a village partly in this township, is the Thomas Orphan Asylum, founded in 1864 for Indian children. Pop. of township, 2100.

Collins, a township of Edgefield co., S. C. Pop. 733.

Collins, a township of Georgetown co., S. C. P. 1440.

Collins (Anthony), an able and liberal English writer on theology, was born in Middlesex June 21, 1676. He was an intimate friend of John Locke, and was a subtle disputant. Among his works, which excited much commotion and were censured by the clergy, are "Priestcraft in Perfection" (1709), a "Vindication of the Divine Attributes," a "Discourse on Free Thinking" (1713), and a "Discourse on the Grounds and Reasons of the Christian Religion" (1724). Died Dec. 13, 1729.

Collins (Arthur), an English antiquarian of great industry and of high authority, was born in 1682. He was author of the "Peerage of England" (1709), "Baronetage of England" (1720), and other works. Died at Battersea Mar. 16, 1760.

Collins (Charles), D. D., was born in North Yarmouth, Me., April 17, 1813, and graduated in 1837 at Middletown,

Conn. He was distinguished as an educator in the Methodist denomination, having been president of Emory and Henry College, Va., Dickinson College, Pa., and of the State Female College, Memphis, Tenn. He was an effective writer in the periodicals of his denomination, and author of a volume entitled "Methodism and Calvinism Compared." D. at Memphis, Tenn., July 10, 1875.

Collins (John) was born in 1717, governor of Rhode Island (1786–89), and a member of the first Congress under the Constitution. Died in 1795.

Collins (Napoleon), U. S. N., born May 4, 1814, at Madison, Ind., entered the navy as a midshipman Jan. 2, 1831, became a passed midshipman in 1840, a lieutenant in 1846, a commander in 1862, a captain in 1866, and a commodore in 1871. He commanded the steamer Anacostia, Potomac flotilla, in the fights with the Aquia Creek batteries during the summer of 1861, and the gunboat Unadilla at the battle of Port Royal Nov. 7, 1861. On the 7th of Oct., 1864, in the steam-sloop Wachuset, Commander Collins ran alongside of and captured the privateer Florida at anchor in the harbor of Bahia, Brazil. D. Aug. 9, 1875. Foxhall A. Parker, U. S. N.

Collins (William), an eminent English lyric poet, born at Chichester Dec. 25, 1720, was educated at Oxford. He became a resident of London in 1744, and was a friend of Doctor Johnson. He produced in 1747 an admirable ode on "The Passions," and lyric poems, among which are odes to Mercy and Evening. In 1749 he received a legacy of £2000 from an uncle. He was subject to melancholy, and was confined in an asylum in the latter part of his life. Died in 1756. Among his works is "The Dirge in Cymbeline." (See Johnson, "Lives of the Poets.")

Collins (William), an English landscape-painter, born in London Sept. 18, 1787, became a student in the Royal Academy in 1807. His favorite subjects were familiar and rural scenes and views on the sea-coast. He was elected a Royal Academician in 1820, and visited Italy in 1836, after which he produced several pictures of Italian scenes which were much admired. Among his works are "Cromer Sands," "Prawn-Fishers," and a "Frost Scene." Died Feb. 17, 1847.

Collins (William Wilkie), a novelist, a son of the preceding, was born in London in 1825. He was first articled to a tea-merchant; then entered Lincoln's Inn. He produced in 1848 a "Life of William Collins" (his father), and is the author of numerous popular novels remarkable for their dramatic construction, among which are "Antonina" (2d ed. 1850), "Basil" (1852), "The Dead Secret" (1857), "Woman in White" (1859–60), "Armadale" (1866), "Man and Wife" (1870), and the "Lighthouse" and "Frozen Deep," dramas.

Col'linson (Peter), F. R. S., an English merchant and naturalist, born in Westmoreland Jan. 14, 1693. He lived in London, and was a member of the Society of Friends. He promoted botanical science by importing foreign seeds and plants, and wrote several scientific memoirs. He rendered valuable gratuitous services to the Philadelphia Library. Died Aug. 11, 1768.

Col'lin's Store, a township of Madison co., Ala. Pop. 933.

Col'linsville, a post-village of Hartford co., Conn., on the Farmington River, on a branch of the New Haven and Northampton R. R., and on the Connecticut Western R. R. 25 miles W. N. W. of Hartford. It has a large axe-factory, paper-mills, manufactures of ploughs and cutlery, and a savings bank.

Collinsville, a post-village of Madison co., Ill. It is on the St. Louis Vandalia Terre Haute and Indianapolis R. R., 11 miles E. by N. of St. Louis. It has two weekly newspapers.

Collinsville, a post-village of Milford township, Butler co., O., on the Cincinnati Richmond and Chicago R. R., 11 miles N. by W. of Hamilton. Pop. 140.

Colli'sion [Lat. *collisio*, from *collido*, *collisum*, to "strike together"], in mechanics, the impact of two bodies, one or both of which were previously in motion. The laws of the direct impact of two spherical bodies are deduced from the principle that the sum of the momenta of the impinging bodies, estimated in a fixed direction along the line of motion, is not altered by the collision. The velocities of the bodies after impact, however, depend upon the hardness and elasticity of these bodies. If inelastic and completely incompressible, they will move after impact as one body, with a velocity and in a direction which is ascertained by dividing the algebraical sum of their previous momenta by that of their masses. If compressible and not wholly without elasticity, a certain compression takes place on collision, and is immediately followed by a more or less perfect restitution of form, according to the degrees of elasticity which the bodies possess. In this case the bodies will *not* move as one body after collision, but the impinging body will move more slowly than the other, and may even have the direction of its motion reversed.

Collision, in maritime law. (See Road, Law of the, by J. N. Pomeroy, LL.D.)

Collo'dion [from the Gr. κολλώδης, "sticky," from κόλλα, "glue"], a clear, colorless, gummy liquid, insoluble in water or alcohol, but soluble in ether, consisting of pyroxyline or gun-cotton dissolved in a mixture of alcohol and ether. When dried, it gives a transparent residue, becoming electric by friction, and exploding less readily by heat, percussion, etc. than ordinary gun-cotton. It is used principally in photography, though it also finds application in surgery and medicine for covering wounds to exclude the air, coating caustic substances, etc. Small quantities of gun-cotton for the preparation of collodion are made by immersing cleaned cotton in a solution formed by dissolving nitrate of potassium in concentrated sulphuric acid. Larger quantities are made by treating cotton with a mixture of concentrated commercial sulphuric and nitric acids. Some water is added, in order to cause the formation of the lower nitro-compounds of cellulose; but if too much water is added, the cotton dissolves, instead of forming the desired compound. The operation is conducted at a temperature of about 150° F., and great care and judgment are required throughout the process. After treatment the cotton is washed with cold water, the use of alkalies for neutralizing the excess of acid having a bad effect on the quality of the collodion if it is to be used for photography. The best gun-cotton for this purpose shows an increase of 25 per cent. in weight over that of the cotton originally employed. In making the solution of the gun-cotton, if too much alcohol is employed the sensitiveness of the film and its capacity for adhering to glass are impaired; if too little, the film is apt to contract after sensitizing. Photographers make use of two kinds of collodion—the "plain" and the "iodized," the latter being the plain collodion which has received the addition of some iodides or bromides, generally the iodides of cadmium and ammonium. Plain collodion is often of two kinds—"positive" and "negative," the pyroxyline for these being prepared according to a slightly different formula. For the "positive collodion" less water is used in the preparation of the pyroxyline.

Small balloons, lighter than those made from gold-beaters' skin, are sometimes made with collodion. The liquid is poured into a flask and shaken about until the interior is completely covered, the ether and alcohol are then evaporated off by a blast directed into the flask. By drawing the air out of the flask by means of a tube suitably adjusted, the film is detached, the balloon collapses, and may be drawn out. It is then distended and dried.

C. F. Chandler.

Collot-d'Herbois (Jean Marie), a French Jacobin, born in Paris in 1750, originally a strolling player, was a member of the Convention, and a partisan of Robespierre, notorious for his violence and cruelty. He became a member of the Committee of Public Safety in 1793, and was sent to Lyons, where he caused hundreds to be put to death. In the crisis of the 9th Thermidor, 1794, he acted with the enemies of Robespierre. In 1795 he was transported to Cayenne, where he died Jan. 8, 1796.

Col'lum, a Latin word signifying "neck," is applied in botany to that part of the axis of a plant whence the stem and root diverge. In the beginning it is a space easily distinguishable, but in the process of time it is externally obliterated.

Col'ly, a township of Bladen co., N. C. Pop. 1220.

Coll'yer (Rev. Robert), an able and eloquent Unitarian divine and a popular lecturer, born at Keighly, England, Dec. 8, 1823. In 1847 he came to the U. S., and became a Methodist preacher. Three years later he embraced Unitarian views. Since 1859 he has been pastor of Unity church, Chicago.

Col'man, a township of Elmore co., Ala. Pop. 868.

Colman (Benjamin), D.D., a Congregational divine, born at Boston, Mass., Oct. 19, 1673, graduated at Harvard in 1692. On a passage to England he was taken prisoner by a French vessel in 1695, but finally visited England, and returned to America in 1699. He became pastor of the Brattle street church, Boston (at that time an independent church), with which he was connected till his death (Aug. 29, 1747).

Colman (George), an English dramatic author, was born at Florence, April 28, 1733. He produced in 1760 "Polly Honeycomb," and in 1761 the "Jealous Wife," comedies, and a good metrical translation of Terence (1764). In 1777 he became the proprietor of the Hay-

market Theatre. He wrote and adapted several other dramas. Died Aug. 14, 1794.—His son, George Colman, born Oct. 21, 1762, became director of the Haymarket Theatre in 1785, and wrote numerous successful comedies and farces, among which are "John Bull" (1805), "Inkle and Yarico," and "The Heir-at-Law." He published autobiographic memoirs, entitled "Random Recollections" (2 vols., 1830). Died Oct. 26, 1836.

Colman (Henry), an American agricultural writer, born in Boston Sept. 12, 1785. He was minister of a Unitarian church at Salem, Mass., from 1825 to 1831, and was afterwards appointed agricultural commissioner for that State. He visited Europe in 1842, after which he published, besides other works, "European Agriculture and Rural Economy." Died in London Aug. 14, 1849.

Colman (Samuel), an American artist, born at Portland, Me., in 1832. He ranks high as a painter of American and European landscapes. His first picture was exhibited in 1850.

Col'mar [Lat. *Columbarium*], a city of Elsass, is finely situated on the river Lauch, near the base of the Vosges, 36 miles S. S. W. of Strasburg. It is well built, and contains a cathedral built in 1363, a theatre, a college with a library of 60,000 volumes. The old ramparts have been converted into boulevards. Colmar has extensive manufactures of cotton fabrics, cutlery, paper, hosiery, and ribbons. It was an imperial city in the Middle Ages, and was ceded to France in 1697. Pop. in 1871, 23,045.

Colne, a market-town of England, in Lancashire, is on a high ridge at the junction of the Midland Railway with the Lancashire and Yorkshire Railway, 32 miles N. E. of Manchester. It has manufactures of woollens, cottons, calicoes, and mousselines-de-laine. Coal and limestone abound in the vicinity. Colne is an ancient town, and many Roman coins have been found here. Pop. 6315.

Co'lo, a post-village of New Albany township, Story co., Ia. It is on the Iowa division of the Chicago and Northwestern R. R., 173 miles W. of Clinton. Pop. 226.

Col'ocynth [Gr. κολοκυνθίς; Lat. *colocynthis*], a well-known purgative medicine, the dried and powdered pulp of the colocynth gourd, a fruit about the size and color of an orange, with a smooth, thin, solid rind. *Cucumis Colocynthis,* the plant which produces it, is nearly allied to the cucumber. It is common in Southern Europe, Asia, and Africa, and is grown also to some extent in the U. S., especially by the Shakers. The fruit, when it begins to turn yellow, is gathered, peeled, and dried quickly. It is chiefly in the form of "compound extract of colocynth" that it is used in medicine. In large doses it is a drastic, irritant poison. It owes its cathartic properties to a bitter neutral principle called colocynthin. The seeds of the plant have no cathartic principle. The extract of colocynth is used in pills in combination with other purgatives, and frequently with extract of hyoscyamus. In small doses colocynth acts as a safe and useful purgative, and when associated with hyoscyamus the latter prevents much of the pain which usually results from the use of colocynth by itself.

Colocyn'thin ($C_{56}H_{84}O_{23}$?), the bitter principle of colocynth. It is resolved by the action of acids into colocynthein ($C_{40}H_{54}O_{18}$) and sugar, and is, for this reason, supposed to be a glucoside.

Colo'gna, a town of Italy, in the province of Verona, 20 miles S. E. of Verona. It has manufactures of silk. Pop. 6496.

Cologne [Ger. *Köln;* anc. *Oppidum Ubiorum,* afterwards *Colonia Agrippina*], a fortified city of Prussia, the capital of the province of Rhenish Prussia, on the left bank of the Rhine, 24 miles S. E. of Düsseldorf; lat. 50° 56′ N., lon. 6° 58′ E. It is at the intersection of several important railways, and is connected with Deutz by a handsome iron bridge across the river and a bridge of boats. Cologne is a fortress of the first rank. It is built in semicircular form close to the river. The streets are narrow and dirty. Outside the walls are fine gardens and promenades. It has an archbishop's palace, an observatory, a botanic garden, a public library, a museum, a theatre, an arsenal, with a curious collection of armor, a seminary for the education of Catholic clergymen, three gymnasia, and one pro-gymnasium, a normal school, and a fine town-house. Here are several remarkable and ancient churches—viz. that of Saint Peter, containing a picture of the crucifixion of Saint Peter painted and presented by Rubens; the church of Saint Mary, founded about 1000 A. D.; and that of Saint Ursula, which is said to contain the bones of 11,000 virgins who were massacred by the Huns. The greatest object of interest is the cathedral, which was founded in 1248, and is one of the noblest specimens of Gothic architecture in Europe. It is in the form of a cross, is 510 feet long and 231 feet wide. The towers, when finished, will be about 500 feet high. The construction of this edifice was suspended by the Reformation. Early in the nineteenth century the national enthusiasm of the Germans raised large sums of money to repair and complete it, and Zwirner was appointed architect of the work. Cologne has extensive manufactures of silk and woollen fabrics, cotton yarn, velvet, hosiery, lace, hats, thread, clocks, and *eau de cologne.* About 1,500,000 bottles of this perfume are annually exported from this town. It derives also much prosperity from the navigation of the Rhine, and has an active trade in grain, wine, oil, etc. Cologne was annexed to the German empire in 870 A. D., and was afterwards one of the most populous and wealthy cities of the Hanseatic League. The archbishops of Cologne were princes and electors of the German empire during several centuries. Pop. in 1871, 129,233.

Cologne, a township and post-village of Mason co., West Va. Pop. of township, 1023.

Cologne Water. See Eau de Cologne.

Colo'ma, a post-twp. of El Dorado co., Cal. Pop. 925.

Coloma, a township of Whitesides co., Ill. Pop. 856.

Coloma, a post-township of Waushara co., Wis. Pop. 309.

Colom'bia, United States of, formerly **New Granada,** a republic of South America, is bounded on the N. by the Caribbean Sea and Venezuela, on the E. by Venezuela and Brazil, on the S. by Brazil and Ecuador, and on the W. by the Pacific Ocean. The Amazon forms part of the southern boundary, and the Orinoco flows along the eastern border of this republic. Area, 357,179 square miles, but a considerable portion of the border territory is claimed by Brazil and Venezuela. Pop. in 1864, 2,794,473, exclusive of the independent Indians, whose number amounts to about 126,000.

Physical Features.—The most prominent features of this region are the Andes, three chains of which extend through the western part. These are called the Cordillera of the Coast (or Choco), the Central Cordillera or Quindiu Chain, and the Eastern Cordillera. Between the last and the Quindiu Chain lies the broad valley of the Magdalena, which is separated from the long valley of the Cauca by the same Quindiu Chain. The highest peak in Colombia is the peak of Tolima, which is in lat. 4° 46′ N., and rises 18,317 feet above the level of the sea. Other summits of the central Cordillera rise above the limits of perpetual snow. These mountains seriously obstruct the communication between the sea-coast and the interior. In the south-eastern part of Colombia occur extensive plains called *llanos.* The chief rivers of the interior are the Magdalena and the Cauca, which flow nearly northward to the Caribbean Sea.

Minerals.—Colombia is rich in mineral resources, though they have been imperfectly explored. Gold is obtained in Antioquía and the valley of the Cauca. Platina is found in the Choco, and silver is said to occur at Marquetones. Coal is found in the plain of Bogotá.

Climate, Productions, etc.—The climate of the lowlands is hot, humid, and in some parts unhealthy. The yellow fever is endemic at Cartagena and other places on the coast. Torrents of rain, it is said, fall incessantly in the forests of Darien. The middle regions, called *templadas,* enjoy a more temperate and salubrious climate. A large portion of the country is covered with luxuriant forests, in which are found the wax-palm and the *Cinchona,* which yields quinine. Cotton, rice, sugar-cane, tobacco, cocoa, and tropical fruits are among the productions of the soil near the coast. Maize and wheat flourish on the elevated plains of the interior, but agriculture is generally neglected. Many cattle and horses are reared on the llanos. Among the wild animals are the jaguar, puma, tapir, monkey, alligator, armadillo, and deer.

Colombia is divided into nine states—viz. Antioquía, Bolivar, Boyaca, Cauca, Cundinamarca, Magdalena, Panamá, Santander, and Tolima. Capital, Bogotá. The present constitution was adopted May 8, 1863. The legislative power is vested in two chambers—a house of representatives and a senate. The executive power is exercised by a president elected for a term of two years. The religion of the state is the Roman Catholic.

History.—The Spaniards planted a colony in 1510 on the Gulf of Darien. This part of the continent was called New Granada, and continued to be subject to Spain until 1811, when it revolted with success. New Granada, Venezuela, and Ecuador united to form the republic of Colombia, but the union was dissolved in 1831, when each of these three states became a separate republic. A civil war or revolution broke out in 1860 between the Federalists and Liberals, the latter of whom were directed by General Mosquera. In Sept., 1861, the name of New Granada was exchanged for that of the "United States of Colombia" by the congress of the liberal party. A. J. Schem.

Colom'bic Acid ($C_{42}H_{46}O_{13}$), the acid contained in colombo root.

Colom'bin, or **Colombo Bitter** ($C_{21}H_{22}O_7$), the active principle of colombo root.

Colom'bo, a seaport-town and the capital of Ceylon, on its W. coast, in lat. 6° 55′ N., and lon. 79° 45′ E., and near a rocky headland, the *Jovis extremum* of Ptolemy. It is fortified and defended by seven batteries, besides several bastions, etc. The harbor is small, and is only safe during the S. E. monsoon. The mean temperature is about 80° F., and the average annual rainfall is 72.4 inches. Colombo has a lighthouse, a military hospital, a government-house, and churches for the English, Dutch, and Portuguese. The houses are mostly of one story, each having a verandah in front. Many of the Europeans reside in the suburb Colpetty. Most of the foreign trade of Ceylon is transacted at this port. It was occupied by the Portuguese in 1517, taken by the Dutch in 1603, and conquered in 1796 by the British, who still possess it. Pop. in 1871, 100,238.

Colombo (Realdo), [Lat. *Realdus Columbus*], an Italian anatomist, born at Cremona, succeeded Vesalius as professor at Padua in 1544. He was the reputed discoverer of the pulmonary circulation. He wrote an important work on anatomy, "De Re Anatomica" (1559). Died about 1576.

Colombo Root, the root of *Cocculus palmatus*, a menispermaceous vine from Eastern Africa. It contains colombin, berberine, and colombic acid, starch, coloring-matter, etc. It is one of the most useful of the mild tonics.

Co'lon [Lat. *colon;* Gr. κῶλον], in anatomy, is that part of the large intestine which leads from the cæcum to the rectum. In the adult of the human species it is about four and a half feet long, and consists of four portions—the right or ascending, the transverse, and the descending colon, and the sigmoid flexure (so called from its resemblance in shape to the ancient form of the Greek letter *sigma*, C for Σ). The colon, owing to the peculiar arrangement of its muscular fibres, consists of a series of pouches, which serve to detain the contents of the intestine on their way to the rectum. The colon is provided with numerous glands, which assist in removing the waste matters from the blood. It is believed also to have the power to some extent of digesting food; and it is certain that persons who are unable to swallow food have often been kept alive for a long time by nourishing liquids thrown into the intestinal canal by enema.

Colon, a township and post-village of St. Joseph co., Mich. The village is on the Michigan Central R. R., 53 miles S. W. of Jackson. It has one weekly newspaper. Pop. of township, 1504. Ed. "Enterprise."

Colo'na, a township and village of Henry co., Ill. The village is on the Illinois division of the Chicago Rock Island and Pacific R. R., 170 miles W. S. W. of Chicago. Pop. of township, 1223.

Colonat. See Slavery.

Colonel [from the Fr. *colonne*, a "column," *i. e.* the chief of a column], the title of the highest officer of a regiment in the armies of the U. S., England, France, and other countries. The colonel is the officer next higher than lieutenant-colonel, and next lower than a brigadier-general. In the British army at the present time the position of a colonel is a sinecure, the real active commander of the regiment being the lieutenant-colonel. Every British regiment has a colonel, who is a general officer, and whose command is merely honorary, but he receives high pay, which varies from £500 a year in the infantry of the line to £1800 a year in the Horse Guards.

Colo'nial Corps, in the British army, are certain regiments of native troops in the East and the West Indies, South and West Africa, etc., which are officered (except in Malta) by the British. The native troops of British India are not included in the colonial corps, being paid from the Indian revenues, and not from the army estimates.

Col'oniza'tion Soci'ety, The Amer'ican, an association formed in 1816 for the purpose of transporting negroes from the U. S. to Africa. Many years earlier, Samuel Hopkins, D. D., had advocated such an enterprise. Among the principal founders of the society were Charles F. Mercer of Virginia, the Rev. Doctor Finley of New Jersey, and Bishop Meade. The constitution of the society was adopted at a meeting held in Dec., 1816. In 1820 the society sent out a company of eighty-six colonists to Liberia. Bushrod Washington was the first president of the society. They afterwards sent out nearly 10,000 free colored persons to Liberia, which became in 1847 an independent republic. Henry Clay was for many years president of the Colonization Society.

Colon'na, the name of a celebrated noble and powerful Roman family which has produced many eminent generals, ecclesiastics, cardinals, and authors. This family acquired distinction as early as the twelfth century. In the succeeding centuries they were adherents of the Ghibelline party. Otho Colonna was elected pope in 1417. (See Martin V.) The Colonna palace in Rome is celebrated for its rich treasures of art.

Colonna (Fra Francesco), a Dominican monk, born at Venice about 1449, was professor of theology at Padua, and author of a work "Hypnerotomachia Poliphili" (1499), a singular *mélange* of fables, antiquities, and architecture. Died in 1527.

Colonna (Vittoria), a celebrated Italian poetess, a daughter of the constable of Naples, was born in 1490. She married in 1507 the marquis of Pescara, afterwards a famous general killed in battle in 1525. She was eminent for virtue and beauty, as well as poetical genius. She composed poetical laments on the death of her husband, and many religious poems ("Rime Spirituali," 1548). In 1541 she retired into a convent at Orvieto. Died in 1547. "The rare virtues and consummate talents of this lady," says Hallam, "were the theme of all Italy in that brilliant age of her literature." (See Mrs. Henry Roscoe, "Vittoria Colonna: her Life and Poems," 1868.)

Colonnade [from the It. *colonna*, a "pillar"], a range of columns attached to or detached from the body of the building they are designed to ornament and support. When it surrounds the building on the exterior, the colonnade is called a *peristyle;* when detached from the general line and projecting forward, it is called a *portico;* but when comprised under the same cornice as the building itself, it is styled a *colonnade.*

Col'ony [Lat. *colonia*, from *colonus* (from *colo*, to "till," to "cultivate"), a "husbandman," a "settler"], a term denoting a settlement formed in a distant region or country by emigrants who are under the protection and supreme government of the mother-country. The British colonies in Australia and America are practical instances of the colony in this sense; but there are other dependencies (like the Indian empire) which deviate more or less from the true characteristics of a colony. Territories have afforded profitable residence without being colonies; the most conspicuous of this class is the British empire in Hindostan, where the British people scarcely hold land or concern themselves in agriculture, from which the term colonist is taken. The Greeks established communities in Asia Minor, Africa, Italy, and France, for Marseilles was a Greek colony, founded by the inhabitants of Phocæa about 600 B. C.

The principle of colonial responsibility to a central government was brought to great perfection by the policy of Rome, that not only every conquered territory, but every district where citizens settled, should be an integral part of the empire. There were various grades of colonies—some where there was the full privilege of Roman citizenship, and others where citizenship was of an inferior grade. The Italian colonies of the Levant in the Middle Ages bore some resemblance to those of ancient Rome. The settlements of the barbarians who destroyed the Roman empire were not colonies, for the tribes were not connected with any parent state; and the Normans, who spread over Europe at a later period, were unconnected in the countries where they settled with the government of the states whence they migrated. Hardly a trace of the genealogy of the Normans of England or France can be found anterior to their settlement in the latter country, so little connection did they preserve with the country of their ancestors. With the exception of the Italians in the Levant, the Spanish and Portuguese were the first among modern Europeans to establish true colonies. The Spanish monarchs aimed at the creation of a new empire in America, which was looked on as the property of the Spanish crown. Other governments of Europe subsequently colonized America, Africa, and Asia. The permanent settlement of British colonists in America dates from the reign of James I. The settlers were privileged companies with royal letters-patent, but practically they were almost independent (with the exception of those whose charters were resumed by the Crown). They were largely dissenters seeking refuge from the grievances of the Established Church.

The great advantage of a colony is that it widens the field of enterprise and gives a larger choice of the means of livelihood. It is especially an addition to the existing stock of a very valuable and important kind of raw material—viz. land. It is to the agriculturist, then, that it generally holds out its first inducements. In modern times penal colonies have been established by several European nations. (See Transportation.)

Colony, a township of Adams co., Ia. Pop. 190.

Colony, a township and village of Delaware co., Ia.

The village is 30 miles W. N. W. of Dubuque. Pop. of township, 1400.

Col'ophon [etymology doubtful] is the name of the last page of ancient books. The colophon formerly gave the date, printer's name, etc., with much of the information now conveyed on the title-page.

Colophon [Gr. Κολοφών], an ancient Greek city of Ionia, in Asia Minor, was near the sea-coast, and on the river Ales or Halesus, about 9 miles N. of Ephesus. It was one of the seven cities which claimed the honor of being the native place of Homer. The celebrated philosopher Xenophanes was born here about 600 B. C. It was also the native place of the poet Mimnermus. The Colophonian cavalry had a high reputation. It was anciently famous for its resin (colophony), which was the product of the noble pine forests which even now exist near its site. A village of miserable cabins occupies the site of ancient Colophon.

Col'ophony [Gr. Κολοφωνία ῥητίνη—*i. e.* "Colophonian resin," from its place of export, Colophon], the chemical name of resin of pine, or rosin. (See RESINS, by PROF. C. F. CHANDLER, PH.D., LL.D.)

Col'or [Lat. *color*; Gr. χρῶμα]. Among the various appearances of external objects is that which depends solely on the kind of light which those objects reflect or transmit to the eye. Several other properties, as form, roughness, smoothness, etc., may be discerned by the sense of touch, but color, properly speaking, can be perceived by the sight alone. For though blind persons are said to be sometimes able to distinguish certain colors in cloths by the touch, they only perceive the roughness, harshness, or other property which is usually imparted to the cloths by the particular material employed in dyeing, but they have not any perception of the color itself.

According to the classification of Newton, there are seven primary colors—viz. red, orange, yellow, green, blue, purple, and violet, which, when combined together in their proper proportions, produce white light; but according to some other eminent authorities (including the celebrated optician Brewster), the number of primary colors may be reduced to three—red, yellow, and blue (or green); all the other colors being in their view produced by different combinations of those three elements. Some bodies (certain kinds of colored glass, for example) appear to be of one color by reflected and of another by transmitted light. The cause of the appearance called color may be simply stated thus: if a body absorbs every other kind of light and reflects or transmits red light only, it will appear of a red color; if it absorbs every kind except yellow light, it will appear yellow, and so on. Again, if it absorbs nearly all the rays, reflecting or transmitting scarcely any, it will appear dark or black; and if the greater part of the light is absorbed except a little red and a little yellow, the object will appear of a dark-brown color. (See OPTICS.)

Colora'do, a river of Texas, rises in the high table-lands in the N. W. part of the State. Its general direction is south-eastward. It passes by Austin City, Bastrop, and Columbus, and enters Matagorda Bay near the town of Matagorda. Total length, estimated at 850 miles. Steamboats can ascend it above Austin City.

Colorado, or **Rio Colorado** (*i. e.* "Red River"), a large river of the U. S., rises among the Rocky Mountains by two branches—namely, Green and Grand rivers—which unite in Utah about lat. 38° N. It flows generally south-westward, and passes through the north-western part of Arizona to the south-eastern border of Nevada. It afterwards runs nearly southward, forms the boundary between Arizona and California, and enters the head (or N. end) of the Gulf of California. The entire length, including Green River, is estimated at 1200 miles. It is navigable for small steamboats for 300 miles or more. Among the most wonderful natural objects in North America is the Great Cañon of the Colorado, between lon. 112° and 115° W. Here the river flows between walls of rock which are nearly vertical, and are in some places 6000 feet high. This cañon is more than 300 miles long.

Colorado, a Territory of the U. S., situated in the central belt of States and Territories in the Rocky Mountain region, lying between the 37th and 41st parallels of N. lat., and between the 102d and 109th meridians of W. lon. from Greenwich. It is bounded on the N. by Wyoming Territory and Nebraska, E. by Nebraska and Kansas, S. by the Indian Territory and New Mexico, and W. by Utah. Its area is 104,500 square miles, or 66,880,000 acres, or about equal to that of the whole of New England and the State of Kentucky.

Face of the Country, Geology, Soil, etc.—The Territory is traversed near its centre, from N. to S., by the main chain of the Rocky Mountains, whose snow-capped peaks constitute the watershed of the continent. The mountain-valleys have an altitude of from 5000 to 8000 feet, while the highest culminating crests rise to a height of from 11,000 to 15,000 feet above the level of the sea. The other surface divisions of Colorado are the plains and valleys, and the parks. The plains embrace the section E. of the Sierra Madre, being elevated, rolling prairie, rising gradually from the eastern boundary to the mountains westward, being well watered by the South Platte and Arkansas rivers and their tributaries. The soil is fertile, being covered with rich nutritious grasses, upon which cattle pasture the year round. Vast herds of buffalo and numerous other graminivorous animals roam over these plains, existing upon their grasses; and experiments show that domestic animals thrive as well upon the indigenous herbage. The section of the plains lying near the South Platte, in the north-eastern part, is an iron region abounding in red hematite ore. Magnetic and hematite ores are also found in sections of the mountain country, as in the vicinity of the Golden Gate in Jefferson co., and it is believed that the mining and manufacture of this metal will soon be extensive in Colorado, furnishing machinery for mills and mines, implements for agriculture and the lumber-trade, and rails for iron roads. In the vicinity of the eastern foot-hills of the mountains are the principal outcroppings of the great coal-beds, the strata varying from five to thirty feet thick, stated by geologists to underlie a large portion of the plains, sometimes extending eastward nearly to the Nebraska and Kansas line. This coal is generally of the variety known as lignite, of excellent quality for household economy, as well as for manufactures and for railroads: the mines being already extensively worked in Boulder, Jefferson, Arapahoe, and Douglas cos., but increased facilities for transportation are required to develop this branch of the mineral wealth. A large vein of albertite coal, the stratum being from ten to twenty feet in thickness, has recently been discovered on White River in Summit co., and there are evidences of its extending sixty miles in one direction and twenty-five in another. It resembles cannelite, burning with great readiness and intense heat, and is estimated to contain fifty to sixty gallons of oil to the ton. The percentage of carbon in this coal is from 58.70 to 59.20, and though very brittle and crumbling upon long exposure to the air, it is nearly as hard as anthracite. In the southern part of the plains are numerous Mexican settlers, principally engaged in cattle-herding and agriculture, being aided in the latter by irrigation, for which there are excellent facilities; and the result of its employment is abundant and certain crops. The soil of the plains rests upon calcareous rock, and is principally of alluvial formation, having been washed from the vast granite mountains rising above their western limits, and contains elements of great fertility. Near the streams a large proportion of decomposed vegetable matter enters into its composition, united with ashes and sand; on the plateaus there is less vegetable deposit, the soil being principally composed of sandy loam and friable clay. This section of country is exceedingly well adapted to agriculture; cereals, vegetables, and fruits being cultivated with a success that is astonishing in view of the altitude of the surface of the earth and the scarcity of rain at certain seasons of the year. The quality of the wheat grown in Colorado is excellent, and the average yield thirty bushels to the acre, while fifty, sixty, and even eighty bushels have been grown on some of the new lands under irrigation. In character the wheat resembles that of California more than the Eastern wheat. The average yield of oats is fifty bushels, and of barley forty bushels to the acre, and instances are given of a yield of 100 bushels to the acre of each. The yield of Indian corn, when irrigated, in the vicinity of the Denver Pacific Railway, is almost beyond belief. Single fields have yielded, according to the general land-office report, 1869, 316 bushels to the acre, and 150 to 200 bushels are represented as an average crop. The vegetables are of great size and of excellent flavor, and though the yield is slightly less than in some of the Eastern States, the quality is far superior.

The average yearly precipitation of water in these plains or valleys is twenty inches, falling principally in the rainy season of May, June, and July, and in the snows of winter. For two months in the year, therefore, irrigation is an absolute necessity for abundant crops, and the farmer in selecting his lands does so with a view to the convenience with which this artificial means of supplying the requisite water can be introduced. The construction of acequias or irrigating canals is performed chiefly with the plough and scraper, attended with but small expense, the certain abundance of the resulting crops more than repaying the extra outlay. Acequias thirty miles long, having a fall of four feet per mile, watering 20,000 acres, have been constructed, each adjoining proprietor contributing his share towards their construction and maintenance. In the vicinity of the Denver Pacific Railway, about the head-waters of the

South Platte, at Greeley, Evans, and other points, irrigation is practised on a still more extensive scale, and with the highest success. The present most important resource of the plains of Colorado is stock raising, the rich nutritious grasses which abound there furnishing an ample supply of food to keep the cattle in excellent condition during the entire year, as the grass, when ripe, dries upon the stalk, forming hay superior to that prepared by the most careful curing in the Eastern States. The winters are so mild that not once in five years is there any necessity for shelter and the gathering of hay and fodder for the cattle during any portion of the winter months. Since the opening of the Union Pacific, Kansas Pacific, and Denver Pacific Railways, Colorado has become very largely interested in stock-grazing, as ready markets are furnished by means of these railways for all the cattle the farmers can rear.

The parks of Colorado are a distinctive and remarkable feature of the mountain-region, being apparently the basins of former lakes upheaved and deprived of their waters by volcanic agency, with their original shape and situation at the foot of high mountains undisturbed, while their lowest depths are from 6000 to 9000 feet above the level of the sea. Many of these parks are of small size, being little valleys at the sources of single streams or the beds of small lakes, into which several streams from the surrounding mountains are emptied; yet there are four of these elevated valleys, the smallest of which extends 20 by 50 miles, and the largest 100 by 200, equal to the size of some of the most important of the New England States. These are called the North Park, Middle Park, South Park, and San Luis Park.

The North Park reaches to the northern boundary of the Territory, and within forty miles of the Pacific R. R., it being the basin in which converge the small streams forming the head-waters of the North Platte River. Its surface is alternately meadow and forest, supporting an abundance of game, such as deer, antelopes, and bears; its streams are well supplied with dainty fish; but on account of its great elevation, added to its northern latitude, it has not the same advantages for agriculture possessed by the other large parks, which have less altitude, besides a more southerly location.

Middle Park lies next below North Park, being separated therefrom by a range of mountains extending from S. E. to N. W., which constitutes a section of the dividing-ridge of the continent, separating the rivers of the Atlantic from those of the Pacific slope. The waters of this park flow into the Colorado of the West, emptying into the Gulf of California. Middle Park is 50 miles wide by 70 long, and embraces within its basin several ranges of hills, besides two or three distinct and extensive valleys; it is surrounded by the great mountain-peaks of the Territory, including Pike's Peak, Gray's Peak, Long's Peak, and Mount Lincoln, rising to an elevation of from 13,000 to 14,500 feet, snow-capped mountains circling its whole area. It is milder in climate and possesses a vegetation superior to that of the North Park, but inferior to that of the South Park.

South Park is 30 miles wide and 60 long, lying on the eastern side of the divide, and furnishing the head-waters of the Arkansas and South Platte rivers. This is the most beautiful and the best known of all the parks, discoveries of rich mines having opened roads and scattered settlements throughout its limits. The soil is fertile and the scenery magnificent, offering, aside from the rich deposits of precious ores, inducements to settlers unsurpassed upon the continent. Water and forests are both plentiful, and the climate is delightful.

The San Luis Park is in the southern portion of the Territory, between the Rio Grande del Norte and the head-waters of the Arkansas River, surrounding a beautiful lake of the same name, which is sixty miles in length, receiving the waters of nineteen streams, with no apparent outlet. This is the largest of the parks, having an area of 18,000 square miles, and containing, besides those streams emptying into the San Luis Lake, sixteen others which empty into the Rio Grande del Norte. This park is remarkable for its natural scenery, the grandeur of its forests, the fertility of the soil, the purity of its waters, and the vast deposits of peat in the vicinity of San Luis Lake. It contains a population of 25,000, principally of Mexican descent, who are chiefly occupied in herding and agriculture. Cattle subsist the year round upon the indigenous grasses of these elevated pastures, without other food, and with no shelter except that afforded by the forests and undergrowth. The grass, whether green or cured into hay upon the stalk by the dry winds of the later summer months, appears to possess qualities similar to that of the plains, although growing at a much greater altitude. In fact, it is surprising how little the vegetation seems to be affected in this region by elevation above the sea-level, the luxuriant pastures and majestic forests of South and Middle Parks being from 7000 to 10,000 feet above the sea. Cereals and tender vegetables thrive abundantly at 7000 feet, while potatoes, cabbages, and turnips, are cultivated at an elevation of 8000. Beautiful flowers and nutritious grasses grow at 11,000 feet, and evergreen trees attain considerable size at 11,500 feet, above sea-level.

The gold and silver mines of Colorado, until recently, were supposed to be located principally in the park and mountain country, commencing in Summit and Boulder counties, between the 105th and the 106th meridians, near the 40th parallel, extending thence in a south westerly direction through the Territory. The region embracing the mines possesses a width of from 30 to 60 miles. These mines are of gold, silver, and copper, the gold ore rarely being without an intermixture of more or less silver, or the silver ore without traces of gold, and frequently all three metals are combined in the same ore, this being the case in several of the most profitable mines in the Territory. In 1873 a new mining territory was discovered in the S. W. corner of the Territory, said to be richer in silver and gold than any mining district before known.

The mountains of Colorado all belong to the Rocky Mountain system, and consist for the most part of elevated table-lands (the plains and valleys already described), having an altitude of from 4000 to 9000 feet above the sea; from these plateaux rise numerous peaks and summits to heights varying from 11,000 to nearly 15,000 feet, the lower portions of them covered with trees, mostly evergreens, but the upper portions either gray bare rock or snow-covered, and some of them with extensive glaciers. The most noted of these summits are Gray's Peak, Long's Peak, Pike's Peak, Mount Lincoln, the Mountain of the Holy Cross, Mount Grant, Mount Sherman, Rabbit Ears, Mount Yale, Tarry-all Mountain, Mount Harvard, Dome Peak, Black Butte on the Wet Mountain range, and the Spanish Peaks. The Rocky Mountains in Colorado are the sources of many large rivers, some flowing into the Mexican Gulf and some into the Pacific. On the eastern slope are found the principal sources of both the North and South Platte, as well as those of their principal tributaries, the Republican and Smoky Hill Forks of the Kansas River, and the entire upper course of the Arkansas River, with that of its principal tributaries. In the S. part of the Territory the Rio Grande del Norte derives its head-waters from the slopes that bound San Luis and Las Animas Parks, and from the precipitous sides of the Sierra La Plata and the Uncompahgre ranges, which there form the boundaries of the great Colorado plateau. On the W. the Green River, the Grand River, and its principal affluent, the Gunnison River, as well as the San Juan, the streams which form the Rio Colorado of the West, all have their sources, and the greater part of their independent course, in Colorado. The Grand River penetrates to the centre of the Territory, and finds its ultimate source in Grand Lake on the E. side of the Middle Park, and but a very short distance from the upper waters of one of the affluents of the South Platte, and the Arkansas River at two points almost interlocks with the sources of the Grand and Gunnison rivers.

Geology and Mineralogy.—In speaking of the mineral wealth of Colorado we have made some necessary allusions to its geological structure, but this deserves more particular description. The present accomplished head of the geographical bureau at Washington, Dr. F. V. Hayden, has explored the Territory in so many different directions that we are able to comprehend its geology much better than that of some of the older States and Territories. Its various superficial formations are not, however, local, but extend into other States and Territories adjacent. The prevailing geological character of the Rocky Mountains throughout their whole extent is eozoic, but this is much more widely developed in Southern than in Northern Colorado. Between the 37th and 39th parallels it spreads out to a breadth of nearly 300 miles. In the centre of this expanse of eozoic rocks are the great parks, extending, though in interrupted lines, from N. to S. through the entire Territory, and into New Mexico. These are tertiary. Along the eastern border of the eozoic or gneissoid formations, extending from Wyoming to the centre of New Mexico, with the exception of two breaks of moderate length, runs a narrow bed of Devonian and carboniferous rocks. But the coal-beds of the Territory are almost entirely tertiary, or perhaps cretaceous. On the south-western border of the mountains a similar narrow stratum of Silurian rocks comes to the surface. W. of these, and following the same curves, with about the same width, are triassic and Jurassic rocks, and these crop out also on the E. side of the mountains between Pueblo City and the Spanish Peaks. The only positively volcanic rocks in Colorado are those in the valleys of the upper Rio Grande del Norte and Canadian River. The valley of the Rio Grande, Dr. Hayden believes to have been

at some remote period a vast volcanic crater. In the N. W., between the affluents of Green River, there are considerable tracts of tertiary, forming the surface of the elevated plateaus; but the remainder of Western Colorado, including the valleys of the principal streams, is cretaceous. E. of the Rocky Mountains, the valleys of the Arkansas and South Platte rivers and their tributaries are cretaceous, but all the remainder of the Territory is tertiary. The mineral wealth of the Territory is very great. The minerals of commercial value are auriferous iron and copper pyrites, zinc, blende, argentiferous galena, brittle silver ore, fahlerz (a compound of iron, copper, and zinc, with occasionally silver and mercury), specular iron, hematite and magnetic pyrites, cerussite (a carbonate of lead), anglesite (sulphate of lead), native gold and silver, horn silver, embolite (a bromo-chloride of silver), titanic iron ore, micaceous iron ore, spathic iron ore, smithsonite (a carbonate of zinc), copper-glance, salt, coal, and albertite coal. Of the other minerals of the Territory, the most common are yellow ochre, a bog-iron ore; quartz in all its forms, especially those most in demand as secondary precious stones—rock-crystal, agate, amethyst, bloodstone, cornelian, chalcedony, chrysoprase, jasper, onyx, and sardonyx; opals are abundant; all the varieties of felspar, hornblende, diorite, garnet, mica, leucite, chlorite, amphibole, epidote, tourmaline, calc-spar, gypsum, anhydrite, heavy spar, meteoric iron, beryl, brucite, and idocrase. There are numerous mineral springs, hot and cold, soda, sulphur, chalybeate, magnesian, and others, some of them in the vicinity of the great parks and others in smaller valleys in the mountains.

Vegetation.—Colorado cannot be called a treeless region, though its vast plains have few trees except in the river-bottoms, and these few mainly cottonwoods and box-elder, with some scrub-oaks, and pine and spruce on the foot-hills and spurs of the mountains which extend into the plains. The sides of the mountains up to the snow-line are covered with pine of various kinds, spruce, and fir, those lowest in altitude being of much inferior quality to those higher up the mountain. These furnish at present what lumber and timber is needed, but, unless replaced by new growth, the result of extensive planting of trees, will not do so for many years. The native grass of Colorado is remarkably rich and nutritious, furnishing the best of pasture to its vast and constantly increasing herds of cattle and sheep. The soil is admirably adapted to the growth of cereals, which yield astonishing crops, both in quantity and quality. Vegetables of all kinds and most of the fruits do well also, though peaches and apples are liable to be winter-killed. Grapes succeed well in the valleys of Southern Colorado, where they can have a southern exposure. The soil of the greater part of the Territory is very fertile where it can have sufficient moisture.

Climate.—The climate of the Territory is remarkably healthful. The air is clear, dry, and pure, and though most of the country is elevated, it is admirably adapted to the cure of diseases of the lungs and throat. Neither intermittent nor remittent fevers prevail there, as in most new countries. The annual range of the thermometer is much less than in other sections of the country. In the parks it does not average more than 60°, the highest temperature not exceeding 80° nor the lowest falling below 20°.

Zoology.—The wild animals of Colorado are those of the Rocky Mountains generally. The buffalo has long ranged over its grand parks and along its extensive plains; while the grizzly and black or brown bear, the elk, antelope, and red deer, the coyote or prairie wolf, the fox, the gopher or prairie dog, the sage-hare, and many smaller animals abound. At certain seasons wild-geese and several species of wild-duck are found in the lakes and marshes of the Territory, and the sage-hen and other species of grouse and the usual variety of song-birds are abundant. Of birds of prey there are two species of eagle, several vultures, hawks, and owls in the mountains.

Agricultural Productions.—We have no definite or authoritative statement of the agricultural condition of the Territory later than the census of 1870. At that time there were 320,346 acres of land in farms, of which 95,594 acres were under cultivation. (Stock-raising, being conducted with herdsmen on the public lands, requires no purchased lands or farms at present.) The average size of farms was 184 acres. The value of farms was $3,385,748, and of farming implements, etc., $272,604. The Territory contained at that time 6446 horses, 1173 mules and asses, 25,017 milch cows, 5566 working oxen, 40,153 other cattle, 120,928 sheep, and 5509 swine. These numbers have since been greatly increased, especially the cattle, sheep, and swine. Within the past three years the pastoral or stock-raising facilities of the Territory have received a very rapid development, and there are now not less than 200,000 cattle and 500,000 sheep in its pastures. The chief productions of the Territory in 1869–70 were 255,939 bushels of spring and 2535 of winter wheat; 5235 of rye; 231,903 of Indian corn; 332,940 of oats; 35,141 of barley (this crop, as well as the wheat, has enormously increased since that time); 178 of buckwheat; 890 pounds of tobacco; 204,925 of wool; 7500 bushels of peas and beans; 121,442 of Irish potatoes; 392,920 pounds of butter; 33,626 of cheese; 19,520 gallons of milk sold; and 19,787 tons of hay.

Manufactures.—The total number of manufacturing establishments in 1870 was 256, employing 49 steam-engines of 1433 horse-power, and 31 water-wheels of 792 horse-power. In these there were employed 876 hands. The amount of capital invested, $2,835,090; wages paid during the year, $528,221; amount of raw material used, $1,593,280; of products, $2,852,820.

Railroads.—For so new a Territory, Colorado is well supplied with railroads, while more are in course of construction. The Kansas Pacific, from Kansas City, Mo., to Denver, has 194 miles of its route in the Territory. It was completed in 1870, and now leases also the Denver Pacific, 106 miles in length (which connects Cheyenne on the Union Pacific with Denver), and the Boulder Valley R. Rs., 15 miles in length, from Hughes to Erie. The Denver and Rio Grande R. R., projected to run from Denver to El Paso on the Rio Grande, in Texas, a distance of 850 miles, has completed its main track to Pueblo, a distance of 120 miles, and a branch to Cañon City, 65 miles in length. This branch is intended to follow up the valley of the Arkansas and South Arkansas rivers, and entering San Luis Park at the N. by the Duntho Pass, traverse its entire length, and join the main road (Denver and Rio Grande) near Fort Garland. The Colorado Central R. R. branches in all directions, N., S., E., and W., from Golden City. One branch, 18 miles in length, connects it with Denver; another with Longmont, 41 miles distant; another with Black Hawk and Central City, 21 miles in length; another still with Floyd Hill, 17 miles distant. Other branches not yet completed will extend to Georgetown, to Jefferson, to Littleton, and to Bradford. All these roads, as well as three other roads now constructing, are E. of the Rocky Mountains. W. of these mountains no roads have been projected, and as there are very few settlers except Mexican rancheros, it is hardly probable that they will be built for some years to come. The completed railways of the Territory up to July, 1873, amount to 597 miles; 719 miles more are in course of construction within the Territory, and perhaps one-half of that amount will be completed before 1875.

Finances.—The assessed valuation of Colorado in 1870 was $17,338,101; the true valuation was estimated at $20,243,303. In 1872 her assessed valuation was over $30,000,000. The Territory has no debt, but the counties have pledged their credit to railroads to the extent of $678,829. At the close of 1872 there was a surplus of $50,000 in the territorial treasury. No tax was levied for 1872, and that for 1873 was one and a half mills on the dollar of taxable property. The railroads in operation in the Territory in 1872 delivered in Denver alone an average of 10,000 tons of freight per month, and the business of that city for the year was estimated at more than $14,000,000. The yield of the precious metals in 1872 was nearly $30,000,000. There were in Nov., 1872, six national banks in Colorado (five of them in Denver), having an aggregate capital of $575,000, and carrying an average amount of deposits of about $1,800,000. There were no savings banks in the Territory. There were no fire or life insurance companies, but most of the leading companies at the East were represented there.

Population.—The first census taken of Colorado was that of 1860, when there were 34,277 inhabitants, of whom 34,231 were whites; in 1870 the true population is stated at 47,164, of whom 456 were colored and 7480 were Indians. A considerable portion of the inhabitants of Southern Colorado are of Mexican extraction, but this fact does not seem to have been noticed in the census. The population in Jan., 1873, was stated by Gov. McCook to be about 80,000, exclusive of nomadic Indians. Of the population not Indian, 24,820 were males and 15,044 females. Of the colored race, 285 were males and 171 females. The population above ten years of age was 30,349, of whom 17,583 were engaged in some occupation; in agriculture, 6462; in professional and personal services, 3625; in trade and transportation, 2815; in manufacturing, mechanical, and mining industries, 4681. The Indians in the Territory are all of the Ute tribe, and mainly of the Tabequache, Yampa, Grand River, and Uintah bands of that tribe. They are all friendly, and have a reservation in Western Colorado of 14,784,000 acres, or a little more than one-fifth of the Territory. A few of them wander about, but most of them confine themselves to their reservation.

Education.—Our latest full reports on education in the Territory are to Jan. 1, 1872. The number of school dis-

tricts at that time was 160; the number of schools, 120; in Jan., 1873, there were 175; the number of male teachers, 80; of female teachers, 84; total, 164—in Jan., 1873, 230. Average monthly pay of male teachers, $69; of female teachers, $54; average number of days in which schools were taught was 92; number of school-houses, 80; of which there were brick, 4; stone, 4; frame, 41; log, 25; adobe, 6. Value of school-houses Jan. 1, 1872, $82,574.05—in Jan., 1873, $186,645. The total population of school age (from five to twenty-one years) in 1871 was 7742, of whom 4357 were enrolled in the schools, and the average attendance was 2611; in Jan., 1873, there were 5640 children enrolled. The amount of school-tax levied in 1871 was $79,901.04, and the rate 41 cents on the assessed valuation. Of this, at the close of the year, but $47,387.53 had been collected, and the districts had raised by local taxation $33,886.49 more. The total expenditure for school purposes was $67,395.48, or $3.66 per month per pupil. The amount of the school fund was $81,274.02; in Jan., 1873, it had increased to $121,372. Graded schools are in successful operation in Denver, Central, Black Hawk, Greeley, and several other towns in the Territory. Teachers' institutes were held in 1871 in Arapahoe and Boulder cos. There are no normal schools, colleges, or universities in Colorado. There is a theological seminary (Episcopal) at Golden, with two professors. There are two academies of high order: St. Mary's Academy, a Roman Catholic institution for girls, at Denver, with 9 instructors and 120 pupils, a library of 1200 volumes, and $5800 annual income; and Jarvis Hall Collegiate School at Golden, an Episcopal institution, under the care of the bishop, with 9 instructors and 67 pupils (boys), and a library of 250 volumes. This school is in connection with the territorial school of mines. There are also an Episcopal academy, established in 1872, at Georgetown, with 2 teachers, and a high school for girls, Wolfe Hall, at Denver, of which Bishop Randall is rector, with other teachers in charge. The Roman Catholics have also St. Joseph's Academy, for girls, at Trinidad, with 5 instructors; St. Mary's boys' school at Denver, and are erecting a hospital and school at Central City, and schools at Conejos and Costilla. There were in 1870, besides these, 16 private schools, with 20 teachers—8 males and 12 females—and 396 pupils, 203 males and 193 females. The total income of these schools was $7090. The territorial school of mines, which is to receive the agricultural land-grant, was provisionally organized in 1872, and has its instruction at present in connection with Jarvis Hall. The number of persons of ten years old and over in 1870 who could not read and write (exclusive of tribal Indians) was 6823, of whom 3400 were males and 3423 females.

Libraries.—There were 30 public libraries in the Territory in 1870, with 11,385 volumes, and 145 private libraries reported, with 27,959 volumes.

Newspapers.—There were 14 newspapers of all classes published in the Territory in 1870, having an aggregate circulation of 12,750, and issuing annually 1,190,600 copies. This number has since somewhat increased, and the circulation is now nearly 20,000. Of these papers, 5 are dailies, with an aggregate circulation of somewhat more than 3000, 9 are weeklies, with a present circulation of about 15,000; 1 is a monthly, with a circulation of 1000: this is an advertising sheet. Four of the dailies and six of the weeklies are political, and one daily and three weeklies literary and miscellaneous.

Churches.—In 1870 there were 55 church organizations of all kinds, with 47 church edifices, 17,495 sittings, and church property valued at $207,230. Of these, the Baptists had 5 churches, 4 church edifices, 855 sittings, and $11,000 worth of church property; in 1872 they had 13 churches, 12 ordained and 2 licensed ministers, and 469 members. There were, in 1870, 2 Christian churches, but no particulars are given of them. In 1870 there were 4 Congregational churches, with 4 edifices, 1050 sittings, and $28,200 of church property; in 1872 there were 6 churches, 4 ministers, and 173 members. In 1870 there were 9 Episcopal churches, 8 church edifices, 2000 sittings, and $46,040 of church property; in 1872 there were 10 clergymen, 9 parishes, and about 300 communicants. There was in 1870 one Jewish synagogue. In 1870 there were 14 Methodist churches, 13 church edifices, 3815 sittings, and $50,800 worth of church property; in 1872 there were 26 ordained ministers, 23 churches (6 of them with parsonages), 1070 members, 207 probationers, and church property valued at $121,100. In 1870 there were 6 Presbyterian churches, 5 church edifices, 1200 sittings, $21,800 of church property; in 1872 there were 3 presbyteries in the Synod of Colorado (which, however, includes some of the adjacent Territories), 22 ministers, 21 churches, 560 communicants, and 1251 children in the Sunday schools. In 1870 there were 14 Roman Catholic churches, 13 church edifices, 8575 sittings, and $49,300 of church property; in 1872 there were 15 clergymen in the vicariate apostolic of Colorado, 17 churches and chapels, besides 14 chapels building, and the adherent Catholic population was stated at about 16,000.

Constitution, Courts, Delegates in Congress, etc.—Colorado is still under territorial organization, and her territorial constitution is similar in its provisions to those of the other new Territories. It contains a provision, engrafted by Congress upon the organic act of all the new Territories, "that there shall be no denial of the elective franchise or any other rights to any person by reason of race or color, except to Indians not taxed." The judicial power of the Territory is vested in a supreme court, district courts, probate courts, and justices of the peace. The supreme court consists of a chief-justice and two associates, appointed by the President of the U. S. for the term of four years. For district court purposes the Territory is divided into three districts, in each of which one of the justices of the supreme court holds the sessions. There is also in each district a clerk of the court, who appoints deputies in each county. The supreme and district courts have chancery as well as common-law jurisdiction. The probate judges are appointed by the legislature for each county. The Territory is represented in Congress by one delegate, who has the right to debate, but not to vote. The present delegate is Jerome B. Chaffee of Central City.

Counties.—Colorado has now (in 1873) twenty-one counties. As it was not organized as a Territory until 1861, it has of course no former record of county population, though its population as an unorganized Territory was recorded in 1860. The following are the counties and their population in 1870, and their county-seats at present:

Counties.	Population.	Capital.
Arapahoe	6829	Denver.
Bent	592	Las Animas.
Boulder	1939	Boulder.
Clear Creek	1596	Georgetown.
Conejos	2504	Conejos.
Costilla	1779	San Luis.
Douglas	1388	Franktown.
El Paso	987	Colorado City.
Fremont	1064	Cañon City.
Gilpin	5490	Central.
Greenwood	510	Kit Carson.
Huerfano	2250	Badito.
Jefferson	2390	Golden.
Lake	522	Dayton.
Larimer	838	La Porte.
Las Animas	4276	Trinidad.
Park	447	Fair Play.
Pueblo	2265	Pueblo.
Saguache	304	Saguache.
Summit	258	Breckenridge.
Weld	1636	Evans.

The principal towns are Denver, the capital, which in 1870 had 4759 inhabitants, and is now (1873) estimated to have about 14,000; Central City, Greeley, and Black Hawk have between 2000 and 3000; Georgetown, Golden City, St. Vrain, Pueblo, and Boulder have nearly 2000 each; Evans, Kit Carson, and Cañon City are growing towns.

History.—Colorado has had a brief history. In 1857 a party of civilized Cherokees made the first organized attempt to explore it, but were driven back by the roving tribes of Indians. In 1858 a company from Georgia, and another from Lawrence, Kan., reported that they had discovered gold in paying quantities in the valleys near the base of Pike's Peak, a lofty mountain discovered by Gen. Z. M. Pike in 1806. In May, 1859, gold was discovered in large quantities in the vicinity of the sources of Clear Creek, 50 miles N. of Pike's Peak. This discovery caused great excitement, and there was a general rush of emigrants to Pike's Peak, as the whole region was called, during the next two years. Many of the emigrants, not provided with food or other necessary articles for so perilous and tedious a journey, perished miserably by the way, or reached there in a starving condition; but others followed, till in 1860 the Territory, though not yet organized, had nearly 35,000 inhabitants. It was found, after the first placers were exhausted, that both gold and silver, but especially gold, existed there in large quantities, but in new conditions—combined with sulphur and copper or iron in the form of pyrites, and very difficult of extraction. This discovery checked the fever of the gold-miners, and though the Territory was organized in Feb., 1861, under the name of Colorado, its growth was very slow for some years. Meantime, two other discoveries had been made: one, that, rich as it was in the precious metals, its greatest wealth lay in its admirable climate and its fine pasture-lands, which made it the finest stock-raising region on the continent; the other, that the vast elevated plains of Eastern Colorado, which had formed a portion of the so-called "Great American Desert," and so late as 1863 were re-

garded as worthless for agricultural purposes, were really, when irrigated, the richest and most arable portion of the continent. These two discoveries have done much to turn the tide of emigration to Colorado within the past four years, and the invention of new processes of extracting gold and silver from the pyrites inexpensively has given a fresh impetus to its mining industry. Colorado sent two regiments of cavalry, one of infantry, and a battery of artillery into the service of the government in the war of 1861, besides organizing a force for home defence. A convention was called, a State constitution prepared and adopted, and application made for the admission of Colorado into the Union as a State in Dec., 1865. The bill passed both houses of Congress in April, 1866, but President Johnson vetoed it. Another bill was passed for its admission in Jan., 1867, but this was also vetoed. A bill was subsequently passed in Congress giving permission to the Territory to apply for admission, but its legislature failed to avail themselves of it. In the session of 1872–73 application was made, but Congress denied it. The present population of the Territory is nearly sufficient to entitle the new State to a member of the House of Representatives, and it is probable that its admission will not be long delayed.

In Sept., 1873, Hon. Felix R. Brunot and Mr. Thomas K. Cree, chairman and secretary of the board of Indian commissioners, negotiated with the Utes, who occupy an immense reservation in Western Colorado, a treaty by which the U. S. government comes in possession of a tract of mining lands in the S. W. corner of Colorado extending from the 107th meridian W. to the Utah line, and northward from the northern boundary of New Mexico 100 miles. This tract, enclosing about 6000 square miles, is very rich in silver ores of great purity, assaying from $1000 to $4000 per ton, and gold-bearing quartz has been found which is said to have yielded $36,000 to the ton. It will be known as the San Juan River Mining District, and there is already a colony of 250 or 300 miners at work there. The treaty, which will in all probability be ratified by the Senate, binds the Government to pay to the Utes the annual income from $500,000.

Governors.—The governors of the Territory have been—

John Evans	1861–65	Edward M. McCook	1869–73
Alexander Cummings	1865–67		1873–
A. Cameron Hunt	1867–69		

As a Territory Colorado has never had a presidential vote.

L. P. Brockett.

Colorado, a county in the S. E. of Texas. Area, 905 square miles. It is intersected by the Colorado River. The soil is generally fertile, and produces good crops of cotton and maize. The county is well timbered, and is traversed by the Galveston Harrisburg and San Antonio R. R. Capital, Columbus. Pop. 8326.

Colorado City, a post-village, capital of El Paso co., Col., at the base of Pike's Peak, on a small affluent of the Arkansas River and near the Denver and Rio Grande R. R., 76 miles S. of Denver. Gold is found in the vicinity.

Colorado Springs, a post-village of El Paso co., Col., on the Denver and Rio Grande R. R., 75 miles S. of Denver. It has a delightful climate and mineral springs, and is a place of summer resort. It was founded by a company of educated Eastern men and called the Fountain Colony. It has a bank, a weekly paper, four churches, four hotels, good schools, and is surrounded by fine scenery.

Color-Blindness, want of sensibility in the eye to differences of color. This defect exists in different degrees, but is not necessarily accompanied with any other imperfection of vision. In extreme cases the colors most strongly contrasted seem not to differ except as to degree of brightness or dulness. Very remarkable examples are given by Brewster in his "Natural Magic." Color-blindness is sometimes called Daltonism, because the distinguished John Dalton and his brothers suffered from it.

Color-Guard, The, in the U. S. infantry, consists of the color-bearer and a guard of eight corporals in each regiment. They must all be good soldiers. The color-guard is attached to the right-centre company in the line, and its post on the field is one of honor as well as danger. (See Color-Sergeant.)

Colorine, a township of Lowndes co., Ala. Pop. 2951.

Coloring-Matters. Nature abounds in these principles, and art has added to the number. The colored appearance is not an inherent property of the body itself, but due to its effect upon ordinary light, which is composed of rays of all colors. If a body absorbs nearly all the light, it appears black; if it absorbs scarcely any, but throws it off, it will appear white; but if the body contains any substance (pigment) that has the power of decomposing white light, its color will depend upon which of the rays it absorbs and which it reflects. Strictly speaking, therefore, the *color* of a pigment is due to light which it cannot absorb, and which is reflected to the eye of an observer. (See Dyestuffs, Dyeing, and Pigments, by Prof. C. F. Chandler.)

Col'orist, a painter who excels in coloring or in whose work success in color is the chief excellence. According to some critics, Titian was the greatest colorist that ever lived. "The sixteenth century," says Ruskin, "produced the four greatest *painters*—that is to say, managers of color—that the world has seen; namely, Tintoret, Paul Veronese, Titian, and Correggio."

Col'ors, a military term applied to banners or flags carried by each regiment of infantry. The banners of the cavalry are called standards. Each U. S. regiment has two colors, one national and one regimental. They are made of silk, and display the honors and distinctions of the regiment.

Colors, Complementary. See Complementary Colors.

Color-Sergeant, in the U. S. infantry, is called, in strict military language, the color-bearer. He has no higher rank than other sergeants, but is detailed by the colonel for carrying the regimental colors. In the British army he is a non-commissioned officer of higher rank and better pay than the ordinary sergeants. There is one to each company of infantry, and the office is specially given to meritorious soldiers. He fulfils the ordinary regimental and company duties of sergeant, but in addition to these he attends the colors.

Colos'sæ [Κολοσσαί or Κολασσαί], an ancient and ruined city of Asia Minor, situated in Phrygia, on the river Lycus. It was nearly destroyed by an earthquake in 65 A. D. Saint Paul's Epistle to the Colossians was addressed, in 62 (some say 58–60) A. D., to the believers at Colossæ. Its site is about 3 miles N. of the modern *Chonas* or *Khonos*.

Colos'sal [from *colossus*], in the fine arts, a term applied to any work remarkable for extraordinary dimensions. It is, however, more especially applied to works in sculpture. It seems probable that colossal statues had their origin from the attempt to astonish by size at a period when the sciences of proportion and of imitation were in their infancy. In Babylon we learn from Daniel that the palaces contained statues of great size, and in the present day the ruins of India present us with statues of extraordinary dimensions. The Egyptians surpassed the Asiatics in these gigantic monuments. The taste for colossal statues prevailed also among the Greeks. The principal Roman colossus was the figure of himself, as the sun, set up by Nero before the Golden House; it was in bronze, the work of Zenodorus; and if, as Pliny says, it was 110 feet high, it was larger than the Colossus of Rhodes.

Colos'sians, The Epistle of Saint Paul to the, was written at the same time and place as those to the Ephesians and Philemon, probably during the apostle's first imprisonment at Rome. It seems to be directed against certain Jewish heresies of the Alexandrian or Gnostic type.

Colos'sus [Gr. Κολοσσός] **of Rhodes,** a brazen statue of Apollo, or perhaps of the sun-god, executed by Chares of Lindus, and completed in 280 B. C., was one of the Seven Wonders of the World. The statement that one foot rested on each side of the harbor of Rhodes, and that ships passed under it in full sail, does not rest on good authority. It was 105 feet in height, and was ascended by a winding staircase. It was overthrown by an earthquake about 224 B. C., and was never re-erected. Its fragments remained on the spot till 672 A. D.

Colos'trum [a Latin word of uncertain etymology], the first milk yielded after accouchement. It contains more sugar, more butter, and rather less caseine than true milk, and also contains a much greater proportion of phosphates and chlorides, which may possibly give to colostrum the evacuant properties which it is said to possess. It also has a great number of leucocytes, called "colustrum corpuscles."

Colquhoun (Patrick), a Scottish political economist, born at Dumbarton Mar. 14, 1745. He became a merchant in Glasgow, and promoted the manufacture of muslin in Scotland. In 1761 he went to Virginia, and in 1789 settled in London. He published, besides other works, a "Treatise on the Police of the Metropolis" (1796) and "On the Population, Wealth, etc. of the British Empire." He applied his mind to the elevation of the poor classes. Died April 25, 1820.

Col'quitt, a county in the S. W. of Georgia. Area, 600 square miles. It is drained by the Ocopilco, and bounded on the E. by Little River. The surface is nearly level. Cotton, tobacco, wool, and rice are raised. Capital, Moultrie. Pop. 1654.

Colquitt, or **Col'quit,** a post-village, capital of Miller

co., Ga., on Spring Creek, about 100 miles S. of Columbus. It has one weekly newspaper.

Colquitt (Walter T.), an American lawyer and Senator, born in Halifax co., Va., Dec. 27, 1799. Having removed to Georgia, he was elected a member of Congress in 1838, and a Senator of the U. S. in 1842, by the Democrats. Died in Macon, Ga., May 7, 1855.

Colt (Samuel), a celebrated American inventor, born at Hartford, Conn., July 19, 1814. He invented a pistol called a revolver, for which he obtained a patent in 1835. He began about 1848 to manufacture revolvers at Hartford, where he erected an extensive armory. Colt's revolvers soon attained a world-wide reputation, and were adopted as cavalry arms by most civilized nations. (See Revolver.) Died in 1862.

Col'ton, a post-township of St. Lawrence co., N. Y., has extensive forests and numerous lakes, and is the seat of important manufactures of sole-leather. Pop. of Colton village, 633; of township, 1719.

Colton (Calvin), LL.D., an American writer and Episcopal clergyman, born at Longmeadow, Mass., in 1789. He wrote, besides other works, "Four Years in Great Britain" (1835) and a "Life of Henry Clay" (3 vols., 1844). Died at Savannah, Ga., Mar. 13, 1857.

Colton (Charles), U. S. N., born Feb. 15, 1843, in Wisconsin, graduated at the Naval Academy in 1861, became ensign in 1862, a lieutenant in 1864, and a lieutenant-commander in 1866. He served in the steam-sloop Oneida at the battle of Mobile Bay, Aug. 5, 1864, and is thus highly spoken of by the executive officer of that vessel, Charles H. Huntington: "Too much praise cannot be awarded to Lieutenant C. S. Colton, Lieutenant E. N. Kellogg, and Acting Ensign John Sears, commanding gun divisions, for the admirable examples of courage they afforded their men, and for their skill in directing the fire of the guns." Foxhall A. Parker, U. S. N.

Colton (Walter), an American writer, born in Rutland, Vt., May 9, 1797. He was a chaplain in the navy. Among his works are "Ship and Shore in Madeira, Lisbon, etc." (1835), "Deck and Port" (1850), and "Three Years in California" (1850). Died in Philadelphia, Jan. 22, 1851.

Col'uber, the Latin name of a genus of serpents, originally including many species agreeing only in having a double row of plates on the under side of the tail. Most of the poisonous species, with many harmless ones, are now excluded from the genus. A number of them are of brilliant colors. The serpent of Æsculapius (*Coluber Æsculapii*) was taken by the ancients as a symbol appertaining to the god of medicine. It is four or five feet long, and of a brown color. It is very gentle and easily tamed. It is a native of Southern Europe.

Colubri'na [from *Coluber*, one of the genera], one of the two great sub-orders of serpents, is distinguished from the Viperina by being oviparous instead of ovo-viviparous, and has also a different arrangement of the teeth and maxillary bones. The sub-order probably comprises more than half the existing species of serpents. Comparatively few of them are venomous.

Colum'ba, Saint, called also **Saint Colm,** was born at Gartan, county Donegal, Ireland, in 521 A. D. In 563 A. D. he set out on his mission to Scotland. He founded in Iona, one of the Hebrides, an abbey and a college which had a high reputation. Died in 597 A. D.

Col'umban', or **Colomban,** Saint, an Irish monk, born in Leinster Nov. 21, probably in 543 A. D. He founded the monastery of Luxeuil, near Besançon, in France, about 590 A. D., and was the author of a monastic rule. He was a man of real learning and genius. Died in Italy in 615 A. D., after two years' residence there.

Columba'rium [a Latin term originally signifying a "dove-cote"], among the ancient Romans a sepulchre containing niches like pigeon-holes (whence the name), in which were placed burial-urns for receiving the ashes of slaves and dependants after incremation.

Colum'bia, or **Or'egon,** a river of the U. S., is the largest American river that enters the Pacific Ocean. It rises on the western slope of the Rocky Mountains in British Columbia, about lat. 50° N. and lon. 116° W. It flows north-westward nearly 150 miles, and then southward to Washington Territory, in which it unites with a large branch called Clark's River. Below this junction it pursues a very tortuous course to the northern boundary of Oregon. From this point it flows westward in a nearly direct line, and forms the boundary between Oregon and Washington Territory until it enters the Pacific. It is a rapid stream, passing through many mountain-gorges, and its navigation is much obstructed by falls. The tide ascends to the Cascades, a series of rapids, where the river passes through the Cascade Range, 140 miles from its mouth. At its mouth is a bar covered with twenty feet of water at low tide. Vessels of 300 tons or more can ascend the river to the Cascades. At the Dalles, in Oregon, the river is contracted to a channel about 100 yards wide between basaltic rocks. Steamboats ply daily on the Columbia, both below and above the Dalles (which s. c). Entire length, estimated at 1400 miles. A large affluent, called Lewis or Snake River, enters it near lat. 46° 20′ N. The scenery of the Columbia is sublime, especially where it passes through the Cascade Range.

Colum'bia, a county in the S. W. of Arkansas. Area, 825 square miles. It is drained by the Dorcheat River. The surface is nearly level; the soil fertile and well timbered. Cotton, corn, and wool are raised. Capital, Magnolia. Pop. 11,397.

Columbia, a county of Florida, bordering on Georgia. Area, 800 square miles. It is partly bounded on the N. W. by the Little Suwanee River. The surface is nearly level; the soil is fertile and well timbered. Rice, cotton, corn, wool, and fruit are raised. It is intersected by the Jacksonville Pensacola and Mobile R. R. Capital, Lake City. Pop. 7335.

Columbia, a county in the E. of Georgia. Area, 580 square miles. It is bounded on the N. E. by the Savannah River. The surface is uneven; the soil is based on granite and other rocks. Cotton, corn, and wool are raised. It is intersected by the Georgia R. R. Capital, Appling. Pop. 13,529.

Columbia, a county of New York, bordering on Massachusetts. Area, 688 square miles. It is bounded on the W. by the Hudson River. The surface in the E. is hilly, and in the other parts nearly level. The soil is fertile. Cattle, grain, wool, and dairy products are raised, and iron, cotton, and woollen goods, paper, and a great variety of articles are extensively manufactured. Its commerce is also extensive. Limestone, marble, iron, and lead are found here. It is intersected by the Boston and Albany R. R., the Hudson River R. R., and the Harlem Extension R. R. Capital, Hudson. Pop. 47,044.

Columbia, a county in the N. W. of Oregon, is bounded on the N. and E. by the Columbia River. The surface is partly mountainous, and covered with forests of fir, cedar, and hemlock. The soil is fertile. Capital, St. Helen. Pop. 863.

Columbia, a county of E. Central Pennsylvania. Area, 425 square miles. It is intersected by the North Branch of the Susquehanna River, and also drained by Fishing and Catawissa creeks. The surface is hilly; the soil of the valleys is derived from limestone, and is fertile. Wool and grain are staple products, and carriages, leather, iron, and metallic wares are extensively manufactured. It is traversed by the Lackawanna and Bloomsburg, the Danville Hazleton and Wilkesbarre, and Catawissa branch of the Philadelphia and Reading R. Rs. Capital, Bloomsburg. Pop. 28,766.

H. L. Dieffenbach, Ed. "The Columbian."

Columbia, a county in S. Central Wisconsin. Area, 727 square miles. It is intersected by the Wisconsin and the Fox or Neenah River. The surface is undulating; the soil fertile. Cattle, grain, and wool are raised; wagons and carriages are manufactured. The Milwaukee and St. Paul R. R. passes through it. Capital, Portage City. Pop. 28,802.

Columbia, a township and post-village of Henry co., Ala. The village is 110 miles S. E. of Montgomery. Pop. of township, 1382.

Columbia, a post-village of Tuolumne co., Cal., is near the Stanislaus River, 4 miles N. of Sonora. It has four churches. Gold-mines have been opened here. Pop. 1125; of the township, 2192.

Columbia, a post-township of Tolland co., Conn. Pop. 891.

Columbia, a post-village of Monroe co., Ill., about 100 miles S. by W. from Springfield. Pop. 1246.

Columbia, a township of Du Bois co., Ind. P. 1622.

Columbia, a post-township of Fayette co., Ind. Pop. 929.

Columbia, a township of Gibson co., Ind. P. 2238.

Columbia, a township of Jennings co., Ind. P. 1272.

Columbia, a township of Martin co., Ind. Pop. 831.

Columbia, a city, capital of Whitley co., Ind., on the Detroit and Eel River and the Pittsburg Fort Wayne and Chicago R. Rs., 19 miles W. N. W. of Fort Wayne. Two newspapers are issued here. Pop. 1663; of Columbia township, 2934.

Columbia, a township of Tama co., Ia. Pop. 718.

Columbia, a township of Wapello co., Ia. Pop. 2101.

Columbia, a post-village, capital of Adair co., Ky., 100 miles S. S. W. of Frankfort. It has one weekly newspaper. Pop. 506.

Columbia, a post-village, capital of Caldwell parish, La., on the Washita River, 230 miles by water N. N. W. of Baton Rouge. Pop. 235.

Columbia, a post-township of Washington co., Me. Pop. 668.

Columbia, a township and post-village of Jackson co., Mich. The village is 10 miles S. E. of Jackson. Total pop. 1002.

Columbia, a township of Tuscola co., Mich. P. 424.

Columbia, a township and village of Van Buren co., Mich. The village is on the Kalamazoo and South Haven R. R., 27 miles W. of Kalamazoo. Total pop. 1269.

Columbia, a post-village, capital of Marion co., Miss., on Pearl River, 90 miles S. by E. from Jackson. Pop. 66.

Columbia, a post-village, capital of Boone co., Mo., 10 miles N. of the Missouri and 24 miles E. of Boonville. A branch road connects it with the St. Louis Kansas City and Northern R. R. It is the seat of the State university and the Christian and Baptist female colleges. It has two national banks, a library, and two newspapers. Pop. 2236; of township, 5560. Ed. "Herald."

Columbia, a post-township of Coos co., N. H. P. 752.

Columbia, a post-township of Herkimer co., N. Y. Pop. 1637.

Columbia, a township of New Hanover co., N. C. Pop. 1715.

Columbia, a township of Randolph co., N. C. Pop. 1254.

Columbia, a post-village, capital of Tyrrell co., N. C., on a creek or inlet of Albemarle Sound, 182 miles E. of Raleigh. Pop. of township, 1206.

Columbia, a post-village of Hamilton co., O., on the Ohio River, 5 miles above Cincinnati. Pop. 1105.

Columbia, a post-township of Hamilton co., O. Pop. 3184.

Columbia, a township of Lorain co., O. Pop. 892.

Columbia, a township of Meigs co., O. Pop. 1286.

Columbia, a township and village of Bradford co., Pa. The village is on the Williamsport and Elmira R. R., 58 miles N. of Williamsport. Pop. 1521.

Columbia, a post-borough of Lancaster co., Pa., on the left bank of the Susquehanna River (here nearly one mile and a quarter wide), 80 miles by railroad W. of Philadelphia. It is the south-western terminus of the Reading and Columbia R. R., 45½ miles long, and the northern terminus of the Columbia and Port Deposit R. R. A railroad bridge across the river connects Columbia with Wrightsville. It contains two national and three private banks, three newspaper-offices, waterworks, a female institute, two rolling-mills, a mill for railroad iron, engine and boiler works, several iron-furnaces, a patent rake manufactory, and a fine library. Here is an extensive market and dépôt for lumber, which is brought down the river by rafts. Pop. 6461. A. M. Rambo, Ed. "Courant."

Columbia, the capital of South Carolina and seat of justice of Richland co., is on the left (E.) bank of the Congaree River, just below the confluence of the Saluda and Broad, 137 miles by railroad N. N. W. of Charleston; lat. 33° 57′ N., lon. 81° 7′ W. It is on the Charlotte Columbia and Augusta and the Wilmington Columbia and Augusta R. Rs., is the south-eastern terminus of the Greenville and Columbia R. R., and is connected with Charleston by a branch of the South Carolina R. R. It is the seat of South Carolina College, called since 1865 the South Carolina University, founded in 1804. Columbia has a State-house, penitentiary, an asylum for the insane supported by the State, a Presbyterian theological seminary, a Methodist female college, two national banks, one cotton factory (just out of the corporate limits), three foundries, two sash and door factories, an orphans' home, waterworks, a park, and large libraries connected with the theological seminary (18,300 vols.) and South Carolina University (30,000 vols.). Four daily, eight weekly (four of them religious), two tri-weekly, and one monthly newspaper are published here; there is also one quarterly publication. It is at the head of steamboat navigation. It was taken by Gen. Sherman's army Feb. 17, 1865, and was then much injured by fire. Pop. 9298; or, including the township of Columbia, 10,130. Ed. of "Southern Presbyterian."

Columbia, a post-village, capital of Maury co., Tenn., on Duck River and on the Nashville and Decatur R. R., 46 miles S. S. W. of Nashville. It is the seat of Jackson College, and has one national bank, two female seminaries, and three weekly and one monthly newspaper. Pop. 2550.

Columbia, a post-village of Brazoria co., Tex., on the W. bank of the Brazos River. It has an extensive trade, carried on in steamboats and by rail. It is the W. terminus of the Brazoria and Houston Tap R. R. Pop. 426.

Columbia, a township and post-village of Fluvanna co., Va. The village is on the James River, 25 miles S. E. of Charlottesville. Pop. of township 2331.

Columbia, British. See British Columbia.

Columbia College, an institution of learning in New York City, originally chartered as "King's College" by George II., Oct. 31, 1754. Moneys had been previously raised for the endowment of the college, under acts of the provisional assembly authorizing lotteries for the purpose, of which the first was passed as early as 1746. It received also a liberal grant of land from Trinity Church, and on a portion of this its first building was erected. The Episcopal denomination has always had a controlling influence in its governing board, but it is not, and has never been, sectarian in its teaching. Its original site was near the City Hall Park, and was approached through Park place, which has since been extended over it. In 1857 the college was removed to East Forty-ninth street, where it has since occupied buildings not originally erected for it; but these will soon be replaced by others more suitable, unless it should be a second time removed to a point farther up the island. The occurrence of the public troubles which led to the war of the Revolution seriously interfered with the business of the college, and finally arrested its operations altogether. On the night of May 10, 1775, the president, Dr. Cooper, being a zealous loyalist, fled, through fear of popular violence, and no commencement was held that year. Early in the following year the building was converted into a military hospital, and all the students were dispersed. Business was resumed in May, 1784, when the college, on its own application, was erected into a university, under the corporate title of "The Regents of the University." The body which now bears this name in the State of New York is of more recent creation. In 1787 the university scheme was abandoned, and the institution received its present name of "Columbia College." A medical department was connected with the college from 1767 to 1813, when it was discontinued. In 1860 the "New York College of Physicians and Surgeons" became connected with Columbia College. The law department (established in 1858) has met with great success. The number of law-students (1873–74) was 425. The law-graduates of 1873 numbered 138. The school of mines (organized in 1864) embraces five distinct courses of scientific study: (1) mining engineering; (2) civil engineering; (3) metallurgy; (4) geology and natural history; (5) analytical and applied chemistry. The college has in its four faculties more than 60 professors and instructors, and nearly 1000 students (1873). Its principal library contains nearly 17,000 volumes; the library of the law school, 4000; that of the school of mines, 5000; and the botanical library, 1100. This latter was the gift of the late eminent naturalist Dr. John Torrey, who presented to this college, at the same time, his immense herbarium, embracing over 50,000 specimens. This collection has recently been more than doubled in magnitude by the addition to it of the extensive herbarium of Prof. Meisner of Bâle, presented by Mr. J. J. Crooke of New York in 1872. It is now probably the largest and most complete in the world, except the royal collection at Kew, England. The cabinets and apparatus of the college for the illustration of the various branches of physical and chemical science, and of geology, mineralogy, and natural history, are surpassed for completeness and excellence by few. The gross income of the college for 1873 was more than $260,000, largely derived from ground-rents. This income is rapidly increasing, and the financial prospect of Columbia College is excellent.

The presidents of the college have been—Samuel Johnson, D. D. (1753–63); Myles Cooper, S. T. D., LL.D. (1763–75); Rev. W. Moore (1784–87); Dr. W. S. Johnson (1787–1800); C. H. Wharton, D. D., LL.D. (1800); Rt. Rev. Benjamin Moore (1800–11); W. Harris, S. T. D. (1811–29); Hon. W. A. Duer (1829–42); N. F. Moore, LL.D. (1842–49); Charles King, LL.D. (1849–64); and Rev. F. A. P. Barnard, S. T. D., LL.D., L. H. D. F. A. P. Barnard.

Colum'biad, a sea-coast howitzer, of cast-iron, proposed by the late Colonel George Bomford, chief of ordnance, and introduced (about) 1812. Some of these guns were in service during the war with England, 1812–15. Three calibres were recommended — 50-pounders, 100-pounders, and 150-pounders—for coast defence, particularly against shipping, as a single shell of the larger sizes exploding in a vessel's side, or on her decks, would, it was thought, produce great injury, if not complete wreck.

Meyer's Technologie des Armes à feu mentions under date 1815, "the explosion of an English vessel hit by an American shell before New York;" and again, under the same date, "Very good results were obtained in America from ovoidal (spherico-cylindrical) percussion shells of the calibre of 100, which are fired from a kind of carronade designated by the name of Columbiad." This is the first notice given by this diligent and accurate author of the existence of such a gun, or of a percussion shell, in the world. He seems to have searched thoroughly from the commencement of the Christian Era.

Halleck ("Military Art and Science," page 280) states (in a note), after designating large howitzers as "*Paixhans Guns*," or "*Columbiads*"—"the description of one of Colonel Bomford's Columbiads which was at Governor's Island, New York Harbor, was taken to France by a young French officer, and thus fell into the hands of General Paixhans, who immediately introduced them into the French service."

Whether General Paixhans received as above the description of the columbiad or not, there would seem to be no doubt that this gun was the first howitzer of cast-iron of like calibre and length that was successfully used for shell-firing. 8-inch and 10-inch howitzers had been proposed and made at earlier dates—that is, chambered guns shorter than cannon and longer than mortars, and having trunnions in advance of their vents, and near the centre of gravity of the gun—but these guns were of bronze, generally shorter than the columbiads, and were not designed or used for shell-firing at low angles, but for heavy projectiles, to obtain great range.

In 1749, France adopted the 8-inch siege howitzer, but suppressed it in 1803 as useless, upon Gassendi's recommendation, retaining only a 5½-inch field howitzer. In 1804, 9-inch and 11-inch howitzers, proposed by Villantrois, were made at Douai of eight calibres length, and were fired with lead-filled shells at high angles; and in 1810, at Seville in Spain a 10-inch howitzer of seven calibres length was cast to obtain a long range at the siege of Cadiz.

From 1809 to 1819, according to Meyer, Paixhans was interested in experiments to prove the superiority of hollow projectiles over hot shot for naval warfare, and the destructive effects of bursting shells. In 1819 he presented his treatise *Nouvelle Force Maritime*, but not published until 1822, in which he first proposes his *Canon-Obusier*, an 8-inch howitzer shell gun of cast-iron. The English claim that General Millar, who introduced a like gun in 1824, proposed it in 1820.

In the U. S. the 8-inch howitzer and 10-inch howitzer shell guns were remodelled in 1841 and 1844, intending these last, called *Columbiads*, to be fired with solid shot and with one-sixth their weight of powder; but subsequently they were reserved for shell-firing only, and a new pattern (without a chamber and heavier) was adopted in 1858; two of which (one cast solid and one hollow, and as proposed by Gen. Rodman, cooled from the interior) were subjected to comparative proof, both enduring the remarkable number of 4082 rounds, with solid shot and service charge, without destruction.

In 1861, the Rodman exterior form of guns was adopted for the Columbiads, as for all others, and calibres of 13, 15, and 20-inch smooth-bore, 10-inch and 12-inch rifled, and 13 and 15 mortars, adopted for sea-coast guns.

Col. Bomford, the inventor of the columbiad, distinguished himself through his long military career by many other valuable suggestions in artillery science. Among others, he proposed and carried out the first practical experiments demonstrating the proper exterior lines of a cannon, as shown by the pressure of the fired charge at regular distances from the bottom of the bore. He also proposed the 12-inch gun of 1846, and while testing its capabilities carried on a series of experiments proving the best and simplest form of fuse-shells fired from heavy guns, with the safety-caps sufficient to protect the fuse from extinction by ricochet on land or water.

P. V. HAGNER, *U. S. Army.*

Columbia, District of. See DISTRICT OF COLUMBIA, by L. P. BROCKETT, M. D.

Columbia Falls, a township of Washington co., Me. It has manufactures of lumber. Pop. 608.

Columbian'a, a county in the E. N. E. of Ohio. Area, 490 square miles. It is bounded on the S. E. by the Ohio River. The surface is partly hilly and partly undulating; the soil is calcareous and very fertile. Cattle, grain, and wool are raised. Building-stone, leather, pottery, brick, etc. are here produced extensively. Coal and limestone are found. It is intersected by the Cleveland and Pittsburg R. R. and the Pittsburg Fort Wayne and Chicago R. R. Capital, New Lisbon. Pop. 38,299.

Columbiana, a post-village, capital of Shelby co. Ala., on the Selma Rome and Dalton R. R., 72 miles N. N. E. of Selma. It has one weekly newspaper. Pop. of Columbiana township, 1040.

Columbiana, a post-village of Fairfield township, Columbiana co., O. It is on the Pittsburg Fort Wayne and Chicago R. R., 60 miles N. W. of Pittsburg, Pa., and has one weekly newspaper. Pop. 870.

Colum'bian Col'lege, Washington, D. C., was incorporated by an act of Congress in 1821. Its founders were mainly members of the Baptist denomination. The name of Luther Rice, so honorably connected with the cause of foreign missions, is no less honorably connected with the educational movement which led to the establishment of this institution. The record of the college has been honorable, if not illustrious. The college proper has sent forth about 400 graduates, of whom 120 have entered the Christian ministry; 5 have been foreign missionaries; 18 have been professors in colleges, and 4 have been college presidents. The medical department has sent forth 382 graduates. The law department, though of comparatively recent foundation, has already contributed 581 members to the legal profession, some of whom have attained to distinction at the bar and to stations of public honor. By an act of Congress, approved Mar. 3, 1873, the corporation of the Columbian College was changed into "The Columbian University," and the friends of the institution are now taking steps for the establishment of schools of science, technology, and of the fine arts as a part of its university system, hoping that it may avail itself of the magnificent libraries and collections of the capital. The presidents of the institution have been as follows: Rev. William Staughton, D. D., Rev. Stephen Chapin, D. D., Rev. Joel S. Bacon, D. D., Rev. Joseph G. Binney, D. D., Rev. Geo. W. Samson, D. D. The present president is James C. Welling, LL.D. The college in 1872 had 18 instructors, 283 students, and property to the value of $350,000.

JAMES C. WELLING.

Columbian Grove, a post-township of Lunenburg co., Va. Pop. 1422.

Colum'bidæ [from *Columba*, the principal genus], a

Rock Dove.

family of birds forming the transition from the passerine to the gallinaceous orders. They agree with the true gallinaceous birds in the character of the bill, and in the soft membrane at the base of it; the sternum is deeply notched. A dilated crop is developed from both sides, in which they differ from all other birds. The stomach is a true gizzard, and the lower larynx has a single pair of muscles. The male assists his mate in rearing the young, which are at first supported by a milky fluid secreted in the crop. The Columbidæ resemble the passerine birds in their powers of flight, in living in a state of monogamy, in building their nests in trees and crevices of rocks, and generally in laying but two eggs at a time. In domestication there have arisen

many remarkable varieties, as carrier-pigeons, fan-tails, tumblers, etc. The domesticated varieties are descended from the rock-dove, *Columba livia*, of the Old World. The study of these varieties has been thoroughly carried out by Mr. Darwin, and seems to have suggested his theory of the origin of species. (See PIGEON.)

Col'umbine (*Aquilegia*), a genus of perennial plants of the order Ranunculaceæ. They have five petals, all alike, with a short spreading lip, produced backward into large hollow spurs, much longer than the calyx; pistils five. The *Aquilegia vulgaris*, or common columbine, a native of Europe and of the Rocky Mountains in the U. S., is cultivated in gardens for its showy flowers. The *Aquilegia Canadensis*, a native of the U. S., has beautiful scarlet flowers of curious structure.

Colum'bium, or Nio'bium, a rare metal originally discovered in columbite from Massachusetts by Hatchett in 1801. Wollaston in 1809, in investigating minerals containing columbium, expressed the belief that the metal was identical with tantalum, and this view was generally accepted until 1846, when H. Rose showed that the two were distinct, though tantalum occurs in many of the columbium minerals. Rose, indeed, inclined to the belief that what had been described as columbium really consisted of two metals, which he called niobium and pelopium. Further investigations showed him that but one metal was the basis of the supposed two; so the name pelopium was dropped, and the name niobium was retained, the symbol Nb being now used for columbium. The black powder produced by heating columbium compounds with sodium has been supposed to be the metal, but Delafontaine states that this powder is the protoxide, and that the metal is a steel-gray powder obtained by igniting the chloride $NbCl_5$ in a current of hydrogen. With tantalum, columbium forms a group distinct from the other elements. The principal minerals in which columbium is found are columbite, a columbate of iron and manganese; bragite, a columbate of yttrium and iron; samarskite, a urano-columbate of yttrium and iron; pyrochlore, a columbate of lime, cerium, etc.; æschynite, a titano-columbate of cerium, iron, lanthanum, etc. Some of these minerals contain tungsten. They are found in small quantities in a few localities in Europe and the U. S. The combining number of columbium is 94.

Columbo. See COLOMBO ROOT.

Colum'bus, a county in the S. of North Carolina. Area, 600 square miles. It is bounded on the N. W. by the Little Pedee River, and intersected by the Waccamaw. The surface is level, and partly occupied by swamps, in which rice is produced. It is intersected by the Wilmington Columbia and Augusta R. R. Capital, Whitesville. Pop. 8474.

Columbus, a city of Georgia, capital of Muscogee county, is on the E. bank of the Chattahoochee River, which here forms the boundary between Georgia and Alabama. It is 100 miles W. S. W. of Macon and 292 by railroad W. of Savannah. Steamboats ply at all seasons between Columbus and Appalachicola, Fla., light drafts only being used in summer. Columbus is the northern terminus of the Mobile and Girard R. R., the eastern terminus of the Western Alabama, the western terminus of the Central Georgia, and the southern terminus of the North and South R. Rs. It has six cotton-factories, and the falls of the river at this point afford a water-power sufficient for 100,000 spindles. It has three saw-mills, two machine-shops, and one foundry, besides planing and flouring mills. There are four banks, one of them national, and four papers, one daily and three weekly. The public schools for white and colored are unsurpassed by any in the State. Columbus has pleasant suburbs, noted for the beauty of their scenery and the taste of their private residences. The neighboring country has some of the finest farming-land in Western Georgia. Pop. 7491. A. R. CALHOUN, PROP. "ENQUIRER-SUN."

Columbus, a post-township of Adams co., Ill. Pop. 975.

Columbus, a post-village, capital of Bartholomew co., Ind., on the East Fork of White River and on the Jeffersonville Madison and Indianapolis R. R., 41 miles S. S. E. of Indianapolis. Another railroad extends from this point north-eastward to Cambridge. It has one national bank and two newspaper-offices. Pop. 3359; of township, 5187.

Columbus, a post-village, capital of Cherokee co., Kan., on the Missouri River Fort Scott and Gulf R. R., 50 miles S. of Fort Scott. It has one weekly newspaper. Pop. 402.

Columbus, a city of Hickman co., Ky., on the Mississippi River, 196 miles by rail below St. Louis. It is the northern terminus of the Mobile and Ohio R. R., 472 miles long. The St. Louis and Iron Mountain R. R. terminates at Belmont, on the other side of the river, and crosses by means of inclined planes and a ferry. It has one weekly newspaper. Pop. 1574. R. SUMMERS, ED. "DISPATCH."

Columbus, a township and post-village of St. Clair co., Mich. The village is 15 miles S. W. of Port Huron. Total pop. 1218.

Columbus, a township of Anoka co., Minn. Pop. 71.

Columbus, the capital of Lowndes co., Miss., is on the navigable Tombigbee River and on a branch of the Mobile and Ohio R. R., 235 miles by rail from Mobile. It has 3 banks, 3 wagon-factories, 10 churches, a female seminary, a university, and 2 public academies, and a very large trade, especially in cotton. It has 3 weekly, 1 tri-weekly, and 3 monthly newspapers. Pop. 4812.
LEWIS & BLISS, EDS. "PRESS."

Columbus, a township and post-village of Johnson co., Mo. The village is 10 miles N. W. of Warrensburg. Pop. of township, 1394.

Columbus, a city, capital of Platte co., Neb., on the Platte River and the Union Pacific R. R., 92 miles W. of Omaha. It has a bridge across the Platte, one bank, three school-houses, a high school, five churches, various industries, and a weekly newspaper. Pop. of Columbus township, 1233. M. K. TURNER, ED. "PLATTE JOURNAL."

Columbus, a township and post-village of Chenango co., N. Y. The village is about 40 miles S. of Rome. Pop. of township, 1197.

Columbus, a post-village, capital of Polk co., N. C., about 90 miles W. of Charlotte. Pop. of Columbus township, 744.

Columbus, the capital of Franklin co. and of the State of Ohio, is pleasantly situated on each side of the Scioto River, but principally on the eastern side, and 70 miles from its mouth, 110 miles N. E. of Cincinnati, and 350 miles from Washington, D. C. It is in lat. 39° 57′ N. and lon. 83° 3′ W. from Greenwich. Previous to 1863 the city occupied an area of 1100 acres; by an annexation of territory that year its area was increased to 2700 acres. In 1871 its corporate limits were enlarged by the annexation of territory from surrounding townships, increasing the whole area of the city to 6752 acres. It is well surrounded on all sides by an almost unlimited extent of level land.

At the time Columbus was laid out as a town in 1812, it was an almost unbroken forest, with no resident within its limits. Three years afterward, in 1815, its population was 700; in 1820, 1450; in 1830, 2437; in 1840, 6048; in 1850, 17,882; in 1860, 18,554; and in 1870, 31,274. The increase from 1820 to 1830 was 987, making 70 per cent.; from 1830 to 1840 it was 3611, making 150 per cent.; from 1840 to 1850 it was 11,834, nearly 200 per cent.; from 1850 to 1860 it was only 772; and from 1860 to 1870 the increase was 12,720, being over 70 per cent. Of the whole population in 1870 (31,274), 23,663 were of native, and 7611 of foreign birth; 29,427 were white, and 1847 colored.

Commerce.—Its shipments and receipts are by rail and canal, principally by rail. The cash capital employed in trade amounted in 1872 to $3,034,400, and the sales to $13,281,450.20. The leading commodity is coal. The geographical situation of Columbus, with a vast coalless district extending N. and N. W. of it for hundreds of miles, its accessibility to a coal-seam of enormous quantity and superior quality, make it a great outlet for the article. The shipments of coal over the Hocking Valley road for 1872 were 433,936 tons; the number of tons is expected to reach over 1,000,000 for 1873. This is a new road to the mines; shipments were formerly made by canal.

Manufactures.—The principal article manufactured here is furniture, of which there are three large factories, employing a cash capital of $193,000 and 355 hands; products for 1872, $900,000. Car-building is also carried on very extensively, giving employment to 300 hands; a capital of $400,000 is employed; the products in 1872 reached $1,500,000. Of rolling-mills, iron-furnaces, and pipe-works there are five large establishments, employing 1200 hands, with a capital of $1,000,000; products for 1872, $2,600,000. The manufacture of boots and shoes is carried on here by two firms, employing a capital of $230,000 and 220 hands; products for 1872, $690,000. In the manufacture of regalias one firm employs a cash capital of $35,000 and 80 hands; products for 1872, $120,000. In edge-tool manufacturing two firms employ a capital of $210,000, with 180 hands; products for 1872, $350,000.

Finances.—From April 8, 1872, to April 8, 1873:

Receipts	$213,112.80
Disbursements	212,309.29

The valuation of property on the city duplicate for the year 1872—

Real estate	$15,718,240.00
Chattel property	8,677,610.00
Total	$24,395,850.00

The city levy by the city council for 1872 was eight and eight-tenths mills. The following statement shows the taxes levied for all purposes for 1873:

State debt	$20,223.76
General revenue	15,167.82
Asylum	27,807.67
Common schools	25,279.70
Total State taxes	$88,478.95
County	25,279.70
Poor	20,223.76
Bridge	40,446.52
Building	10,111.88
Infirmary building	25,279.70
Agricultural college	10,111.88
City schools	176,957.90
Corporation purposes	240,157.15
Total taxes levied	$637,048.44
Valuation of lots	$16,368,250
Valuation of chattels	8,911,450
Total valuation	$25,279,700

Debt.—The total funded debt of the city on April 8, 1872, was $888,000, since which time there have been added—new city hall, $10,000; extension of waterworks, $50,000; completion of sewers, $62,000; total funded debt April 10, 1873, $1,010,000. The floating debt of the city is $60,000. There is due the city on tax duplicates for December and June, $105,436.72, which will more than cover the floating debt and current expenses.

City Courts and Prisons.—There is one city court, presided over by the mayor, two common pleas courts, and one probate court. There is a county prison and a State penitentiary. The latter contained during 1872 an average of 1014 3-5 convicts. The number remaining in the prison Oct. 31, 1872, was—from State courts, males, 905; females, 27; from U. S. courts, males, 16; from U. S. military courts, males, 7; total, 955.

There are also two houses of reformation. Number of inmates in 1872, women, 65; children, 123; total, 188.

Education.—Columbus is the seat of Capitol University (Lutheran); cost of buildings, $80,000. It has 5 professors and 4 tutors. Its library contains 2500 volumes. The regular course requires two and a half years. Its income is derived from the Lutheran synod of Ohio. The Ohio Agricultural and Mechanical College has 10 professors. It has funds as follows: Proceeds from sale of land, $435,000; donation of Franklin co., O., to the college in bonds, $300,000; total, $735,000. It was opened for students in 1873. Terms, $14 per session of five months. The Starling Medical College has 13 professors, 70 students (1872), and an endowment of $35,000 by Lyne Starling. This college contains a well-stored museum and an unrivalled chemical laboratory. Terms, $50 per course.

The public schools are as follows: high school, 1; grammar schools, 25; primary and ungraded, 74; total, 100. Number of teachers in high school, 7; in grammar schools, 27; in primary and ungraded schools, 71; of music, 1; superintendent and assistants, 4; total number (men 14, women 96), 110. Number of pupils in high school, 211; in grammar schools, 1714; in primary and ungraded schools, 4129; total, 6054.

Number of youths, in 1872, between five and twenty-one years	10,117
Number of school buildings owned	25
" " " rooms	117
" " recitation-rooms, offices, etc	38
" " seats for pupils	5,379
Value of school sites	$123,550
" " buildings	269,650
" " furniture	15,841
Total value of school property	$409,041

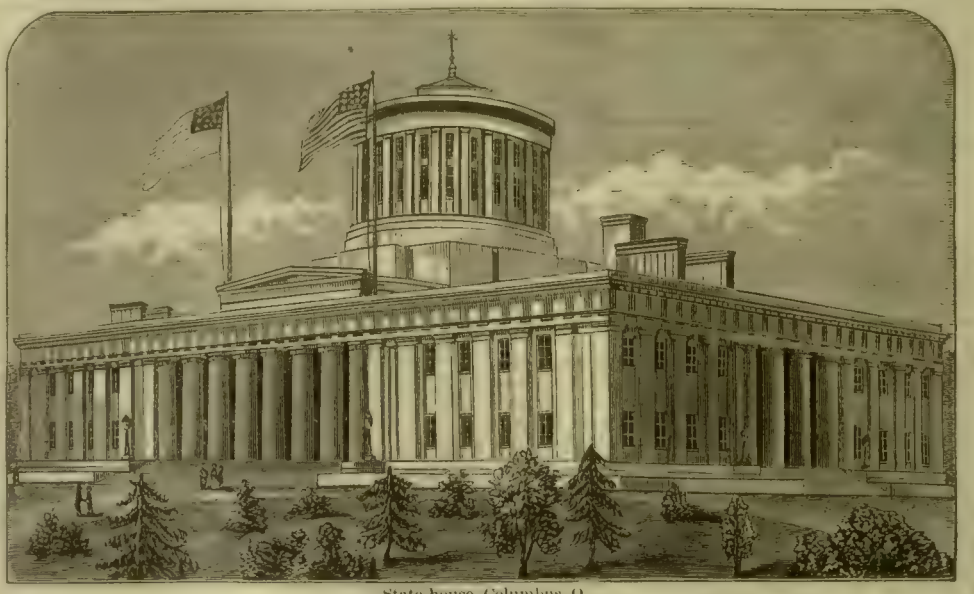
The total receipts for public schools (1872) were $162,543.50; the disbursements for the same period were $150,016.10; which sum includes $68,453.05 for superintendent's and teachers' salaries, also $32,452.81 for buildings erected. The funded debt of the board of education consists of $50,000 in bonds dated Aug. 1, 1870.

Private Schools.—St. Mary's of the Springs (Roman Catholic), number of teachers, 15. In 1872 there were 120 boarding pupils. Its income is from tuition; the cost for the same is, including board, per session of five months, $70, $75, $80, and $90, according to the studies pursued. There is a library of 400 volumes. St. Aloysius's Seminary (Roman Catholic) has 4 professors; number of students for 1872, 30. It derives its chief support from the Catholics of the diocese of Columbus. A library of 700 volumes is connected with it. In the Roman Catholic schools the number of teachers is 20, of pupils 1100. Their income is derived from donations of the Roman Catholic Church. Salaries paid the teachers, $6000; value of school property, $30,000; number of rooms, 20; number of buildings, 4. There are two business colleges; attendance in 1872, 391; number of teachers, 9.

Libraries.—Ohio State Library has 31,984 volumes; additions made in 1872, 959 volumes; income from State taxation 1842-52, $5000; from 1824-42 appropriations, varying from $350 to $1000, were annually made for the same. Appropriation in 1872, $5000; disbursements in 1872, $4894.43. The Public Library has 2060 volumes; income derived from taxation (new). The Circulating Library has 900 volumes; income derived from membership fee. The Young Men's Catholic Library has 700 volumes; income derived from membership fee. Law Library (State) has 5418 volumes; additions in 1872, 270 volumes.

Newspapers and Periodicals.—Daily, 2, circulation, 4500; weekly, 7, circulation, 27,000; semi-weekly, 2, circulation, 1500; periodicals, monthly, 5, circulation, 25,500.

Churches.—Number, 43; number of sittings, 25,000; value, $1,200,000; membership, 14,100. Those of remarkable architectural beauty are the St. Joseph's cathedral (Roman Catholic), which cost $250,000, built of solid sandstone; next come the Trinity (Episcopal) and the First and Second Presbyterian.



Benevolent and Charitable Institutions, etc.—Number, 48. Hospitals 2, one city and one presided over by the Sisters of St. Francis, inmates in 1872, 250; infirmary, 1, number of inmates in 1872, 300; asylum for insane, 1, completed in 1874; orphan asylum, 1, inmates 50 in 1872; home for aged, 1, inmates in 1872, 70; for children, 1, inmates in 1872, 80; for the friendless, 1, inmates 170 in 1872. There is one deaf and dumb asylum. Cost of building, $625,000; value of ground, etc., $900,000; expenses for 1872—salaries for teachers, $16,825; current expenses, $56,216.49; total, $73,041.49; actual cost per pupil (1872), $216.09; number of inmates in 1872, 390—231 males, 166 females; number of teachers, 26. The inmates are classified as follows: scientific, 29; grammar, 84; primary, 225. Departments of trade: printing, book-binding, and shoemaking. There is one institution for idiotic and imbecile youth. In 1872 the number of inmates was 212—males 72, females 140; number of teachers, 11; cost of buildings, $275,000. There is one blind institute. Cost of building, $318,000. Number of pupils in 1872, 112; expenses, $29,225; total number admitted, 752; number of teachers, 14. There are 2 children's aid societies, attendance 140 in 1872. The relief and aid societies number 9. Of Masonic bodies the membership is 400; Odd Fellows, number 16, members 2600; Druids, number 5, members 600; Good Templars, number 2, members 300; Knights of Pythias 4, members 300; Knighthood 4, members 367; Red Men 3, members 470; Catholic benevolent societies 4, members 700.

Public Buildings of Note.—The State-house is a grand and attractive edifice, of great solidity and magnitude, Doric in its style of architecture. It covers two acres of ground, is a bold and noble structure, and is built of beautiful gray limestone. The cost of the building complete was $1,359,121. The time consumed in building it was fifteen years. Height of building from ground to top of blocking course, 61 feet; to pinnacle of cupola, 158 feet; total number of rooms in the building, 53. The Blind Institute, cost $318,000. The architectural character is English, of the later period of Elizabeth. The central arcaded portico is of cut stone, flanked on either side by cast-iron piazzas of the same general character. The Deaf and Dumb Asylum is built of brick, elaborately trimmed with lime and sandstone; cost, $625,000. The front of the building is 270 feet in length. It is surmounted by seven towers, the central one 115 feet high. The new Insane Asylum, which is still in progress, consists of, first, ashlar stone three feet four inches high; on this cut-stone belt-course rests the brickwork proper of the superstructure. It is one mile around the outside walls, and is estimated to cost $1,200,000. St. Joseph's Cathedral (Roman Catholic) is a vast and noble structure, Gothic in the style of its architecture. The material of the walls is sandstone, of a kind which becomes hardened by exposure to the atmosphere. Dimensions, 92 by 185 feet. It will cost $250,000. The spire is to be 250 feet in height. Trinity Church (Protestant Episcopal) is Gothic in style, built of sandstone, in the shape of a cross; it is an imposing edifice; cost, $70,000. The city hall, 187½ feet long by 80 wide, cost $210,000, and the opera-house (building) will cost $120,000. There is an Odd Fellows' Temple costing $75,000. A new union dépôt is in course of erection, to cost $300,000. There are two well-located public parks of good size. The city railroads are four in number; miles of route, 11¾; capital, $227,000; cost, $183,000. There are three national banks.

The steam railways centering in the city are the Baltimore and Ohio (Central Ohio division), the Columbus and Hocking Valley R. R., the Pittsburg Cincinnati and St. Louis, and the Cleveland Columbus Cincinnati and Indianapolis R. Rs. Two new roads are building—one from here to Toledo, and one to Cleveland.

The waterworks are public, and cost $424,299.51; length of pipe laid, 23¾ miles. There are 184 fire-hydrants and 113 stop-valves; 550,000 gallons of water can be supplied every twenty-four hours. The gasworks are private; capital $400,000. Twenty-four miles of main pipe have been laid in the streets. The gas-consumers number 2100. There are 661 street-lamps.

History.—Columbus was selected for the capital of Ohio in 1812, as the State wanted a capital at or very near the centre. Chillicothe was originally the seat of government. In Feb., 1810, the legislature appointed five commissioners to examine and select the most eligible site. In their report to the legislature, dated Sept. 12, 1810, the commissioners recommended a site twelve miles above Franklinton, now a part of Columbus (made so by annexation in 1872). At the session in 1812 a company composed of Lyne Starling, John Kerr, Alexander McLaughlin, and James Johnston proposed that the legislature establish

State-house, Columbus, O.

the seat of the State government on the high bank E. of the Scioto River, nearly opposite Franklinton. The same company made proposals for the erection of a State-house, penitentiary, and other public buildings, the same to be completed by 1817. An act was passed Feb. 14, 1812, accepting the proposals and bond of the company, and permanently establishing the seat of government on the lands named therein, the legislature to commence their sessions there on the first Monday of Dec., 1817, and there continue to May, 1840, and from thence until otherwise provided by law. The refugee lands upon which our State capital was located comprised a narrow tract of four miles wide from N. to S., and extended forty-eight miles eastwardly from the Scioto River. On the 18th of June, 1812, the same day on which the U. S. declared war against Great Britain, the first public sale of lots took place. In 1814 the "Western Intelligencer" was removed from Worthington to this city, and the title changed. The first saw-mill was built in 1813. The first tavern was opened in 1813; the first school in 1814; the first census taken in 1815; the first market-house erected in 1814; the first bridge over the Scioto River was built in 1813. Two churches were built in 1814—a Methodist and Presbyterian; both log cabins. The town was incorporated on the 10th of Feb., 1816. A U. S. court-house was erected in 1820. The first sængerfest of the North American Sængerbund ever held in Columbus took place June 5 and 7, 1852. (See STUDER; "Columbus, its History, Resources, and Progress." 1873.) JACOB H. STUDER.

Columbus, a township and post-borough of Warren co., Pa., on the Atlantic and Great Western and the Philadelphia and Erie R. Rs., 27 miles W. N. W. of Warren, Pa. Pop. 1257.

Columbus, a city, capital of Colorado co., Tex., on the W. bank of the Colorado River, 95 miles S. E. of Austin City. It is the W. terminus of the Galveston Harrisburg and San Antonio R. R. The river is crossed by a railroad bridge. The trade of Columbus is extensive. It has one weekly newspaper, and is the seat of Colorado College.

Columbus, a post-village of Columbia co., Wis., on Crawfish River and the Milwaukee and St. Paul R. R., 63 miles W. N. W. of Milwaukee. It has one national bank and two weekly newspapers. Pop. 1888; of Columbus township, 2840.

Columbus (Don BARTHOLOMEW) was a younger brother of Christopher Columbus, whom he accompanied in his second voyage to America in 1493. He was appointed governor of Hispaniola, where he founded the town of St. Domingo in 1496, and showed himself an able commander. He died in St. Domingo in 1514.

Columbus [It. *Colombo;* Sp. *Colon*], (CHRISTOPHER), the discoverer of America, was born at Genoa in 1436. His origin was humble and obscure, and accounts of his early life are meagre. His son and biographer, Fernando Colombo, wrote: "The admiral tells us himself in a letter that his occupation, like that of his ancestors, was to traffic on the sea." His father, Dominico Colombo, according to some writers, was a wool-carder. In a will made 1594 he calls himself "formerly a weaver" (*olim textor pannorum*). His mother's name was Susanna Fontanarossa. There were three sons, and a daughter who married a butcher. Of his education and early life Columbus wrote in a letter to the king of Castile (1501): "In my young years I was a sailor, and I have continued to follow the sea to this day; it is the art which they should pursue who wish to know the secrets of this world. I occupied myself much with navigation; with astronomy, geometry, arithmetic I was not less familiar. I had a hand sufficiently skilled and enough of knowledge to draw the terrestrial globe, with the position of cities, mountains, rivers, and all ports that there were. While quite young I studied books of cosmography, history, philosophy, and other sciences; it is that which has aided me in my undertaking." He studied at the University of Pavia, and went to sea at fourteen. He mentions in letters the command of a cruiser in the service of René, count of Provence, and voyages to the Archipelago, as well as one in 1477 to the isle of Thule, which he says the moderns call Friesland (a supposed typographical error for Iceland). There is an account of a cruise upon four Venetian galleys, richly laden, when Columbus jumped from his burning ship and swam two leagues by the aid of an oar to the Portuguese coast, and walked to Lisbon, where he found several Genoese. Some say that he went to Lisbon voluntarily in 1470, attracted by the fame of the Portuguese prince, Henry. Las Casas describes him at this period as having a long face, ruddy in places, an aquiline nose, clear gray eyes, a quick, commanding glance, and light hair, which had commenced to grow gray at thirty. His dress was simple. He expressed himself easily and eloquently. Gentle and kind, he warmly attached those to him who knew him intimately. His temper, naturally irascible, he had learned to control. Always attentive to the duties of religion, his piety consisted above all in doing good to his fellows. He fell in love with and married Filipa Moñis de Palestrello, who was in the convent where he went to pray. Her father was an able navigator, governor of Porto Santo, but poor, and leaving little but charts and instru-

ments. Columbus supported his family, and helped sustain his father and educate his brothers by making maps and charts. He went on expeditions to West Africa. He lived some time at Porto Santo, where his wife bore a son named Diego. Here he heard of great reeds and a bit of carved wood seen out at sea floating from the west. The idea of a western ocean-way to India gradually occupied his mind, fed by ancient tradition and contemporary speculations. Toscanelli, an Italian mathematician, had written, at the instance of King Affonso of Portugal, instructions for a western route to Asia. With him Columbus entered into a correspondence, which greatly strengthened his theories. He applied for means to accomplish this voyage to Genoa and to John II. of Portugal, who long kept him waiting with half promises. His wife died, and he left Portugal in indignation. He lived (1484–86) at the Franciscan convent of St. Mary's of Rabida in Andalusia, whither he had wandered, impoverished, with his son. The prior took an interest in his plans, and gave him letters to Fernando de Talevera, confessor to Queen Isabella. He plied the court with untiring solicitations, following the king and queen on all their expeditions against the Moors, until he was granted two small vessels, with the title of viceroy or governor-general of all the lands that he might discover. On the 3d of Aug., 1492, he sailed from Palos, with 120 men, in the Niña, Pinta, and Santa Maria. He stopped several weeks at the Canary Islands. After he had sailed a great distance over an unknown sea, the crew became dismayed, impatient, and finally mutinous. They had begun to talk of throwing him overboard when land was discovered, on the 12th of Oct., 1492. This was San Salvador (Cat Island), or perhaps Watling's Island, one of the Bahamas. He soon discovered Cuba and Hispaniola (Hayti), and returned to Spain in Mar., 1493. He was received with abundant demonstrations of honor and joy by the public and the court, which gave him the title of admiral. In Sept., 1493, he sailed with seventeen ships on a second expedition, during which he discovered Jamaica, Porto Rico, and other islands, founded a colony in Hispaniola, and returned to Spain in June, 1496. He commenced a third voyage in May, 1498, and visited the Terra Firma at the mouth of the Orinoco. Francisco de Bobadilla was sent to the West Indies in 1500, with power to supersede Columbus as governor. By his order Columbus was carried in chains to Spain in 1501. The public expressed such indignation at this ill-treatment that King Ferdinand disavowed the conduct of Bobadilla, but declined to reinstate Columbus in his office. Having sailed on his fourth voyage in May, 1502, he explored the coasts of Honduras and Costa Rica, but was shipwrecked and escaped to Jamaica, which island he left, after long hardships, for Spain, June 28, 1504. Died May 20, 1506, at Valladolid.

The life of Columbus by his son, Don Diego Colon, appeared in Barcia's "Historiadores Primativos" (vol. i., Madrid, 1749). The relation of the first voyage by himself was published (Madrid, 1825–37) in Navarrete's "Viages de los Españoles," first and second volumes. This also appeared with notes by Cuvier, Balbi, Rémusat, and others in "Relations des quatre voyages, suivres par divers lettres et pieces inedites" (3 vols., Paris, 1828). Torre has published a collection of his writings in Italian. (See also his Life by Irving, Arthur Helps, Lamartine, and Spotorno, Leipsic, 1823, and Humboldt's "Examen Critique de l'histoire de la geographie.") The authenticity of Columbus' discoveries has of late been sharply questioned.

Columbus, or **Colon** (Diego), the eldest son of the preceding, was born at Lisbon about 1472. He accompanied his father on the second voyage, and became governor of the West Indies soon after his death. He married Doña Maria de Toledo, a daughter of one of the grandees of Spain. His right to the office of viceroy of the New World was recognized by Charles V. Died in 1526.

Columbus, or **Colon** (Don Fernando), the biographer of the discoverer, was an illegitimate child of the same and Beatrix Henriques, a noble lady of Cordova. He was born Aug. 15, 1488, accompanied his father on his fourth voyage, and afterwards devoted himself to study and contemplation, collecting around him men of science and gathering a library of 12,000 volumes, which he willed to the cloister of St. Paul in Seville. Died about 1541.

Columbus, or **Colon** (Louis), son of Admiral Diego, withdrew his rights to the viceroyalty of India 1540, and received the title of duke of Veragua and marquis of Jamaica and a pension. With Diego, the fourth admiral, son of Christopher, second son of the great Columbus, the male line became extinct.

Colum'bus Cit'y, a township and post-village of Louisa co., Ia., near the crossing of the Burlington Cedar Rapids and Minnesota and the Chicago Rock Island and Pacific R. Rs., and 40 miles N. of Burlington. It has one national bank and one weekly newspaper. Pop. of township, 2341.

R. H. Moore, Ed. Louisa County "Safeguard."

Columbus Grove, a post-village of Pleasant township, Putnam co., O., on the Dayton and Michigan R. R., 84 miles N. of Dayton. Pop. 578.

Colum'busville, a village of Newtown township, Queen's co., N. Y. Pop. 1251.

Columel'la [a diminutive of the Lat. *columna*, a "column"], in botany, the remaining central column or axis formed of the placentas when the carpels of certain fruits have separated; also the axis of the capsules of mosses. In conchology, the upright pillar around which the whorls of univalve shells are wound is called the columella.

Columella (Lucius Junius Moderatus), an ancient Roman rural economist, born at Cadiz (*Gades*), in Spain. He flourished about 20–40 A. D., and was a practical cultivator of the soil. He passed the greater part of his life near Rome. He is the author of an important Latin work entitled "De Re Rustica," which is a copious and systematic treatise on agricultural and rural affairs in twelve books, one of which is in verse. His Latinity is nearly pure.

Col'umn [Lat. *columna*], in architecture, a cylinder of stone or wood used to support a roof, an entablature, or an arch. In countries where forests abound the earliest columns would be made of the trunks of trees, and in India, in Assyria, Persia, and Asia Minor we find the stone columns of a later age imitating in the shapes of their shafts the forms of carpentry, and in the capitals the blocks of wood by which the shafts were surmounted for the purpose of giving a better bearing to the weight the column must carry. But we may be sure that utility would be the first consideration, and that it was late when the artist began to decorate the parts that originally were merely constructive. The Egyptians did not confine themselves to the use of cylindrical columns, but had them of many forms—square, hexagonal, and Pococke (quoted by Gwilt) mentions one, at least, triangular in plan. Some of them are smooth on the surface, and these are ornamented with hieroglyphics. Others look as if they were composed of bundles of rods or stems tied together at intervals by bands. These are less elegant in form than the Gothic columns which they recall, and were perhaps no more based upon an imitation of stems of trees bound together in the one case than in the other. Certainly, the clustered columns of the Gothic architecture were not based upon any such imitation. The porticoes of some of the grottoes at Beni-Hassan are supported by pillars, polygons of sixteen sides in plan, "each slightly fluted, except the inner face, which was left flat for the purpose of introducing a line of hieroglyphics." These columns have no bases, and each is crowned with an abacus only slightly exceeding the diameter of the summit, which in its turn is only slightly less than that of the bottom of the column. From their resemblance to the Doric column of the Greeks, those of the Beni-Hassan grottoes have been called Proto-Doric, but there is no proof whatever of any connection between the two.

The Greeks in early times employed the so-called Doric and Ionic columns, of which the Ionic seems to have been by far the earlier brought over from Asia, though all the most ancient temples of Greece whose ruins are in existence to-day belonged to the Doric style. As the reader will find descriptions and engravings of each of the Greek "orders" as they are called, "Doric," "Ionic," and "Corinthian," in their proper places, we shall not describe them here. It is necessary to remark, however, that while there can be no doubt that many features in Indian architecture and in the architecture of Assyria, Persia, and Asia Minor are reminiscences of wooden forms, there is no such reminiscence to be found in the Greek Doric, though there may be possibly in the capital of the Ionic column. The Doric is essentially a stone construction, and its supposed origin in the imitation of carpentry forms is purely imaginary. The Greek columns were generally composed of many cylindrical pieces, placed one upon another until the requisite height was attained. These were cut in the nearest quarry, and being attached in couples by means of an axle fixed in holes drilled in the centre of each, intended finally for iron clamps, they were rolled as wheels to the site of the building they were to adorn. When they had been placed in position, and well strengthened by iron clamps, the outer surfaces were dressed to give the column the look of being made of a single stone. When the material was of fine marble, this could be perfectly done, as the Greeks excelled in making joints, but where the stone was coarse or defective, they covered the whole shaft with a coating of stucco.

The Greeks ornamented all their shafts with longitudinal incisions, which we call flutes. In the so-called Doric col-

umns these incisions are about twenty in number; this is the case with all the Athenian examples, but "at Pæstum the exterior order of the great temple," says Gwilt, "has twenty-four, the lower interior order twenty, and the upper interior sixteen only." These flutings are separated from each other in all Greek examples by a sharp edge, but "their horizontal section varies in different examples. In some the flutes are formed by segments of circles; in others the form approaches that of an ellipse." The sole use of these flutes is to break up the light on the surface of the column, and to increase the effect of perpendicularity. The Doric column, as found in the Parthenon at Athens, was the last result of the exquisite sense of refinement in form possessed by the Greek architect, and every portion of it is in symmetry with those scientific laws which in the last analysis are one with beauty. The Romans employed the Corinthian in preference to any of the other orders, though the Greeks rarely used it except in small buildings, such as the Temple of the Winds and the Monument of Lysicrates. The Romans also made use of a capital formed by a union of the Corinthian and the Ionic, to which the name of "Composite" has been given, but it has nothing to recommend it.

When the Christian religion arose in the decaying days of the Roman empire, the new sect had need of buildings for their worship, and in erecting new ones made use of the materials abundantly supplied at first by the ruins of the temples and palaces. In this way the Roman columns were worked into buildings with which they had no affinity, and it was only with the exhaustion of the supply, and with the necessity of new materials, that the antique forms were developed naturally to meet the new requirements, and the Gothic column was created—an old body with a new soul. In the Gothic system there is no longer a fixed order of proportions, as with the Greeks, but the architect followed the law of his own eye, both in proportion and in decoration, and the consequence is a great variety in both, and great inequality in excellence. The Gothic columns were developed from the precedent forms of both Greek and Roman architecture, and we find in the vast variety of their capitals and bases all three forms in embryo.

In the time of the Renaissance there was an effort to return to the classic forms, but the result was chiefly a new combination and a new individuality. The Gothic could not be entirely shaken off, nor the spirit of the classic fully entered into, and the Renaissance column therefore has distinct traces of the influences under which it was formed. Since the introduction of iron no new developments of the column have been introduced, as might have been hoped, but builders have contented themselves with imitating in the new material the forms that belong to stone and wood alone, and which have no meaning when employed in a material different in its nature from both.

CLARENCE COOK.

Column [from the Lat. *columna*, a "pillar"] signifies, in military tactics, a mass of soldiers several ranks in depth, as opposed to line. There may be columns of brigades, of regiments, of divisions, or of companies, presenting a depth depending on the number of elements in the column. In a battalion the formation is called *open column* when the distance between the elements of the column is such as to admit of their wheeling into line; when the distance is only a few yards it is termed *close column*, or "column closed in mass;" when intermediate between these two, it is "column at half distance." Battalions are drawn up in column with either the right or left in front, or the battalions may be doubled upon their centres. To pass from column to line is to "deploy;" to pass from line to column is to "ploy." The relative advantages of column and line in drawing up troops for action are among the matters closely studied by the commanders of armies. Sometimes the name column is given to a small army, especially when engaged in active operations.

Colure [Lat. *colurus*; Gr. κόλουρος, from κόλος, "clipped," and οὐρά, a "tail," perhaps because a part is always below the horizon], one of the two great circles of the celestial sphere which intersect each other at right angles in the poles of the equator. The equinoctial colure passes through the equinoctial points, and the other is called the solstitial colure.

Colu'sa, a county in the N. W. of California. Area, 2200 square miles. It is bounded on the E. by the Sacramento River, and drained by Sycamore and other creeks. The Coast Range of mountains extends along the western border. The soil is generally fertile. Wool, wheat, barley, and cattle are raised. Capital, Colusa. Pop. 6165.

Colusa, a post-village, capital of the above county, is on the Sacramento River, 50 miles in a direct line N. N. W. of Sacramento. It has one weekly newspaper. Pop. 1051; of township, 2193.

Col'ver (NATHANIEL), D. D., a Baptist divine, born at Orwell, Vt., in 1794, entered the ministry in 1836, became eminent as a preacher and as an opponent of slavery. He preached in Boston, Detroit, Cincinnati, and Chicago, and founded the Colver Institute at Richmond, Va., after the civil war. Died Sept. 25, 1870.

Colvocores'ses (GEORGE M.), an American naval officer, born in Greece, entered the navy as midshipman in 1832, served with honor in the civil war, and was placed on the retired list as captain in 1867. He was murdered at Bridgeport, Conn., June 3, 1872.

Col'well (STEPHEN), an American author, born in Brooke co., Va., Mar. 25, 1800, practised law and became an iron-merchant of Philadelphia; wrote religious, political, and commercial works. Died Jan. 15, 1871.

Colyar (ARTHUR ST. CLAIR). See APPENDIX.

Colym'bidæ [from *Colymbus*, one of the genera], the name applied to web-footed birds having short wings, and legs placed so far back that when standing they assume an erect position, and a compressed bill, pointed at the tip. The three principal genera are the divers, including the loon (*Colymbus*), which have the front toes webbed; and the grebes (*Podiceps* and *Podilymbus*), with the feet lobed, each toe with a separate membrane. They are aquatic in their habits, and possess great powers of diving and swimming. Several species occur in America.

Col'za, a variety of rutabaga or Swedish turnip (*Brassica campestris*), which is cultivated for its seeds, from which oil similar to rapeseed oil is made in Europe. The oil is used for lamps, lighthouses and machinery, and the leaves and refuse seeds after the oil is expressed are fed to cattle and sheep. The roots are not bulbous.

Co'ma [from the Gr. κόμη, "hair"], in astronomy, the nebulous envelope of a comet's nucleus. In botany, the name is sometimes given to the head or top of a tree, and also to the hairy crest of certain seeds.

Coma [Gr. κῶμα, "heavy sleep"], a medical term signifying a state of lethargy or unnatural profound sleep. It occurs in apoplexy, epilepsy, and other diseases of the brain. The patient is quite or nearly insensible to external impressions. Coma is also seen in narcotic poisoning. In the fatal forms the breathing is stertorous, the pupils of the eyes contracted or dilated, insensible to light, and immovable.

Co'ma Bereni'ces (*i. e.* "Berenice's Hair"), a small constellation of the northern hemisphere, between Boötes and the tail of Leo. (See BERENICE.)

Comac'chio (anc. *Comacula*), a fortified town of Italy, province of Ferrara, is 3 miles from the Adriatic and 29 miles E. S. E. of Ferrara. It is situated in the marshes of Comacchio, in which great numbers of eels are caught. These and other fish are cured in an excellent manner. It is the seat of a bishop, and has salt-works. Pop. 6475.

Comal', a county near the central part of Texas. Area, 575 square miles. It is bounded on the S. W. by the Cibolo, and intersected by the Guadalupe River. The surface is hilly, the soil fertile, producing cotton, corn, and fruit. There is some timber and plenty of building-stone. There are manufactures of saddlery, harness, and various other goods. Capital, New Braunfels. Pop. 5283.

Coma'na, an ancient city of Cappadocia, on the river Sarus, was the site of a temple of Artemis-Tauropolis. Comana was ruled by the chief priest, next in rank to the king. The site is now occupied by *El-Bostân*.

Coman'che, a county in the S. W. of Kansas, bounded on the S. by Indian Territory. Area, 800 square miles. It is bisected diagonally by Crooked or Nescutunga Creek.

Coman'che, a county in N. Central Texas. Area, 1050 square miles. It is intersected by the Leon River. The surface is partly hilly. A range called the Comanche Mountains extends along the south-western border. The soil is fertile. The W. part of the county is covered with forests. Corn, wheat, and cattle are raised. Capital, Comanche. Pop. 1001, according to the census of 1870, which, however, reports the return of population as incomplete.

Comanche, a post-village, capital of Comanche co., Tex.

Coman'che In'dians, or **Camanches,** a warlike tribe of American savages who roam over the northern part of Texas and of Mexico. They are nomadic, and range over a wide extent of territory, including part of New Mexico and the valley of the Rio Grande. They have large numbers of horses. Their principal occupations are robbery and war. They always fight on horseback, and have some firearms, but more commonly use the bow and arrow. They are by treaty placed upon a large reservation in the S. W. part of the Indian Territory, with some Kioways and Apaches. The Comanches were estimated in

1872 at 3180 souls. They appear to be of the same stock with the Shoshonees or Snakes.

Comar'ca [It.], a judicial district. Comarca di Roma, the district of Rome and its vicinity, including in particular Tivoli and Tubiaco.

Comatula. See Feather Star.

Co'ma-Vig'il (*i. e.* "wakeful coma"), a name sometimes applied to the semi-comatose state observable in certain cases of fever, etc.

Comaya'gua, formerly **Valladolid,** a city of Central America, the capital of Honduras, on the river Humuya, about 180 miles E. of Guatemala. It is the seat of a bishop, and has a cathedral, a college, a hospital, and several convents. It was founded in 1540 by Alonzo de Cáceres. It was once much larger, but has been visited repeatedly by war and pestilence. Pop. 8000.

Comb [from the Lat. *como*, to "comb or dress the hair," and more remotely from *coma* (Gr. *κόμη*), "hair;" Anglo-Saxon, *camb;* Ger. *Kamm;* Lat. *pecten;* Fr. *peigne*], an implement used for cleaning the hair, as well as for adjusting and keeping it in place. The ancient Greek and Roman combs were made of box-wood, but, later, ivory combs came into use among the Romans, as they had long before among the Egyptians. Combs are made of tortoise-shell, ivory, horn, wood, bone, metal, and India-rubber. The old method of cutting the teeth is by a saw, which has two blades of steel set parallel to each other, with a space between them equal to the thickness of the intended tooth. The teeth are then finished by means of thin, wedge-shaped files. By these processes the material corresponding to the spaces between the teeth is wasted; but combs are now made by a method in which the otherwise wasted material is made to form the teeth of a second comb. The plate of material is cut through by means of a cutter, consisting of two thin chisels inclined to each other; between these, and connecting the ends, is a small cross-chisel. When this cutter descends with sufficient force upon the plate, it will cut one of the teeth; while the cutter is rising, the table carrying the plate is made to advance a distance equal to the thickness of one tooth, and thus the successive cuts are made. The plate is easily parted into two combs, the teeth of which only require filing and finishing. India-rubber combs are made by pressing the material into the required form in moulds, and "vulcanizing" or combining it with sulphur afterwards.

Combaco'num, an ancient city of Hindostan, in the Carnatic, 20 miles E. of Tanjore. It is regarded as a holy city by the Hindoos, and has numerous pagodas and tanks, the water of which is supposed to be capable of washing away sin. Pop. estimated at 40,000.

Combe (Andrew), M. D., born in Edinburgh Oct. 27, 1797, wrote "The Principles of Physiology Applied to the Preservation of Health" (1834), often reprinted, and the "Physiology of Digestion" (1836). Died Aug. 9, 1847.

Combe (George), a phrenologist, a brother of the preceding, born in Edinburgh Oct. 21, 1788, practised law in his native city for many years. He produced in 1819 "Essays on Phrenology" and "The Constitution of Man Considered in Relation to External Objects" (1828; 9th ed. 1860). He married in 1833 a daughter of Mrs. Siddons, the actress. In 1838 he visited the U. S. and delivered lectures on phrenology. Died Aug. 14, 1858.

Combermere, Viscounts (1827), Barons Combermere (1814, United Kingdom), and baronets (1677).—Wellington Henry Stapleton Cotton, second viscount, born Nov. 24, 1818, was M. P. for Carrickfergus 1847–57, and succeeded his father Feb. 22, 1865.

Com'bermere (Stapleton **Cotton**), Viscount, an English general, born Nov. 17, 1773. He served in India, and in 1810 obtained command of the cavalry under the duke of Wellington. At the battle of Salamanca, 1812, he was severely wounded. In 1814 he was raised to the peerage, in 1825 he became commander-in-chief in India, and a field-marshal in 1855. Died Feb. 21, 1865.

Combi'nant, in mathematics, is a covariant (or invariant) of two or more quantities, which possesses the additional property of remaining unaltered, a factor excepted, when the quantities are replaced by linear functions of themselves.

Combination. See Co-operation, by Hon. Thomas Hughes, M. P., and Trade Unions.

Combination, Alternation of Position. See Permutation.

Combreta'ceæ [from *Combretum*, one of the genera], a natural order of exogenous plants, trees, or shrubs, mostly natives of tropical countries, and distinguished by a convolute embryo. They possess astringency, and some of them are employed in dyeing. The order comprises about 200 known species. There are in the Southern U. S. several unimportant shrubs of this order, and one large tree, the *Terminalia Catappa*, which grows in Florida and the East and West Indies, and produces an edible nut resembling the almond.

Combs (Leslie), General, a lawyer, born in Kentucky in 1794. He served with great distinction as an officer in the war of 1812, afterwards practised law in his native State, and became a prominent Whig politician and general of militia.

Combus'tion [Lat. *combustio*, from *con*, intensive, and *uro, ustum*, to "burn"], the process of burning, which usually consists in the union of oxygen with the combustible substance. The evolving of heat and light which attends the process of combustion announces intense chemical action. Some substances burn at ordinary temperatures, such as phosphorus, which glows when exposed to the air; wood, coal, etc. require to be raised in temperature before they possess the power of combining with the oxygen of the air. Chlorine and some other gases may be made to support combustion in certain limited circumstances. Different combustible substances give off different amounts of heat. The mode in which the heat evolved may be measured is either—1. To observe the quantity of ice which a given weight of the combustible will melt when burning; 2. To notice the weight of water which the combustible will convert into steam; or, 3. To estimate the number of pounds of water which the burning body will raise from 32° to 212° F. The amount of heat evolved appears to be proportional to the quantity of oxygen required to burn the various combustibles. The quantity of heat given out during the combustion of any burning body is the same whether the burning takes place rapidly or slowly, yet the sensible heat may vary according to the rapidity of the process.

Combustion, Spontaneous. See Spontaneous Combustion.

Com'edy [Gr. *κωμῳδία*, probably from *κῶμος*, "festivity," and *ᾠδή*, a "song:" Lat. *comœdia;* It. *commedia;* Fr. *comédie*], a species of drama, of which the characteristics in modern usage are—that its incidents and language resemble those of ordinary life; that the termination of its intrigue is happy; and that it is distinguished by greater length and greater complexity of plot from the lighter theatrical piece entitled a farce. The original Attic comedy was a burlesque tragedy in form, in substance a satire on individuals, and founded on political or other matters of public interest. The Attic comedies are usually assigned to three schools—the "old," the "middle," and the "new comedy." The old comedy lasted till the end of the Peloponnesian war. It was characterized by personalities, great freedom and irregularity, and was a powerful political engine. The middle comedy was more finished, less personal and direct in its aims, satirizing systems and opinions rather than individual men; it ceased with the Macedonian conquest. The new comedy was very much like our modern comedy in scope and general character.

Come'gys (Cornelius G.), M. D., a native of Delaware, and professor of the institutes of medicine in Miami University, Oxford, O., published in 1858 a "History of Medicine," 8vo.

Come'nius (John Amos), a Slavic educational reformer and philologist, born in 1592, was a Moravian minister, and taught school at Lesna, in Poland. In 1631 he published "Janua Linguarum Reserata" ("The Gate of Languages Unlocked"). He went to Sweden in 1642, and was employed by Oxenstiern in reorganizing the schools. In 1648 he settled at Amsterdam. Among his other works are "Opera Didactica" (1657) and "Orbis Sensualium Pictus" (1658), the original child's picture-book. Died Nov. 15, 1671.

Co'mes (gen. **Com'itis**), a Latin word signifying a companion among the later Roman emperors, was the title of an officer with territorial jurisdiction. It was nearly equivalent to count or earl. (See Count.)

Com'et [Gr. *κομήτης* (from *κόμη*, "hair"): Lat. *cometa*, so called because its tail was supposed to resemble a lock of hair], a celestial body revolving about the sun, generally in an extremely elongated orbit, and consisting of exceedingly attenuated matter. The characteristic features of a comet are—a definite point or nucleus, a nebulous light or coma around the nucleus, and usually a luminous train or tail following or preceding the nucleus. Sometimes several tails are observed on one comet. Formerly, when the train preceded the nucleus—as is the case when a comet has passed its perihelion—it was called the beard. Neither the tail nor the nucleus is now considered absolutely essential to a comet, but all bodies are classed as comets which have the peculiar motion of comets and an extremely ec-

centric orbit. Among the differences between comets and planets are the following: planets move in the same direction from west to east, which is called "direct motion," but the movements of comets are sometimes from east to west, or retrograde; the orbits of all the planets are limited to a comparatively narrow zone on either side of the ecliptic, but the paths of comets cut the ecliptic in nearly every direction, some being even perpendicular to it; the orbits of all the planets are nearly circular—the orbits of comets present every degree of eccentricity. Of 200 comets whose orbits have been ascertained with more or less accuracy, forty or more appear to describe ellipses, seven or eight hyperbolas, and the rest parabolas. In general, it is held that comets with parabolic or hyperbolic orbits are only occasional visitors to the solar system, whose return is not to be looked for. The discovery that comets are extraneous to our atmosphere was made by Tycho Brahe, who ascertained the fact by observations of the comet of 1557. Newton demonstrated that they are guided in their movements by the principle which controls the planets; and Halley was the first, by determining the elements of a number of comets from recorded observations, to identify the comet of 1682 with one observed in 1607 and in 1531, and thus confidently to predict its return at the end of 1758 or beginning of 1759. The comet passed the perihelion on the 12th of Mar., 1759, exactly a month before the date fixed upon by astronomers. There are other comets whose periodicity is established and whose paths are accurately known; for example, those of ENCKE, PETERS, and FAYE (which see).

In 1770, Messier discovered a comet, known as Lexell's, which remained visible a long time, and observations showed the orbit to be an ellipse whose major axis was only three times the diameter of the earth's orbit, and indicated a period of five and a half years. It was impossible to identify this comet with any before observed, and yet it was very difficult to conceive that a bright comet with so short a period should have previously escaped observation. What was still more remarkable, it was never seen again, though carefully looked for in the places where according to previous observations its orbit should have been. It gave occasion to many sarcasms by the wits of the day at the expense of astronomers. At present the explanation is easy. The comet was never seen before 1770, because of its nearest point to the sun having been as distant as the orbit of Jupiter. In 1767 it was in such close proximity to Jupiter, moving in the same direction, and nearly in the same plane, that the attraction of this great planet entirely changed its orbit. Its passage to the perihelion in 1776 took place by day, and in 1779, before another return, it again encountered the vast body of Jupiter, the attraction of the planet deflecting it into more distant regions, and so changing the form of the orbit that if it had been again visible it would not have been recognized. The great comet of 1680—which gave Newton the means of proving that comets revolve around the sun in conic sections, and that they are retained in their orbits by the same force as that which regulates the movements of the planets—was the most remarkable for brilliancy among all those of which we have any authentic account. This comet is supposed to be the one that appeared about the time of Cæsar's death (44 B. C.), and that seen in the reign of Justinian (531 A. D.), and in 1106. There is, however, some doubt among astronomers as to these points. This comet came nearer to the sun than any known, except perhaps the comet of 1843. It approached the sun within less than 600,000 miles, about two-thirds of the sun's diameter. The tail or train of comets is nearly always turned away from the sun, frequently assuming a curved form. It increases in length with its proximity to the sun, but in most cases does not acquire its greatest length till after its perihelion. It is believed to consist of finely-divided matter, which is driven off from the comet by some unknown force residing in the sun.

The comets most remarkable for brilliancy in the present century have been the comets of 1811, of 1843, and of 1858 (Donati's), the latter having a period of about 1950 years, and an aphelion distance of some 15,000,000,000 miles. It has been a question among astronomers whether comets are self-luminous, or merely reflect the light of the sun. The fact of their becoming invisible in receding from the sun, though still of considerable apparent size, strongly leads to the adoption of the latter hypothesis. Experiments were made by Arago which showed that the light from comets is partially polarized in the same way that the sun's light is reflected by our own atmosphere, which strongly corroborates the same belief. The substance of the nebulosity and the tail is of almost inconceivable tenuity. Stars seen through them suffer no diminution of brightness, though the light traverses millions of miles of the cometary atmosphere; comets have never been observed to cause any sensible disturbance of the planetary motions, though themselves much affected by the neighborhood of a planet. The curvature of the tail and the acceleration of the periodic time in the case of Encke's comet indicate their being affected by a resisting medium which has never been observed to have the slightest influence on the planetary periods. Even the nuclei of comets appear to be of extremely small density. There are accounts of stars of a very low order of magnitude being seen through the nuclei.

Comets were formerly regarded with dread, as presaging pestilence, war, or some other great calamity, not merely by the ignorant, but by a large portion of the people. Milton alludes to this notion when he says that a comet

> "from his horrid hair
> Shakes pestilence and war!——"
> *Paradise Lost*, book ii., l. 710.

Halley's comet in 1456, being observed soon after the Turks had taken Constantinople, was regarded by all Europe with a superstitious terror, and to the Ave Maria was added the prayer, "Lord, save us from the devil, the Turk, and the comet!" The occurrence of a lunar eclipse at Constantinople at the same time increased the portentousness of the event. The discoveries of the magnitude of the space filled by cometary bodies, and their prodigious velocity, together with the confessed impossibility of always predicting their approach, have produced fears of another kind in the public mind. The groundlessness of such alarms from the extreme improbability of collision with the nucleus, and the probable harmlessness of a contact with the extremely attenuated surrounding matter, seems sufficiently evident. Already on many occasions some of the matter in the tail of comets must have come within the earth's atmosphere. Whether the effect is deleterious or salubrious, or whether it has any influence at all, is a matter of question.

Observations with the spectroscope have failed to give satisfactory evidence of the chemical constitution of comets, though some of them seem to consist in part of vaporized carbon or hydro-carbon gases. In Mar., 1872, Schiaparelli received the gold medal of the London Astronomical Society for his discovery that comets are sometimes connected with those remarkable displays of meteoric phenomena known as "meteoric showers." The importance of this discovery has been recognized by Donati, Peters, Prof. Newton, Oppolzer, Le Verrier, Chladni, Schellen, and other eminent savants. (See METEORITES.)

Comet-Finder, a telescope of low magnifying power and large field of view, used in searching for comets.

Com'fort (GEORGE FISK), A. M., an able Methodist educator, born Sept. 30, 1833, in Berkshire, N. Y., graduated at Wesleyan University, Middletown, Conn., in 1857. He taught in Amenia Seminary, N. Y., in 1857–58, in Fort Plain Seminary, N. Y., in 1858–59, in Van Norman's Female College in 1860, travelled and studied in Europe and the East (1860 till 1866), was professor of modern languages and æsthetics in Alleghany College, Meadville, Pa., 1866–68; was chief originator and organizer of the American Philological Association (1869), and its secretary from 1869 to 1873; was one of the principal movers in founding the Metropolitan Museum of Art, New York (1869–72); was appointed professor of modern languages and æsthetics and dean of the College of Fine Arts in Syracuse University, N. Y., 1873; author of various essays upon linguistics, æsthetics, and pedagogics; is a corresponding member of the Archæological Institutes of Rome, Berlin, and Paris, and author of an excellent series of text-books for the study of the German language (1868–72).

Comfrey, kum'fre (*Symphytum*), a genus of perennial plants of the natural order Boraginaceæ, distinguished by a 5-cleft calyx and a corolla enlarged upward, its throat closed by awl-shaped scales. The species are natives of Europe and Asia. *Symphytum officinale* was formerly much esteemed as a vulnerary. It is often seen in the U. S. in gardens, and is also naturalized in our fields.

Comines, or **Commines,** a town on the S. W. frontier of Belgium, is divided by the river Lys into two nearly equal parts, one of which is in France. It is 9 miles N. of Lille. Here are important manufactures of ribbons, threads, etc. Pop. of the French town, 6246; of the Belgian, 3480.

Comines, de (PHILIPPE), lord of Argenton, an historian and statesman, born near Menin, in Flanders, in 1445. The son of an ancient race, his education was conducted with the greatest care, notwithstanding he had early lost his parents. He entered the service of Charles the Bold, who employed him in important diplomatic business. About 1472 he proved untrue to the duke, forming a secret compact with Louis XI. while he was held a prisoner by Charles, who took him captive at Peronne, and became a minister of the French king, his enemy. After the death of Louis XI., Comines was an adherent of the duke of Orleans, aiding that

prince in his ambitious plans against the French government. This cost Comines his ministerial office; whereupon he aided the Bourbon prince the more zealously. He wrote memoirs of historical events from 1464 to 1498 (1523), Langley-Dufresnoy, London, 1747, more complete; and Dupont, Paris, 1840–47. Died at Argenton, Oct. 17, 1509. (See FELIX VAN HULST, "P. de Comines.")

Comi'so, a town of Sicily, in the province of Noto, about 41 miles W. S. W. of Syracuse. It has manufactures of paper. Pop. 15,803.

Comitia, ko-mish'e-ą [from the Lat. *com* (for *con*), "together," and *co, itum*, to "go"], in ancient history, were certain political assemblies of the Roman people. The comitia were of three kinds, distinguished by the epithets *curiata, centuriata*, and *tributa*. The comitia curiata were the assemblies of the patrician houses or *populus*, and in these, before the plebeians attained political importance, was vested the supreme power of the state. The name curiata was given because the people voted in *curiæ*, each curia giving a single vote, representing the sentiments of the majority of the members composing it, which was the manner in which the tribes and centuries also gave their suffrages in their respective comitia. After the institution of the comitia centuriata, the functions of the curiata were nearly confined to the election of certain priests and passing a law to confirm the dignities imposed by the people. The comitia centuriata were the assemblies of the whole Roman people, including patricians, clients, and plebeians, in which they voted by centuries. By the constitution of the centuries these comitia were chiefly in the hands of the plebeians, and so served originally as a counterpoise to the powers of the comitia curiata, for which purpose they were first instituted, it is said, by the king Servius Tullius. These comitia quickly attained the chief importance, and public matters of the greatest moment were transacted in them, as the election of consuls, prætors, etc. The comitia tributa were the assemblies of the plebeian tribes. According to tradition, they were first instituted after the expulsion of the kings, and in them were transacted matters pertaining to the plebeians alone, as the election of their tribunes, etc.

Comity of Nations. See INTERNATIONAL LAW, PRIVATE, by PRES. T. D. WOOLSEY, S. T. D., LL.D.

Comman'der, in the British navy, is an officer next under a captain in rank, but independent of him. He is, in effect, the captain of a ship of war under eighteen guns, or of a sloop of war or a bomb-vessel. In matters of etiquette he ranks with a major of the army. The duties of a commander on shipboard are almost exactly the same as those of a captain.

In the U. S. navy a commander is of the grade next below that of captain, and next above that of lieutenant-commander. He takes rank with a lieutenant-colonel of the army.

Commander-in-Chief, a title given to the officer in whom is vested the supreme command of all the land or naval forces of any nation. In Great Britain he is appointed by the sovereign and holds office for life. His duties have never been clearly defined as distinguished from those of the cabinet minister who presides over the war office. He is responsible to the Crown for the discipline and efficiency of the army. The office of the commander-in-chief, technically called "Horse Guards," comprises the departments of the military secretary, the adjutant-general, and quartermaster-general. Great changes have recently been effected in the status of the commander-in-chief, who has lost his separate official abode, and is now more completely subordinate to the secretary of war and responsible to Parliament. The office is usually vacant, and its duties performed by a "field-marshal commanding in chief." In the U. S. the President is the commander-in-chief.

Commandite [from the Late Lat. *commenda*, a "trust"], **Société en,** in France, a word used to express a partnership in which a person advances capital without taking charge of the business. In this country a person thus connected with a firm is termed a special partner. (See PARTNERSHIP, by PROF. T. W. DWIGHT, LL.D.)

Commandments. See DECALOGUE.

Commandments of the Church are rules imposed upon the laity of the Roman Catholic Church, which are regarded as just as binding as the Decalogue. They are frequently called the five commandments, and are variously given; those most commonly taught are as follows:

"1. The Catholic Church commands her children on Sundays and holy days of obligation to be present at the holy sacrifice of mass, to rest from servile works on those days, and to keep them holy.

"2. She commands them to abstain from flesh on all days of fasting and abstinence, and on fast days to eat but one meal.

"3. She commands them to confess their sins to their pastor at least once a year.

"4. She commands them to receive the blessed sacrament at least once a year, and that at Easter or during the paschal time.

"5. To contribute to the support of their pastor.

"6. Not to marry within the fourth degree of kindred, nor privately without witnesses, nor to solemnize marriage at certain prohibited times."

Commen'da [Late Lat. *commenda*, a "trust," from *commendo*, to "entrust"] was originally the conferring of a vacant benefice for temporary administration on a clergyman already provided with one; afterwards it came to be the bestowal of such a benefice for a long period or for a lifetime. As, however, after the eleventh century abuses crept in, and influential ecclesiastics especially availed themselves of the commenda to increase their incomes, it was found necessary to oppose it. This was done by Gregory VII. and Innocent X., and also at the Councils of Constance and Trent. Formerly in the Church of England, when a clergyman was promoted to a bishopric, all his other preferments became void, but the interest in the living was retained by its being *commended* to the care of a bishop (called the commendatory) by the Crown till there should be provided for it a proper pastor. Such a living was called an *ecclesia commendata*, and it was said to be held *in commendam*. The holding of benefices and livings in commendam in England has been abolished by law. Among the ecclesiastical orders of knights the name *commenda* (commandery) was given to the domain over which the members (*commendatores*) exercised jurisdiction.

Commen'sal [from the Lat. *com* (for *con*), "together," and *mensa*, a "table"], a term recently (1870) introduced into natural history to denote those small animals, sometimes mistaken for parasites, which accompany or attach themselves to others, not to prey upon them, but to share their prey. The word means a "table-companion." Thus, a Siluridan fish of Brazil, of the genus *Platystoma*, accommodates in the cavities of his mouth quite a family of small commensal fishes, of a species to which the name *Stegophilus insidiosus* has been given, which take toll of his food as it passes to his throat.

The term commensal was originally applied to certain court-officers of France who were furnished with food at the king's table.

Commen'surable [Lat. *com* (for *con*), "with," and *mensura*, "measure"], applied to magnitudes measurable by a common unit. It is one of the inscrutable things in geometry that there are magnitudes of which the relations to each other are determinate, yet incapable of numerical expression. Such magnitudes are said to be incommensurable. Magnitudes, on the other hand, of which the relations to each other can be numerically expressed with exactness, are called commensurable. By this is meant that, in the case of such magnitudes, there exists some smaller magnitude capable of being contained in each an exact number of times, without, in either case, a fractional excess. But no linear dimension, however small, is small *enough* to be a common measure of the diagonal and the side of a square, or of the diameter and the circumference of a circle. These pairs of magnitudes are therefore examples of relative incommensurability. In reasoning upon cases of incommensurability, the method of proceeding is to show that what we mean to prove of a magnitude incommensurable with another is very nearly true of either of two magnitudes commensurable with that other, the one greater and the other less than the incommensurable; and that the approximation to the truth is closer and closer as these commensurables are taken more and more nearly to the incommensurable. This approach can be carried so far that the commensurables shall differ from each other by less than any assignable quantity; while yet the incommensurable will always lie between them; and as the proposition to be proved is not true of the larger of the two commensurables, because that is too large, nor of the smaller, because that is too small, we infer that it must be true of the incommensurable, which is always smaller than the larger commensurable, and larger than the smaller. Very many of the quantities symbolized in mathematical investigations—*e. g. sines, cosines, logarithms*, and (generally) *roots*, are incommensurable with each other, with the quantities from which they are derived, and with any common unit.

F. A. P. BARNARD.

Commentry, a town of France, department of Allier, on the Œil, 8 miles S. E. of Montluçon, in the centre of important coal-fields. It derives its prosperity from coal-mines and iron-works, and has increased rapidly in recent times. Its manufactures of looking-glasses are very celebrated and remunerative. Pop. 9978.

Com'merce [from the Lat. *commercium*, *merx*, "traffic, merchandise"], the exchange of commodities with foreign nations. Common usage distinguishes between trade and commerce by assigning the former to the land and the latter to the ocean, whence the contrast of *domestic* and *foreign*. Trade includes every kind of exchange or sale of property, by barter or otherwise, between individuals or communities, while commerce refers more appropriately to trade carried on by ships. Water-transport on the great lakes of North America is called inland commerce. Commercial treaties are treaties between different nations regulating their mutual tariffs on merchandise exchanged, or sold by one to the other. In this article commerce is considered as trade and intercourse between nations by sea; briefly, the trade in imports and exports, or international trade. "Commerce," says Galiani, "owes its rise to the necessity of exchanging the surplus of our commodities for those we stand in need of, and may be defined the interchange of the produce of general labor to provide for the wants of all."

The desire of wealth has always been the most constant and most influential motive and spur to human exertion; and the possession of it, both with nations and individuals, has proved to be the synonym of power in all achievements, whether of peace or war. Gold and silver being the most palpable evidences of wealth and its most convenient forms, to possess them in abundance has been an object of universal ambition in all ages. Hence the various methods by which their acquisition might be assured have been subjects of attentive investigation by economists and statesmen. Before the rise of commerce the only kind of intercourse that nations held with each other was aggressive. There were but two sources of national wealth: one was the cultivation of the land; the other, mutual invasion and pillage. Military expeditions were organized on a vast scale for no other purpose than that of despoiling opulent states which were not prepared for self-defence. Cyrus (B. C. 537) led the Persians to the conquest of the rich provinces of Asia for the express purpose of plunder. He distributed the treasures of conquered kings among his generals, grandees, and most daring soldiers. The Romans did likewise. "Masters of the world, they arrogated to themselves all its treasures. Having heard of the immense wealth of Ptolemy, king of Egypt, they passed a law by which they constituted themselves the heirs of a living monarch, and confiscated the dominions of an ally." (*Montesquieu.*) The Romans had no commerce and few arts. They were constantly at war to procure citizens, women, and lands; and every successive war enabled them to undertake a new one. Such was the state of the world to which commerce put an end. It converted jealous and hostile nations into amicable communities, and displaced the atrocities of war by the industries and the arts of peace. It rid the ocean of pirates, established a police of the seas, and gave birth to navigation. (See HANSEATIC LEAGUE.)

The earliest authentic date assigned to the rise of commerce is about 1000 B. C. The Phœnicians occupied a narrow strip of land between Lebanon and the Mediterranean Sea. They were an ingenious race, remarkable for intellectual activity and industry in the arts, whereby they acquired great wealth. Their proximity to the sea disposed them to maritime adventure, and they became skilful sailors. Their commercial expeditions extended to India (Ophir), and they are said to have doubled the Cape of Good Hope in a voyage of three years, returning home by the Pillars of Hercules (Straits of Gibraltar). They carried on commerce with the British Isles and the shores of the Baltic. They established colonies on Crete and Cyprus, in Sicily, Sardinia, the south of Spain, and on the coast of Africa, of which Carthage was the most celebrated, surpassing in splendor and the power of its arms even the famous cities of Tyre and Sidon. In that age of the world there was no safety for accumulated wealth and treasure but in the power to defend them. Universal rapacity was the law, and superior strength the justification of invasion and pillage. But the Phœnicians maintained themselves for near 800 years against the surrounding barbarians, and ruled the sea by their merchant-fleets. When at last they fell under the repeated attacks of their enemies, they carried their wealth, their arts, and their industries to the nations that inherited their commerce. But these nations themselves soon became the prey of Rome, and shared a common fate with all the colonies of Phœnician industry and enterprise. With the fall of Carthage may be said to have terminated the career of ancient commerce. "When the genius of Rome," says Ganilh, "grounded on the ruins of Carthage the conquest of the world, the sources of wealth were dried up in Europe, in Asia, and in Africa, because those countries had no longer any commercial communication. The treasures which Rome had gathered by the plunder of all nations did not prove a source of wealth to any country; they fertilized no lands, improved no kind of industry, and did not extend the bounds of civilization in any one respect. They were consumed in appeasing the sedition of the cohorts and saving the empire from the successive depredations of its barbarian invaders. From the destruction of Carthage to an advanced period in the Middle Ages, an interval of more than thirteen centuries, the sources of wealth were dead throughout the Roman empire, which at that time embraced the known world. It was not till the twelfth century, when Venice, Genoa, and Pisa were greatly enriched by the Crusades, that those sources revived, and Europe was again indebted to foreign commerce for prosperity and wealth. Those cities, and Florence, acquired great wealth by their commerce with the produce of the East and North. They dictated laws to the Greek empire, commanded the respect of the greatest monarchs, and held the fate of Europe in their hands for more than three centuries. But they became involved in ambitious rivalries and expensive wars, and were finally reduced to their territorial limits and local industries. They had, however, established numerous factories in the north of Europe at Lübeck, Bruges, Bremen, Hamburg, and Antwerp, from which sprang the Hanseatic League."

The introduction of the mariner's compass by Flavio Gioja, an Italian, in the year 1302, gave a new and powerful impulse to maritime adventure. The Portuguese were the first to avail themselves of this great aid to navigation, and to push out from the shores on the broad and unknown ocean. They discovered the islands of Porto Santo and Madeira, and soon after took possession of the Azores. Their voyages extended to the coast of Upper Guinea and Congo, from which Bartholomew Diaz reached the "Cape of Storms," which King John II. renamed the Cape of Good Hope. Eleven years later, in 1497, Vasco de Gama made the sea-passage to the East Indies, and established on the coast of Malabar the first European commercial colony; and three years later Cabral discovered and took possession of Brazil in the name of the king of Portugal. In the following ten years the Portuguese established colonies and factories on the island of Ceylon and the coast of Coromandel, at the same time subjecting the spice-bearing Molucca and Sunda Islands. Lisbon then became the chief seat of commerce in the world. But the most important maritime enterprise that had ever yet been conceived, and which was destined to exert a greater influence over the world than any other of ancient or modern times, was that of Christopher Columbus, a native of Genoa, who set sail from the Andalusian harbor of Palos on the 3d of August, 1492, in three small vessels, to accomplish a passage to the Indies by a due western course round the globe. His patron, Queen Isabella of Spain, invested him with the title of Great Admiral and Viceroy of all the lands and islands that he might discover, and the tenth part of the revenue that might be derived from them. The result of this memorable expedition was the discovery of the western continent of America. Numerous adventurers followed in the track of Columbus; among others, Balboa, who crossed the Isthmus of Panama and was rewarded by a sight of the Pacific Ocean. Magelhaens, a Portuguese, passed through the straits which bear his name at the southern extremity of South America, and accomplished the first circumnavigation of the globe by reaching the East India Islands (1514). These discoveries were followed by the conquest of Mexico by Cortez (1520), that of Peru by Pizarro (1529), and of Chili by Almagro (1535). All these expeditions were characterized by frightful atrocities on the part of the Spaniards, and a fearful destruction of the native populations. A cruel though well-deserved fate befell the chief actors in these bloody scenes. Cortez was recalled to Spain, and died neglected in 1547; Francis Pizarro and his brother quarrelled with Almagro and beheaded him; the son of Almagro, in revenge, killed Francis Pizarro; and his brother, the last Pizarro, was hung by a priest who was sent out as governor of Peru by Charles V. One of the consequences of the conquest of Mexico and Peru was an immense addition to the amount of gold and silver, resulting from the working of the rich mines of those countries, whereby the values of commerce underwent a material change. The trade of the world was led into new currents. Portugal, Spain, the Netherlands, and Great Britain became centres of wealth and commerce (for particulars of which see, severally, the countries named). Of modern commercial nations, England occupies the first place. Her proud title of "mistress of the seas" has been well earned by the energy with which she has carried her arms and arts into all regions of the globe. But her policy has not always been free from the reproach of violence. She has not hesitated to extort commercial treaties at the cannon's mouth when she has failed to obtain them by amicable means.

The commerce of the U. S. originated with the separa-

tion of the colonies from the mother-country. While they were subject to British domination the people were prohibited by act of Parliament from engaging in any kind of manufactures. In 1719–32 the British merchants complained in memorials to the government that the people of Massachusetts, New York, Connecticut, Rhode Island, and Maryland were setting up manufactures of woollen and linen clothing for the use of their own families, and of flax and hemp for coarse bags and halters. Parliament prohibited the exportation of hats from the colonies, and trading in them from one colony to another by ships, carts, or horses. Iron-mills for slitting and rolling and plating forges were prohibited under a penalty of $2500. Among the grievances recited in the Declaration of Independence was that "the king had cut off our trade with all parts of the world." Such were the difficulties with which the infant commerce of the country had to struggle. In 1789 the whole tonnage of the country did not exceed 201,562, but the wars of the French Revolution breaking out about this time, and England soon becoming involved as one of the belligerents, the American came to be the only neutral flag on the ocean, and the tonnage increased rapidly, reaching near 1,000,000 in 1800. For a succession of years following this date the harvest-fields of Europe were trodden under the feet of hostile armies, which created an active demand for American breadstuffs. In the first decade after 1789 the united exports and imports of the U. S. aggregated near $1,000,000,000. The nation was almost without manufactures, and it was regarded by a large party as a significant indication of its true policy that it was able in the short space of ten years to pay for near $500,000,000 of foreign manufactures exclusively with the products of agriculture. The following statement shows the progressive development of the commercial capacity of the country in tonnage by decades, coincidentally with the aggregate of its foreign trade:

	Tonnage.	Foreign trade.
1789	201,562	$43,205,156
1800	972,492	162,224,548
1810	1,424,748	152,057,970
1820	1,280,167	144,141,669
1830	1,191,776	144,726,428
1840	2,180,764	239,227,455
1850	3,535,454	330,037,038
1860	5,353,868	762,288,550
1869	4,107,336	1,003,066,748 *

The ocean-carrying trade of the U. S. is divided between American and foreign vessels in the proportion of about one-third to the former and two-thirds to the latter. During the late civil war the commercial flag of the U. S. was driven from the ocean by the hostile policy of the British government in allowing its colonial ports to be used as a base of operations by a class of armed pirates which had no lawful home or status on any land. In consequence of this fact, a large proportion of the tonnage of the U. S. was transferred to foreign flags, and at the close of the war there were found to be legal difficulties in the way of its restoration. A singularly rapid development of the commerce of the U. S. began about the year 1850. Up to that time the yearly foreign trade had scarcely exceeded an average, except in a few instances, of $200,000,000 a year. In 1851 it rose to $400,000,000; in 1860, to $762,000,000; and in 1866, to over $1,000,000,000. This rapid increase, if not developed under circumstances positively inauspicious, received no encouragement whatever from any general causes or principles connected with political or civil administration. It is foreign commerce, and foreign commerce only, that maintains in any country that healthy state of exchange with the common markets of the world which alone is compatible with the preservation of a prosperous state of industry, labor, manufactures, and trade at home. A continuous adverse balance, involving a constant drain of the precious metals to other markets, is the precursor of inevitable derangement and disorder in the finances, which cannot possibly have any other effect than to drag down the best devised system of domestic trade and labor, and plunge it into hopeless ruin. Since the year 1846 the commerce of the U. S. has been perpetually exhausted of the precious circulation which gives it vigor and life, as the blood does the human system. The Independent Treasury policy of finance takes from commerce, on every return from its foreign adventure, the gold which it has earned, and which ought to be allowed to return into its service to reinvigorate its strength, and locks it up a dead, unprofitable mass, worth no more in its abstraction from use than it was while it yet slept unknown and undreamed of in its native bed among the mountains and sands of the Pacific coast. There is no instance in all the records of history, from the most ancient times, in which this policy of robbing commerce of its precious earnings has not resulted in paralyzing its energies, destroying its hopes, and prostrating the labor, the manufactures, the industries, the arts, and the trade of the nation. It is a self-evident proposition that the circulation of the medium, and the circulation of the commodities which are their object, must be coincident. The one cannot be obstructed or stagnated without involving paralysis of the other.

In political economy, commerce is the coefficient of both production and consumption. It gives life and value to both. While treating of commerce in the restricted sense of foreign trade, we cannot lose sight entirely of its elementary idea of distribution as the simple agent of exchange. But for it production would be limited to the extent required for the mere subsistence of the people. All beyond that would be dead and valueless. Consumption likewise would be limited, since each country would have nothing to consume beyond a supply for immediate wants. It is man himself who is the primary object of development. In proportion as his nature expands he experiences new desires, and employs himself in new devices and arts for their gratification. History furnishes a sad picture of those nations and races of men which have restricted themselves to a single occupation, as of hunting or fishing, or even of agriculture. "Whatever be the kind of labor they are employed in," says Ganilh, "wealth cannot be acquired, increased, and preserved among any people but when commerce, bringing foreign in exchange for the national produce, affords greater means of subsistence, more comforts and enjoyments, and particularly when it directs their labor to new objects, with the utility of which they were unacquainted, and in which they find new instruments of exchange and wealth. Such has everywhere been the progress of labor, civilization, and wealth."

In our own time commerce has set in motion those immense tides of emigration which have transplanted the excess of population in the older countries of Europe to the boundless fields of production in America and Australia, brightening the destiny of millions of our race, and essentially banishing the spectre of famine from the face of the earth. With one hand it has joined the navigation of European waters with that of the Indian Ocean by the canal of Suez, while with the other it has brought the countless populations of Eastern Asia into contact with the influences of modern thought and the improvements of modern science. It has changed not only the physical relations, but the social and moral destiny, of more than half the inhabitants of our globe.† There are, in reality, few great achievements of modern enterprise that do not owe their conception to the incitements of commerce. The canal of Suez and the transport of the Isthmus of Darien are directly designed to facilitate commerce by avoiding the desolate and dangerous navigation of the great Southern Ocean; and their success to this end is attested by the fact that the sailing-distance saved by them supersedes a navigation equal to the entire circuit of the globe. The government of the U. S. is now pushing forward scientific surveys of the Isthmus of Darien with a view to the construction of a ship-canal to unite the two great oceans. No doubt is entertained that this grand and beneficent project will be carried to successful completion within a few years. Another very important measure, or series of measures, has been originated by the Senate of the U. S. in aid of the extension of the national commerce. A commission was appointed in Mar., 1872, in pursuance of the recommendation of the President, to examine minutely and to take testimony on the subject of improving the transportation-routes from the interior of the country to the seaboard. The result of the inquiry is given in two large volumes published by order of Congress. The committee report, "That after a most careful consideration of the merits of the various proposed improvements, they have come to the unanimous conclusion that the following are the most feasible and advantageous channels of commerce to be created or improved by the national government in case Congress shall act upon this subject—viz. (1) The improvement of the Mississippi River; (2) a continuous water-line of adequate capacity from the Mississippi River to the city of New York *viâ* the northern lakes; (3) a route adequate to the wants of commerce, through the central tier of States, from the Mississippi River, *viâ* the Ohio and Kanawha rivers, to tide-water in Virginia; (4) a route from the Mississippi River, *viâ* the Ohio and Tennessee rivers, through Alabama or Tennessee, to the ocean." The total cost of these improvements is estimated by the committee at from $120,000,000 to $155,000,000. The committee rec-

* Of this sum, the imports ($437,640,935) are valued in gold, while the exports are valued in currency. This aggregate belongs to the year 1866.

† It is computed that of the 1,000,000,000 of the existing human race on the earth, more than 600,000,000 occupy the southern and eastern parts of Asia and the islands of the Pacific Ocean. The population of China and British India alone is computed at 680,000,000. (*Whitaker.*)

ommend that these "four great channels of commerce shall be improved, created, and owned by the government, and stand as permanent and effective competitors with each other, and with all the railways which may be within the range of their influence." (For details and particulars of these projects, see SENATOR WINDOM'S "Report," in 2 vols., 1874.) The commerce of the U. S. has never, like that of England, enjoyed the subsidies of the government. It has been developed by private enterprise alone. The official yearly volume published by the government on "Commercial Relations" contains statements of the foreign trade of all nations with which intercourse is maintained by the U. S.

J. S. GIBBONS.

Commerce, a game played with cards and counters; of the latter, each player puts an equal stake into the pool. The dealer is called the banker, gives each player three cards, and then inquires, *Who will trade?* The eldest hand can either *barter* or *trade for money*. Barter means the exchange of a card with the right-hand player, and cannot be refused unless the right-hand player declines the exchange. To *trade for money* is to forfeit a counter to the pool for the privilege of exchanging a card for one in the stock or pack. When the trading and bartering is completed, three like cards are reckoned as a *tricon*, and the best tricon wins the pool. If there is *no* tricon, the best sequence of three cards in the same suit will win; and if there is no sequence, the best *point* takes the pool; that is, the three cards having the smallest number of pips—aces reckoned as 11, and court-cards as 10—but the rules vary in different sets of players.

Commerce, a township and post-village of Oakland co., Mich., on the railroad between Bay City and Toledo, and 28 miles N. W. of Detroit. Pop. of township, 1392.

Commerce, a post-village, capital of Scott co., Mo., on the Mississippi River, 154 miles below St. Louis. It has one weekly newspaper, and manufactures flour, leather, pottery, shingles, etc. Pop. of township, 1267.

Commerson (PHILIBERT), a French botanist, born at Châtillon-les-Dombes Nov. 18, 1727. He accompanied as naturalist the expedition of Bougainville, which sailed in 1767, and he visited South America and explored Madagascar, etc. He died in the Isle of France in 1773, leaving some works in manuscript. Commerson was a man of profound science. An exceptional honor was conferred on Commerson by the French Academy of Natural Sciences in electing him a member notwithstanding he had never sent them a memoir. Unfortunately, when this distinction was conferred he had been already eight days dead. Forster gave the name *Commersonia* to a genus belonging to the order Byttneriaceæ, several other botanists having previously established genera bearing this name, but Forster's genus alone has stood the test of critical study, and still bears the name.

Commina'tion [from the Lat. *comminor*, to "threaten," because in it God's threatenings against sin are repeated] is the name of a penitential service in the Liturgy of the Church of England. In that of the Protestant Episcopal Church of the U. S. it is nearly all omitted. The commination in the English Book of Common Prayer comes with little change from the old missals of Sarum and York. The Greek and Latin churches retain the commination, but only for Ash-Wednesday. The commination is in substance a repetition of the curses found in Deut. xxvii., and at the reading of each sentence the congregation responds *Amen*. It is read in the English Church upon Ash-Wednesday, and upon such other days as the ordinary shall direct. Its use is traced back to about 700 A. D.

Commines. See COMINES.

Comminges, Counts of, in French history, a noble family whose descent can be traced from the sixth century.—BERNARD, the fourth count of Comminges, was an Albigensian, and fought on the side of Raymond of Toulouse, his relative, against Simon de Montfort, but after the battle of Muret (1213) was compelled to recant at Narbonne, and become a Catholic. In 1218 he took arms and recovered a part of his ancestral domain, and in 1219 commanded the victorious Toulousans at Basiège. We also find him waging a long war with the count de Foix. D. in 1226. After his time the family never attained much importance in French history.

Commire (JEAN), born at Amboise, in France, Mar. 25, 1625, became a Jesuit, and was for many years a teacher of theology, remarkable for his frank and upright character and for spirituality. Died in 1702 in Paris. He is now remembered only for his Latin poems (*Poemata*, 1678), which are mostly upon religious and moral themes, and are remarkable for elegance of diction rather than for power or originality. He produced some fine Latin fables in verse.

Commissa'riat [Fr., from *commissaire*, a "commissioner"], a term originally meaning a "commissionership," has come to be applied to that department of the military administration which has in charge the furnishing of food for the men. The other supplies of the troops, including forage for horses, etc. (with the exception of ordnance stores), are furnished by the quartermaster's department. In ancient Rome the quæstors attended to the victualling of the troops. The first English commissary-generals were called provant-masters. The British commissariat is now under the charge of a commissary-general-in-chief. That of the U. S., at present, is under an officer who has the rank of a brigadier-general and the title of commissary-general of subsistence. The accounts of the U. S. commissary officers are referred for settlement to the third auditor of the treasury department. (See SUBSISTENCE OF ARMIES.)

Com'missary [Fr. *commissaire*], a term nearly synonymous with deputy, signifies one to whom the power and authority of another is committed. It is sometimes used in a sense nearly equivalent to that of commissioner. In the army the officers of the commissariat department are styled *commissaries of subsistence*. The officers having charge of musters in and out are *commissaries of musters*. In ecclesiastical law, a commissary is appointed by a bishop to exercise jurisdiction in remote parts of the diocese. A papal commissary is a bishop or other high functionary deputed to perform duties properly belonging to the pope. There are *temporary* commissaries appointed for the performance of a single act or a few particular acts; and *perpetual* commissaries, who regularly represent the pope or some superior prelate in a specified place or district. Often the duty of a commissary is performed by a board of officers, who together constitute a *commission*.

In Scotland the sheriff of each county is called also *commissary* of that county. When the Reformation drove the papal commissaries from Scotland, there was established a supreme commissary court in 1563 for administering the law in such cases as had been formerly decided by the ecclesiastical courts of the papal representatives. The commissary court gradually lost its powers, its duties being performed by the civil courts. In 1836 it was abolished; but there are still commissary courts for the counties, presided over by the sheriff. They transact some of the business which in the U. S. comes before the probate courts.

Commis'sion [Lat. *commissio*, from *committo*, *commissum*, to "commit"], the act of committing or performing; also a writing, generally in the form of a warrant or letters-patent. Instruments bearing this title are issued by the executive to officers in the army and navy, judges, and others. The term is sometimes applied to a number of persons joined in an office or trust. All the officers of armies above the grade of sergeant hold their authority by warrants called commissions, and hence they are called *commissioned officers*. The practice of buying and selling all commissions under the rank of colonel formerly prevailed in the British army, but it was abolished by royal warrant, against the will of the House of Lords, in 1871.

COMMISSION, in law. See TRUSTEES, by PROF. T. W. DWIGHT, LL.D.

Commis'sion Mer'chant, Agent, or **Factor,** a person who sells goods which belong to another party or person, by whom they have been consigned to him for that purpose. The owner of the goods is called the consignor, and the commission merchant the consignee. The latter receives for his services a percentage on the sum for which the goods are sold.

Commissionnaire [Fr.], an attendant at European hotels, employed to attend at the arrival of railway trains and steamboats to secure customers, to take charge of baggage, see it passed through the hands of the custom-house officers, and send it on to the hotel; for which services the commissionnaires charge a fee. They likewise procure visés to passports, and act as valets-de-place.

Com'missure [Lat. *commissura*, a "joining together," from *com*, "together," and *mitto*, *missum*, to "send"], in anatomy, the union of any two parts or the structure which unites any two parts. Thus, at the outer and inner angles of the eye there are *commissures* between the lids; and in fact the angles of the eye, the mouth, etc. are often spoken of as the commissures of the lids, the lips, etc. Among the parts named commissures are the following: the *commissura simplex*, a little lobe of the cerebellum situated near the posterior incisure, and forming a part of the superior vermiform process; the *commissura brevis*, a lobule arising from the inferior vermiform process of the cerebellum, within the posterior incisure; the *great commissure* of the brain, called often *corpus callosum*, which unites the hemispheres of the cerebrum; the *anterior, middle* or soft, and *posterior commissures* of the brain, bands which cross the cavity of the third ventricle; the *optic commissure*, or chiasma, the point of the decussation of the optic nerves.

Committee. See INSANITY, by PROF. T. W. DWIGHT.

Com'modore, in the British navy, is a title given to the senior captain of a squadron when there is no admiral present. It is not a permanent rank, but is bestowed for a time on a captain. A commodore usually commands more ships than one, detached from a fleet on some special service; and he then hoists a pennant. In the U. S. navy the title of commodore was formerly given by courtesy to a captain commanding a squadron. The office was recognized by law in 1862, commodores taking rank next below rear admirals, and next above captains. Their rank corresponds to that of brigadier-general in the army. (See ADMIRAL.)

Com'modus (LUCIUS ÆLIUS AURELIUS), a Roman emperor, born in 161 A. D., was the son of Marcus Aurelius and Faustina. He was carefully educated. He succeeded his father in the year 180, and soon manifested the excessive cruelty and sensuality of his disposition. His wife Crispina and many other innocent persons were put to death by his order. He abandoned the government to Perennis and other favorites. Assuming the title of Hercules, he claimed from his subjects divine honors. His officers Eclectus and Lætus conspired against him, and caused him to be strangled in 192. He was succeeded by Pertinax.

Common. See HEREDITAMENTS INCORPOREAL, by PROF. T. W. DWIGHT, LL.D.

Common Carriers. See CARRIERS, COMMON, by PROF. T. W. DWIGHT, LL.D.

Com'mon Coun'cil, a name given in some cities of the U. S. to one of the governing bodies which control the municipal and local affairs. The other is sometimes called select council.

Com'moner, one of the common people, applied in general to all persons except the hereditary nobility; also a student of the second rank in the University of Oxford (England), who pays for his board or *commons* and other charges. The term "great commoner" has been applied to the English patriot Hampden, and to the elder William Pitt before he entered the House of Peers.

Common Law. See LAW, by J. N. POMEROY.

Common Pleas, Court of. See COURTS, by GEORGE CHASE, LL.B.

Common Prayer, Book of, a collection of all the forms of worship used in the Church of England. The King's Primer, published by Henry VIII. in 1546, was the first form of this book, but it contained only the Creed, Lord's Prayer, Commandments, and Litany. Edward VI. had this primer twice revised and republished (in 1549 and 1552), and his second Liturgy is very similar to that which now exists. He caused the Sentences, Exhortation, and the Confession and Absolution to be prefixed to the Daily Service, and introduced the Decalogue into the Communion Service (1548). At this time certain Romish customs were abolished. In the reign of Elizabeth the Liturgy was again revised (1559), but with few alterations. After the conference with the Presbyterians at Hampton Court, James I. instituted another revision, and added the explanation of the sacraments in the Catechism (1604). It was again revised under Charles I. (1633). After the restoration of Charles II., when a conference had been held with the dissenters at the Savoy, the Common Prayer-Book was further revised in 1662. Certain forms were added, and slight changes were made in the services; and a very few have been made since that time. A revision was made under William III., and several changes proposed, but they were rejected by convocation (1689), and have not been restored. The Protestant Episcopal Church in the U. S. has adopted the Anglican Prayer-Book with a few modifications.

Com'mons, the dinner provided in English colleges and inns of court for their members. In the inns of court it is provided only during term. Separate tables are appointed for the benchers, the barristers, and the students.

Common Schools. The aim of common schools is to provide elementary instruction for all the children of proper age in the community. Such schools were unknown in ancient nations. "The wisdom of the Egyptians" was not for the mass of the people. Babylon and Nineveh and the Medo-Persian empire won renown by their victories in arms, but not by educating their inhabitants. The schools of Athens were for those who had the wealth and leisure to profit by them. Sparta cared for the bodies of her children, but neglected their minds. Rome trained her citizens to be soldiers, rather than scholars; they were masters of the pilum rather than of the alphabet.

The origin of common schools is found in the Christian Church. Christianity, in its ideal, and as illustrated in the life of its Founder, is the religion of beneficence. It recognizes the value of every human being, and esteems the man as more than the accident of his birth or rank; and it aims to benefit him for the whole period of his existence. With this estimate of man, and with the beneficent impulse received from the teachings and the example of their Master, the Christian clergy very early acknowledged and assumed the duty of educating the people. Synods and councils of the early Church frequently enjoined this duty, and directed that it should be performed gratuitously, especially for the poor. One council ordered that a grammar school should be established in connection with every cathedral, a parochial school in every town and village, and other schools wherever opportunity could be found. These schools were to receive as pupils the poor and the rich without distinction. By this means large numbers were able to gain knowledge who would otherwise have been doomed to perpetual ignorance. But it was easier to command universal education than to secure it. The difficulty of bringing under instruction the scattered population of rural districts was almost insurmountable. Yet the early servants of Christianity attempted the education of all. Wherever they went they founded both churches and schools. Some of their schools took the form of monasteries, which were at once the academies, the libraries, and the universities of those early times.

The schools thus established had very slight resemblance to the common schools of our times. The instruction was meagre, and pertained largely to church dogma and scholastic theology. Books were few and costly, being necessarily in manuscript. Education could not have the fulness and completeness that are now easily possible. Ideas were relatively few, and were restricted to a narrow range of subjects. The schools resembled the parish schools of later times, rather than the common schools of this day. As they were under church control, they were in fact church schools. When wars and civil commotions incident to the unsettled state of society interrupted them, as was frequently the case, their influence was diminished, and ignorance extended its sway. But the fundamental idea of *educating all the people* was never lost. The Church of those early centuries never fully accomplished what it attempted, but that grand idea was so deeply planted in the convictions of the Christian world that it could not be plucked up. The development of that idea has given to the world the modern school-system. In this way the common school is the outgrowth of the Christian Church.

The invention of the art of printing greatly increased the facilities for teaching all the people. Books ceased to be the exclusive possession of the few, for a single volume no longer represented the labor of months for its mere reproduction. But the Reformation, with the intense mental activity which it induced, gave to popular education its strongest impulse. The Reformers previous to Luther had used their influence in favor of universal instruction, but his efforts in the same cause were most effective, as his influence was greatest. His ideas respecting schools were far in advance of any previously maintained, and were nearly identical with those now upheld in Germany and the U. S. He advocated the maintaining of schools by the *civil government*, rather than the Church. Through his influence a free-school system was established in Saxony as early as 1527, and other German states followed the example, particularly those in which the Reformation became predominant. In the early part of the next century the Germans were probably the best-educated people in Europe. The religious wars which so largely occupied the first half of that century prevented the development of educational plans, but very soon after these wars ceased many states of Germany renewed their devotion to popular education, and in some of them compulsory attendance laws were passed. The Swiss Reformers contemporary with Luther were zealous friends of schools, and the impulse which they gave to education in their country is still felt. In Scotland, John Knox advocated the founding of schools in every parish at the cost of the Kirk. His views were widely adopted, and more than a century later were substantially embodied in a law requiring such schools, the expense to be divided between the parish and the parents of pupils. The Established Kirk of Scotland has continued these schools from that time, and other churches in that land have established their own schools. Within a few years some changes in the mode of management have been introduced. For a long time the Scotch were the most universally educated people in Europe, but the Prussians now claim that honor. The pre-eminence of Prussia in this respect is of recent origin. The present educational system of Prussia was not put in force till after the conquest of that country by Napoleon in 1806. A similar system had been nominally in force for nearly a hundred years previous, but had not been carried out. Wars rather than schools had filled the mind of the nation, particularly

during the reign of Frederick the Great. As the military spirit has long been dominant in Prussia, the discipline of the schools is essentially military. The state rules its schools as strictly as its army. The complete supremacy over education long exercised by the Church is now exercised in Prussia by the government. The Prussian system is the general model for schools in other parts of Germany.

Within the last few years a remarkable interest in popular education has sprung up in every country in Europe. Only the beginnings are yet seen. Each nation is striving, in its own way, to set up a school-system adapted to its peculiar wants. Many years must pass before the perfected results of these efforts can appear, but the prospect is that the close of the nineteenth century will find common schools maintained for the elementary instruction of all the children in Europe. Other parts of the world, particularly the colonies and other dominions of Great Britain, those regions where American missionaries have extensive influence, and, most wonderful of all, the Japanese empire, are moving in the same direction.

But the most complete and successful trial of the common-school system has been made in the U. S. The first settlers of Massachusetts and Connecticut were hardly established in their new homes before they provided for the education of their children. In the more southern colonies schools were not so highly valued. But the early records of the towns and colonies now included in those two States contain frequent mention of votes and appropriations for maintaining schools. Each town set up its own school, and ere long the colonial legislatures adopted codes requiring a school in every considerable settlement. These schools were not in all respects like the common schools of this day, for many of them provided for instruction not only in reading, writing, and other elementary branches, but in Latin and other studies preparatory for college. Though burdened by poverty, and not seldom by taxation for carrying on inevitable wars, those sturdy pioneers never ceased to uphold their schools. New Hampshire early followed the example of her southern neighbors, and Maine, as a part of Massachusetts, participated in her institutions. Emigrants from these Eastern States settled in Vermont, Northern New Jersey, and the central and western parts of New York and Pennsylvania. Wherever they went they carried with them that New England institution, the public school, and those flourishing commonwealths cordially adopted it. And when Ohio, Michigan, and the States westward of them, even to the Pacific, received their first settlers from the Eastern States, common schools at once appeared in every hamlet. In the Southern States little was done for popular education till after the great civil war which ended in 1865. Before the war many of these States possessed funds for supporting public schools, and made some not very successful efforts to maintain such schools. But, except in a few localities, they had a scattered population, of which a large portion was not permitted to receive instruction, and another large portion was extremely ignorant, and content to remain so. The wealthier class among them was indeed highly cultivated, but wealth was not so generally diffused as in the Northern States, and those who had it could accomplish little for instructing the untrained multitudes around them. But since the restoration of peace these States have made great exertions to establish public schools, and, notwithstanding many hindrances, especially the impoverishment occasioned by the war, and the unwillingness to admit both white and colored children into the same schools, which in the thinly-settled districts can hardly be avoided, many of them are making commendable progress. Every State in the Union, and nearly every organized Territory, has now the beginning, at least, of a common-school system.

The schools in the U. S. differ from those in European countries in that they are established and controlled under State instead of national authority. In Great Britain or Germany the national parliament enacts laws for all the schools in the realm, but no act of the American Congress relates to the establishing or controlling of common schools. Each State passes such laws on this subject as it pleases. Under these State laws a superintendent of schools is appointed for each State (except Delaware), and in most of the States each county has also its superintendent. In the New England States no county superintendents are appointed, but each town has its own school officers. In Arkansas, Louisiana, and Texas, districts composed of from one to fourteen counties have their district superintendents, and in New York each county constitutes from one to four districts, with a corresponding number of superintendents. Most of the larger cities in all the States have their own school superintendents.

The support of schools is derived from various sources. The earliest schools of New England were maintained partly by appropriations from the town treasuries, and partly by rate-bills to be paid by the parents or guardians of pupils, or, if they were unable, by the towns. The rate-bill system was long retained, but is now abandoned in all the States. Schools receive support (1) from the income of permanent funds. Most of the States have such funds, the annual interest of which is expended for education, the principal remaining intact. In some cases counties, towns, or other small divisions of States possess similar funds. (2) The greater part of the cost of schools is provided by taxation. Of this a part is levied (*a*) as a State tax. In some States the avails of certain special taxes, as capitation-tax, licenses, etc., are appropriated for schools; in others a fixed sum, or the amount raised by a certain rate of taxation, or a certain amount for every child of "school age," is distributed among the several counties or towns. (*b*) In some States each county has its separate school-tax. (*c*) Town taxes for schools are levied in most of the States which have organized townships. (*d*) District taxes are frequently levied, both for current and special school expenses. (A district, in this sense, is usually a part of a town.) (3) Besides moneys received from funds and taxes, small amounts are raised by voluntary contributions or subscriptions.

The sources of permanent school-funds may be briefly named. The earliest considerable State fund was established by Connecticut in 1795. A tract of land containing about 5700 square miles, now constituting the N. E. part of Ohio, and known as the "Western Reserve," because Connecticut reserved it when she ceded to the general government all her other public domain, was sold for $1,200,000, and the entire sum was set apart to be a perpetual fund for supporting public schools, the interest alone to be expended. By judicious management the principal of this fund was afterwards increased to over $2,000,000. Massachusetts appropriated a part of her unoccupied lands in what is now the State of Maine for creating a similar fund. In all the newer States one thirty-sixth part of all the land (the sixteenth "section" or square mile in every six-mile-square township) is set apart by national law to be converted into a permanent fund in each State for supporting common schools. In the States most recently admitted, beginning with Minnesota in 1858, *two* sections, the sixteenth and thirty-sixth, in each township, are devoted to this purpose by the terms of the acts of Congress admitting those States. West Virginia, containing no public lands, is an exception. The States which have exercised proper care in disposing of their school-lands have secured magnificent endowments. In some States a large part of this fund has been lost through mismanagement, the faithlessness of officials, or the absorption of it in the expenditures of the late civil war.

The common schools in those States where they are efficiently conducted accomplish quite fully what they attempt. The system provides for (1) the examining and approving of teachers by competent authority; (2) the regular visiting and examining of all public schools by competent officials, who are paid for their services; (3) the maintaining of schools in as many districts or localities as the convenience of the people requires: in this way the children of sparsely settled communities have good school privileges; (4) the establishing of graded schools wherever the population is sufficiently compact to require them: in these schools the range of studies is often so extended in the higher departments as to include history, philosophy, algebra, geometry, French, and astronomy; also drawing and vocal music, which are now finding a place in schools of lower grade; (5) high schools, which, as the highest departments of graded schools or under separate management, are maintained in the larger towns of many States: in Massachusetts they are required by law in all towns containing a certain number of inhabitants; the studies in these schools, besides the higher English branches, sometimes include a complete preparation for entering college; (6) in New York City the public-school system includes "The College of the City of New York." In several States, most notably in Michigan, a State university, including all the departments of scientific and professional education, crowns the system of free public instruction. Most of the newer States received from the U. S. government grants of land expressly for endowing these universities. Additional endowments have in some cases been provided by State appropriations or individual contributions. Pupils of both sexes are admitted to many of these institutions. The tuition fees are usually small, and in some States certain classes of pupils can obtain instruction without charge. Where this is done, the common school system rises by regular gradations to the university and the professional school.

As subsidiary to the common-school system—(1) Normal schools for the training of teachers are established in each of the States except Nevada, the least populous of all. (2) Teachers' associations are formed, teachers' institutes are

held, and educational publications are encouraged in most of the States. (3) Arrangements are made for procuring libraries, books of reference, maps, and charts; also philosophical, astronomical, and chemical apparatus, particularly for the more advanced schools. (4) Uniformity of text-books is secured in some cases for entire States by State authority, more commonly in towns or other small sections by local authority. (5) In several States the law gives the power of compelling the attendance of all children of certain ages for a specified number of weeks each year. Where school-expenses are provided by taxes and the income of funds, compulsory attendance is generally advocated.

The most perplexing question respecting common schools relates to moral and religious training, and results from diversities of religious opinions. As the schools are supported chiefly by taxes levied upon all classes indiscriminately, no one sect can be favored without injustice to all others. But the right moral training of a child is even more important than the culture of his intellect, and common schools cannot safely omit all such training. Nor can it be wisely remitted to other times and places, for the principles of honesty, virtue, truthfulness, and morality are for constant daily use. The problem is to give such instruction as shall be efficient for its purpose, but shall not violate the rights or excite the just apprehensions of any sect. If this can be accomplished, the amount of such training may be too small to give general satisfaction. The idea of universal education was developed, as has been seen, in the Christian Church, and for centuries the Church accomplished nearly all that was attempted for popular instruction. In the U. S., and in Germany since the time of Luther, the state or civil government has taken the place of the Church in the management of public schools. But the old traditional opinion that the right to such management belongs exclusively to the Church has never disappeared. Very naturally, this opinion is held most tenaciously (though not exclusively) in the Roman Catholic Church, and from that source particularly, as well as from others, the demand has come that moneys for supporting schools be divided among the several religious parties, and each be permitted to maintain its separate school. To assent to this demand would be to annihilate the common-school system. In populous communities the plan proposed might educate most of the children, but in thinly-peopled regions they must be educated together or not at all. In truth, neither the Church nor the State has the first right and duty of training children. The family takes precedence of both, and whatever either of them may do for universal education, that earliest of all human institutions can never be superseded, either in its duties or its rights. "The newborn child is placed neither at the door of the church nor on the steps of the court-house, but in the midst of the family."

The difficulty that is experienced in common schools of the lower rank becomes more urgent when higher studies are to be pursued. Both teachers and text-books in such studies as history and philosophy must advance positive opinions, some of which will inevitably conflict with those of a part of the people. There is obvious injustice in compelling people to pay taxes for supporting the teachers of doctrines which they abhor, and in thus depriving them, wholly or in part, of the means for establishing such schools as teach the views which they approve. This religious question is arising in all countries where diverse religions are found, and it is sure to claim increased attention in the future. It does not admit of a ready solution, and perhaps no single solution will ever be discovered. It may assume such proportions as to limit free popular education to a lower range of studies than its most ardent friends have hoped. Surely, the earnestly religious part of the people, who are the firmest friends of schools for all, cannot consent to the total banishment of moral training from the common schools. A severe struggle upon this point is one of the possibilities of the near future. (See SCHOOL SYSTEMS OF BOSTON, by HON. JOHN D. PHILBRICK.)

JOHN G. BAIRD, *Ass't Sec. Conn. State B'd of Education.*

Commons, House of. See PARLIAMENT.

Common Time, in music, that in which each measure or bar contains notes equal in value to one semibreve or whole note; such, for example, as two minims or four crotchets. It is indicated by a large C, placed in the staff immediately after the clef.

Commonwealth', a state, a body politic; properly a free state, a republic. The official title of Massachusetts is the "Commonwealth of Massachusetts," and several other States use the title commonwealth.

Commonwealth of England, in history, the form of government established in England on the death of Charles I. in 1649, and which existed during the protectorate of Oliver Cromwell and his son Richard, until the restoration of Charles II. in 1660. The substitution of a democratic for a monarchical form of government was provided for and enjoined by two successive charters. The first charter of the Commonwealth was drawn up in Dec., 1653, by the council of officers who on the voluntary resignation of the Parliament in the early part of the same year had declared Cromwell "Protector;" it was styled the "Instrument of Government." The second charter, called the "Petition and Advice," was framed in May, 1657, by the Parliament which the Protector had assembled in the previous year. Under the first charter the English government may be classed among republics, with a chief magistrate at its head; under the second it became substantially a monarchy, and Oliver Cromwell from 1657 to the period of his death was virtually king of England.

Commune, a French word signifying "common," is the name of a small territorial division in France. Each canton is subdivided into communes, each of which is governed by a mayor and a municipal council. The law for the organization of communes was enacted in 1791, but communes had existed in French towns before that date.

Commune of Paris, an organized band of socialists, outlaws, and proletaires connected with the International Association who revolted against the new régime or Versailles government on the 18th of Mar., 1871. Paris had a few days before this date been evacuated by the Germans, who had taken it after a long siege. The National Guard of Paris had been permitted to retain their arms, and a large part of that guard supported the Commune, whose head-quarters were in the suburbs of Belleville and Montmartre. Among the prominent leaders of the Commune were Flourens, Félix Pyat, Assi, Delescluze, Paschal, Grousset, General Cluseret, Dombrowski, Arnould, Jules Vallès, Blanqui, and Rochefort. Their principles and aims are thus defined by one who was a member of the Commune: "Their philosophy is atheism, materialism, the negation of all religion; their political programme is absolute individual liberty by means of the suppression of government, and the division of nationalities into communes more or less federated; their political economy consists essentially in the dispossession, with compensation, of the present holders of capital, and in assignment of the coin, land, etc. to associations of workmen." The same writer affirms that "the central committee of the National Guard, exclusively composed of workmen, members of the *Internationale*, has taken the initiative, and alone has the merit of the movement."

As those members of the National Guard who favored the cause of order were irresolute and not inclined to fight, the Communists quickly became absolute masters of Paris. Their ranks were reinforced by many convicts, whom they released from the prisons, and by many foreign refugees. The leaders who had some intelligence, some definite purpose, and some lingering scruples were soon discarded one after another and imprisoned, and the control of the Commune was obtained by desperadoes and outlaws, who initiated a reign of terror. On the 26th of March an election was held in Paris to choose members of the Commune, but as the party of order declined to vote, only 180,000 votes were cast, and the election resulted in the triumph of the insurgents. On the 29th they issued a proclamation in these terms: "The central committee has remitted its powers to the Commune. Citizens: your Commune is constituted. The vote of the 26th of March has sanctioned the victorious revolution," etc. The government organized at Versailles sent an army to suppress the insurrection. On the 2d of April a large body of insurgents marched against Versailles, but they were repulsed at Meudon, and much injured by the fire of Fort Mont Valérien. Gustave Flourens, one of the commanders of the Commune, was killed soon after. The army of the republic began to besiege Paris under the command of Marshal MacMahon. The chief command of the besieged forces was held successively by Dombrowski, Cluseret, Rossel, and Delescluze. Violent dissensions disturbed the counsels and hindered the success of the Commune. On the 5th of April they arrested Darboy, archbishop of Paris, and other persons, whom they kept in prison as hostages. The insurgents, who occupied several forts in the environs, made an obstinate resistance to the besiegers. The official journal of the Commune announced on May 1st that a committee of public safety had been appointed. This committee was composed of five members—viz. Antoine Arnaud, Félix Pyat, Charles Gérardin, Ranvier, and Léon Meillet. Rossel, who bore the title of delegate of war, resigned the command on the 9th of May, and was succeeded by Delescluze. Having captured several of the forts, the besieging army, about 90,000 strong, entered Paris on the 22d of May by several gates, enclosing the insurgents in a great semicircle. The latter continued

for five days fighting behind barricades in the streets, and revenged their defeat by atrocious acts of cruelty and vandalism. They set fire to the public buildings, and endeavored to destroy the ancient monuments and treasures of art. Among the finest edifices that were burned were the Tuileries, the Palais de Justice, the Palais Royal, and the Hôtel de Ville. The Louvre was partly consumed. During the last days of the power of the Commune they shot Archbishop Darboy, Bonjean, president of the court of cassation, and other persons whom they held as hostages. In order to execute their incendiary designs on a grand scale, they ignited petroleum, gunpowder, and other explosive materials in many parts of the city. Delescluze was killed while fighting in the street on the 26th of May. The civil war ended on the 27th, when M. Thiers issued a bulletin stating that 25,000 Communists had been taken prisoners. Large numbers of these were put to death, and several thousand were punished with deportation. The ringleaders of the Commune who survived the battles were mostly arrested and executed. "The Commune," says the "Edinburgh Review" for July, 1871, "has been supremely arbitrary and supremely stupid. In the name of liberty it destroyed every condition of freedom; in the name of the common interests of the city, it reduced that city to the depth of ruin, drove away the wealthier classes, and pauperized the lower. . . . As a means of government the secret committee of the Commune was odious and contemptible, but as an engine of social war it was terrific, for in the frenzy of despair it let loose all the powers of destruction. We shall not attempt to describe in detail the appalling spectacle of Paris as it appeared in the month of May in this year, an awful prelude to the most tremendous catastrophe in the history of man."

The Commune of Paris took a prominent part in the revolution of 1790. After it was constituted by the law of May 21, 1790, it was a political power in the capital which proved itself superior to the lawful authority of the Assembly and the nation. It was in the Commune and the Cordeliers' Club that the real authors of the excesses of the revolution had established their stronghold. From this arsenal of crime came forth the conspiracies and seditious movements which overturned the throne and stained the revolution with the bloody outrage of the 10th of Aug., 1792, and the massacre of September. (See Sempronius, "Histoire de la Commune de Paris," 5th ed. 1871; Beaumont-Vassey, "Histoire Authentique de la Commune de Paris," 1871; "Guerre de Communeux de Paris, 18 Mars–18 Mai, 1871," 1871; Moriac, "Paris sous la Commune," 2d ed. 1871.)

William Jacobs.

Communica'tio Idiom'atum ("conjoint possession of attributes"), the name marking the doctrine that the One person of Christ has conjoint possession of the attributes of the two natures—that the attributes of the two natures are so held together in the One person as *in it* to have fellowship with each other; the person which conjoins the nature conjoins their attributes in itself. The two natures are inseparable, both actively and passively. What is proper to either nature in the abstract belongs to Christ in the concrete; and what the divine, which is the assuming nature, has in itself, the human, which is the assumed nature, has in and through its personal conjunction with the divine. (See Krauth's "Conservative Reformation," 476–481.)

C. P. Krauth.

Communion Service. See Eucharist, by F. A. P. Barnard.

Commu'nipaw, a station in Jersey City, N. J., on the Central R. R. of New Jersey. Communipaw had a famous abattoir or slaughter-house, which supplied great quantities of meat for the New York markets. It was closed in 1874.

Com'munism, the theory which teaches that property should be held in common—a theory which Plato advocates in his "Republic," and which was probably practised before his time by the followers of Pythagoras. In later times the Neo-Platonist Plotinus attempted to establish community of goods upon the plan which had been proposed by Plato. Among the Jews the Essenes and Therapeutæ practised a sort of communism. The first Christian church at Jerusalem for a time made no distinction of property; and, following their example, certain monastic and semi-monastic organizations had their possessions in common. Booddhism and other Oriental religious systems have for ages had followers who have practised a rude communism. In Europe there were numerous mediæval sects of heretics (Catharists, Brethren of the Free Spirit, etc.) who advocated some practice of the kind. Later came the Anabaptists of Münster, the Libertines of Switzerland, the Familists of England. Still later we find the Herrnhuters, the Shakers, the Harmonists, the Buchanites, and numerous other religious communists—some practically successful, and others not. Bacon, More, and other English theorists long ago wrote treatises which looked towards the ultimate establishment of communism, but Robert Owen was the first great advocate of the doctrine in that country. The first French Revolution brought forward a number of communistic theories, but none survived long. In later times, Saint-Simon, Fourier, Louis Blanc, Proudhon, Cabet, and Considérant have been representative French communists. Karl Marx is the best-known German representative of these ideas. It is remarkable that the most successful communistic experiments of modern times have been organized and conducted by those who are inspired by strong religious notions, like the Shakers, Oneida Communists, and Harmonists. The teachings of the great communists of the present century have, however, not been without value, since the highly successful co-operative movements of Europe have been in part guided by the best thought and truest philanthropy of the better class of communistic writers. (See Co-operation, by Thomas Hughes, M. P.)

Commute [from the Lat. *com* (for *con*), "with," and *muto*, to "change," literally to "exchange one thing for another"], in law, to exchange one penalty for another, usually less severe. A sentence of death is often commuted into a long imprisonment. Also, to receive one thing for another; thus officers in the army are allowed so many rations each; these they commute for cash.

Comne'nus [Gr. Κομνηνός], the name of a Byzantine family of Italian origin, from which descended six emperors of the East and all the emperors of Trebizond. (See Alexis I., Andronicus I., Isaac I., Manuel I., and Anna Comnena.)

Co'mo, a province of Italy, bounded on the N. by Switzerland and Sondrio, on the W. by Novaro, on the S. by Milan, on the E. by Bérgamo and Sondrio. Area, 1049 square miles. It consists of the territory about Lake Como and the eastern part of Lake Lugano, and reaches westward to Lago Maggiore. This province contains several magnificent regions; the finest of them is the tract called Brianza, lying between Monza and the two southern branches of Lake Como, which is as much as 25 miles long and from 1 to 3 miles broad, and watered by the Adda. The province produces much silk and wine. The principal industry is the rearing of silk-worms. Pop. in 1871, 480,339.

Como (anc. *Comum*), a city of Italy, in Lombardy, capital of a province of the same name, is at the south-western extremity of the Lake of Como, 24 miles N. of Milan, with which it is connected by a railway. It is beautifully situated in a valley enclosed by verdant hills, covered with gardens and groves of orange and olive trees. On a hill overlooking the town are the ruins of the Castle Baradello, which was destroyed by Frederick Barbarossa. It has a fine cathedral founded in 1396, by the side of which is a clock-tower built in 1463. Here are also an ancient town-hall, a public library, a museum, theatre, and botanic garden. Here are manufactures of cotton yarn, silk and woollen fabrics, and soap. It has a trade by the lake with Ticino and Germany. Pop. in 1872, 24,350. *Comum* was an important town under the Romans. Pliny the Younger and Volta were natives of this place.

Como, Lake [It. *Lago di Como;* anc. *Larius Lacus*], a lake of Italy, in Lombardy, is an expansion of the river Adda, which enters it at the foot of the Lepontine and Rhetian Alps, and issues from the south-eastern extremity of the lake. It is divided into two branches, one of which, extending south-westward, is called the Lake of Lecco. It is 698 feet above the sea, and about 35 miles from Como to the northern end, and is nearly 3 miles wide. Its greatest depth is 1925 feet, the superficial extent 62 square miles. It is celebrated for the beautiful scenery of its shores, covered with elegant villas. Numerous steamboats ply on this water.

Comonfort' (Ignacio), a Mexican general and president, born at Puebla Mar. 12, 1812. He was chosen a member of Congress in 1842, and senator nearly six years later. He co-operated with Alvarez against Santa Anna in 1854, and became provisional president on the resignation of Alvarez Dec., 1855. The clergy and conservatives raised an unsuccessful revolt against Comonfort, who in 1856 issued a decree to confiscate the property of the Church. He was proclaimed constitutional president Dec., 1857, but his power was rendered only nominal by the enmity of the clergy and the disaffection of the army. He was driven into exile Jan., 1858. In 1863 he commanded a republican army against the French invaders. He was killed by bandits Nov. 13, 1863.

Comorn, a county of Hungary, is bounded on the N. by the counties of Presburg and Bars, on the E. by Gran, on the S. by Stuhlweissenburg, and on the W. by Raab. Area, 1146 square miles. It is divided into nearly equal

parts by the Danube, besides which it is also traversed by the Waag River. In the N. it is level, but in the S. mountainous. The country at the entrance of the Waag into the Danube consists of large swamps. The soil is generally fertile and well cultivated; sheep-raising is extensively pursued. Chief town, Comorn. Pop. in 1869, 143,090.

Co'morn, a fortified town of Hungary, capital of the above county, is on the left bank of the Danube, at the mouth of the river Waag, 46 miles W. N. W. of Pesth, on the Great Schütt Island at its eastern extremity. The streets are narrow and irregular. The Danube is here crossed by a bridge of boats. The fortress of Comorn, originally built by Matthew Corvinus, is considered one of the strongest in Europe, and requires for its defence 15,000 men. Comorn has eight churches and two theatres; also manufactures of woollen cloth and leather, a trade in wine, grain, wood, and fish, and coal-mines in the vicinity. It was besieged and bombarded by the Austrians in 1848 and 1849 without success, but finally capitulated of its own choice, Sept. 27, 1849. Pop. in 1869, 12,688.

Com'oro Isles, a group of four volcanic islands in the Mozambique Channel, between Africa and Madagascar. They are mountainous, and the highest peaks rise about 6000 feet above the sea. The inhabitants are upright and well-mannered. They are of mixed Arab and negro blood. Area, 1050 square miles. The soil is fertile. The prolific tropical vegetation includes the cocoa and areca palms, excellent rice and maize, yams, bananas, mangos, pineapples, oranges, lemons, cotton, wild indigo, and sugar-cane. Excellent wood for shipbuilding is found. The principal exports are palm oil and tortoise-shells. The greater part of the people are Mohammedans, but fetishism is practised among them. They support themselves mostly by tillage; there are among them skilful cutlers, weavers, and jewellers. Three of the islands have each their own sultan. The rule of the rest is exercised by numerous elective chiefs. Mayotte, one of these islands, is a French colony. The island of Johanna is celebrated for its beauty. Pop. about 49,000.

Compans (Jean Dominique), Count, a French general, born at Saliès, in Haute Garonne, June 26, 1759. He served in the armies of the Alps and of Italy; and in 1799 at the head of a division of the Army of the Alps, then commanded by Grenier, he raised the siege of Coni, took Fossano and Savigliano, and reopened communications between the right and left divisions of the French army; he thus relieved a portion which was hemmed up by the Austrians and was suffering fearful hardships, shoeless and half naked among the Alpine snows, and depending upon wild herbs for nourishment. He served afterwards in Italy, which had been reopened to the French arms by the battle of Marengo; and the assaults of Mincio, Montebello, and Villafranca witnessed his bravery. After the peace of Lunéville, Compans was made commandant of the province of Cuneo. Falling at one time into the hands of brigands, who then swarmed in the country, he thought himself lost, until one of the band approached and addressed him: "Have no fear, general; we have not forgotten how in war-times you protected our wives and children and preserved our dwellings." In the Prussian campaign Compans was raised to the rank of general of division. He was created a count of the empire in 1808. He served with distinction through the Russian campaign, took up arms again in the Hundred Days, and was taken prisoner at Waterloo. Died Nov. 10, 1845.

Company. See Joint-Stock Company and Partnership, by Prof. T. W. Dwight, LL.D.

Com'pany [Fr. *compagnie*], in an army, is a body of men commanded by a captain, and forming an aliquot part of a regiment or battalion of infantry. A full company consists of about one hundred men. In the British service a regiment of infantry generally comprises ten or twelve companies. The captain of each company is assisted by two subaltern officers, the lieutenant and ensign. A regiment of cavalry is divided into troops instead of companies. In the U. S. army each of the three arms of the service is divided into companies. Each battalion of infantry is divided into ten companies, and each company has a captain and two lieutenants. The cavalry companies are often known as troops, while the artillery company is more properly a battery. The U. S. marine corps also has its companies.

Company Shops, a thriving post-village of Alamance co., N. C., 2 miles W. of Graham, on the North Carolina R. R., is the site of the repair and construction shops and the general offices of the Richmond and Danville R. R.

Comparative Anatomy, the science of the structural constitution of animals; so called because it is based upon the comparison of the anatomy of different animals.

I. Primary Elements.

Animal bodies either consist of homogeneous substance, or of that substance disposed in tissues. Tissues, in the vast majority of cases, are made up into organs, the simplest forms of which are the sac, the tube, and the segment. By multiplication and modification of these elements, organs become complex. The simplest expression of tissue is, on the other hand, the nucleated cell, and all tissues are made of multiplied and modified cells, with the addition of unorganized or homogeneous substance.

This substance, whether homogeneous or exhibiting structure, is chemically identical throughout the animal kingdom, and constitutes the living part of plants. It belongs to the class of protein compounds, and is called gelatin, albumen, fibrin, etc., or, regarded structurally, protoplasm. Its composition is $C_{24}H_{17}N_3O_8$, with very small amounts of sulphur and phosphorus added under some circumstances. It is therefore a nitryl of cellulose—*i. e.*, $C_{24}H_{20}O_{20} \cdot 3NH_3$.

According to the latest investigations, the cell is not usually a hollow body, but consists of a superficial layer, which represents the wall (but which may be of considerable thickness), and a central body which fills it, which is called the nucleus. This nucleus may contain another visibly distinct body, or nucleolus. The essential difference between the nucleus and the wall consists in the fact that the former alone is capable of direct nutrition from the blood, while the wall is derived from it by additions on its inner surface. All growth originates in the nucleus; that is, all cell-division or discharge of homogeneous protoplasm has its origin there. Hence it has been called the germinal matter, while the wall is termed formed matter. Formed matter exhibits the active functions of life other than growth. Thus it contracts, as in muscular tissue, or is irritable and conductive of force, as in nerves. It constitutes the primary substance of secretions, by its breaking down and mingling with special compounds brought by the blood. It may then be concluded that the formed protoplasm or wall converts heat, etc. into motion, chemism, etc., while the germinal matter converts heat into growth-force.

II. Tissues.

Tissues are naturally arranged, according to their structure, into four groups—viz., connective tissue, tissue of independent cells, nerve-tissue, and muscular tissue. The connective tissue consists of cells, frequently presenting narrow prolongations, which are separated by formed substance of various character, but always either gelatinous or solid. It includes the supporting and connecting tissues of the body, as the osseous, cartilaginous, connective, etc., as well as those of less consistence, as the vitreous humor of the eye, adipose tissue, etc. The tissues of independent cells include those floating in fluids, as blood- and lymph-corpuscles, with those which are stationary, but not bound together by connective substance, as the epithelium. The muscular tissue consists of elongate cells, which are massed together in longitudinal bundles or fibrillæ, without the intervention of non-cellular substance. The nervous tissue consists of isolated cells surrounded by formed matter, which terminate in tubular prolongations or nervous fibres which extend throughout the body. These cells are of delicate texture, and are separated by the equally soft altered cell-contents.

The *connective tissue* (figs. 1 and 2) is composed in the lower animals more exclusively of cells than in the higher. The formed matter exterior to the nucleus of the cells assumes various forms. In the gelatinous tissues (which are most abundant in young animals) this substance is relatively large in quantity and thin in consistence. In the more numerous forms the latter assumes a fibrous character, and consists of bands of fibres, with the cells scattered at intervals. In the upper layer of the true skin the cells assume a radiate form, and contain the coloring pigment (fig. 3) which is generally characteristic of the animal. These cells may contract under nervous influence, so as to obliterate the color, as in many fishes. In

Fig. 1. Connective tissue: 1, white fibrous element, 2, yellow fibrous element.

many of these they are expanded only at certain seasons of the year; in the squids (*Loligo*) they pulsate during life, and produce great changes in the appearance of the skin. In many batrachians and reptiles one color may be rapidly substituted for another, as in the tree-frog, chamæleon, etc. Here there is more than one stratum of pigment-cells, each containing a peculiar color. Under nerve influence the inferior cells may expand while the superficial contract, and, penetrating between the latter, give color to the whole surface of the skin. Cartilage (fig. 4) differs from other forms in the large quantity of formed matter which is discharged from the germinal centres or nuclei, and which separates the latter widely. It is but slightly fibrous in typical cartilage, but in fibro-cartilage highly so. In elastic tissue certain bands of fibres agglomerate and harden, and become elastic through the addition of toughness to the original qualities. By hardening in extended layers, connective

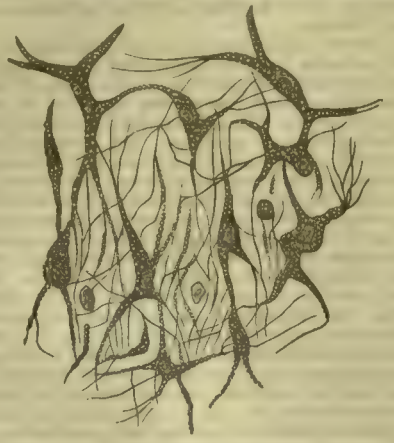


FIG. 2. Connective tissue, partially developed.

tissues form basement membranes, or those supporting glandular structures. Osseous tissue (fig. 5) is developed either in typical connective tissue, skin, or cartilage, but usually in the latter. It consists of a deposit of phosphate of lime in the formed intercellular substance by the minute capillaries which traverse it. It is generally concentric to the cells.

The connective tissue is the medium for transmission of the blood-vessels in most regions of the body.

The *tissues of independent cells* are various in situation and function. As epithelium it covers the surfaces of the cavities of the body, as well as its exterior. Its cells are packed together, forming a stratum which may be depressed and hardened, as the epidermis or outer skin, or soft and of little consistency, as inside of the mouth. The cells are flat or cylindric, and in some situations furnished with movable cilia. The columnar epithelium (fig. 6) is only found in the mucous membrane; the spheroidal exists as the lining of the urinary and perspiratory vessels and ducts; the ciliated (fig. 7) belongs to the air-passages, the conjunctiva of the eye, and the lining of the ventricles of the brain. The crystalline lens of the eye is one of its most modified forms. The lymph-corpuscles are white nucleated cells thrown off from the lymphatic glands into the blood, in which they float. They are highly important in nutrition. The red blood-corpuscles (fig. 8) give color to the circulatory fluid; in the invertebrates, where the blood is frequently white, it contains only the white corpuscles, while the latter are much more numerous in the lower than in the higher Vertebrata. In this class the red corpuscles are nucleated below the Mammalia; in the latter, their contents appear to be homogeneous. They are disk-like, with slightly concave surfaces, sometimes with a median convexity. They are largest in Batrachia, especially in the *Proteus*.

The *muscular cell* is of a peculiarly elongate or rod-like form, and possesses a well-defined wall or sheath. It is composed originally either of a single cell, which elongates with growth, chiefly in its formed substance (but in some measure with its nucleus also), or of several confluent cells. In the fresh water *Hydra* the contractile cells of its body-walls and arms preserve their original form. Muscular cells are divided into the unstriped and the striped—the former having homogeneous formed matter; the latter exhibiting transverse divisions (figs. 9 and 10), which produce the appearance of a series of disks. Muscles terminate in tendons, which present a form of connective tissue, the nuclei being few and the formed substance fibrous, and very dense and hard.

The *nerve-cells* (fig. 11) are found in nervous centres—*i. e.*, brain and spinal cord—and in ganglia. They form, with the intervening substance, the gray nerve-matter. The white matter and the nerves proper are composed of nervous fibres or tubes. The nerve-cell has to various observers presented a greater complexity of structure than other cells. In some, fibrous layers in the wall and covering the nucleus have been observed, the external layer being continuous with the external walls of the nerves. Others describe tubular vacuities in the nucleus. Nerves consist of more or less granular formed protoplasm, surrounded by a sheath or neurilemma, and containing nuclei. Many nerves exhibit thick walls, while in others, especially the sympathetic, the nerve-walls are extremely thin.

III. Organs and Systems.

Tissues arranged and united in forms, so as to be usable for vital processes, form organs. All organs not constructed of cells alone are composed of elementary parts, which may be regarded as repetitions of the sac, the tube, or the segment, no matter how complex they may be. The organs are classified into systems by their structural connection with one another, which of course signifies functional association for some common vital process. The systems are as follows:

1. *Cellular Systems*—The nervous, the muscular, the mucodermal.
2. *Sac and Tube Systems*—The digestive, the circulatory, the respiratory, the urogenital.
3. *Segment System*—The skeletal.

The nervous system consists of central bodies or ganglia, and nerves which extend from them to the periphery of the body. The structure presents much variation among the several groups of animals. The muscular is composed of muscles and the tendons by which they are attached to the part of the skeleton to be moved by them. The muscles are composed of innumerable fibrillæ enclosed in a common sheath. The bundles in invertebrate animals are smaller, till in some of the lowest they are composed of but few fibrillæ. Unstriped fibres prevail in invertebrate animals, excepting the Arthropoda, where the muscles are striped. The fibres in vertebrates are striped, excepting in involuntary muscles, where they are unstriped, save only in the heart. In invertebrates they may have thick sheaths, and the contents are frequently granular. In most Arthropoda the central part of the striped fibrillæ retains the original cell-nuclei in one or more columns. The mucodermal system covers the body externally, and as mucous membrane enters and lines all the cavities that communicate with the open air; as serous membrane it lines the closed cavities. In animals no system presents greater varieties of exterior structure. In invertebrates it is sometimes hardened by segments produced by a deposit of lime, which resemble bone (sea-urchin), or form a more elastic substance, chitin (Arthropoda). In vertebrates it may support osseous pieces of various forms (scales), or hairs, or feathers, which are simply enlarged hairs finely branched. Finally, as horn it appears as nails, claws, and horn-sheaths; these are simply thickened epidermis.

The digestive system is a tube usually open at both extremities. Portions of its course are enlarged into stomach, large intestine, etc., while glandular bodies are distributed along it from one end to the other, and pour their contents into it. These glands are formed of sacs, in a few cases simple (fig. 12) (gastric glands of stomach), in others simply forked, but usually many times divided and subdivided, forming masses of lobules. Some of these bodies are almost universal in the animal kingdom. Thus, it is usual to find one or more situated near the cavity of the mouth (fig. 13), which secretes a fluid to aid in deglutition; another, most frequently met with, discharges its secretion into the alimentary canal just beyond the stomach. This is the liver and its representatives. The walls of the canal are supplied with several layers of muscular tissue in the vertebrates, and in a less complex form in lower animals.

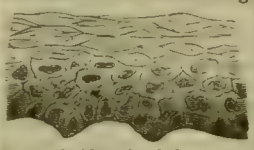

FIG. 3. Epidermis of the negro.

The circulatory system consists of tubes for the conduct of the results of digestion throughout the body; it originates from branches of the digestive canal in the lowest types (Medusæ), but becomes highly specialized, so that communication with that system is had by endosmosis only. It early acquires a specially muscular enlargement, which pulsates. This organ becomes more specialized, isolated, and divided, and is known as the heart. The arteries (which take blood from it) are muscular throughout their length. The veins are not so, but are distinguished by the presence of valves in the higher animals.

The respiratory system consists of a series of tubes which carry air through the body: in some animals (snails, spiders) these are blind, forming pulmonary sacs, on which capillary arteries are distributed. In animals inhabiting the water this system is little or not at all developed, it being replaced by branchiæ or gills. In vertebrates it does not exist, but large sacs, connected by tubes with the digestive system, answer the same functional purpose, except among fishes, where it is used as a float. Gills aërate the blood in this class.

The urogenital system consists of tubes, sacs, and glandular and cellular bodies, which are connected with the outer air at the posterior end of most animals, and are usually blind at their termini. Their exit is usually common to the alimentary canal, and is called cloaca. These organs exhibit usually bilateral symmetry, the opposite sides having distinct exits, except among females of some of the higher animals, where the discharge tubes unite and form a chamber called the uterus. The tubes are termed oviducts (or tubæ Fallopii), and terminate in a fibrous and cellular body, the ovary. In its circumference appear cells, which grow, and after discharge are modified into the embryo. Originally, the embryo-cells of low animals grow into adults by a simple vegetative process, but in higher forms a stimulus to such growth is required from the other or male sex. In this sex the ovaries produce, by a form of secretion, independent cells, each of which bears a long cilia or lash (*spermatozoöids*), and being modified in structure are properly termed testes. The efferent tube is called the vas deferens. These only unite near their point of exit. The urinary system is present in the vertebrates only. Tubes connect it with the reproductive canals near their termini. These are derived from paired glandular bodies, the kidneys, and usually unite into a common reservoir before exit—*i. e.*, the urinary bladder. The object is the removal of uric acid, etc. from the blood.

The skeletal system exists only in vertebrates. It constitutes the solid framework of the body, and is axial or internal. It is composed of cartilaginous and osseous tissue. It is composed of segments, which possess a solid centrepiece and two opposite arches attached to it—one superior, the other inferior. It thus forms two tubes connected by a solid axis. The upper protects the nervous—the lower, the nutritive organs. Each segment is divisible into subsegments, which are originally separate. These are much modified in form at the anterior extremity of the body—above, to contain the brain; below, to aid the sense of hearing, to prepare food for digestion, etc. Appendages to inferior segments are seen in limbs, which are the supports of the body and resistant elements in motion. They are also composed of segments arranged in lines or radii.

IV. Classification of Animals.

All known animals are referable to seven "branches" or primary types. Four plans of structure cover these, without expressing their intimate or essential structure. The four are the *radiated* (Cœlenterata and Echinodermata); the *longitudinally-jointed*, with external and ring-shaped skeleton (Vermes and Arthropoda); the *bag-shaped* (Mollusca and some Protozoa); and the *vertebrated*, whose essential character is mentioned above under the skeleton of the Vertebrata. The characters may now be given in more detail.

Branch I., Protozoa.—Low animals, composed of single or aggregated solid cells or protoplasmic masses, without blood or nerves. When symmetrical, bilateral or radiate.

Branch II., Cœlenterata.—Hollow animals, without special digestive organs, or with a sac-like stomach opening into the common cavity. Circulatory system wanting or represented by branches from the digestive cavity. No nervous system. The form is radial and bilateral, or radial only.

Branch III., Echinodermata.—Digestive system independent of the body-walls, not filling the cavity; the circulatory system present, largely isolated; a water-circulatory system; nervous system an œsophageal ring, with radii; skin with hard protective bodies. Form bilateral and radial.

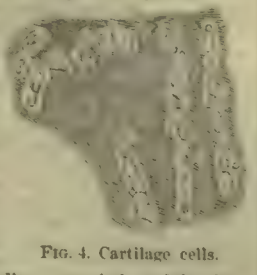

Fig. 4. Cartilage cells.

Branch IV., Vermes.—Digestive system isolated, not occupying the body cavity; circulatory system incomplete or wanting; nervous system an œsophageal ring, with ganglia, or consisting of the chief ganglia only. No jointed limbs; body elongate. In development the alimentary canal is excavated in the embryo.

Branch V., Mollusca.—Alimentary canal complete, isolated; circulatory system incomplete at the distal extremities; nervous system with ring round œsophagus, which bears a ganglion above and one below; a third ganglion inferiorly placed, connected by a ring with the former. Form sac-like. Intestines excavated from yolk of egg, not formed by a fold.

Branch VI., Arthropoda.—Digestive system complete; circulatory with complete central organ, but open extremities: nervous system with œsophageal ring and ganglia, and generally an axis on the inferior surface of body, with ganglia at intervals. Skin hardened into a chitinous, jointed skeleton, which is furnished with jointed legs. Form bilateral. Intestines formed by excavation of yolk, not by infolding of membrane.

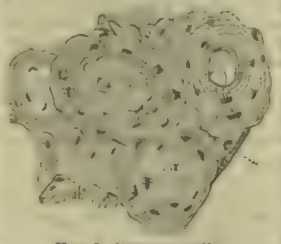

Fig. 5. Osseous cells.

Branch VII., Vertebrata.—Alimentary system complete; respiratory, a branch from it; circulatory, with complete circuit; nervous, of a longitudinal ganglionic axis on the upper side (spinal cord), with usually ganglionic bodies at one end (brain). An internal bony or cartilaginous skeleton, consisting of solid axis; superior tube for nervous and inferior for other systems. Form bilateral. Digestive tubes formed by the infolding of a membrane formed on the yolk.

A few years ago the number of species of animals known was stated to be 500,000, of which 400,000 were Arthropoda; of the remainder, 25,000 were Vertebrata.

The classes of animals number thirty-six, distributed and defined as follows:

Protozoa—*Rhizopoda.*—Bodies of homogeneous protoplasm, which throws out threads or arms of the same substance, which are elastically retractile. No internal organization; often a silicious covering, which is perforated. (Fig. 14.)

Spongiæ.—Unicellular animals (fig. 15), in which the cells are frequently associated in large numbers on axes of a horny, calcareous, or silicious nature, forming branched masses. These are penetrated by canals.

Infusoria.—Body with wall distinguished from contents, with mouth and often anus; often a contractile vesicle and ovarian nucleus. Surface frequently ciliated. (Fig. 16.)

Cœlenterata—*Hydrozoa.*—The cavity of the body the only digestive system; skin distinct; form radiate only. (Fig. 17.)

Medusæ (jelly-fish).—Digestive system an open sac communicating with the body cavity, from which canals radiate as isolated grooves. Eight series of swimming-lobes on the surface. Form bilateral. (Fig. 18.)

Anthozoa (corals, etc.).—Digestive system the body-cavity and an appended open sac, the former divided round the walls by vertical septa into grooves, which continue into tubular tentacles. Septa and skin often filled with deposit of carbonate of lime. (Fig. 19.)

Echinodermata—*Crinoidea.*—Body cup-shaped, the surface covered with mineralized plates, which are solidly united, but wanting on a part next the stomach; arms present, formed of articulating segments. (Fig. 22.)

Asterida.—Body depressed, star-shaped, covered with calcareous plates, which are wanting on a part of the dorsal surface, and which articulate with each other in clusters (star-fishes). (Fig. 20.)

Echinida.—Body discoidal or globular, surface covered with calcareous plates, which are immovably united together; no arms (sea-urchins). (Fig. 21.)

Holothurida.—Body elongated, cylindric, covered with soft skin; a calcareous ring round œsophagus; mouth surrounded by tentacles (trepangs). (Fig. 23.)

Vermes—*Gephyrea.*—Body cylindric, not jointed, alimentary canal complete in the hollow body; a nervous system, an œsophageal ring and abdominal axis.

Rotatoria.—Alimentary canal developed in the hollow body; ciliated disks or wheel-organs for movement; a water-circulatory system.

Cestoda.—Body jointed, nearly solid, without digestive system; head with suckers and hooks; a water-circulatory system (tape-worm).

Trematoda.—Body not jointed, solid except in the developed digestive tubes, and water-circulatory system; head with suckers and hooks (flukes).

Acanthocephala.—Body hollow, not jointed, cylindric, without digestive canal; head with a hook-bearing proboscis.

Nematoda.—Body hollow, unjointed; digestive canal well developed.

Turbellaria.—Body unjointed, flat, solid, except in the

developed digestive canals; nervous system of two supra-œsophageal ganglia; surface covered with cilia.

Annelida.—Body hollow, segmented, with well-developed digestive canal and nervous system; the latter an œsophageal ring and abdominal ganglion chain; a system of respiratory tubes (earth-worms, etc.). (Fig. 23.)

Mollusca—*Bryozoa.*—Head, tongue, and foot wanting; a shell-producing mantle enclosing the hinder portion of the body; mouth surrounded by a crest of tentacles as respiratory organs. Nervous system rudimental. (Fig. 24.)

Tunicata.—Head, tongue, and foot wanting: a large bag-like mantle, which bears a shell of connective tissue, enclosing saclike gills. Nervous system rudimental. (Fig. 25.)

Brachiopoda.—Head, foot, and tongue absent; mantle large, bearing large shells, which are dorsal and ventral; branchiæ supported on two spiral arms, which are attached to the shell. (Fig. 26.)

Acephala.—Head and tongue wanting, foot anterior; mantle covering the body on each side, and enclosing laminiform branchiæ; two shells, right and left (mussel, clam). (Fig. 27.)

Gasteropoda.—Head, tongue, and foot present, the latter extending posteriorly; mantle small, posterior; gills comb-like on the back. Shell, when present, single, spiral (conch, snail). (Fig. 28.)

Pteropoda.—Head, tongue, and foot, the latter developed into two lateral fins; mantle covering the hinder part of body; gills comb-like on the back. (Fig. 29.)

Cephalopoda.—Head and tongue present; foot divided into arms, which radiate from the mouth as a centre; posterior part of body enclosed in a mantle; gills on back; cartilages behind eyes, and ganglia in head (cuttle-fish). (Fig. 30.)

Arthropoda—*Crustacea.*—Two pairs of antennæ; post-abdomen developed; limbs on all segments of the body, those of the thorax converted into mouth-organs; respiratory organs, gills or wanting (shrimp, crab). (Fig. 31.)

Arachnida.—No antennæ nor anterior cephalic segments; the last pair of cephalic limbs of the form of legs; three

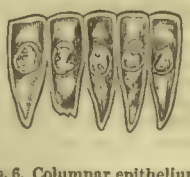

Fig. 6. Columnar epithelium from the intestine of the rabbit.

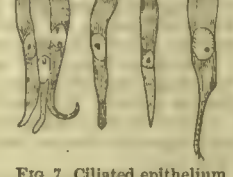

Fig. 7. Ciliated epithelium from the membranes of the human nose.

additional pairs on the thorax; head and thorax united into a cephalothorax, abdomen and developed post-abdomen without legs; respiration by tracheæ or sacs (spider, scorpion).

Myriopoda.—One pair of antennæ; a part of the thoracic limbs used as mouth-organs; abdomen not distinguished, many-jointed, furnished with limbs throughout; post-abdomen rudimentary; respiration by means of tracheæ (centipedes).

Insecta.—One pair of antennæ; abdomen without limbs, post-abdomen rudimentary; three pairs of limbs on the thorax; respiration by means of tracheæ; usually two pairs of wings (insects). (Fig. 32.)

Vertebrata—*Leptocardii.*—Cranium membranous, without mandibular arch, no brain; heart with one chamber; five aorta-roots (lancelet).

Dermopteri.—Cranium and skeleton cartilaginous; no mandibular arch; heart with two chambers; five aorta-roots (lamprey).

Pisces.—Cranium and skeleton osseous or cartilaginous, or both, with under jaw composed in part of malleus, and supported by incus and stapes, as hyo-mandibular bone, etc. Limbs with many segments in contact with scapula without intervening humerus; pelvis mostly wanting. Brain well developed; optic lobes generally larger: cerebellum distinct; two chambers of the heart; five aorta-roots on each side. A parasphenoid bone (shark, sturgeon, sucker, perch).

Batrachia.—Skeleton osseous; cranium with parasphenoid, no basi-occipitals; under jaw embracing malleus, and supported by a single "quadrate" bone, "the incus;" limbs with humerus and few radii; pelvis present; brain with cerebral hemispheres largest, and small cerebellum. Three chambers to the heart; four or three aorta-roots; a coracoid bone (salamander, frog).

Reptilia.—Skeleton osseous, with coracoid bone and mandible, latter with malleus, and supported by incus; no parasphenoid, but a basi-occipital; brain with large cerebral hemispheres; two or one aorta-roots; two aorta-bows; heart with three or four chambers; metatarsal bones distinct; limbs with few radii; a humerus and pelvis.

Aves.—Skeleton osseous, with coracoid bone and mandible, which includes malleus, and is supported by single incus; a basi-occipital, no parasphenoid; metatarsal and tarsal bones united; humerus and pelvis present: optic lobes lateral, small; four chambers to the heart; one aorta-root and bow, turning to the right (birds).

Mammalia.—Skeleton osseous, without coracoid bone; with the stapes, incus, and malleus withdrawn into the ear, and simple, mandible sessile on the squamosal bone; cranial axis behind the basi-occipital; limbs ambulatory, with distinct tarsal and usually metatarsal bones; optic lobes inferior; cerebral hemispheres very large; one aorta-root and bow, turning to the left; heart with four chambers.

The preceding descriptions express a few of the structural peculiarities of the animals included in the respective divisions—*i. e.*, such as are common to those of each, and by which they may be distinguished from each other. But the innumerable characters found in the subordinate or contained divisions and species of each remain to be considered.

V. The Nervous System.

1. *In Invertebrates.*—In Protozoa, and perhaps Cœlenterata, where the nervous system has not been certainly discovered, spontaneous movements in the taking of food and moving from place to place are readily observed. It is therefore evident that the contractibility of their protoplasmic walls is under the direction of stimuli which do not require nerves for their conduction or direction. The nervous system of higher animals must therefore be looked upon as designed for the specialization or location of movements—a capacity entirely necessary to the activity of special mental powers. These demand particular movements for special objects; hence the necessity of concentrating the directors of movements in particular parts—*i. e.*, nerves, muscles, etc.

In the Bryozoa, the lowest mollusks, there is not certainly known to be an œsophageal ring, but there is a considerable ganglion above the gullet, which sends nervous threads around the horse-shoe respiratory crest. One of these extends on each side at the base of the processes, but, though they approach, they are not known to unite on the inside of the arc. In Tunicata in like manner a single ganglion exists above the œsophagus, between it and the vent, and sends out nerves in a radiating manner. These are distributed to the orifices of the body and to the muscles. In Brachiopoda the system is more highly developed, there being a complete œsophageal ring, with a broad band-shaped ganglion on the inferior side. The latter represents two united ganglia, and gives off on each side a strong nervous trunk. These trunks turn forward and outward, and soon divide, the weaker branch going to the spiral respiratory arms, representing that above described in the Bryozoa. The stronger branch goes to the muscles that close the shells, to the mantle, etc. Each one forms a ring in the former locality, which gives off small threads. In Acephala (called also Lamellibranchs or bivalves) the ganglia are transparent, yellowish, orange, or rosy, containing fat cells, as well as the nervous. There are three well-separated pairs of ganglia, the ganglia of each pair connected by a commissure. The anterior pair is near the mouth; they are rarely close together (*Venus, Mactra*) or united (*Mesodesma, Teredo*); they give off on each side a nervous thread which extends to the foot, and is connected with the foot-ganglion pair. These are wanting in the oyster and other genera which want the foot. This forms an open œsophageal ring. The nerves of the foot are derived from the ganglion, but none of the intestinal nerves. These are derived from the third pair of ganglia, which are the most posterior, and which are connected with the front pair by a nervous stem on each side, forming a second ring round the digestive axis. It sends nerves to the mantle, gills, etc., meeting those from the anterior ganglia. In *Ostrea, Pinna, Mytilus*, etc. its nerves contribute to form a circuit which extends round the edge of the mantle, connecting with the anterior pair.

In Gasteropoda the ganglia and commissures are homologous with those of the Acephala, but the former are concentrated near the mouth, forming much more contracted rings. The two supra-œsophageal ganglia (or "brain-ganglia") are connected by short commissures. They send down commissures to the foot-ganglia, which are close to the œsophagus; the visceral ganglia or third pair are behind these, and connected with the superior ganglia by special commissures; sometimes they are on the upper side of the œsophagus, and connected by commissure below it. The superior sends nerves to the lips, mouth, tentacles, and eyes; the foot-ganglia to the under side of the œsophagus, to the ear, and the foot; the visceral ganglia to the mantle, gills, heart, intestines, and certain muscles. In the naked

division (Opisthobranchia) the upper ganglia give a special ganglion to the tentacles; the foot-ganglia in like manner are adjoined by a pair for the gills. In *Chiton* all three pairs of ganglia are found on the inferior side of the œsophagus. In *Turbo*, *Littorina*, *Janthina*, *Phasianella*, and *Patella* the superior pair occupies the opposite sides of the gullet. In *Natica* all three are closely massed together. As in other higher Mollusca, a sympathetic nervous system exists which supplies the involuntary organs of the body.

The Pteropoda exhibit the three pairs of ganglia connected by commissure. In the Gymnosomata they are all separate, but in the Thecosomata they are concentrated on the lower side of the œsophagus, so as not to be readily distinguished.

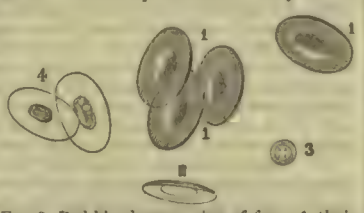

Fig. 8. Red blood-corpuscles of frog: 1, their face; 2, edgewise; 3, lymph-globule; 4, corpuscles changed by acid.

In Cephalopoda this system displays the most concentrated type known among mollusks. In *Nautilus* the ganglia are almost confluent, and form thick bands, one above and two below the œsophagus. The cerebral pair give off each an enormous optic nerve, appropriate to the size of the eyes in this class. The pedal pair supply the tentacles and organ of hearing, and the visceral pair the other organs. The inferior arches rest on the cephalic cartilage which characterizes the Cephalopoda.

The nervous system is in many of the Vermes very imperfectly developed, including the œsophageal ganglia with a few divergent nerves. In the Annelida the most highly developed condition is observed, where each body-segment possesses a ganglion connected by a longitudinal double commissure, which originates from the ring. In the Arthropoda this type is also the basis of the various arrangements observed, and is constantly discoverable in the larvæ of the various forms. As a general rule, it may be understood that where a special organ exists the ganglion of the segment in or on which it is placed is enlarged for its supply, as in the thoracic ganglia of insects. Here several segments are confluent; correspondingly, nervous ganglia unite, forming larger masses, thus supplying the legs and wings. The transition from the simple type found in the larvæ to the modified and concentrated types of the adults has often been observed in tracing the history of the growth and metamorphosis of insects. In the Crustacea and Arachnida the concentration is carried still farther than in insects. Thus in some lower Crustacea there are numerous ganglia, and the lateral commissures of the abdominal axis are only united in front; in the highest division, the Decapoda (crabs, lobsters, etc.), the axis is largely undivided, is short, and the ganglia are massed together. In the scorpions (Pedipalpi) there are but few distinct ganglia, but in the spiders (Aranea) there are no ganglia in the abdomen, and the nervous axis is short, massed together, and undivided. On the other hand, in the lowest Arachnida, the Acaridæ, there is no abdominal axis by defect, and the œsophageal ring is incomplete above, reminding one of the condition of the lowest Mollusca.

2. *In Vertebrates.*—In this branch the nervous system reaches its highest development, though in the lowest form, the Leptocardii, it can hardly be considered to be more perfect functionally than in many Mollusca. Here there is a spinal cord or medulla, but no brain, but in its place a slight enlargement of the diameter of the medulla.

The spinal cord of vertebrates, like the brain, is composed of gray and white nerve-tissue, the gray being the ganglionic or cellular tissue, and the white the fibrous or conducting. Unlike the brain, the spinal medulla possesses the white substance externally, and the gray internally. The cord is divided longitudinally by an anterior and a posterior fissure of some depth, and by two less profound lateral ones. The gray substance exhibits in section a crescentic outline, the horns of the crescent being turned externally and reaching the lateral grooves. Here each horn gives origin to a nervous stem, and the two soon unite and pass out through a foramen between the vertebræ. The posterior bears a ganglion, and is devoted to the function of sensibility or feeling; hence it is termed *sensory*. The anterior is the smaller, and is termed *motor*, as its office is to convey the stimulus which gives origin to muscular movements or contractions. After leaving the spinal column the single stem divides again, each branch containing fibres from both roots. The extremity of the cord is divided into a number of radiating threads, together constituting the cauda equina. In all the Vertebrata, from the Dermopteri to (and including) the Aves, there is an axial tube of small diameter; in Mammalia this is wanting, except a short anterior trace of it. Birds add the peculiarity of a sinus rhomboidalis, which is a long rhomboidal expansion of the tube in the sacral region (rump), which is open superiorly. The spinal nerves in many of the branches form networks by unions and separations opposite the fore and hind legs, which are called the brachial and sacral plexus. The ganglia of the sensory root are in the Batrachia accompanied each by a deposit of white phosphate of lime, forming a rounded mass. In some fishes with a short spinal cord the division of the cauda equina takes place far anteriorly, as in *Diodon* and most other Plectognathi, thus leaving a very short axis.

The anterior part of the column enlarges, and is called the medulla oblongata; as this is within the cranium, it is reckoned as part of the brain. The six columns are here better defined, and there are added two well-defined oval prominences termed the corpora olivæformia between the lateral columns of Mammalia. This contains a corpus dentatum of gray matter. The fibres of the posterior columns cross or decussate; they are, however, only those of the anterior or motor root of the spinal nerves that do so, having passed upward through the column; the fibres of the posterior roots decussate in the gray matter of the cord near their exit, and pass thence into the brain without further exchange. The divergence of the posterior columns leaves a rhomboidal cavity or basin in the superior face of the medulla, which is the fourth ventricle. The roots of the auditory (seventh) nerve originate below its fundus. This chamber is variously exposed in different vertebrates. The postero-lateral columns (corpora restiformia) diverge upward and backward, and support the first great brain ganglion, the cerebellum. In the Elasmobranchi (sharks, etc.) the fourth ventricle is greatly extended laterally, having a lobate outline, with sinuous walls; in other Vertebrata this peculiarity does not exist. In Dermopteri, one division (Hyperotreti) exhibits prominent lateral lobes, which do not open externally; they are wanting in the remainder of the class (Hyperoarti). In many bony fishes there are ganglionic enlargements of the medulla, corresponding to the origin of the nervus vagus; hence vagal lobes. There are numerous lobes on the medulla of the pike. The medulla is straight in most vertebrates, but in Reptilia and birds it is bent rather abruptly downward and forward after entering the cranium.

The cerebellum is a simple oval or flat body in the fishes, Batrachia, and reptiles, excepting in the crocodiles. In these it develops two small lateral lobes, while the middle portion, now called the *vermis*, becomes transversely grooved. In the birds the lateral lobes are a little larger and the plicæ deeper, and on section it yields a digitate and serrate outline of gray matter with a white centre, called the *arbor vitæ*. In Mammalia the size is increased, especially as regards the lateral lobes. In Dermopteri it is small—in the division Hyperoarti apparently composed of two lateral ganglia. In sharks it is much enlarged longitudinally, and on section displays a weak arbor vitæ; in *Pristis* (saw-fish) it even reaches the cerebrum, covering the optic lobes. In other fishes it is smaller, in the usual osseous orders a flat transverse commissure bridging the fourth

Fig. 9. Striated muscle magnified.

ventricle, in *Polypterus* it is similar, but in *Lepidosteus* and *Amia* it is larger and oval. In Batrachia and in Dipnoi it is more insignificant than in any other division, being a very small transverse commissure, not nearly covering the fourth ventricle. In Batrachia this cavity contains a triangular network of blood-vessels, which fits it, called the plexus chorioideus; this is only seen elsewhere in the tortoises (Testudinata). In reptiles the cerebellum is still small and transverse, but exceeds that of the Batrachia: it is convex and scutiform; the fourth ventricle is nearly closed. In the crocodiles it is first approximately closed.

Anterior to the cerebellum, the brain is best understood

as a double body, bilaterally symmetrical, and composed of a series of ganglia on each half of the divided axis or prolongation of the medulla oblongata. These ganglia are, primarily, the optic lobe, the cerebral lobe or hemisphere, and the olfactory lobe. The middle columns of the medulla support the optic lobes, while the cerebral lobes are supported by the middle and anterior columns. The optic lobes are the largest of the ganglia from the Dermopteri to the Batrachia (fig. 33), with the following exceptions: the cerebral hemispheres are larger in elasmobranchs and *Polypterus*, The lobi are sub-globular, and exhibit no marked external peculiarity till we reach the Batrachia, where they are smaller than the hemispheres, as in all the succeeding classes. In the tailless Batrachia (Anura) they are divided transversely, forming four sub-round bodies; it is possible that the anterior one should be considered the lobus ventriculi tertii, or optic thalamus, of the next ganglion or cerebrum; but as it is united with the posterior in the tailed Batrachia (salamanders) and Proteida (*Necturus*) (fig. 34), they are more probably the anterior bodies of the corpora quadrigemina of mammals. The posterior, and half or all of the anterior, are covered by a fold or lamina, which rises from the posterior part of the posterior bodies in the Anura. In the Urodela the posterior is reduced, like the cerebellum, to a narrow transverse commissure, while in *Necturus* both it and the cerebellum are wanting.

In Reptilia the optic lobes are more simple, but they are partially divided into superior and inferior bodies. In lizards the superior is laminar, and separated by a vacuity from the inferior; but in serpents the latter is a mere fissure. In harmless snakes (fig. 36) the lateral bodies are connected by a commissure, but in the venomous *Trigonocephalus* and *Bungarus* they are united behind; in Vipera the superior and inferior bodies appear to be quite separated from each other. In birds the optic lobes are simple, and situated infero-laterally, since the cerebellum and hemispheres are in contact. In Mammalia they are superior, and continuous with each other, and consist of four protuberances, the corpora quadrigemina. They are much reduced in size, and cover a narrow vacuity or tube, the

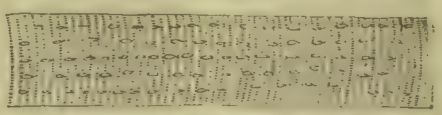

Fig. 10. Muscular fibre, greatly magnified.

aquæductus Sylvii. In front of the anterior pair is situated a sac-like body, the pineal gland, which is the rudiment of an important organ of the brain of lower orders, the epiphysis. This is a highly vascular membranous body, which rises to the inner surface of the cranium in Dermopteri, fishes, Batrachia, and Reptilia. It is very variable in structure in fishes; in reptiles (lizards) it often communicates with the outer surface by the foramen parietale of the table of the skull. Directly opposite to it another sac descends from the cavity below the optic lobes (the aquæductus Sylvii), which is termed the hypophysis. It exists in the classes which possess the epiphysis, and is represented among Mammalia by the pituitary body and infundibulum.

The cerebral hemispheres are small in the classes below the Batrachia, except in sharks and a few fishes, as the Dipnoi, Polypterus, and Ginglymodi (gar). In Dipnoi, Crassopterygia, Chondrostei (sturgeons), Ginglymodi and Halecomorphi (*Amia*) the hemispheres are at a distance from the optic lobes, being supported by the elongate crura of the medulla oblongata; in other classes and orders the hemispheres are sessile. In the mammals alone we find the pons varolii, a body of transverse fibres which cross and bind together these crura cerebri on the inferior side. The hemispheres in the mammals present many peculiarities: their size is increased, and in many the surface is thrown into vermiform ridges or "convolutions." In the fishes and higher types they are hollow, enclosing the "lateral ventricles." The floor of these is occupied by various bodies in the different types. Thus in Batrachia there is a body on the inner side of each. In reptiles this is represented by a narrow body, while another mass occupies the outer part of the floor of the ventricle. In Mammalia two bodies, little separated, occupy this position—viz., the "lobus ventriculi tertii" (or thalamus opticus) and the corpus striatum. The cerebral hemispheres are not united till in certain birds we find a narrow bridge connecting them, the fornix. In the lowest Mammalia (Marsupialia, etc.) we observe another connecting body in a rudimental state above the fornix. This is the corpus callosum, which in higher mammals is a massive bridge, and much larger than the fornix. There is another bond of connection called the anterior commissure, which is short and sub-cylindric: its size in mammals is nearly in inverse ratio to the development of the corpus callosum. The ventricles are separated by the septum lucidum in this class only, but is much reduced in the monotremes (duck-bill). The characters of the brain in the orders of Mammalia may be best expressed in tabular form, thus:

I. No calcarine sulcus nor hippocampus minor; corpus callosum rudimental; hemispheres smooth, leaving cerebellum and olfactory lobe exposed: Monotremata, Marsupialia.

II. Corpus callosum well developed, short, without rostrum; no calcarine sulcus nor hippocampus minor; hemispheres smooth, short; olfactory lobes and cerebellum not covered: Edentata, Rodentia, Insectivora, Cheiroptera.

III. Corpus callosum longer, with a recurved rostrum in front; no calcarine sulcus nor hippocampus minor; the hemispheres convoluted, and partially covering the olfactory lobes and cerebellum: Proboscidia, Hyracoidea, Ungulata, Carnivora (hoofed and carnivorous animals).

IV. Corpus callosum long, with rostrum; a calcarine sulcus and hippocampus minor; hemispheres mostly convoluted, partly or wholly covering the olfactory lobes and cerebellum: Primates (monkeys, man).

Exceptions to the definition of the Primates are seen in some of the Lemuroidea, in which the hemispheres are smooth. In man they have nearly twice the size seen in the allied forms of apes (chimpanzee, etc.). The calcarine sulcus is on the lower side of the posterior part of the hemisphere, and the hippocampus minor is the convex body within the ventricle, which its presence causes; it forms the inner wall of the posterior horn of that chamber.

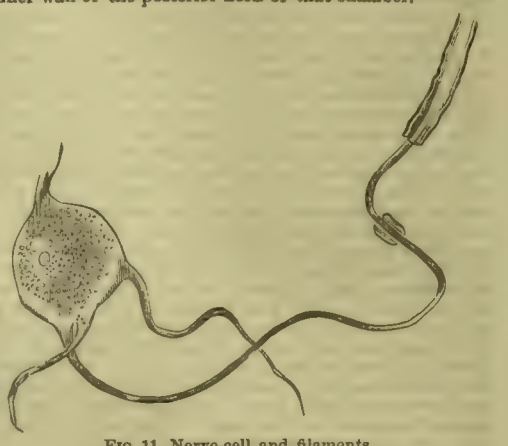

Fig. 11. Nerve-cell and filaments.

The *olfactory lobes* are very large in elasmobranchs, and are connected with the hemispheres by a narrow commissure. In fishes they are less developed, and in batrachians are sub-cylindric and separated by a groove. In reptiles they are continuous with the hemispheres, obpyriform in shape, and often slender; they are frequently hollow. In birds and mammals they bear a smaller proportion to the whole brain, and are entirely concealed in Primates.

The optic nerve originates by fibres derived from the optic lobes. Its fibres decussate or cross from the right side to the left, and *vice versâ*, shortly after leaving the brain in all Vertebrata, excepting the lower Actinopteri (Halecomorphi, Ginglymodi, and Chondrostei), the Elasmobranchii, and the Dermopteri. In all of these the nerves are connected by a commissure, which is in part (*Amia*) composed of fibres which leave the brain and return again, forming a short circuit. In the Dermopteri this "chiasma" takes place near the roots of the nerves; in the others, at a greater distance from the brain.

The remaining cranial nerves are in fishes only four pairs, the vagus, glossopharyngeus, trigeminus, and facialis. The first two and the last two are each approximated. The vagus exhibits in the fishes above the Dermopteri two distinct roots. The first is the nervus (ramus) lateralis, which extends posteriorly beneath the scapular arch, and runs along the middle of the side of the body to the tail; it is abortive in Dermopteri. The second or larger nerve supplies the gills and viscera. The nervi trigeminus et facialis have four distinct origins, which sometimes unite and form one or two plexuses outside the cranium. The branches are distributed to different parts of the head; but one, which especially characterizes many bony fishes, but is wanting in Clupeidæ, Plectospondyli, *Amia* (gar), Chondrostei, and elasmobranchs, the ramus lateralis, runs upward within the cranium, issues above, and extends along the back to the caudal fin, supplying the dorsal fin. In Der-

mopteri and Dipnoi the glossopharyngeal is a branch of the vagus: in other vertebrates it is distinct.

In Batrachia the rami laterales of the vagus are present; and the glossopharyngeus unites with the vagus, forming a ganglion, from which nerves issue. The origins of the nervi trigeminus and facialis are wholly or in part common, and they support a ganglion Gasserii. The hyoid and scapular muscles are supplied from the first pair of spinal nerves, and the vagus supplies branches to the scapula. These characters are in part those of reptiles, but more prominently those of fishes. In the Reptilia there are nervi accessorii, as well as hypoglossi. The latter supplies the hyoid and scapular regions, and the former certain muscles inserted in the scapula in front. The rami laterales of both vagus and trigeminus are not present, and the facialis has a distinct origin. In mammals all these nerves are present, except laterales, but the facialis frequently is identical with the trigeminus in origin.

VI. The Muscular System.

Muscles are entirely wanting to the Protozoa and to the Cœlenterata, excepting the Medusæ. In the latter, delicate bundles of unstriped fibres exist, extending vertically from both the inner and outer surfaces of the umbrella, while between them concentrically curved bundles run between the eight circulatory canals. Among echinoderms the innumerable segments of which they are composed give origin and insertion to many muscles. In addition there are muscles devoted to the masticatory apparatus. This consists in Echinoidea of five tooth-like bodies, which form a pyramidal mass when closed. For the opening and shutting of these, twice ten paired and twice five single muscles are arranged, as well as several others. In Holothurida five longitudinal muscles extend from the hard œsophageal ring to the vent. A sphincter closes the mouth, and the superior part of the gullet is thickened with muscular walls. The tentacles possess muscles.

In Mollusca muscles are universally present, though fewer in number than in the groups just described. In Bryozoa (or Polyzoa) a system of muscles is arranged for the withdrawal of the crown into the sheath-like body; these are median, longitudinal, slender muscles. Those designed for projecting it again are horizontal, curved, and situated on the inner wall of the body; the successive contractions of these from below upward will produce the result. Avicularia are peculiar bird-head-like bodies, situated near the mouth in the marine Bryozoa; they are furnished with a bird-like beak, with an under jaw which frequently closes with a snap, and slowly opens. These movements are conducted by muscles whose movements are automatic. The large mantle enclosing the body of the Tunicata is composed of two muscular layers—the one of transverse (hence annular) fibres, the other of longitudinal or oblique. Muscles for producing progressive movement or swimming are found in many genera. These are annular, and at intervals around the body. *Appendicularia* possesses a long and deep rudder-like tail, which contains muscular layers. The Brachiopoda are attached to a fixed body by a muscular arm or anchor, which enters the shell through a foramen. This is connected with the dorsal and ventral valves of the shell by corresponding opposite muscles, which determine the direction of its open borders. There are two pairs of adductor muscles arranged longitudinally, and two pairs of abductors (divaricatores), one of the pairs smaller, and sometimes wanting. There are muscles also in the mantle and branchial arms. In lamellibranchs or Acephala there are powerful musculi adductores. There is but one in the Ostreidæ, Aviculidæ, and Muelleriidæ. They are of very unequal size in the Mytilidæ, but sub-equal in the remaining Acephala. In *Anomia* there are three.

There are also retractor muscles of the siphons, and a band round the edge of the mantle. The muscles of the foot are often large. The principal one divides next the body, and each half is inserted near the hinge of the shell between the adductor muscles. In Gasteropoda the muscular structures have a different arrangement. The foot is largely muscular, and its upper and posterior region gives insertion to the columellar muscle, which attaches the animal to the shell. It arises from the columella at the beginning of the last whorl. Its size depends on the size of the whorl and length of foot. Other muscles are devoted to the elongation or retraction of the proboscis and the penis. In Cephalopoda the columellar muscle is represented by a large symmetrically divided mass, which arises from the cephalic cartilages, and is inserted into opposite sides of the shell. An annular muscle surrounds the neck, and another the funnel. From the latter diverge the longitudinal muscles of the tentacles, which are perforated by radial muscular fibres. The mantle is occupied by a flat muscle. The usually muscular foot is here represented by a flat body, which projects forward from beneath the mantle. It is rolled up, forming a tube. By the energetic expulsion of water from the mantle-chamber through this tube the animal is driven through the water, the mantle end first.

The interior surface of the outer chitinous skeleton of the Arthropoda is lined with a muscular layer. Longitudinal and oblique muscles connect the annuli, which repeat each other in those forms (Myriopoda and larvæ) in which the segments are similar. Where (as in all the higher types) the segments are much specialized, the muscles are modified accordingly, either by increase of size or number. Muscles of the dorsal and ventral regions are usually more

Fig. 12. Tubular follicle of the pig's stomach.

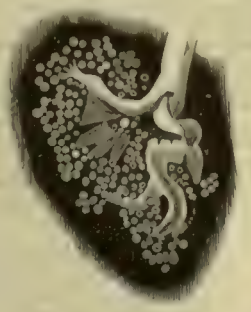

Fig. 13. Lobule of parotid gland, magnified.

enlarged than those of the lateral, while in the types where the sides are soft, to allow of the movements of the back and belly plates, the latter are connected by straight muscles which pass through the viscera. All the limb-muscles are within them, or are inserted into internal processes of the chitinous walls. Sometimes they are inserted into fibrous bodies which have been hardened by calcareous or chitinous deposit, which also subserve the purpose of levers.

Arthropoda possess muscles which perform the functions well known among vertebrates as rotators, elevators, depressors, retractors, protrusors, etc. But the flexors and extensors exceed the others greatly in importance and size. Their relative size is the reverse of what is seen in vertebrates: in the latter the extensors are the more important; in the Arthropoda the flexors exceed the extensors several fold.

2. *In Vertebrates.*—The muscles of the animals of this type are divided into two classes by their position and the relation they bear to the skeleton, and are termed episkeletal and hyposkeletal. The former are situated on the upper surface of the vertebræ—*i. e.*, of the body and arches, including ribs—and are developed in the fœtus coincidentally with the vertebræ. Hence they are in segments which correspond to these, and are separated by intervals termed inter-muscular septa. The hyposkeletal are developed later, and below the vertebræ; they are in part attached to the latter, or to the abdominal walls or the limbs.

In vertebrates below the Batrachia the hyposkeletal muscles are developed to a very slight degree. The segments of the episkeletal series (or myocommata) cover the sides of the body posterior to the head, and meet on the median line below. They present an angle forward, near their middles, having thus an open chevron shape. In Batrachia the tails and sides retain the largely developed myocommata, while the abdominal muscles have the character of those of the Reptilia. In these and higher Vertebrata the hyposkeletal muscles are well developed. In the latter numerous muscles (spinalis, semispinalis, longissimus dorsi, sacrolumbalis, inter transversales, levatores costarum, complexus, splenius, recti postici, and recti laterales) are derived, by subdivision, from the upper portion of the myocommata. In the same way the inferior half gives rise to the recti abdominis, which extend from the pelvis to the sternum: the sterno-hyoidei from the sternum to the hyoid apparatus; the genio-hyoidei from the latter to the lower jaw. On the sides the derivative muscles are obliquely directed—viz., the external intercostales; the obliqui externi of the abdomen; the subclavius from the first rib to the clavicle, and the scaleni from the anterior dorsal ribs to the cervical ribs and processes; lastly, the sterno-cleido mastoid extends from the sternum and clavicle to the skull. The fasciculi of these muscles are all directed, as is the lower part of the myocomma of the fish, from above, or dorsally, downward and posteriorly. The hyposkeletal muscles occupy the inner side of the body-walls, and include, besides many others, the diaphragm of Mammalia

and birds. This septary muscle is wanting or rudimental in vertebrates below the Aves.

The muscles of the limbs are of two kinds: (1) those that originate from the body, and (2) those that take origin on some bone of the limb. The former move the whole limb, the latter, its parts. They are extensors, flexors, and rotators; among the most notable of the last is that which, in the Mammalia, rotates the radius of the fore arm on the ulna. Of flexors, the pectorales major and minor pertain to the fore limb; they are enormously developed in birds, subserving the function of flight. The extensor of the hind limb, the glutæus maximus, is greatly developed in man, as essential to the erect attitude. The longitudinal dorsal muscular tendons are generally ossified in birds.

A remarkable modification of the muscular system is seen in the electrical organs of certain fishes, the torpedo, electric eel (*Gymnotus*), and catfish (*Malapterurus*). Here a system of enormous cells, packed in parallel columns, discharges electricity instead of developing movement or contraction. The contents are gelatinous, and are divided by connective tissue into transverse disks, imitating striped muscular fibre. The columns are vertical in the torpedo and longitudinal in the other genera. They are richly supplied with nerves, which are distributed on one face only. The rays possess rudimental organs of the same kind at the base of the tail.

VII. The Muco-Dermal System.

1. *In Cœlenterata, Echinodermata, and Mollusca.*—The superficial or cellular layer of the skin, or epidermis, is universally present in animals. The inferior layer in vertebrates is fibrous, and belongs strictly to the system of areolar or connective tissues; it is not found in the Cœlenterata, but is represented by a non-cellular, granular, and sometimes slightly striate "true skin." In these animals and in polyps (Anthozoa) there are two or three layers of cellular skin, of which the lower contains the "nettle-cells." These are minute bladders .02 to .07 millimètres long, and one-third to two-thirds as thick, which contain a hair-like body coiled within them. These are suddenly projected upon external irritation, and act as irritants or offensive weapons upon the object they strike, producing sometimes severe smarting and paralysis. These cells occur also as an external lining of the mesenterial threads of polyps. The true skin is the layer in which is deposited the carbonate of lime, which, penetrating or not the folds of the internal cavity of the body, produces the radiating and tubular solid structures characteristic of corals. In the Gorgoniidæ the deposit of the basis of the first simple, and therefore of the axis of the compound, animal, is horny; this is afterwards covered with a thin calcareous layer.

In the Echinodermata the dermal system fulfils an important function, as the basis of deposit of mineral matter in the form of innumerable symmetrical segments. In the Holothurida these deposits are frequently isolated and internal, and sometimes entirely wanting; the tentacles always contain them. Among Mollusca the superficial layer consists of ciliated epithelium (except on the eye-peduncles). The true skin is fibrous, and contains many cells; it is in the form of a sac, and often reaches considerable thickness. An extensive fold derived from the posterior part of the body in Cephalopoda and Gasteropoda, or the superior in Acephala, envelops the body more or less completely. In mollusks which possess a shell the latter is produced by the margin of the mantle. This margin is

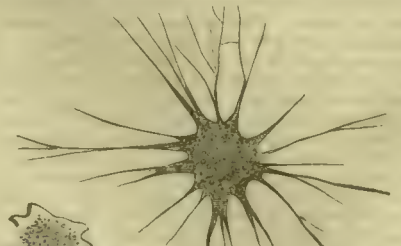

Fig. 14. Amœba, Rhizopods.

supplied with glands which secrete or separate carbonate of lime, which they deposit on the general border. Thus the shell takes the form of the body, which the mantle closely enfolds. In Gasteropoda it is sub-cylindric; the shell has the same character, being sometimes partially or wholly straight (*Vermetus, Teredo*), or generally spirally twisted. In the bivalves the mantle has the form of two lateral oval laminæ, thus producing the well-known form of the shells. The periodical deposits of lime by the mantle are seen in the lines of growth of all shells. The form of the mantle border is faithfully repeated in the shell; thus the projections caused by the protrusion of the proboscis in *Murex, Strombus*, etc., is seen in the convexities and canals of their margin. In Acephala the mantle extends beyond the body, enclosing a space known as the mantle-chamber. The margins of the mantle in a large number of families are extensively united, thus forming a nearly closed chamber. They are entirely separated in the oyster, the *Arca, Myophoria*, etc. They are sometimes only united by a bridge; when more extensively, there usually remains an opening through which the foot is protruded. Of these some leave a single opening at the posterior end of the body (Mytilidæ, Unionidæ), or the latter is divided into two (*Tridacna, Isocardia, Cyprina*). Of these the upper is the point of exit for excrement and water, while the lower admits water to the gills and food to the mouth. The lips of these openings are in many families prolonged into tubes, sometimes very extensively. These may be united or separate. They are either fixed or retractile; when the latter, the space they occupy in the shell requires that the line of attachment of the mantle to the shell should be indented, sometimes to a great degree. The opening for the foot also admits water. It is much reduced in size in genera with a rudimental foot (as *Gastrochæna, Aspergillum*, etc.), and is finally closed in *Pholadidea*.

Besides the mineral substance, the colors of the shell are secreted by special pigment-glands on the margins of the mantle.

The shell is not always composed of carbonate of lime; in *Lingula, Pinna*, etc., the material is phosphate of lime, and resembles bone. The pearl layers of many shells are aragonite. The shell may be composed of laminæ or prisms, or both. *Anomia* exhibits the first, *Inoceramus* the second, and *Strombus* the third type. In Brachiopoda the shell-valves are dorsal and ventral; in Acephala, right and left; in Gasteropoda and Cephalopoda the shell is central and single. In Acephala tightly-closed valves indicate retractile siphons; posteriorly gaping shells, projected ones.

The valves are united by a marginal hinge, composed of teeth, pits, and cartilage ligament, in most families.

In Gasteropoda the coil may be flat (*Planorbis*) or much prolonged (*Mitra*). The "body-whorl" is that last made; it may be either contracted (certain snails), or greatly enlarged, as in *Cypræa*, where it almost or quite conceals all the other turns, in its fold.

In the fossil *Endocardines* (or *Rudistes*) the valves are fastened by hinge-processes on the inner face of the free and smaller valve.

The shell of Cephalopoda is distinguished by its septa. These enclose chambers, the animal only occupying the last one constructed. This structure is not without parallel among Gasteropoda (where the unused portion is generally broken off), but the Cephalopoda are peculiar in that the body is not entirely withdrawn from the first chamber, but leaves a long tube, which passes through all the chambers, and secretes a pearly sheath, which is known as the siphon of the shell. In life this contains nothing but air, which is wanting in carbonic acid. The margins of the septa are simple in *Nautilus, Orthoceras*, etc., but fold in a most complicated and symmetrical manner in *Ammonites, Baculites*, etc. In *Goniatites, Aturia*, etc., the folds are fewer and more simple.

The *Argonauta* (paper nautilus) is peculiar in the character of its shell, which only belongs to the female. It possesses indeed no true shell secreted by the mantle, in common with other octopod genera, but that which bears the name is secreted by the margin of the large expansions of the two posterior arms. These enclose the shell, which is thus evidently a product of their inner face.

The byssus is a fibrous rope or thread-like body which is secreted by a gland in the foot of certain Acephala. By means of it the animal is attached to fixed bodies. It is well developed in *Mytilus*, rudimental in some *Unionea*.

2. *In Arthropoda.*—The external covering of the body and limbs of animals of this class has been already stated to be chitin. This substance is composed chemically of $C_{17}H_{14}NO_{11}$—that is, a protein body, $C_8H_6NO_3$, plus a hydrated carbon, $C_9H_8O_8$. In higher Crustacea and in various Myriopoda (*Iulus, Polydesmus*, etc.) it is accompanied by an equal or even greater amount of carbonate and phosphate of lime; of these the former exceeds the latter in quantity. The chitin layer proper is a secretion from a layer of cells, which in turn lies above a stratum of connective tissue. The cells resemble the epithelial, and have distinct nuclei. The chitin originates from these as a transparent layer, but frequently becomes streaked or fibrous.

The pattern on which each segment of the arthropod

body is constructed is that of an annulus composed of several pieces. These are a median dorsal and ventral, and a pair of lateral shields on each side. The number of these rings in the different orders averages twenty and less, but in some Myriopoda it rises as high as 140 (*Geophilus*). They are greatly modified in forming the head, to which five segments are reckoned by some (seven by others). In Myriopoda those remaining are very similar to each other, while in the other orders they are much modified, and generally arranged in groups. These are distinguished in insects as head, thorax, and abdomen; in Crustacea the first two and part of the third series are united into a cephalothorax, while the numerous remaining segments are the post-abdomen. In Arachnida only, however, we have the true cephalothorax, including head and thorax only, the abdomen remaining entirely distinct. The number of segments in the Crustacea Decapoda Amphipoda and Isopoda, is 20; in the Copepoda and insects, 12; in Arachnida it varies from 12 to 19.

The limbs of Arthropoda are composed of hollow, variously altered cylinders, articulated together where com-

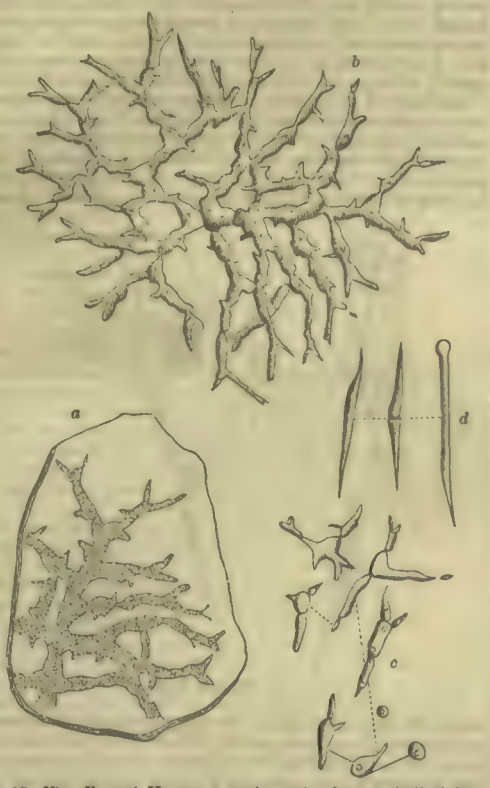

FIG. 15. *Vioa Freyeri*, Hanc.: *a*, entire animal on a shell of *Placunæ placenta*; *b*, *c*, the sponge removed, the branches in different stages of growth; *d*, spicules.

posed of more than one segment. In Crustacea and Myriopoda they are present on all the segments of the body; in Arachnida and Insecta on head and thorax only. In the last-named class only those of the head are modified to aid in seizing and devouring food; in the Crustacea, those of the thorax are partly (*Gammarus*) or wholly (*Astacus*) devoted to this service. As organs of progression only those of the thorax are employed in Insecta; in Arachnida the last head-limb is included; they thus possess four pairs of limbs, while the Insecta have but three. The larvæ of lepidopterous and some (tenthredenid) hymenopterous insects possess false feet or pro-legs on the abdominal segments. In the former they are beset by an arched series of minute claws, which are absent in the latter. The abdominal legs of Myriopoda are, like the thoracic, simple. In Crustacea they are in part swimming organs, and many of them bear plates and fringes in which the blood is exposed and oxygenized.

The organs of the head, or altered feet, are in jawed insects as follows: 1st, wanting; 2d, antenna; 3d, mandible; 4th, maxilla; 5th, labium. In insects with a tubular mouth it is similar, except that the third pair are bristles for puncturing, the fourth similar, and the fifth a tubular body or rostrum, enclosing them. The hemipterous rostrum is of this type. In Lepidoptera, where there is a tubular or suctorial tongue-like rostrum, the third segment is rudimentary, the fourth is the rostrum, and the fifth is the labium. Of the jawed type of the Coleoptera are the orders Orthoptera and Neuroptera. In the Hymenoptera (bees, etc.) the mandibles are developed as jaws, but the maxillæ are elongate, and form the opposed halves of a tube which encloses a projectile tongue. The suctorial orders, Hemiptera and Lepidoptera, have been mentioned; the structure in the Diptera (flies) is similar to that of Hemiptera.

The antennæ of insects are organs of special sense, but whether of hearing, smell, or taste is not well known. In the basal segment of certain Crustacea (*Sergestes*, etc.) a chamber containing grains of sand has been suspected to be an organ of hearing; while a microscopical nervous structure in the posterior wings of Coleoptera has been regarded as of similar significance. The antennæ are set with bristles, which evidently subserve the ordinary but here highly delicate sense of touch. The Crustacea are distinguished by the presence of two pairs of antennæ; the second pair only of these is present in other Arthropoda, excepting the larvæ of insects, where the first pair exists in a rudimental state, the second being absent. In Myriopoda they are as in Insecta, but in Arachnida both appear to be wanting; the second pair is, however, present as jaw-antennæ, taking the place of the absent mandibles.

In Insecta the forms of the antennæ are very numerous. The typical structure is that of a succession of (nine to twelve) sub-similar cylindric segments. Thus they appear in carnivorous and other Coleoptera, in phryganoid Neuroptera, acridiid Orthoptera, nematocerous Diptera, etc. In most Diptera they are excessively shortened and of few joints; the last is enlarged, and supports at its base a large bristle, which is frequently plumed. In Lepidoptera Diurna they are club-shaped; in Sphingidæ, triangular in section, and in Lepidoptera Nocturna, fusiform and often plumed. In many Orthoptera they are very short; in Hymenoptera short (bees), elbowed (ants), or much prolonged (Ichneumonidæ). The Coleoptera exhibit the greatest varieties. In some (*Elater*, *Dictyopterus*) they are serrated; in Silphidæ, short and clubbed; in Longicornia their length is often excessive; in Curculionidæ some of the basal segments are elongate, forming an elbow with the remainder. In Lamellicornia the terminal segments are expanded, leaf-like, one on each side of the axis, and open and shut like the leaves of a book.

In Myriopoda the maxilla and labium of insects are represented by a large labium. In the Strongylia there are a second and third labia; but in Chilopoda the last is represented by a pair of powerful foot-jaws, which are perforated for the conduct of poison. The first leg corresponds to the third of the insect. In Arachnida the insect maxilla is represented by jaws, which are simple in spiders, acute, and perforated by a poison duct, but in Phalangia, scorpions, etc. (Pedipalpi) are furnished with an opposable joint, or are cheles.

In Crustacea the second pair of maxillæ are not united into a labium, as in Insecta. The cephalothorax in some of the higher order of Decapoda (crabs, lobsters, etc.) is distinguished from the abdomen by a groove, as in the crayfish (*Astacus*): in all of them the ambulatory limbs arise from the abdomen. One or more of these are chelate (furnished with nippers) in the Decapoda and other orders, but in the Stomapoda the first pair has instead the last joint opposed to the whole length of the penultimate, forming a reversed scissor-like organ. The limbs of the post-abdomen usually bear branchial organs, while those of the last segment are in the form of plates, which, when extended, form a swimming shield (lobster), or are hook-like bodies for maintaining the hold in the shell (*Pagurus*).

The limbs in Insecta are always similar in construction, though the hinder may be much elongated (grasshopper), and never chelate. They consist of four regions—the coxa, femur, tibia, and tarsus. The coxa attaches the limb to the body by a ball-and-socket or hinge-like joint, and may be from globular to laminar in form. The femur is the stoutest joint, containing the muscles which flex and extend the rest of the leg. The tibia is slender and often long; the tarsus usually consists of several joints. In some Hemiptera it consists of but one or two; in most Coleoptera it embraces at least five. In the latter order the number is an important index of relationship. The lower groups (Phytophaga, etc.) possess but three; the curculios, longicorns, etc. possess four, and the Tenebrionidæ and others five in front and four on the hind limbs only; lastly, the serricorn, clavicorn, monilicorn, and other types with five joints, all round. The last joint usually consists of a pair of chitinous hooks; others may be modified by expansion, etc. for adhesion to vertical surfaces, etc.

3. *In Vertebrates.*—The skin in the Vertebrata is primarily smooth and soft. Its epithelial glands may secrete mucus, as in many fishes, or glands seated in the true skin may separate sweat. The latter are simple, convoluted, and

with a long efferent duct. The epithelial layer produces the horny sheaths of claws and horns, feathers and hairs. Mammalia are generally covered with hairs, but in the manis it is thrown into extensive folds, which are ossified, and become the scales of those remarkable animals. In the shell of the armadillos and on the head of various batrachians it is penetrated by ossification, which is confluent with that of bony structures below them. Hairs are an epithelial growth in the form of a hollow cylinder. The epidermis is sunk into a pit of the true skin, and then returns outward as the hair. It increases in length by addition of cells and pigment from below. A modification of the same structure is seen in feathers, where the axis is split laterally, and thus develops the barbs and fibrillæ on each side. Birds are covered with feathers. The first growth appears as down, in which the fibrillæ are softer and in much smaller number, so as not to be coherent; the bases of the true or mature feathers are furnished with the same. Those of the body are generally soft; in aquatic birds excessively dense on the lower surfaces. They arise from certain patches only. There is one on each scapular region, and one along the middle line of the neck above. Another is on the rump, and one on each side of the breast. The abdomen presents a large median patch. In ostriches, penguins, and a few others the feathers are evenly distributed over the whole body. Besides the main shaft of the feather, a second one is developed behind it in many birds. It is generally much smaller than the first, but it is equal to it in the Casuariidæ. The largest feathers are developed on the caudal vertebræ and on the fore limb. In the latter they subserve the function of flight. Those attached to the carpus and manus are the longest and most important, their length bearing a direct relation to the powers of flight of the bird. These are the *primary* quills; they are enormously developed in the swallows and swifts, in the humming-birds and frigate-pelicans (*Tachypetes*), etc. They consist of naked shafts only in many of the ostriches. The quills attached to the fore arm are the *secondaries;* they are proportionately large in gallinaceous birds. Those inserted into the skin of the humerus are the *tertials*, and are most highly developed in the wading families (Grallæ) and certain song-birds—*e.g.*, the Motacillidæ. The caudal quills or rectrices are from twelve to eighteen in average number; they are greatly elongated in the tropic-bird (*Phaeton*), *Milvulus*, etc., and are almost wanting in some gallinaceous birds, in some tinamous, etc. The rump-feathers or tail-coverts are sometimes so developed as to conceal them, as in the peacock, *Pharomacrus*, *Egretta*, etc.

The scales of reptiles are areæ of true derm, bounded by simple folds, which are covered exactly by epidermis. These areæ may be filled with an osseous deposit, as in *Heloderma;* in snakes they are soft. In tortoises the intervening folds are very shallow, and remotely correspond to the skeleton below. The epithelial layer is horny (tortoise-shell), while the derm is ossified and united with the osseous skeleton below. In Crocodilia the distinct ossifications occupy the dermal areæ of the back, or on both surfaces of the body in the caimans, etc. The areæ are symmetrically distributed on the head in serpents, most Lacertilia and some tortoises. In the first they are fewest and most regular, numbering usually nine on the upper surface. They correspond remotely with the cranial bones, and hence are called parietal, frontal, superciliary, prefrontal, internasal, rostral, etc. In venomous snakes and boas the vertex is frequently covered with scales.

Fishes frequently display ossifications of the epidermis as well as of the true skin, as on the cranium of sturgeons, their dorsal and lateral shields, etc. The scales which cover the bodies of most fishes are developed in pouches of the true skin by deposit of mineral matter. Their exposed surfaces are covered by epidermis, which enters between them, and reaches there the true skin. In eels they are small and separated. In fishes with closed swim-bladder (Physoclysti) the scales develop spinous projections which produce the effect of a comb on the margin, and are hence called *ctenoid*. Most of those in fishes, with the duct of the swim-bladder (Physostomi), have smooth surfaces and edges, and are termed *cycloid*. In many fishes of early periods, and some now living (*Lepidosteus*, *Polypterus*), the scales are pavement-like and glossy, with a layer of *ganoin*. These are crossopterygians or Physostomi. Sharks have separated mineralized bodies, with flat bases and produced points, granules, etc., whence they have been termed *placoids*. In Dermopteri and Leptocardii the skin is smooth.

The internal parts of the muco-dermal system are the mucous and serous membranes. The former are continuous with the epidermis, and line the cavities of the digestive, respiratory, and reproductive systems. The latter line the closed chambers, being continuous with the mucous membrane only at the fontanelles of the oviducts (tubæ Fallopii). In the thoracic cavity they form a sac, with one side thrust in upon the other, the thoracic viscera being on the outside of the entering portion. The abdominal viscera occupy in the same way the outside of the membrane lining the cavity, which is termed the peritonæum. In the thorax it is the pleura.

4. *The Teeth.*—These bodies are generally developed in an internal or external epithelial layer, like some of the dermal, bony, or mineral plates or pieces. In Protozoa and Cœlenterata they are wanting. In Echinodermata they are present as five hard sub-triangular plates, which close the mouth by their close contact, like radii from its centre. In Mollusca they are described under the digestive system, so that it only remains to consider them in Vermes and Vertebrata. In the former they consist exclusively of hooks, mostly arranged round the mouth. In the Trematodes they occur, weakly developed, in a few genera, in one of which they are attached to an organ at the posterior extremity of the body. In Nematoda, *Chiracanthus* has hooks on the head and body, and *Strongylus* horny teeth round the pharynx. In Acanthocephala all the genera possess a retractile proboscis, which is studded with recurved hooks in various circles. In Cestoda, the tapeworms have hooks as well as suckers on the head, which are especially well developed in the cysticercus larval stage. The Tetrarhynchidæ possess four projectile proboscides, each of which is set with several rows of recurved hooks.

The teeth of vertebrates are developed on papillæ of the mucous membrane, which is usually sunk into successive cavities or alveolæ of the jaw and palate bones. In Leptocardii there are none, and in Dermopteri they are horny processes in concentric series round the inside of the funnel-shaped mouth. The two largest are situated at the

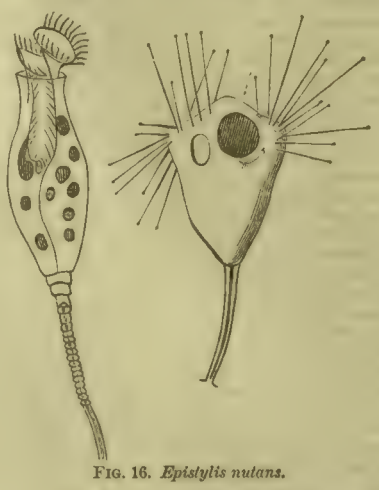

FIG. 16. *Epistylis nutans.*

mouth of the œsophagus. In fishes generally bony teeth are present, but are not usually developed in alveolar cavities, but on the surface of the bones. True teeth are usually composed of a very dense substance allied to bone, called dentine. Exterior to this they have a deposit of a still denser and harder substance, the enamel, which covers the crown. The root is sheathed in a layer of true bone, the cement. Dentine is distinguished from bone (*osteine*) by the presence of great numbers of parallel tubuli, which radiate from the central cavity to the circumference of the tooth. Enamel is, on the other hand, of the nature of a secretion, filling vertical hexagonal cells which stand upon the dentine. Hence it is composed of prisms. It contains, like dentine, a trace of fluoride of calcium, besides the phosphate of lime of which both are composed.

In fishes the teeth are usually covered with dentine instead of enamel, and may be composed internally of true dentine or of its variety, vasodentine. This substance retains the numerous blood-vessels which characterize the early stage of deposit of dentine, which are easily seen in a section of the teeth. Of such character are the teeth of Elasmobranchii, which are moreover of very various form. Thus, they are pavement-like, with vertical lamellar roots, in skates and rays, or they are rootless and with swollen crowns of differing sizes, etc., arranged in symmetrical band-like pavements, as in cestracionts. The crowns may be more elevated, as in hybodonts, or finally isolated and with sharp apices and cutting edges in the existing squalodonts. In Holocephali the teeth are most rudimental, consisting only of the calcified walls of the vessels arranged in alveolar cavities of the jaws. In Dipnoi the teeth form a single serrate cap for each jaw. In Actinopteri the teeth are generally composed of a larger proportion of dentine.

In sturgeons they are only present during immature age. In the Lepidosteidæ the external or dentinal surface is inflected in deep folds, which are closed so as to resemble grooves externally. Physostomi generally have large teeth on the jaws, but in some Characinidæ and all other Plectospondyli, *Coregonus* (grayling), some *Mormyri*, etc., there are none. In some of these fishes there are numerous teeth on the lower segment of the fifth pair of hyoid arches, or the "inferior pharyngeal bones." In Characinidæ these are of very varied type; in Catostomidæ the bones are much prolonged, and the teeth are comb-like in one row, and work against a projecting inferior table of the basi-occipital bone. In Cyprinidæ they are stout, in one or more short rows, and may be hooked, sharp-edged, conic, or grinding in type, according to the food of the fish. This structure does not exist in other fishes. In *Esox* the teeth are raptorial and very numerous; in Clupeidæ, rudimental and wanting. Only in the order to which the latter pertains, the Isospondyli, do we find fishes with fangs sunk in deep alveoli, the extinct Saurodontidæ from the cretaceous formations. In Nematognathi they are more or less bristle-like, and packed together like a brush. In eels they are often dagger-like. In physoclystous (or the higher) fishes they are generally brush-like, frequently with canines intermixed; but in Pediculati they are large, incurved, on flexible ligamentous bases. In some Plectognathi they are incisor-like, and in Pharyngognathi those on the hyoid apparatus are greatly developed. The latter are sub-quadrate, oval, or narrow (*Scarus*), and arranged pavement-fashion for the crushing of hard substances, as shells, etc. In *Scarus* the teeth of the jaws are confluent into a shining, parrot-like beak, useful in scraping out shells and cutting off sea-weed.

FIG. 17. *Hydra viridis.*

In Batrachia the teeth are usually small, often wanting (bufoniform Anura), or in the extinct Labyrinthodontia with deep complicated inflections of the dentine and superficial cementum. In reptiles we find teeth with fangs and with crowns, generally covered with enamel. These may be sunk in deep alveoli (Rhynchocephalia, Acrodonta, Crocodilia, Ichthyopterygia, Sauropterygia, Ornithosauria, Dinosauria-Goniopoda), or may be attached to the inner side of the outer alveolar wall (Lacertilia in general, and Dinosauria-Orthopoda); may stand immediately on the jaw-bones, without fangs (Ophidia), or on a thick column of ossified pulp (*osteo-dentine*) in an alveolus (*Pythonomorpha*). The crowns are generally compressed conic; in some (*Lælaps*) knife-shaped. In herbivorous lizards they present an oblique face inward. In Crocodilia the young teeth rise within the pulp-cavity of the old, and throw them off; in most other orders the successional teeth appear at the side of the fang, and provoke absorption, which cuts off the crown of the old. Tortoises and birds are toothless; Anomodontia are so likewise, except a strong maxillary tusk.

In Mammalia the dental armature is distinguished into series—viz., the incisors, canines, pre-molars, and molars. Their normal number on each side of each jaw is I. 3; C. 1; Pm. 4; M. 3; total, 44. The incisors are normally flat and transverse-edged; the canines longer and conic; the pre-molars compressed, with one to three cusps; and the molars oval in section, with a double series of cusps. In *Ornithorhynchus* there is but one, a horny tooth. In marsupials the number of incisors is excessive (as 8 or 10), or, as in kangaroos, less numerous and the median much enlarged. In these and their gigantic extinct allies two in the lower jaw are much enlarged as tusks. In Rodentia there are but two incisors above and below, which have enamel on the external face only, hence the inner wears more rapidly, and the opposed pairs act as efficient cutters in gnawing. The other teeth are molars only, and these of the complicated type to be mentioned later. In Insectivora the incisors are enlarged, but in Edentata they are always wanting. In Cheiroptera and Carnivora they are similar to each other, and much reduced. In Quadrumana they are well developed, broad, opposed cutters, and are generally 4–4 in number. The proboscidians, on the other hand, have but one (the outer) pair of incisors in each jaw, which are developed into huge tusks above (Elephantidæ) or below (Dinotheridæ). In these cases the opposing pair is reduced or wanting. The Artiodactyla-Ruminantia are remarkable for the entire absence of superior incisors, and the close resemblance of the inferior canine to the lower incisors, producing the appearance of eight of the latter.

The canine is largely developed in the Carnivora, hogs, *Hippopotamus*, and certain extinct proboscidians, as *Eobasileus*, etc. The pre-molars are wanting in rodents and many proboscidians, but numerous in marsupials, insectivores, etc. In Carnivora they are numerous, and the last is peculiarly formed, being the sectorial or flesh-tooth characteristic of the order. The two outer tubercles and connecting ridge are developed into a longitudinal notched blade, while the inner remains a small tubercle at the front of the inner side. In dogs there are two tubercular molars behind it; in weasels and cats, one; in the extinct Hyænodontidæ, several, but all of the sectorial form.

Molar teeth are composed of one, two, or three rows of tubercles. In the first case they may be one- or two-rooted. Thus, in cetaceans generally they are simple cones, covered with cement instead of enamel. In some extinct groups (*Zeuglodon*, etc.), the crowns are compressed and the roots two. In Edentata they are simple throughout, and covered with cement. This forms a thick layer, and encloses a thin one of dentine, which by its superior hardness forms the ring-like grinding surface of the crown; it is filled within by osteo-dentine. In insectivorous animals the tubercles are in two, sometimes three rows, and acute and elevated; thus they appear in Cheiroptera, many marsupials, Insectivora, etc. In kangaroos, sirenians, tapirs, and *Dinotherium* they appear as two transverse crests or keels. These crests are multiplied in *Mastodon*, reaching six or seven. In *Stegodon* they are more numerous; the intervals are a little deeper, and with some cementum in their bottoms. In *Elephas* they are deepened to the roots of the tooth, and filled to the top with cement; are narrowed by the approach of the much elevated transverse crests, which have now reached a great number. Their summits readily wear in use, and thus present bands of alternating dentine, enamel, and cementum.

The transverse crests of *Tapirus* may unite at the inner extremity, forming a V in Bathmodontidæ among hoofed animals, or be connected by an external longitudinal crest in *Rhinoceros*, *Palæotherium*, and *Hyrax*. The outer crest may so be indented as to form two Vs, and the inner portions reduced to knobs, as in *Limnohyus* (Perissodactyl), or curved crests (*Anchitherium*). The latter may be cut off and curve lengthwise, so as to produce four Vs or crescents on the grinding face.

From this point the succession of forms seen in approaching the elephants is repeated in two series, ending in the ox and horse. The intervals deepen, the crescents become elevated, and the tops, being soon worn off in use, present a figure formed by the edges of enamel plates, which enclose islands of dentine. The spaces between them are filled with cementum. In the horse and ox there are five crescent-shaped columns in the upper molars and two in the lower. In other artiodactyls there are four above and two below. In deer the crown and roots are subequal in length, but in the Cavicornia the crown is much the longer.

FIG. 18. *Pelagia.*

The same transition is seen in the rodents. In *Mus* the molars are only tubercular; in squirrels there are elevated crests. In *Arvicola* and beavers there are deep inflections of the enamel of the sides of the tooth, producing a zigzag section when the crown is worn, while in Caviidæ the tooth is entirely divided into several columns by the deep descent of the enamel coating from above. In porcupines figures are produced by both lateral and coronal folds.

Simpler teeth are seen in men and apes, where the molars present four obtuse tubercles (in the last sometimes five); and in the hogs, where the tubercles are more numerous, and sometimes irregular. In *Hippopotamus* each of the four tubercles is trifoliate in section.

VIII. The Digestive System.

1. *In Invertebrates.*—The prominent features of the digestive system in Cœlenterata have been pointed out. There is none in the Hydræ, the inner surface of the urn-shaped body-cavity performing that function; an excretory pore exists in the foot-like support. In polyps a small sac is sometimes formed at the summit of this cavity by the reflexion of the inner skin; it opens into the cavity, and is entered above by the mouth. The body-cavity is ridged on the sides by prominent folds, whose margins bear reproductive organs and nettle-cells. In the Medusæ the body is turned the other side up at maturity, though its position is that of the polyps in the larval state. Hence the stomach is below the body-cavity. The latter is sometimes wanting, and is ridged occasionally, as in polyps. It is produced downward in some genera by its walls becoming a peduncle for the stomach. The latter is bell-like, and often widely open; it is generally closable by the contraction of its margin. The latter bears bunches of tentacles, etc., which in the Rhizostomæ are greatly enlarged and prolonged into four leaf-like bodies, which bear the four mouths at their extremities, and the tubular œsophagi throughout their length. From the body-chamber rise the four radiating tubular canals, which extend through the umbrella to a tube which passes round its margin.

In Crinoidea there is a central column to the body-cavity; round this the alimentary canal winds, and, returning, issues near the mouth. In Asterioidea the stomach is a sac, connected with the mouth by a short gullet, which is closable at the mouth. The stomach is divaricated into five pairs of bunches of cæca, which send out radial tubes, two into each arm of the animal. The vent is wanting in the Ophiuridæ, but present in most Asteriidæ; in the latter case there is an enlarged rectum, which gives rise to five horny radial cæca (often bifurcate), which alternate with those of the stomach. In the Holothurida the vent is present, and the alimentary canal elongate, and divisible into œsophagus (closed behind by a sphincter), intestine, and rectum. The last receives the mouths of the respiratory organs.

In the Vermes this system does not branch radially; otherwise its character is very various. That it is a blind sac in many orders has been already shown. In those without arms it is either a simple blind tube (*Turbellaria-Rhabdocœla, Nephelis, Aspidogaster, Branchiobdella*, etc.), or is early divided into two parallel tubes, as in Trematodes. In tape-worm and *Monostomum* these tubes unite at the posterior end of the body. In the Nemertina, in which the canal is simple, there are two constrictions at the end of the œsophagus, to the anterior of which is attached a projectile stylet furnished with venom-glands. In Polia the alimentary canal becomes a solid ligament, which is turned forward and attached to the wall of the cavity. In *Pontobdella* the blind canal is furnished with a few branches or cæca. In the Turbellaria-Dendrocœla it forms a large number of branching cæca.

In the families with vent, it is wound or knotted (Capitibranchiata and some Dorsibranchiata), simple (Abranchiata, Gordiacea, Nematodæ), or furnished with cæca on the sides. There is but one on each side in *Hæmopis*, but many in the leeches.

In Vermes in general there are no Cuvierian glands, and there are often liver-cells on the canal walls.

Fig. 19. *Paractis alba: A*, expanded; *B*, the reproductive organ of *Cereus*.

In Mollusca an anus and liver are always present, excepting that the former is wanting in most Brachiopoda. An almost universal peculiarity of mollusks is that the alimentary canal, after fewer or more numerous convolutions in the body-cavity, returns and issues not far from the mouth on the dorsal or lateral face of the body; this prevails from the Bryozoa to the Cephalopoda. The general characters of the canal can be expressed schematically as follows:

A. A more or less projectile œsophageal body or tongue, with a movable membrane armed with reverted horny teeth, and more or less retractile into a sheath; no crystal style in the stomach (except two or three genera). Stomach large, unsymmetrical; canal short, with a large pyloric cæcum; liver very large, lobular, discharging anterior to stomach; mouth with horny beaks: Cephalopoda.

Course of canal with two abrupt turns: 1st, at transverse stomach; 2d, of intestine double, under œsophagus; rectum transverse, opening in mantle-hole; liver double, of many cæca, entering each end of stomach: Gasteropoda-Scaphopoda.

Fig. 20. *Ophiura.*

Course of canal little enlarged at stomach, and with an intestinal one; altogether a loop opening forward near heart; liver single, lobulate: Gasteropoda - Heteropoda.

Intestine short (straight), emptying on right side, never in breathing cavity (rarely on back), rarely issuing from anterior part of stomach; latter elongate (longitudinal), receiving straight œsophagus at either end or side, often divided in two or three, when one or more is furnished with horn-armed ridges or teeth; horny jaws: Gasteropoda-Opisthobranchia.

1. Liver lobulate, compact.
2. " " subdiffuse, with connecting canals.
3. " of blind canals.
   - *α.* Branching from large stomach-opening in body.
   - *β.* " in lateral body-wings.
   - *γ.* " in gills.
   - *x.* Two posterior body-trunks of liver.
   - *y.* One " " (including four families).
   - *z.* Three " "

Stomach (with very few exceptions) elongate into a cæcum; intestine rising from middle and turning forward to the vent; ridges armed with horny plates in stomach: Pteropoda.

Stomach a widening of canal, rarely with one or two constrictions; intestine not convoluted (except *Chiton*), emptying into breathing-cavity on right side; small flat jaws, sometimes horny; a pharyngeal lump, with internal cartilage supporting tongue, on lower side of end of œsophagus: Gasteropoda-Prosobranchia.

AA. Movable armed tongue wanting.

a. A crystalline style in cæcal appendage to stomach; lips at entrance of œsophagus; canal mostly uniform, much turned; end of rectum free in cloaca; stomach oval or round: Acephala.

aa. No crystal style; mouth opening between more or less cartilaginous spiral appendages; canal bound by an extra mesenteric sheath; stomach little distinct; liver double with large (sometimes several) discharge canals: Brachiopoda.

1. Canal shorter, ending in blind enlargement.
2. " longer, ending in lateral anus.

Mouth opening at base (or side) of a gill-sac; œsophagus short; stomach not large, simple, both with intestine, forming a V; latter directed forward, opening on same side as mouth: Tunicata.

Mouth surrounded with ciliated tentaculæ (in one genus with a conic lid); œsophagus well defined; stomach distinct, oftener double than single; intestine rising from end of first or single stomach, swollen in part of a straight course to anus near mouth: Bryozoa.

In Gasteropoda there is a pair of salivary glands; in most Cephalopoda, two pairs (in *Sepia* and *Loligo* but one pair, and in *Nautilus* none).

The *radulæ*, or tooth series, and their supporting band, present an enormous number of separate teeth in some of the Gasteropoda. In the Cephalopoda and Pteropoda they are less numerous. In some of the Pulmonata they number as many as 26,800. They are arranged in rows, longitudinal as well as transverse. The latter are more or less irregular in their course, but strictly bilateral. There is a series of median plates or teeth, with one or more rows of lateral ones. The following divisions are indicated by the different tooth-structures in Gasteropoda:

a. Rhachiglossa; only median plates, which are often toothed (0—1—0): Volutidæ.

b. Toxoglossa; no median plates; on each side a single lateral tooth of an awl-like form; no basal membrane of radula: lateral teeth moved by special muscles (1—0—1): Conidæ, Pleurotomidæ.

c. Hamiglossa; a middle plate and single lateral plate (1—1—1): Muricidæ, Bucciniidæ, Olividæ, Lamellariidæ, Fasciolariidæ, Turbinellidæ.

d. Taenioglossa: median plates, and on each side three lateral plates; fourteen families: among them Littorinidæ, Cerithiidæ, Turritellidæ, Cassididæ, Tritoniidæ, etc. (3—1—3).

e. Ptenoglossa; no middle plates; lateral plates similar, numerous (∞—0—∞): Scalaria, Janthina.

f. Rhipidoglossa: middle plates; laterals 4—6 or more, of various forms; outside of these numerous small hook-like teeth (∞—1—6—1—4—6—∞): Neritidæ, Trochidæ, Haliotidæ, Fissurellidæ. The Pulmonata (except Testacella) exhibit a close similarity to this division in their dentition.

The digestive canal in Arthropoda does not turn on itself as in mollusks, but issues at the extremity of the body opposite to that which it enters. The œsophagus is usually straight, and is expanded in the thoracic region into the usually longitudinal stomach. Anterior to this point it has sacciform dilatations (Orthoptera) or diverticula in some types, as the bees, Lepidoptera, flies, etc. After leaving the stomach, the canal, after few or no windings, reaches the anus.

In Crustacea and Insecta there is an extensive fatty mass on each side of the posterior part of the canal, known as the corpus adiposum; in Arachnida it is frequently wanting. The form of the stomach in this class varies; thus in Pedipalpi (scorpions, etc.) it is simple or nearly so, but in Aranea (spiders) and *Pycnogonum* (whale-louse) it branches into radiating diverticula; in the latter these penetrate even into the femora and tibiæ. The digestive system is supplied with various glandular organs. Those nearest the mouth are the "salivary glands," which are present in all the classes except the Crustacea. They are complex glands, and their secretion in some forms (larvæ of some Lepidoptera) hardens on exposure to the air into silk-like threads. The so-called liver-glands or tubes are situated either before or behind the stomach. As their function is unknown, and their position is inconstant, the above name is but provisional. In Insecta they are slender and tubular, sometimes very elongate and undivided. There are usually but four in Coleoptera, but more in Orthoptera and Hymenoptera, forming a whorl. In Arachnida (*Scorpio*, *Mygale*, etc.) and *Limulus* they are more complex, and present a series of more numerous openings into the intestine. In the decapod Crustacea the organ exhibits its highest development. It is there a complex follicular gland of large size on each side of the alimentary canal, and opening posterior to the stomach. Other simple glands are in the Insecta distributed over the surface of the stomach, and are enclosed by its muscular layer.

The stomach-walls are thin or muscular, in some types ridged within and furnished with horny teeth: Orthoptera, some Coleoptera.

2. *In Vertebrata.*—In most of this branch of animals the stomach is present as a distinct enlargement of the alimentary canal, and the intestine is short or long as the food is flesh or vegetable and mixed in character. The liver is present in all, and is of a highly complex glandular character, except in the Leptocardii, where it is a simple diverticulum of the alimentary canal.

In the Leptocardii the pharynx is very capacious, and is abundantly fringed with long processes. It opens into a sac-like stomach, which is continued as the slender straight intestine to the vent. There are no teeth. In the Dermopteri the intestine is also simple and straight. In fishes it presents a good many variations. In some, as the sharks and siluroids, the stomach is large, and the pylorus is remote from the cardiac entrance. In most Clupeidæ, Hyodontidæ, Characinidæ, *Amia*, and *Polypterus*, it is sac-like, with the pylorus near to the cardiac entrance. In most fishes the stomach is bent on itself, but in *Chimæra*, *Symbranchus*, *Amphipnous*, *Fistularia*, and *Belone*, it is straight. The stomach in some sturgeons and in *Heterotis* and *Chatœssus* (clupeoids) is gizzard-like (*i. e.*, sub-round), with muscular walls and tendinous lamina on the sides. It is closed at the pylorus in most fishes by an annular muscle. In the higher fishes (Physoclysti) there are generally found diverticula from the beginning of the intestine at the pylorus, which are termed pyloric cæca. They are also abundantly found in the lower groups, or Physostomi, but their entire absence is more common. They are wanting in Nematognathi, eels, *Fistularia*, *Chirocentrus*, *Hyodon*, the Gobiidæ, and Blenniidæ, and in *Amia*, *Polypterus*, and the Elasmobranchii. They exist in vast numbers in some Salmonidæ and Lepidosteidæ, and are numerous in electric eels and sturgeons. In *Platax* there are but four, in *Chologaster* two, and in *Amblyopsis* one.

The succeeding part of the canal is generally to be distinguished into small intestine and rectum. These are separated by a strong valve in Elasmobranchii (except *Chimæra*) in *Lepidosiren*, *Polypterus*, *Zources*, *Acipenser*, *Mastacembelus*, and it is not strong in *Orestias* and *Clarotes*. The rectum is distinguished in the lower forms by the possession of a spiral internal valve or partition. In Elasmobranchii, *Polypterus*, and *Lepidosiren*, the spiral partition is continuous by its inner margin with a median membranous axis, which is suspended from the ileo-cæcal valve; in *Raja miraletus* there is no axis, and the partitions are transverse and perforated; in *Squatina*, *Polyodon*, and *Acipenser ruthenus*, it has no axis, and revolves spirally on the wall of the rectum. It is also present in *Amia* and *Trachypterus*. In *Acipenser rubicundus* there is no spiral valve, but the walls of the rectum are areolate, somewhat as in tripe. The gall-bladder is always present, and discharges beyond the pylorus.

In Reptilia the divisions of stomach, intestine, and rectum are well marked; in Batrachia rather less so. In both the canal is elongate, and held in a folded position by a mesentery, but in batrachian larvæ it is much more extended, and is horizontally coiled. The liver is large in Batrachia, and usually in three lobes, but in the Brevicipitidæ and Engystomidæ there are but two. There is a sphincter valve at the pylorus, and sometimes one at the end of the small intestine. The gall-duct discharges below the pylorus. In tortoises, whether carnivorous or not, the alimentary canal is elongate.

In some Emydidæ and Trionychidæ there is a cæcum or sac on each side of the rectum, the bursa analis. In many Lacertilia the rectum is double or divided by a muscular valve; in *Iguana* and *Basiliscus* there is a septary valve with small orifice. In serpents the œsophagus is greatly elongate, and the gall-bladder peculiar in being separated from, and sometimes far behind, the liver. The rectum presents many peculiarities. In *Calopeltis* and *Homalopsis*

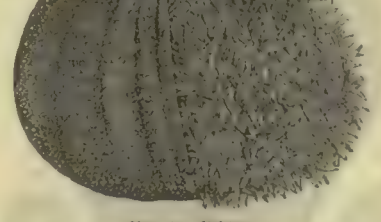

Fig. 21. *Echinus.*

the internal surface is longitudinally folded; in *Hydrophis* with short interrupted folds: in *Dryiophis*, *Dipsas*, *Vipera*, and *Caudisona*, transversely folded; in *Boodon geometricus*, *Bungarus*, *Elaps*, and *Ancistrodon*, the folds are developed into partitions, which are pierced by a single hole each. A pancreas is present in lizards and serpents.

The alimentary canal of birds is distinguished by the peculiarity of the stomach, which is a gizzard—that is, with walls composed on the convex face or borders of contractor muscles, which have a median and common tendon extended sheet-like on the plane side of the stomach. This is, however, not found in certain marine birds, as penguins, where the stomach is a simple sac; and it is little developed in *Sarcorhamphus* and *Vultur*. It is a double sac in *Apteryx*. The crop is a bag-like expansion of the œsophagus, for the temporary stowage of food; it is found in gallinaceous birds, vultures, etc.

Adjoining the stomach is frequently found another more symmetrical expansion, the proventriculus, whose walls are studded with simple glands, whose secretion softens hard food. It occurs in Gallinæ, *Crypturus*, Insessores, *Ibis*, ducks, condor, etc. The rectum is not strikingly distinguished from the ilium, but it sends off at its origin two huge cæca, which extend forward towards the stomach on each side of the intestine. They are excessively elongate in *Phasianus*, *Crypturus*, *Dicholophus*, *Apteryx*, etc., and very short in *Apenodytes*, *Ibis*, etc. They are apparently absent in *Sarcorhamphus*.

In Mammalia the stomach, intestine, and rectum are well distinguished. There is neither crop, proventriculus, pyloric nor rectal cæca, nor rectal valves. The gall-bladder is not separated from the liver, and discharges below the pylorus, as does also the excretory duct of the pancreas. There are glands in the intestines of many forms, known as Peyer's, and the salivary glands of the œsophagus or pharynx are always present. The intestine (colon) is frequently prolonged beyond the origin of the rectum, forming a cæcum; the mouth of the rectum is closed by a strong valve. The stomach is transverse, with a portion projecting beyond the cardium—the fundus. This is excessively elongate in the bat *Desmodus*. The stomach is simple or undivided in Primates, Carnivora, Proboscidia, Perissodactyla,

Cheiroptera, and squirrels. It is lobulate and subdivided in Monotremes, marsupials (generally), many rodents, some cetaceans, and most of all in artiodactyles (ruminants, etc.). In *Ornithorhynchus* the cardium and pylorus issue from a division one-third the size of the remainder of the stomach; in kangaroos the stomach is slender, sacculated, and wound in one and two-thirds turns on itself; the fundus is large. In the hog the fundus is profoundly sacculate. In Artiodactyla-Ruminantia there are four chambers, of which the first is generally the largest, being an enormous expansion of the fundus. In the musk it is not in direct communication with the œsophagus, but is so in the ox. In the former there are five sacs, the last the best defined, with reticulating ridges on the inner wall (tripe), and entered by both cardium and pylorus. The first stomach of the ox represents the first four of *Moschus;* it is followed by the reticulate, which receives the œsophagus; between it and the pylorus are two chambers, whose walls are thrown into elevated folds. The first division has strong papillæ on the inner walls, which are very large in the deer.

In many of the Rodentia (*e. g., Fiber*) the cæcum is exceedingly large and long. In the Primates, etc., it terminates in a narrow, curved extremity, the processus vermiformis.

IX. The Circulatory System.

1. *In Invertebrata.*—This system, as is well known, consists of organs for the propulsion and conveyance of the fluid results of digestion throughout the body for the maintenance of all its functions. It consists essentially of a system of tubes radiating from the central muscular organ, in which resides principally the contractile or propulsive

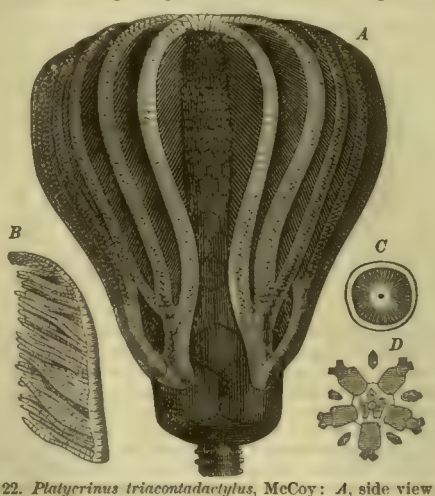

Fig. 22. *Platycrinus trinontadactylus*, McCoy: *A*, side view; *B*, terminus of arm; *C*, articular surface of a stem-segment; *D*, structure of the basin or body.

activity. This centre is in the lowest forms simply a tube, but is greatly specialized in the highest forms. We may divide the system into the systemic, the water-vascular, and the lymphatic systems. The second is found in the aquatic invertebrates, and the last in vertebrates only.

The systemic circulatory tubes first appear in Cœlenterata. In Protozoa the contents of the body are in motion, and probably a small pulsating vesicle contributes to this end. In no cœlenterate class excepting the Medusæ do the tubes appear as isolated; they have been already described as radiating from the stomach or the adjoining body-cavity, and continuing round the margin of the disk as a single tube. The Echinodermata possess a true circulatory system, with a well-developed water-vascular system. The vessels of the former are not derived from the stomach, but form an isolated series. The peculiarities of the classes are as follows:

a. Vessels arising from a basal sac, which connect by a short tube with stomach; vessels radiating, penetrating the pieces and arms: Crinoidea.

aa. From an oral ring.

b. Superior and inferior oral and anal rings: an asymmetrical heart, emptying into the former; no respiratory artery; stomach-arteries (five) collected into two, which enter superior ring at point of entrance of heart: Asteroidea.

Rings and heart connected by marginal intestinal artery: Echinoidea.

bb. Only oral circulatory ring: no heart; distinct respiratory artery (where lungs exist); intestinal arteries gradually disappearing posteriorly: Holothurida.

In echinoids and asterioids there is a septary column extending from the upper to the lower surface, unsymmetrically near the middle line. In a fold of it are placed the shell-canal of the water-circulatory system and the heart. The latter has a narrow opening into the oral ring, which from this fact is termed arterial. The opposite end of the heart communicates by a duct with the superior anal or venous ring. The arterial ring is the smaller and more muscular, and lies between the more superficial nervous ring and the deeper water-canal ring. In the asterioids it sends an artery along the median line of each arm below. The venous ring is larger, and sends two vessels, one on each side of each arm. In Holothurida the vessels are delicate and not largely developed. In all classes the tubes are without cilia internally, and have a wave-like pulsation in life.

The water-circulatory system is greatly developed in the Echinodermata, and forms the basis of their means of movement from place to place. Its central organ consists, first, of a ring canal, which surrounds the œsophagus within the arterial ring; secondly, of a calcareous (or shell) canal which rises from a point on the ring canal to the dorsal (or anal) side of the body, and terminates in a peculiar shield, the madrepore plate, which is perforated by numerous pores. In the Holothurida, where the body is elongate, this shell canal does not reach the posterior end of the body, but terminates freely in its cavity, sometimes in one, often in many tubes, each of which terminates in a madrepore plate. The peripheral system consists of five vessels, which arise from the ring canal, and run at equal distances along the interior face of the body-walls (on the medial line of the arms in Asterioidea), and send branches right and left. These terminate in a large hourglass-shaped sac on each side in Asterioidea, the "ampullæ," or in numerous smaller ones in Holothurida. These project through pores (ambulacra) between the plates, hollow processes which frequently are enlarged as a wart at base or end, and which are used as feet. They are regularly arranged in bands in Asteriida and Echinida, but in some holothurians are distributed in patches (*Psolus*) or all over the body, or in two kinds—one dorsal, the other ventral (*Holothuria*). They are retractile and protrusible by erection. The interior of the water-vessel system is covered with cilia. In all the classes the œsophageal ring communicates with "Poli's vesicles," small bladders situated round its circumference.

In Mollusca and Articulata the arterial and venous vessels are not universally continuous at their extremities by capillaries, as in Vertebrata, but the circulating fluid is emptied into cavities of the connective tissues or lacunæ, whence it is taken up by the extremities of the veins by suction. In some of the highest forms of both (Cephalopoda, Pedipalpi) the capillary vessels are numerous. The prominent peculiarities of the classes in respect to circulation may be indicated as follows:

A. No distinct central organ or vascular system.

a. No lacunary canals; liquid moves in continuous inner concavity of body, without definite direction and with doubtful external orifice: Bryozoa.

aa. Vessel-like lacunary system; five large sinuses; post-abdominal and foot largest; anal (annular) throat and buccal smaller; two mantle-edging vessels: Scaphopoda.

AA. A distinct heart.

a. Neither arteries nor veins; no chambers to heart; a system of canal-like lacunæ decussating from a dorsal and ventral principal; one through the gill-sac, and with fine body ramifications, continuous with each other; two (sometimes more) from heart: Tunicata.

aa. A venous system; no branchial auricle or gill-hearts; one ventricle, and a false heart on each mantle artery: Brachiopoda.

One branchial auricle; no gill-hearts; one branchial artery; ventricle embracing the intestine: Gasteropoda.

Two branchial auricles; no gill-hearts; two branchial arteries; ventricle embracing intestine: Acephala.

Two branchial auricles, and two hearts or expansions on the two branchial arteries; a circulus cephalicus; ventricle not embracing intestine: Cephalopoda.

aaa. No venous system, or a rudiment rarely; branchial veins and arteries: Crustacea.

AAA. No distinct heart; a longitudinal dorsal sinus, more or less subdivided.

a. No pulmonary arteries or veins; no venous system: Insecta.

aa. A pulmonary artery and vein; no venous system: Arachnida-Aranea.

A venous system: Arachnida-Pedipalpi.

In Acephala and Gasteropoda the ventricle receives the contents of certain veins direct, without aëration in the gills; hence the blood forced into the aorta is, as in most reptiles, of a mixed character. In Cephalopoda all the venous blood passes through the gill-hearts and gills, and

is oxygenized before returning through the auricles to the ventricle. In a few Gasteropoda there are two auricles, as *Haliotis*, *Fissurella*, *Chiton*. In a few Acephala (as *Ostrea*) the ventricle does not embrace the intestine.

In Gasteropoda the vessels of this system form extensive ramifications in the foot. They have moreover communication externally by pores, which enables them to absorb large quantities of water. By means of this water-vascular system the foot is inflated, as in erectile tissue, to a size which would forbid its withdrawal into the shell were it not for the power of expulsion of the water.

Among Arthropoda, the decapod Crustacea and the pedipalp Arachnida only possess a complete circuit with veins

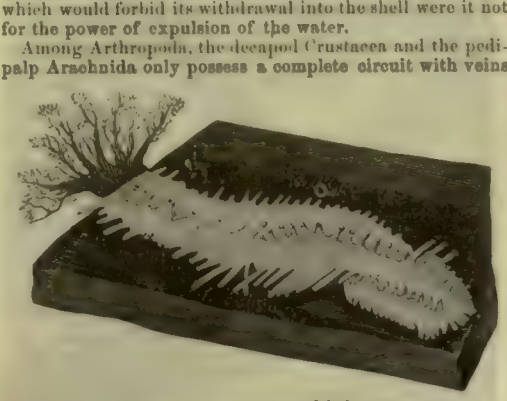

FIG. 23. *Cladodactylus dolioluni.*

and capillaries. In the former the heart sends two aortas forward and two backward; the larger (inferior) of the former is the aorta cephalica, and supplies the head; the two posterior are the aortæ abdominales superior and inferior. A large sinus in the bottom of the anterior abdomen gives origin to the branchial arteries. In Myriopoda the dorsal trunk gives off a pair of lateral trunks to each segment of the body. From the anterior section of the dorsal trunk in Chilopoda the lateral arteries unite beneath the œsophagus and give rise to a longitudinal vessel which accompanies the abdominal nervous axis. In insects the lacunar currents of the body are four principal ones—*i. e.*, one beneath the dorsal trunk, one along the nervous chain, and one along each side. The blood also circulates outward in the tubular ribs or nervures of the anterior part of the wings, and returns along the posterior.

2. *In Vertebrata.*—In the fishes generally the heart is the right or venous heart (except in Dipnoi), but always there are vessels passing directly from the gill-veins into the aorta, whether the gill-veins return arterial blood to the ventricle (making mixed blood) or not (leaving venous blood). The first case occurs among Dipnoi; the second in *Monopterus* (apodal). In *Amphioxus* the usual trunk-like divisions of the heart are blended into one chamber. The gill-artery is rythmical, pulsating, as also the origin of the special gill-arteries; so also is the portal vein, which has the same peculiarity in *Myxine*.

The aorta often forms no distinct isolated circulatory trunk. Sometimes arterial blood passes through a cartilaginous canal, which inwardly is only isolated by perichondrium, as in *Acipenser* and *Spatularia*. In other fishes it is also not isolated, but with its dorsal face (on which an elastic longitudinal band runs) let into the vertebral column (*Esox*, *Salmo*, *Silurus*, *Alosa*, etc.). Many arteries subdivide minutely into retia mirabilia, then continue from the reunited vessels. The arterial blood of the Chorioidea of most fishes must pass through such structure twice before passing into its branches.

In the venous system, not only in the veins that pass to the liver, do the stems lose themselves in capillaries, in order to be again collected into one or more trunks to go to the heart, but in many fishes this structure prevails in most of the veins of the body. The vena caudalis and the intercostales very often subdivide minutely and mix with (or surround) the renal, suprarenal, and other arterial glanduliform bodies, before they return to the veins for the heart. Many veins of walls of the trunk, of the swim-bladder, and of the generative organs appear as roots of the portal system. These structures delay and prolong the venous circulation.

Stagnation of venous blood-currents is common, also blind closings of veins and obliteration of connecting trunks; and at certain periods the so-called "blood-corpuscle-holding" cells and membranes are met with—*e. g.*, in the kidneys. The blood-corpuscles one often finds involved in transformation or degeneration. The formation of exudations occurs not seldom; the transformation of blood-corpuscles into pigment-cells often follows. (These arrangements appear not only as metamorphoses of the blood, but also as favoring rejuvenation of the organic substance and new construction. The great periodical changes, repeated yearly in the increase of the contents of the generative organs, which the animal undergoes, the extraordinary circumference of body which many can reach in high old age, as also the destruction and perforation of the organic substance which parasites produce, and which demand a restitution, is not yet sufficiently estimated. Blind terminations of capillaries have been shown in the skull-cartilage of *Acipenser*. The change of blood-corpuscles to pigment-cells is seen in the kidneys of *Cottus*, *Pleuronectes*. In Leptocardii the portal heart is behind (above) the colon; it pulsates from behind forward. It bends sharply forward, and empties into the gill-artery heart, taking up the venæ cavæ during the curve. The gill-artery heart is straight, equally thick, its cavity without the pericardium longitudinal in the median line, beneath the whole length of the gill-membrane. From it emerge regularly (alternating as beginnings of the gill-arteries) small contractile bulblets in the intervals between the pointed arches of the gills. From the latter the blood through the gill-veins is transferred into a dorsal contractile aorta. Independently of what passes through the gills, a part of the blood is led directly into the aorta by two contractile arterial bows (one on each side of the posterior end of the oral cavity), which issue from the gill-artery heart. These aorta-bows exist also in *Amphipnous*, where each gill-arch that does not bear a gill contains an arterial bow. In *Monopterus* one-fourth the blood passes the gills and traverses an arterial bow in the fourth gill-less gill-arch. The portal-vein heart extends the whole length of the intestine. It is straight, and continued on the colon anteriorly between the gills, then becomes narrower and terminates. It pulsates from behind forward, with pauses (as in the gill-heart) of about a minute. The venæ-cavæ heart is on the dorsal side of the intestine, from the anterior point of the colon, increasing posteriorly to the end of the colon, where it suddenly turns over into the gill-artery heart. Its contraction alternates with that of the inferior or portal-vein heart. This colon (which is green) is equivalent to the liver, and gives blood to the venæ-cavæ or portal heart. On each side of the aorta, on the upper arches of the gills, is a vena cava descendens, which meets a posterior vein (vena cava ascendens), and together they empty themselves into the curve of the venæ-cavæ heart just before entering the gill-artery heart. The blood is colorless.

In Dermopteri, Elasmobranchii, and Actinopteri the muscles of the heart are always of striped tissue. The right or venous heart has the following divisions: an auricle receiving the united veins through a sinus venosus; a ventricle; and a bulbus arteriosus. There are valves between all these. In Demopteri the auricle is more roomy than the ventricle, and is separated from the sinus by a membranous double valve; it has two membranous valves in the ostia venosa and ostia arterialia, each. From the latter proceeds the truncus communis branchialis, which is somewhat "bellied" at its origin, but has no evidence of muscular structure.

In Elasmobranchii and Ganoidea there is a bulbus arteriosus, similar in possessing a ring-like layer of striped muscle-tissue, which ceases abruptly at the boundaries of the gill-arteries, and in numerous valves which are affixed by threads. There are two cross-rows of these in *Chimæra*, *Carcharias*, *Scyllium*, and *Galeus*; three in *Sphyrna*, *Mustelus*, *Acanthias*, *Alopias*, *Lamna*, *Rhinobatus*, and *Torpedo*; four in *Hexanchus*, *Heptanchus*, *Centrophorus*, and *Tryyon*; four to five in *Raja*; five in *Scymnus*, *Myliobatis*, *Pteroplatea*, and *Squatina*. In Ganoidea there are two at the commencement and one at the end of the bulbus; there are nine in *Polypterus*, each of which contains three complete and some abortive veins; there are fifty-four to sixty in *Lepidosteus bison*. In *Amia* there are but three rows: the two inferior, in the bulbus, with two large and two small valves; the superior with only two.

In Teleostei there is no striped muscle-tissue on the outer layer of the bulbus, but an elastic material of thread-bundles, which is produced into pillars on the inner side. There is one pair of valves at the ostium bulbo-ventriculare; between these are sometimes one or two smaller adjoining valves. The only exceptions are species of *Butyrinus*, where there are four valves in two rows, with no muscular bundles round the bulbus. In Teleostei, sharks, and in Ganoidea-Holostei there is a pair of valves at the ostium sino-auriculare, often attached by strong threads. In *Acipenser* there is a ring-like valve in two parts—one with four, the other with five pockets, each one attached by a strong thread. The large, expansible, thin-walled auricle has usually on one or two sides an auricula. Within it are numerous trabeculæ carneæ. The ventricle is on the abdominal side of the auricle. The latter in passing over it is narrowed sometimes (*e. g.*, in *Petromyzon*) for some length. There are usually two valves in the ostium arterio-ventricu-

lare, sometimes four in *Orthagoriscus* and *Acipenser*. The ventricle is thick, with the muscle-structure in two layers. Within are various parietal depressions, ribs, etc., between the muscles.

The heart's position is usually between the claviculæ, which form in Goniodontidæ a kind of transverse bony septum. In Apodes, and particularly in Symbranchii, the heart is more posterior. In Plagiostomi it lies in its sac immediately under the elongation of the copulæ of the gill-arches, which pass through the cartilago-subpharyngea impar. In *Petromyzon*, with the pericardium, it lies in a sort of incomplete capsule, which is separated from the gill-cavity by muscles forming a kind of diaphragm.

The heart-capsule (in all fishes except Leptocardii) is fibrous, is attached to the bulbus arteriosus, and often sends threadlike processes to the heart proper, which are often tendinous, sometimes accompanied by blood-vessels, as in *Anguilla*, or are blood-vessels only, as in *Acipenser*.

In Dipnoi the auricle is externally one, internally divided by an incomplete septum. Into the left auricle enters the vena pulmonalis, at whose entrance is placed a semilunar valve. There is no valve at the ostium atrio-sinosum. From both auricles the ventricle is entered by a common ostium, which has a valve. The ostium possesses a papillar muscle, which is bound with a thread-cartilage which closes the ostium during systole. The bulbus arteriosus (without valves at its origin) forms a curve. It contains two lateral, longitudinal spiral foldings of different lengths, which fade away at their extremities.

In Actinopteri-Chondrostei, on the upper surface of the heart, are numerous bottle- or vesicle-shaped elevations, which are of different sizes in different or in the same animal, sometimes large, sometimes almost wanting. A varied number of arterial vessels from the subclaviæ and mammariæ penetrate the heart-sac and distribute themselves to these elevations, which have various arrangements. These surround bladders which involve their entering arteries in rosy, spongy tissue composed of granules and meshes of fibre and cells containing granules. From the bases of these, vessels enter the heart. This cellular structure is sometimes surrounded by fluid. An elevation frequently contains these bladders, each of which is filled with either cells, nuclei, or liquid. They are connected to the cellular structure by pedicels. These structures may be for the renewal of the muscular tissue of the heart.

In general, on the trunks, except in the Leptocardii, from the anterior extremity of the bulbus arteriosus (which is external to the heart-sac), there issues an incontractile "gill-artery trunk," from which on each side issue directly or indirectly, through other communicating trunks, the branchial arteries.

In myxinoids the truncus communis branchialis is variable, running in a membranous cavity which surrounds the anterior end of the ventricle and projects into the membranous pouch that envelops the gill-sac. Each gill-sac contains an artery which forms a circle at the entrance of the gill-branches, and sends off radiating arteries. In *Petromyzon* four arterial branches on each side leave the truncus communis branchialis, which divides anteriorly into two trunks, each of which divides into three arteries, and an anterior twig is sent to the anterior row of gill-lamellæ. The special branchial arteries pass (except the first and last) between the two gill-pouches, and give their branches through diaphragms to the gill-arches.

In Plagiostomi, from the truncus branchialis communis there issue on each side one or two trunks, each of which afterwards divides into two. In *Raja* and *Pristis*, where one goes off, it divides into three, and the terminal portion into two. In *Pristis* the first of the three runs forward to the trunk in the cartilage, and is taken up by it. The special branchial arteries issuing from the primordial trunks pass between the two rows of gill-laminæ, which are in separate gill-sacs, a special artery supplying the anterior hyoid gill. In many ganoids (*Lepidosteus*, *Acipenser*) the first gill receives the first branch from the arteria branchialis, and the last gill the last branch. In these the branchial arteries run towards the first gill, then bend posteriorly and give off branches successively. In *Spatularia* the first gill receives the second branch, the second gill the first branch, the others regularly. The arrangement in *Amia* is as in the Teleostei.

In Actinopteri the gill-artery stem runs forward in a canal beneath the copulæ of the gill-arches, which bound it above; laterally it is bounded by processes of the same; beneath by the cuiform membrane (which latter is wanting in Apodes). Often (*e. g.*, in *Salmo*) it gives off first a common stem, which divides to the fourth and third gill-arches; then gives one to the second arch, and one to the first, by the forking of the trunk. But (*e. g.*, in *Murænophis punctata*) two distinct branches of the common trunk can be given to the two posterior gill-arches. In Dipnoi two trunks leave the branchial artery on each side: (1) a common vessel for the half gill and the two gill-less "visceral" arches, and (2) a stem for the posterior gill. The first divides in two, which as aorta-bows unite under the skull to form an aorta-root. The first aorta-bow gives off a branch for the half gill, which sends off the carotid before entering the half gill. The aorta-bow gives off also a posterior carotid before union with the posterior aorta-bow. From the second goes

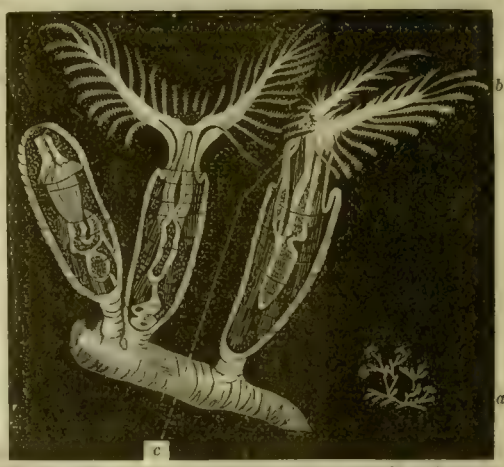

FIG. 24. *Plumatella*: *a*, natural size; *b*, magnified; *c*, the vent.

an artery for the fibres of the external gill. The second trunk divides into two gill-arteries for the fourth aorta-bow. The extremities of both become arteries for the outer gill-threads. The last gill-artery from its upper extremity gives off a branch for the posterior half gill.

The gill-veins unite (in the absence of an arterial heart) for the construction of the great arterial trunk. But often arterial trunks for the body go immediately from the gill-veins. The carotid arteries leave the gill-veins. In myxinoids the gill-veins, after leaving the gill-sacs, form a median trunk, which is prolonged posteriorly as an aorta and anteriorly as an arteria vertebralis impar. All or most of the gill-veins are connected by a trunk running parallel to the aorta, which is continued anteriorly as the arteria carotis communis. Both carotids accompany the œsophagus forward, giving branches to it and to the hyoid region. Each divides behind the head into the arteria carotis externalis (for the tongue and the muscles of the head), and the arteriæ communes internales, which unite, forming a bow, at the origin of the vertebral column, which receives the vertebralis impar; from the latter originates a median head-artery, which, extending anteriorly, gives off branches for the nose, etc. In *Petromyzon*, with the exception of the first and last, each gill-vein issues from the interstitium between two adjacent gill-sacs. There is no arteria vertebralis impar. The carotis communis rises from the first gill-vein, which sends another branch to the formation of the aorta. Each carotid divides into an external and internal: the two internal carotids do not unite to form a median head-artery.

In other fishes each gill-vein originates from the two connected "gill-leaf rows," except those from the two half gills. In Elasmobranchii all or most of the gill-veins come together to form the aorta, either immediately or after the union of some (thus forming homologues of the aorta-roots).

The arrangement of the carotids is various. In *Chimæra* the first gill-vein from the half gill forms the posterior carotid; the second, which like the rest contributes to the aorta, sends off the carotis anterior. In *Raja* the posterior carotid originates from the aorta-root which is formed by the union of the two first gill-veins. It runs in the canalis spinalis. The carotis anterior originates from the vessels of the pseudobranchiæ of the spiracle. In *Chimæra* and Rajidæ the posterior carotids remain ununited; wherefore no anteriorly united circulus cephalicus exists. In the sharks they run under the base of the skull, and unite and give origin to the cerebral artery.

In the Ganoiden there are various arrangements of the gill-veins in the formation of the aorta. The carotids are as in Plagiostomi. (See *Raja* above.) In *Lepidosteus* there is a third cerebralis from near the origin of the aorta. In it the union of the anterior gill-veins is the origin of the aorta. The second pair unite below this, and forming a thicker trunk receive the first aorta. The third pair unite below the union of the second pair and the aorta origin, and forming a still thicker trunk, receive the second stem,

all forming three steps in profile. The sections would be—first ○, second ♂, third ♂. The posterior carotid comes off anteriorly to the mouth of the third pair of gill-veins. The subclavians are vessels disproportionately large; they come off on each side a little behind the embouchure of the posterior gill-vein tube, take the place of the cœliac and superior mesenteric arteries, and send a branch to the stomach, which does not give a strong branch to the spleen, but approaches the pylorus as a bundle of little vessels. In Actinopteri, by the gill-veins is formed a complete arterial circle (circulus cephalicus) without the cavity of the cranium. The gill-veins of each side unite to form the commencement of the aorta, and run together anteriorly as the sphenoideum, through a cross anastomosis. This circulus can be wider or narrower. It is the former when all the gill-veins of each side unite into the aorta-bow, and where both bows are connected anteriorly by a cross trunk, and unite posteriorly to form the aorta, as in *Gadus* and *Lota*. It is narrower when each of the bows forming the aorta is formed from the anterior gill-veins only, and where the hinder gill-veins enter the aorta: *e. g.*, *Scomber*, *Salmo*, etc. The aorta is sometimes independent, free, entirely surrounded by strong tissue, as in most Teleostei, sometimes in a canal of the processes of the vertebræ, without the usual distinct trunk-envelope; sometimes it is in a canal inferior to the vertebral column, with the superior surface

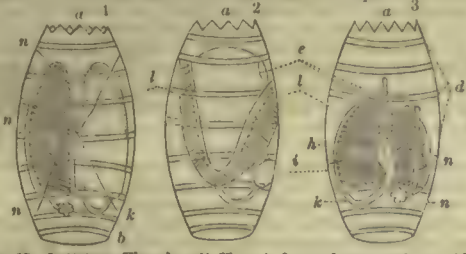

FIG. 25. *Bolidium Ehrenbergii*, Kr.: 1, from above; 2, from side; 3, from below; *a*, mouth; *b*, vent; *d*, annular muscle-bands; *e*, endostyle; *h*, œsophagus; *k*, intestine; *l*, branchial membrane; *n*, nervous system.

thin walled. The commencement of the aorta, in which the gill-veins empty, is under the cranium, first enclosed superiorly by the basilar cartilage. A short section is enveloped below by a fibrous membrane, but soon it is enclosed beneath by the vertebral arch elements, which are arched upward and supplied with intervertebral cartilage. Along the whole length of the aorta-canal there runs in its cavity, from the base of the skull, an elastic band which adheres above to a skin-fold whose continuation as a very thin perichondrium lines the inner side of the canal, to which it closely adheres.

In the Squalidæ and many Actinopteri the aorta is embedded in a gutter of the vertebral bodies. On the side of this there are (in *Esox*) fibrous longitudinal ridges. In these the aorta possesses an external skin on the inferior surface only. It appears from point to point swollen with sinuses. Each such swelling is separated from that succeeding by a contraction. There is a small cross bridge of thread tissue within from one lateral ridge to another. Within the canal is found (in *Esox*, Clupeidæ, Salmonidæ, *Silurus*, etc.) a fibrous longitudinal elastic band, as in *Acipenser*. It commences at the skull beneath, and extends along the whole vertebral column. As an immediate continuation of the basis of this is the elastic artery-envelope. Although in Eventognathi the aorta is more isolated from the vertebral column, and the fibrous longitudinal band is absent, it yet exhibits sinuses in regular position. When the aorta is free it does not always run under the median line; in *Belone* it is on the left side.

In Reptilia and Batrachia the aorta is formed of two roots (which do or do not result from more than one pair of aorta-bows) from the bulbus arteriosus, and which embrace the œsophagus. A ramus communicans anterior exists between the carotids. Each corresponding branch of the aorta either becomes an intercostal artery, or enters the intervertebral foramen for the spinal canal.

The Batrachia have a carotid from each anterior aorta-bow, and a pulmonalis from each posterior aorta-bow. In all Urodela aorta-bows, either united or directly or indirectly issuing from the bulbus arteriosus, contribute to the formation of an aorta-root by the perennial rami communicantes on each side. The Trachystomata agree with fishes in the arrangement of the greater vessels. The bulbus arteriosus upon issuing from the ventricle makes a bend to the right side, and is thereafter in its longer portion straight. At its fore end three arches on each side issue, which are functionally gill-arteries. Through the union of three corresponding gill-veins into one stem an aorta-root arises, two of which form the aorta. The anterior gill-vein sends out a carotid, the hinder a pulmonic artery. The Proteidæ have the system differently arranged. The bulbus is divided into two diverging branches, each of which results in two aorta-bows. The anterior follows the first gill-vein; the second divides in two, of which the anterior follows the second gill-vein; the posterior the third. Each of the two aorta-bows proper consists of an uninterrupted continuation and a respiratory portion. The third bow wants the direct continuation. The three respiratory portions each consists of a gill-artery, intermediate respiratory vessels, and a gill-vein. The two anterior gill veins of each side empty into the continuation of the original aorta-bows. The third gill-vein passes over into the continuation of the second aorta-bow. The continuation of the two primitive aorta-bows and the second and third gill-veins forms an aorta-root. The point of confluence of the aorta-roots lies over the heart. The anterior vessel which results from the union of the continuation of the anterior aorta-bow and anterior gill-vein has two branches—an arteria hyoidea mandibularis and a carotis interna anterior. Each aorta-root formed from the second aorta-bow possesses a postero-cephalic elongation forward, which gives off a carotis posterior, and forms the commencement of an arteria vertebralis. The aorta-root gives off posteriorly a visceral artery, which, after branching for the œsophagus, is destined to become a spermatica interna. From the single aorta proceed subclavian arteries, which are continued as the epigastric, gastric, cœliac, many small mesenteric, renal, and symmetrical iliac vessels. Besides there are pairs of dorsal arteries, which pierce the transverse processes on each side, and emerge in the longitudinal vertebral artery. In *Protonopsis* four vessels on each side go directly from the bulbus arteriosus. They follow the gill-arches. The anterior sends branches to the tongue, and finally becomes the carotid. The two middle vessels form the aorta-root, and, after giving off branchlets for the head, unite close behind the cranium. The fourth vessel bends over the œsophagus, gives it branches, gives a branch to the third aorta-bow, and becomes the pulmonic artery. In Salamandra in the neighborhood of the pharynx is placed the somewhat forward-curved bulbus arteriosus. From its anterior enlargement go on each side four aorta-bows with three mouths. The three posterior bows on each side form aorta-roots which are prolonged anteriorly. The union of both bows into an aorta occurs behind the skull, beneath the first vertebra and above and before the heart. The issuing point of the arterial twigs on the anterior bow is an enlargement—the so-called carotid tumor (or gland). The branches issuing from it are the arteria hyoideo-mandibularis and carotis. The latter divides into the cerebral and occipital. An obliterated continuation of the anterior aorta-bow, binding it to an aorta-root, is called ductus Botalli. The fourth aorta-bow, whose mouth is that of the third, sends off a visceral artery which gives branches to the pericardium and œsophagus, and becomes the pulmonalis. From the aorta-roots issue the arteria maxillaris interna from its anterior prolongation, and the arteria occipitalis to the occiput and glandula auricularis. The aorta is under the vertebræ, and descending gives off the subclavian and intercostal (in pairs), the gastric, cœliac, mesenteric, and numerous renals. Between the kidneys go off the iliacs (which give off the femoralis and epigastrica), and a cloacal branch which is continued as a caudal artery.

In the Anura, on each side are three bows, of which the foremost and hindmost do not contribute to form the aorta-root, which is a continuation of the middle bow. It unites with that of the other side far posteriorly. Two pipes issue from the bulbus. There is one semilunar valve at the base of each. Each of these vessels is internally divided by two partitions into three canals, and each partition is prolonged to the wall of each issuing vessel. At the farther end of the anterior of these canals is an enlargement (carotid tumor), from which issue the arteria hyoidea (lingualis) and the carotid. The latter is divided into ophthalmic and cerebral branches, which last enters the cranium and has anterior and posterior branches. The latter form the basilar, which becomes the anterior spinal artery, into which below the supravertebral vessels empty. The middle canals form the aorta-roots. The right is large, but the left small, after giving off the cœliaco-mesenteric artery, which is so large as to appear like its proper continuation. The third canal gives off two branches. The first, after giving branches to the ramus mandibuli and shoulder muscles, becomes a strong cutaneous vessel, which, with its accompanying vein, running between the levator and anterior adductor muscles of the humerus, gives off branches to the integument of the whole back. The second branch is the pulmonic. Each aorta-root before their union gives off other branches to the larynx, œsophagus, and shoulder, also a subclavian and a supravertebral artery, which runs longitudinally,

crossing the diapophyses, and giving a branch to each intervertebral foramen. The left root also gives off a cœliacomesenteric artery. Union of the aorta-roots takes place opposite the sixth vertebra. The descending aorta gives branches for the kidneys and generative organs. To the two latter go five and six vessels. Each gives a branch to the kidney on one side and to the genitals on the other. Division into common iliac arteries then takes place. In the Gymnophiona, *Cæcilia* have a long muscular bulbus, at whose narrow origin are valves. The cavity is divided by a septum at its anterior extremity into dorsal and ventral chambers. The dorsal terminates in the arteria pulmonalis for the lung; from the ventral proceed two aorta-roots, each of which near the trachea reaches to the hyoid apparatus, and forms a bow behind the skull, from which the carotids proceed. The union of the aorta-roots is hypaxonic, above and a little before the heart. Each root gives off intervertebral (mostly obliquely directed forward) and vertebral arteries.

In *Reptilia* there is a completed form of heart. The division of the auricles is externally visible. The division of the ventricles is partial or complete. In embryonic forms

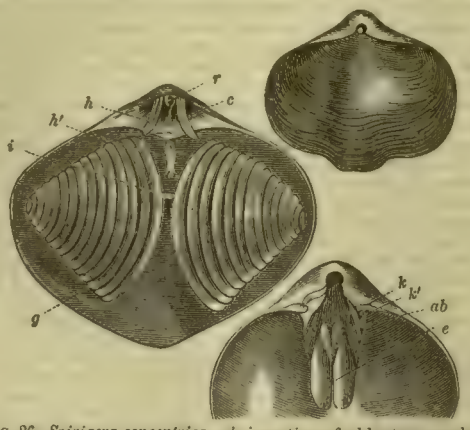

FIG. 26. *Spirigera concentrica*: *ab*, insertion of adductor muscles; *c*, of divaricator muscles; *e*, of adjustator ventralis; *g*, branchial arms; *h*, hinge-sockets; *i*, gill-bridge; *k*, hinge teeth; *r*, tubular body.

the position of the heart is near the gill-slits. This state is characterized by the presence of several aorta-bows which embrace the œsophagus, and form the aorta-roots by successive obliterations of most of the aorta-bows and their connecting anastomoses. There is a ductus Botalli, so that each aorta-root is permanently formed, either through confluence of two aorta-bows, or it is a continuation of a single trunk.

In Lacertilia, Ophidia, and Testudinata, in the ventricle are found fleshy columns of various sizes, which enclose spaces opening into a common cavity. The septum ventriculorum (more or less incomplete) is connected to the sides of the ventricle by tendinous or fleshy cords. The left ventricle is narrower, more dorsal, thick-walled, communicating with the left auricle; the right is broader, straight, ventral. That into which arterial blood enters, and which, as regards its position, is homologous with the left ventricle, is called the cavum arteriosum; the right is the cavum venosum. No trunks arise from the first. From the cavum venosum there issue by three ostia the arteria pulmonalis and two trunci arteriosi, each ostium having three semilunar valves. The space between the orifice of the arteria pulmonalis and those of the trunci arteriosi is the originating point of a flap or muscular valve which extends towards the right border of the ventricle. This divides the cavum venosum into two incomplete cavities, an anterior and posterior, which are completely separated by the systole, during the latter part of which it shuts the entrance to the arteria pulmonalis. A simple bulbus arteriosus is wanting, but its place is supplied by the confluence of the bases of the three great vessels, which are then separated by simple walls. This arterial trunk, containing a cone, is covered by the pericardium, and wants (except in some Testudinata) the striped muscular walls.

In Lacertilia the heart is not far removed from the hyoid region. It is farthest in *Amphisbæna*; among Lacertilia it is farthest in the Varanidæ. Among Varanidæ the septum atriorum is nearly complete, except near the ostium venosum dextrum. Among Pachyglossa, Geccotidæ, Chalcidæ, and Scincidæ, the septum is very incomplete. The walls of the great vessels are united near their origin. A peculiarity of most Sauria is that each aorta-root takes up the common carotid from an arterial trunk which originates afterwards, so that each aorta-root is formed by the union of two aorta-bows as follows: The trunci arteriosi continue, the right as an aorta-root, the left the same after giving off the truncus impar, which divides into the carotids. Each of the latter gives off near its basis an outward directed arterial bow, which empties into the aorta-root of its side. It constitutes thereafter a primitive aorta-bow, whose original branches are the carotids. This occurs in (1) *Scincus*, *Anguis*, *Pseudopus*, *Lacerta*, *Ameiva*, *Platydactylus*, *Uromastix*, *Iguana*, etc., and the aorta-bows from the truncus impar are obliterated, while they are utterly wanting in (2) Varanidæ, Chamæleonidæ, *Amphisbæna*.

In the hearts of serpents the form is elongate, and is far removed from the hyoid region. The end of the pericardial sac appears confluent with the serous lining of the thorax. The cavum venosum arteriosum is always incomplete. The walls of the three trunks are separate, as far as is known. The left trunk continues as the aorta-root without branches; the right gives off the coronaries, etc.; then, where it turns itself posteriorly, a subvertebral anterior branch; then numerous intercostals.

The truncus caroticus impar divides into two arteriæ carotidæ communes, of which the right is scarcely visible in some species; but when visible it may be smaller than, equal to, or larger than, the left.

The Testudinata have the heart broad, abbreviated posteriorly, and widely removed from the hyoid apparatus. The outer sac of the pericardium is attached to the end of the ventricle by a band which encloses the portal vein. The valve, stretching to the right wall of the ventricle, is in some furnished with an ossified cartilage. The walls of the three trunks are slightly united near their origin, forming a bulbus, which in *Emys Europæa* is surrounded by a ring of striped muscle-tissue. The truncus dexter soon after its origin gives off a short anterior arteria innominata, which gives off the carotids and subclavians. The truncus sinister gives off (before union with the dexter) the cardiac branch for the heart and œsophagus, also the gastro-epiploica and mesenterica. After these branchings the aorta-root is narrow. Each carotid gives off (1) the hyoidea (for the pharynx, trachea, larynx, hyoid, and lingual regions); (2) the mylohyoideæ; (3) the carotis externa; (4) the carotis interna; and (5) the intervertebrales, which pass through the foramina intervertebralia to the arteria spinalis. The posterior cervical, the dorsal, and caudal pass from epaxional trunks. The cervical is a single vessel which passes from the carotis externa to the subclavian. From each side the neck there runs to the rump, over the diapophyses in the canal covered by the carapace, a trunk, which, besides the intervertebralis, gives off arteries analogous to the intercostals. The continuation of this is a caudalis, superior to the diapophyses. The intercostals of each side open into a lateral longitudinal trunk, which communicates anteriorly with the subclavian, posteriorly with the iliac vessels. From the aorta proceed symmetrical spermatic, suprarenal, iliac, renal, and hypogastric vessels. It is continued as the caudalis inferior.

The Crocodilia have a complete septum ventriculorum; the right ventricle anterior; each ventricle emitting its respective truncus arteriosus. There is an opening connecting the trunci arteriosi (which corresponds to the bulbus arteriosus), by which arterial and venous blood are mixed. The heart is over the sternum; the left ventricle is thick walled; the right more capacious, reaching to the apex. The right contains a muscular fold which is stretched from a septum behind the origin of the pulmonary artery to the outer wall. It has two valves at each ostium venosum. From the left ventricle issues the truncus arteriosus dexter; from the right ventriole the truncus sinister and pulmonalis. These two trunks are separated at their origin by a common septum; at the origin of each are two semilunar valves. The walls of all three are united between the trunci arteriosi near the semilunar valves. Before uniting, the trunci arteriosi give off the dexter truncus innominatus and subclavia dextra. From the truncus arteriosus sinister, near its union with the dexter, issues the cœliac artery; it then becomes much narrower. The common carotid divides near the head into two branches. Besides these there are other branches to the larynx, neck, tongue, and other parts.

In Aves (birds) the septum ventriculorum is complete. The heart's position is in the middle line of the thorax, its axis parallel with that of the body, its apex between the lobes of the liver, the heart-sac attached to the membrane of the lungs. The auricular appendages do not project, but are tightly drawn down. The right auricle is stronger and with larger appendages than the left. They have comb-shaped muscular columns or ridges. Into the right auricle empty the venæ cavæ. At the mouths of the veins are weak muscular flaps which are attached to the pectinate muscles, whose contraction assists the passage of venous blood into

the right ventricle; the fœtal foramen ovale is closed. The chambers of the ventricles are not very different in size; they do not reach the apex. The septum is very convex into the right chamber. The orifice of the right ventricle is closed by a very strong muscular valve as thick as the outer wall. It is strongest in Natatores, weakest in Cursores, especially in *Apteryx*, where it is almost membranous, and is attached by its free borders by short chordæ tendineæ to the wall of the ventricle. Its free border in most is turned towards the convex septum, to which it is closely pressed in systole, thus preventing regurgitation. It is opposed by a second very weak muscular valve. At the origin of the pulmonalis are three semilunar valves.

From two low ridges at the orificium atrio-ventriculare sinistrum proceed usually numerous tendinous threads, which attach themselves to two or three valves which correspond to the mitrals. Three semilunars are found at the origin of the aorta. The boundaries of the left ventricle are nearly three times the thickness of those of the right. The left auricle has numerous and complicated muscle-bundles; it receives two pulmonic veins through one ostium. There is a valve-like muscular process whose free border is turned to the cavity, and apparently directs the blood to the ventricle. The single aorta, giving off immediately the coronaries, very soon divides; the truncus arteriosus has a branch which is either the innominata or subclavia. In the latter case there is a common carotid. It continues as aorta descendens on the right side of the vertebral column. The left arterial trunk is an innominata or a subclavian. Either each innominate furnishes its common carotid, which is most usual, or else the left or the right furnishes a truncus caroticus impar. Examples of the first kind are furnished by all Natatores (except *Podiceps*); of the second by many Insessores, and some of the Cursores; of the third the *Phœnicopterus* furnishes the only example. In *Botaurus stellaris* both aortas unite on the neck. Sometimes one of the two carotids runs laterally and superiorly on the neck (*e.g.*, *Psittacus chrysotis*). They run in the whole length of the never entirely closed canal, beneath or in front of the vertebral processes. From each originates a vertebral artery, which before entering the cervical canal gives off the œsophagea descendens, transversa colli, and transversa scapulæ. It finally joins the occipital. It does not form the basilar, which results from the union of branches of the cerebral carotids; and after giving off branches finally results in the arteria spinalis anterior. When one truncus caroticus only exists the vertebralis of the imperfect side originates from the subclavian. Sometimes (in *Anas hoschas* and *Ciconia nigra*) the vertebralis continues itself downward in the canal of the rib attachments as the common stem of the intercostales. Each common carotid usually divides into the facialis and the cerebralis; more rarely it is continued as the latter and gives off the branches of the former. The subclavian gives off an external thoracic and axillary; the latter, the brachial, and then the ulnar and radial. From the aorta descendens arise more or less numerous intercostales and lumbales, a strong cœliaca, then a mesenterica superior (both penetrating the diaphragm in *Apteryx*), afterwards renales: from which branches for the generative parts proceed.

Fig. 27. *Panopœa australis.*

Next are two crurales, each giving off an epigastrica. Each results in the ischiadica, which descends to the knee. The sacra media usually gives off the renales posteriores, the mesenterica inferior, two lateral pudendæ internæ, and the hypogastricæ. Finally, it produces the vascular network on the breast and abdomen which is devoted to the panniculus adiposus laid bare by the shedding of feathers during incubation.

In Mammalia the heart is unattached by cellular tissue to the diaphragm, except in man, the higher apes, and Cetacea. It is straight (except in man, the higher apes, and *Talpa*), has two ventricles, and the foramen ovale is always closed. The ventricles are externally separated (in part) in Sirenia. The heart is broad and flattened in all Cetacea; a little less so in *Phoca*, *Bradypus*, *Manis*, and *Elephas*; rounded in Carnivora, Rodentia, and Marsupialia. It has a valvula tricuspidalis: in *Ornithorhynchus*, a transverse muscular valve of the right ventricle, as in birds; the valve in *Echidna* is membranous, has a large tuberculum Loweri,* and no Eustachian valve (in *Felis*, *Canis*, *Ursus*, *Phoca*, *Gulo*, *Mustela*, *Procyon*, *Talpa*, *Halmaturus*, *Equus*, *Sus*, and Ruminantia). There is no tuberculum, but two semilunar valves to the vena cava ascendens in *Didelphis*, *Dasypus*, *Hystrix*, *Cavia*, *Lepus*, *Sciurus* (in *Sciurus maximus* a trace of the tubercle). No Eustachian valve, but a crossband below the fossa ovalis, with filamentous muscle-processes in *Myrmecophaga* and *Bradypus*. It has a Eustachian valve and weak tuberculum Loweri in man, many apes, lemurs, *Lutra*, etc. Both valve and tuberculum are wanting in *Ornithorhynchus* and *Delphinus*.

In many ruminants and perissodactyls in advanced age there is a single or double bone in the septum atrio-ventriculare, and occasionally in Solidungula in the septum opposite the ostium venæ cavæ ascendentis. The aorta-stem at its root is single and curved to the left; it soon gives off coronales (one only in *Elephas*). Its branches vary; *e. g.* (1) A short aorta divides into an anterior (superior) and posterior. (2) The aorta superior gives off a subclavia sinistra, and continues as the truncus caroticus, or divides into a truncus caroticus and both subclaviæ; in Solidungula it also gives off the vertebralis dextra. From the aorta-arch originate the innominata, giving off carotides subclavia dextra and subclavia sinistra in most Marsupialia, in Rodentia, Edentata, Carnivora, *Sorex*, *Halicore*, *Ancheuta*, *Sus*; in which last the two carotids spring from a truncus impar vel primus. (3) In other cases two trunci innominati alone are given off, as in Cheiroptera, *Talpa*, *Phocæna*. (4) The aorta gives off a truncus anonymous dexter, carotis sinistra, subclavia sinistra (as in Monotremata, *Phascolomys*, and *Bradypus*, *Dasypus*, *Cyclothura didactyla*, all Muridæ, *Erinaceus*, Phocidæ, many Quadrumana, man, etc.). (5) Two subclaviæ arise, with a truncus caroticus impar between (*Elephas*). (6) Besides the above subordinate arteries from the aorta, are thoracica interna sinistra and dextra from innominata dextra in *Phocæna* and *Halicore*. In some plunging animals occur widenings of the aorta (*Lutra*, *Phoca*, the young of *Delphinus*, *Monodon*, etc.). The common carotids have their length proportioned to that of the neck. In the short-necked Delphinidæ there is none, both carotids springing from the innominata. It is often divided into two (facialis and cerebralis). The cerebrales enter as single trunks into the cranium in Quadrumana, Cheiroptera, Insectivora, Rodentia, Marsupialia, Solidungula, and some Carnivora, as Ursus, Lutra, Canis, Mustela, or pass through a rete mirabile (*Phocæna*) formed of branching trunklets, or springs from a rete mirabile formed from its origins (Ruminantia, Suidæ, Felidæ). When without retes the cerebrales have various points of origin; they are either head branches (1) or collateral branches (2) of the carotids; or they are branches of the carotides internæ, which give off the cerebrales after some others (Cheiroptera, Insectivora, most Rodentia, some Carnivora, as in *Lutra*, where the carotis interna, a branch of the common carotid, gives off the occipitalis first), or they appear as branches of the maxillares internæ (*Hystrix cristata*) or as branches of Ophthalmicæ (*Cavia dasyprocta*). The bipolar retia mirabilia, from which the cerebrales spring, may be formed of branches from various sources. In *Felis* they come from a larger rete, which is composed of terminal twigs from the common carotid. In *Sus* they are composed of terminal branches of the carotis interna, and give rise to the cerebral vessels. In *Ovis* three branches of the internal maxillary are the sources of each rete mirabile. In *Bos* they are formed from branches of the internal maxillary, which enter through the foramina ovale and opticum and the fissura orbitalis. Here also the branches of the occipital and vertebrals lose themselves in a network which communicates with each rete mirabile. The retia mirabilia of the

Fig. 28. *Voluta undulata.*

* A process separating the mouth of the vena cava descendens from the vena cava ascendens in the right auricle.

Delphinidæ (with artery traversing) are principally formed from the branches of the carotis interna, yet are closely connected with retia lying outside the cranium, formed of branches of the carotis externa and cervico-occipitalis. The rete of each side always communicates with that of the other. The vessels bearing blood from the carotids to the brain enter the skull as follows: through the canales carotici (in Quadrumana, *Ursus*, *Mustela*, *Meles*, *Lepus*, *Castor*), through the foramina jugularia (*Equus*, *Sus*), through the foramen lacerum anterius (*Hystrix*), foramen opticum (*Cavia*), foramen ovale and fissura orbitalis superioris (*Ovis*). In Cheiroptera and many Insectivora and Rodentia the carotis interna passes through the "pessulus," which is between the limbs of the stapes. Besides the cerebrales, the vertebrales conduct blood to the brain. In man and many others these unite and form the basilaris, in others (*Mustela*, *Canis*, etc.) they continue as occipitales, and send smaller branches, which form the basilar artery. Sometimes a communication before reaching the basilar forms a circle. In ruminants this arises from the vertebralis (which is set apart for both canalis spinalis and neck muscles), for the basilaris is very small, and still smaller in Solipedia and Suidæ, where it is constituted by the union of the occipitales in the foramen magnum; and finally in Delphinidæ, by the shortening of the neck, the vertebralis is wanting. It, with the cervicalis ascendens and occipitalis, forms one stem, the cervico-occipitalis, which connects with the spinales through numerous retia mirabilia. The always present circulus Willisii is formed either partly in the cerebrales and partly by division of the basilaris, or through the cerebrales and divided basilari-occipitales, or only by the cerebrales. There are still other modifications of the circle of Willis. The subclavian becomes the axillary and the brachial; the latter in Cetacea and Phocidæ is absent. In many Edentata, and in *Stenops* and *Tarsius*, the arm-arteries possess many retia mirabilia (*Dasypus sexcinctus*, etc.). In *Bradypus* and *Stenops* the trunk of the brachialis passes through many embracing extended arterial vessels. In *Cyclothura didactyla* and *Tarsius* the artery empties itself into these; in other cases they are confined to the fore arm. In *Sus* there is a small one connecting the ulnaris and radialis. In some the brachiales give off only subordinate branches (*Trichecus*, *Mustela*, *Cricetus*, *Sciurus*); in others it is forked. The division of ulnar and radial arteries is variously situated, either high on the humerus (*Phocæna*, *Cebus*, *Callithrix*, *Lagothrix*, where they are often afterwards connected, etc.), or in the middle of the same (*Didelphis*, *Halmaturus*), or near the elbow (*Homo*, *Felis*). Sometimes the brachialis, oftener the ulnaris (in very many apes, marsupials, many rodents), passes through the foramen supracondyloideum humori.

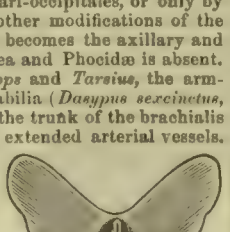

FIG. 29. *Cteodora.*

The aorta thoracica of most Mammalia is peculiar in not giving off immediately the intercostales. In *Mustela* there springs from it at the extremity of the chest a trunk (which divides into two vertebrales), from which the arteriæ intercostales issue. In the Delphinidæ there are two descending arteriæ thoracicæ internæ (or mammariæ internæ), which arise, the left from the arcus aortæ, the right from the innominata dextra, which give off the five anterior intercostales. Here also descends from the aorta thoracica a single trunk, which communicates by branches with the arterial network of the thorax and of the vertebral canal. The intercostales pass through this enormous thoracic rete mirabile, which connects with those of the vertebral canal and the base of the skull. The branches of the aorta abdominalis are usually the phrenicæ inferiores, suprarenales, renales, spermaticæ internæ, lumbales, the cœliaca, the mesenterica superior, and the mesenterica inferior. The cœliaca and mesenterica superior are one stem in *Cavia cobaya*, or originate as one and soon divide (*Talpa* and *Vespertilio murinus*), or originate separately, but connect by strong anastomoses (*Phocæna*). The mesenterica inferior often is trifling, in Marsupialia and Monotremata wanting. Certain twigs of it, forming retia mirabilia, occur in *Sus*; in the same genus is a rete on the stomach from the coronaria ventralis sinestra. Branches for the transversalis and oblique muscles for the psoas, etc., leave the aorta abdominalis. The arteriæ iliacæ communes (so called) seldom are homologous with those of man. In Cetacea they correspond generally with the hypogastricæ. They give off the epigastricæ, which otherwise come from the crurales. In most Mammalia they are homologous with the crurales, since not from them, but from a continuation of the aorta, are given off the hypogastricæ, or at least vessels which rise in *Homo* from the hypogastricæ. So in Monotremata and marsupials the ischiadicæ, and in many others the sacræ laterales, spring in pairs from the aorta beyond the iliacæ communes. In some, with strong skin-muscle or skin-system, from the crurales arise large musculo-cutaneæ, which anastomose with similar descending branches of the axillares (*Erinaceus*). The division of the cruralis is higher or deeper than in *Homo*. In the posterior extremity of the Phocidæ, in many Edentata, and *Stenops* are retia mirabilia, which are weaker than those of the upper extremity, and the sacra media is a continuation of the aorta; larger in large-tailed animals, running in an inferior vertebral canal, often forming retia (*Stenops*, *Bradypus*, *Myrmecophaga*). In *Phocæna* it passes through retia; sometimes weak (in *Erinaceus*, *Lepus*, ruminants, often in Solipedia). There is none in *Manatus australis*, where the aorta forms two hypogastricæ, which lose themselves in two huge retia subvertebralia.

FIG. 30. *Octopus vulgaris.*

X. THE RESPIRATORY SYSTEM.

Apparatus for oxygenizing a circulating fluid is wanting in Protozoa and Cœlenterata. In the other branches its type varies so that a number of distinct systems must be recognized, which are adaptations of as many distinct regions of the body for the purpose of respiration. These may be reckoned as follows:

1. The external pore-system of the Echinodermata.
2. The system of diverticula from the alimentary canal of the Holothurida-Dendropneumones and of most Vertebrata.
3. The gill-system of Mollusca and Crustacea.
4. The tracheary system of terrestrial Arthropoda.
5. The pharyngeal gill-system of Ascidia, fishes, and Batrachia.

It will, however, be convenient to divide the subject first between the Invertebrata and Vertebrata.

1. *In Invertebrata.*—The wall of the body of the Echinida and Asteroida is pierced with a great number of pores, which terminate in blind sacs and are filled with water. In all echinoderms the cavity of the body is filled with water, by which blood is oxygenized. It enters through perforated plates (laminæ cribrosæ) situated in the angles of the arms in the Asteriida, but the orifices which admit it into the body of the Holothurida are not certainly known. In the latter class singular organs called the "slipper-shaped bodies" depend freely from the viscera; their hollow stems are said to contain a blood-vessel; the extremity is like the open end of a short slipper.

The Holothurida-Dendropneumones possess an extensive system of branching blind tubes, which form a mass extending throughout the body. They form two bodies, one on each side of the rectum, and open into the latter near the anus: from it they are filled with water. In some Asteriida (*Petraster militaris*) five radiating tubes, the one for each arm, issue from the rectum, and are filled and emptied of water from it.

In Polyzoa (Bryozoa) and Brachiopoda we have a somewhat similar arrangement of branchiæ. In the former they form a double crest of tentacular fringes round the mouth; they are hollow, and the circulatory fluid moves through them, as elsewhere in the body-cavity, by ciliary movements on its walls. In Brachiopoda, as already stated, there are well-developed arteries. The gills are situated as fringes on straighter and shorter or longer and spirally-coiled arms within the shell, one on each side of the mouth. Their position is somewhat like that in the Polyzoa when retracted. In hingeless Brachiopoda the calcareous arms are wanting, but here the gill-supports are cartilaginous. In Lingula the inner surface of the mantle is furnished with folds and crests, which are supposed to aid respiration. In the Acephala the arrangement is totally different. The gills are curtain- or sheet-like (whence the name of this class, Lamellibranchiata), and hang two from each side of the body within the mantle. Sometimes their margins are free (many Monomyaria, Mytilidæ, Arcidæ, *Lithodomus*, *Cyclas*, etc.): in others immediately united (Veneridæ, *Mactra*, *Donax*, Unionidæ, Pholadidæ, etc.), or are connected by an intervening membrane (Solenidæ, *Cardium*, etc.). The union of the pairs of margins encloses two chambers, one within the other. Each gill-lamella consists of two layers, which enclose tubes and other cavities between them.

Sometimes the outer gill lacks one layer, or sometimes the whole gill is wanting (*Lucina*, *Corbis*, etc.). In others its outer lamina is truncated above, so as to expose the ends of the cavities it embraces. The lamellæ of the opposite side are symmetrical, or not in accordance with the relations of the shell valves.

The branchial structure in Gasteropoda presents many varieties. In the division Opisthobranchia the branchiæ and auricles lie behind the ventricle of the heart: in Prosobranchia the relative positions are reversed. In the former

FIG. 31. 1, *Brachiella*. 2, *Dichelesthium*. 3, *Cyclops*.

the branchiæ are variously extended processes of the dorsal integument of the body, each of which is supplied with an artery. In the lowest group, the Dermatobranchia, these branchiæ are wanting, and the arteries are distributed for blood aëration beneath the dorsal integument. In the Placobranchia they are represented by lateral wing-like expansions of the integument, which may fold over the body. In numerous types the processes are distributed over the body in thread, prism, leaf, and other forms. These are the Ceratobranchia; many of the processes contain liver-cells. In the Polybranchia the processes are arranged along the back, and are branched or forked, and sometimes of diverse forms on the same animal. Other families, as Doridiдæ, have a rosette of branchiæ round the arms only. All the preceding groups form the "naked-gilled" primary division, Nudibranchia. In the remainder of the sub-class the gills are concealed by the edge of the mantle, forming the Tectibranchia. The least specialized of these (Hypobranchia) have symmetrically arranged fringes round the edge of the body, with but few interruptions; while in the higher division, Pleurobranchia, the fringe exists on one side only. The fringe becomes more localized and drawn under the mantle as the size of the shell increases in the succession of genera. Especially in *Bulla*, where the shell is large, the gill is drawn beneath the mantle, and concealed by the upturned margin of the foot.

In Prosobranchia the gill or mantle-sac is generally well defined. It consists of a chamber bounded within by the body-wall and above by the mantle, which also closes it laterally by adhesion to the body-wall. The gills and excretory orifices of the digestive, urinary, and genital systems are seen on its walls. There is generally a single gill, shaped like a half feather, and with two dependent (in *Paludina* three) laminæ of transparent membrane. In many genera there is a rudiment of a second, while in a few the latter is well developed. The orifice of the mantle-sac is on the left side, and can be closed by a sphincter muscle. The mantle is originally composed of lateral halves, which are not always completely united; their separation at the margin produces the deep fissure in the shell of *Pleurotoma*, and divisions higher up correspond to the holes in the shell of *Haliotis*. In the latter genus there are two gill-sacs and two gills, and in others two gills. In some a thickened rib marks the halves of the mantle, and the two gills are placed closed together on it, so as to appear as one. In Patellidæ and Chitonidæ there is no distinct gill-sac, the branchiæ being marginal fringes, as in many Opisthobranchia. In the Pulmonata the mantle-sac does not contain any gills; it has an opening on the right side of the body, produced by a fissure in the mantle margin, which is closed by a sphincter muscle. This orifice opens and shuts regularly for the admission of air. The mantle-sac becomes a lung by the distribution of the venous trunks and branches over its surface. An extensive ring-like trunk (circulus pulmonalis) surrounds its margin, from which vessels converge towards the centre, forming a network which gathers itself again into a few, then a single trunk, the vena pulmonalis, which empties into the auricle of the heart.

In Cephalopoda the mantle is free, and encloses a cavity on the abdominal, instead of, as heretofore, the dorsal face of the body, agreeing in this respect with the Pteropoda. The cavity contains two branchiæ in the greater number of genera (Dibranchiata), or two in *Nautilus* and probably its extinct allies, the Ammonitidæ, etc. These constitute the sub-class Tetrabranchiata. The gills are elongate, triangular, feather shaped bodies, whose axis bears on one side the artery, on the other the vein. In Dibranchiata it bears a row of bows on each side, in which a blood vessel passes from artery to vein. On each of these stand bipinnate processes, so that the whole becomes tripinnate. The arch bounds a membrane in the decapod division, but in the Octopoda the loop is not closed. In Tetrabranchiata the first branches of the gill are leaf-like, with pinnate, leaf-like subdivisions. They are free in the mantle-sac; those of the dibranchiates are attached to the mantle.

In all Crustacea except the Decapoda the gills consist of fringes and expansions of the limbs. In the latter they are regular feather-shaped bodies, arranged within an abdominal cavity above the limbs; the bases form a curved line and the apices are directed inward. The tracheary system prevails in all other Arthropoda. It consists of a great number of tubes, which communicate with the air by means of small orifices or stigmata. These pierce the walls of the segments, usually one on each side, where they are present. They subdivide to a great extent internally, and penetrate all the organs of the body. There are marked varieties of this structure. Instead of issuing by stigmata, the trachea may be produced into a leaf-shaped process which arises from the usual position of the stigma, and may there ramify extensively within the lamella, constituting a trachean gill. This occurs in the larvæ of many Neuroptera. The walls of the tracheæ are elastic, yet firmly bound by a spiral thread, whose close volutions form an interior layer of the tube-wall. In other localities it is wanting, and the tube expands sac-like. In some insects these exist near the stigmata. In the Arachnida (except the group of low forms, the *Trachearia*) this sac-like structure only exists as a large pulmonary chamber, with single stigma, situated on the anterior part of the abdomen on each side.

In insects the stigmata rarely exceed nine or ten pairs; in Myriopoda they are far more numerous. In the Acarina there are but two. In insects they usually have a valve, which opens externally to prevent the entrance of foreign bodies; in some forms they project in laminæ, branched, pinnate, or botryoidal. In the larvæ of many Phryganeidæ and some Lepidoptera the trachea-gills are arranged in six rows along the back. In the larvæ of *Libellula* and *Æschna* they are attached to the inner wall of the rectum.

In ascidian Mollusca there are no free or pinniform gills. There is, on the contrary, a large pharyngeal cavity, which lies between the mouth and the digestive system proper, the alimentary canal both issuing from and discharging into its cavity in many cases. In others it discharges at the side. The pharynx may occupy a small part of the whole length of the cavity of the body; in the latter case the other organs are pushed to one side of it (*Boltenia*, *e.g.*). The mouth and other parts are frequently furnished with cilia. The gills consist of a sac whose walls are abundantly pierced by holes of different forms in the different groups, or it is reduced to a band of such structure only.

2. *In Vertebrata.*—In the Leptocardii there is a large pharyngeal cavity, with a large open mouth whose border is supported by a cartilage. This gives out branches which are the axes of abundantly ciliated tentacles which sur-

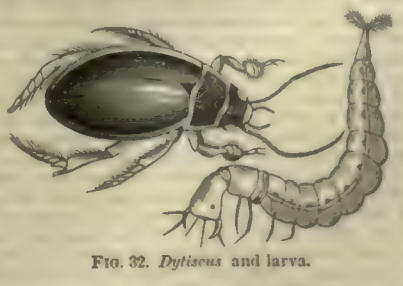

FIG. 32. *Dytiscus* and larva.

round the mouth. On the sides of the pharynx are numerous fissures, which communicate with the outer medium. In the Dermopteri the respiratory organs consist of a series of sacs on each side (which number seven to ten), on whose septary walls the arteries and veins are distributed. In some genera these communicate internally with the pharynx or œsophagus; in the lamprey, on the other hand, with a blind tube which lies beneath the œsophagus and empties into the pharynx. Each sac opens externally by a slit. In Elasmobranchi-Plagiostomi (sharks, rays) the arrangement

is similar, the slits numbering five, rarely six and seven, and communicating with the œsophagus. The septary walls are double, and contain a cartilaginous arch with radii, which elevate the walls into transverse ridges. A trace of the first embryonic external fissure remains in this order as a spiracle or tube from the pharynx to the sides of the top of the head behind the eyes. In Holocephali (*Chimæra*) the external slits are concealed by an opercular flap, which produces the appearance of a single slit. In Actinopteri the hyoid respiratory system is fully developed. The arches support, instead of sac-septa, radiating fringe-like laminæ, which receive the branches of the branchial artery and vein. The fissures are only those between the arches, which are covered externally by an osseous "operculum" or lid. The number of branchiæ is usually four and a half, but in some Pediculati there are but three, in some eels but two. In *Lepidosiren* there is but one. While the processes are usually narrow, lamellar, in Lophobranchii they are subcylindric and branched, each one forming thus a tuft; their number is also reduced.

Besides these fringes there are in some Dipnoi and some Batrachia (Trachystomata, Proteida), and in the larvæ of many salamanders, cartilaginous processes of the arches which bear a double row of fringes, forming the external gills.

The true pulmonary system consists of ducts and chambers, which originate from the alimentary canal, and are connected with it or the pharynx. It is not found in any Vertebrata below the Actinopteri. On the other hand, the hyoid respiratory organs do not exist above the Batrachia. In Actinopteri the pulmonary system consists of a sac with walls either thin and semi-transparent, or rarely thicker and lined with muscular meshes or a few cells (*Lepidosteus, Dipnoi*, etc.). In Physostomi it is connected with the stomach or œsophagus by a tube, the ductus pneumaticus; in *Lepidosteus* the latter enters the œsophagus on the upper side; in *Polypterus* on the under side of the same. In Physoclysti this sac is entirely isolated. Its function is that of a float, and it is hence called the swim-bladder. It usually forms a single chamber, but in Cyprinidæ, Characinidæ, and Sternopygidæ, it is divided by narrow constrictions into two, sometimes into three, chambers. In Cobitidæ and some Siluridæ (*Clarias, Gasterobranchus, Ageniosus*, and *Saccobranchus*) the anterior part, or the whole of it, is enclosed in an osseous case. In Gadidæ the diapophyses are expanded and adherent to it; in Campostoma it is suspended in the abdominal cavity, and surrounded by the spirally coiled intestine. It is furcate, and sometimes branched posteriorly, in Sciænidæ. In Nematognathi and Plectospondyli it is immediately connected with the auditory organs by a chain of small bones, which are supported on the sides of the anterior vertebræ. Besides *Lepidosteus* and *Amia*, the genera *Platystoma* (Nematognathi) and *Chirocentrus* (Isospondyli) possess cellular layers on the inner side of the swim-bladder. In *Lepidosiren* only among fishes is the swim-bladder deeply divided longitudinally, its halves being homologous with lungs. They are cellular within, and lie above the alimentary canal next the vertebral column. They unite, and passing round the œsophagus enter it below by a glottis with small cartilage. In *Saccobranchus* a sac extends on each side above the ribs from the pharyngeal cavity, which is designed to contain water to supply the gills during drought.

In Batrachia we have a further development of the structure seen in *Lepidosiren*. Here the sacs are separate, being connected by the branches of the tube or trachea which leads to the œsophagus. The sacs, now lungs, are occupied by a central longitudinal cavity and a thick layer of cells round the walls. The trachea from this order upward consists of cartilaginous rings, partly or completely closed, which are modified at the glottis into a vocal organ. This consists of a number of segments, the uppermost of which support two parallel tendinous plates (chordæ vocales), whose edges are separated by a slit-like opening, which is opened or contracted by their relaxation or tension. The trachea is longer in reptiles and other vertebrates than in Batrachia, and its inferior branches are called bronchiæ. In all, the œsophagus passes above the lungs, and the stomach is behind them. The interior of the lung continues as a sac in reptiles, being especially elongate and thin-walled posteriorly in serpents. In these animals one of the lung-sacs is nearly always wanting or rudimental. In birds and Mammalia the central cavity is only represented by the bronchi and their branches, the cells occupying the remaining space. In Aves the bronchi are each dilated into a chamber, which is furnished with muscles for altering its form. These are most fully developed in singing-birds, of whose musical faculties they are the organ.

XI. The Urogenital System.

1. *In Invertebrates.—The Reproductive System.*—In the lowest forms of life reproductive organs are only periodical appearances, and their sexuality can only be determined by microscopic examination of their products. In most Echinodermata the organs are permanent, but it is not till we reach Mollusca with a head, that the organs of the sexes essentially differ. A usual mode of reproduction in Protozoa and Cœlenterata is by budding and by fission. The production of ova is a higher form of the budding process, the result being a germ of a new generation, which may or may not require the offices of opposite sexual cells for their further development. Examples of full development of the female element alone (agamogenesis) are known in animals as high in the series as insects. In the Mollusca the two sexual elements, ova and spermatozoöids, are constantly produced, even in hermaphrodites, although they may be the products of the same glandular follicles, as in Gasteropoda-Opisthobranchia and Pulmonata, and in Pteropoda.

The following table exhibits the relations of the classes as far as the Vermes:

I. *No Urinary Apparatus.*

♂♀ organs identical.

Radiata.

* No permanent generative organs.

Polypi. Either androgynous on each mesenterial fold, or the fold monœcious, or rarely the animals diœcious; spermatozoa or eggs in sacs, which are in band-like mass on sides of mesenterial folds.

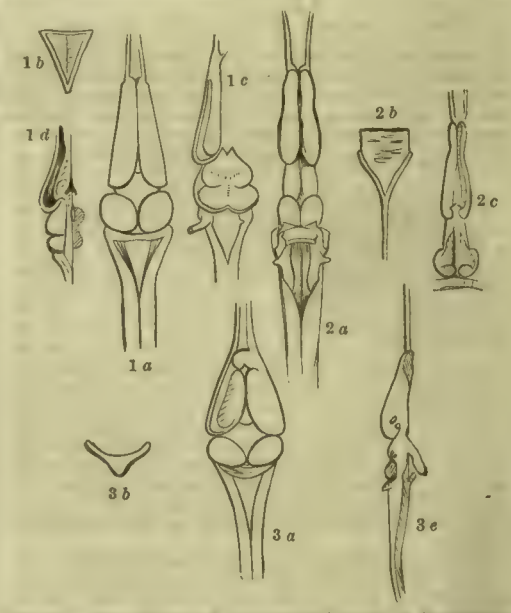

Fig. 33. 1. *Rana esculenta.* 2. *Dactylethra Capensis.* 3. *Bufo viridis.*
a, brain from above; *b*, choroid plexus; *c*, horizontal section of the lobes and hemispheres; *d*, of hemisphere; *e*, longitudinal vertical section.

Hydræ. Androgynous; the eggs single in a lower sprout, spermatozoa in a higher sprout; no permanent organs.

Medusæ. Diœcious; eggs and spermatozoa developed in large cells or bladders, which are attached to stomach, water-canals, mouth, feet, border, etc., etc.

Ctenophora. Androgynous and monœcious; capsules of both kinds in combined or separate bands on radial water-canals; sometimes on central canal or stomach, emerging by same canals.

Crinoidea. Comatula; sacs on swollen bases of pinnules monœciously containing eggs or spermatozoa without tails. (By one observation sometimes androgynous.)

** Permanent organs.

Asteriida. One or many blind sacs each side of septum (which terminates between arms near or far off); sometimes found to reach the end of the arm; much subdivided; orifice of emission through lamina cribrosa in some Asteriadæ; into the body-cavity in others and in Ophiuridæ; all androgynous, with very few diœcious exceptions; in some not known.

Echinida. Diœcious; five (ever less?) sacs or masses of saclets, each opening by narrow duct through separate openings (sometimes four or three) near vent, and lying near together, reaching to middle of shell; males white colored, yellow, red, etc.

Holothuriida. Bunch of few or many tubes embracing œsophagus, and opening on median dorsal line; diœcious, or in *Synapta* and *Apneumona* androgynous: the spermatozoa in projecting masses of walls of ovary-tube.

Mollusca.

* Generative organs not always permanent.

Bryozoa. Androgynous; ♂ organs round body below stomach on a string, with many cells, containing spermatozoa; ♀ with very few ripe ova behind stomach, also on a string; spermatozoa bursting into body-cavity, and reaching ovary; ova break through outer wall or a posterior orifice.

Tunicata. Androgynous; some doubtful, some of same species diœcious, others androgynous; testes and ovary separate, both emptying into cloaca separately; ovary usually with but one egg; organs slightly different in appearance.

** Always permanent.

Brachiopoda. Androgynous; a thick branching glandular body following pallial or generative artery filled with ovary-cells, and surrounded and penetrated by a reddish cell containing male element; discharging near mouth from a large, much-plicate, trumpet-mouthed oviduct, which is not continuous with genital mass.

II. *Urinary Organs Present (Bojanus' Glands).*

A. ♀♂ organs identical, permanent.

Acephala. ♀ and ♂ organs not different, of minute cells gathered in more or less compressed masses, which form main mass, or more simple along central tube or duct, which passes through Bojanus' body or unites with duct of latter, or has opening near latter; spermatozoa in *Dimyaria* long-headed and round-headed; in *Monomya* round only; diœcious, except a *Pecten* or *Cardium*, etc., and hermaphrodite individuals of *Anodonta*. In Unionidæ sexes externally different; gills serve as brood-sac. Androgynous; genera *Ostrea, Cyclas, Pandora, Pecten*, etc.

AA. ♂ organs distinguished by penis or stylet.

a. Animals hermaphrodite.

Gasteropoda-Opisthobranchia. Spermatozoöids and ova produced by the same glandular body (with few exceptions).

Pulmonata. An oviduct with abdomen gland and seminal receptacle; a vas deferens terminating in penis; a stylet-sac with stylet, all emptying into a common cloaca.

Pteropoda. Similar to the last, but no distinct vas deferens, and no stylet; penis usually separate from and in front of vagina.

aa. Sexes distinct.

Gasteropoda in general. Penis behind the right eye; ovary and testis embedded in the liver; oviduct frequently enlarged into a uterus, issuing on the right side; rarely an albumen gland or receptaculum seminis; no stylet.

Cephalopoda. ♀ with ovary enclosed in a peritoneal sac, and with two (sometimes one) oviducts continuous; ♂ without stylet; with a vas deferens and so-called seminal vesicle and prostata near the penis.

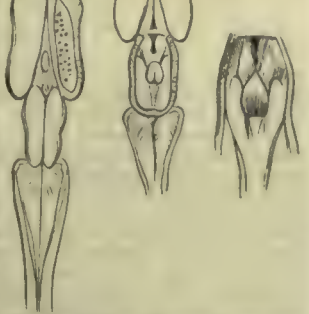

Fig. 34. Brain of *Necturus maculatus.*

The preceding structures present in their details the greatest variety. The generative organs are situated on the right side of the body, but the exits are in some groups on the opposite side, and usually (the female at least) in the mantle-sac. Their inner walls are lined with ciliated epithelium. The stylet is a slender, acute calcareous body of various form, which is inserted into the vagina or body of the other individual in coitus. Its function is supposed to be that of an irritant only.

The males of Cephalopoda are more readily distinguished from the females than in Gasteropoda, being generally smaller. In *Argonauta* the female only bears the shell. But the chief peculiarity of the male is seen in the modified structure of one of the arms, by which it is said to be "hectocotylized." It differs from other arms in being stouter and entirely hollow, terminating in a hollow thread which is open at the extremity, giving exit to the contents. It is developed in a bladder on its inner wall, and is first closely rolled together; the thread bears a bladder which is later lost. The primary bladder finally bursts, its remains forming a fringing membrane on the sides. At the period of impregnation its cavity becomes, in some way unknown, filled with spermatozoöids. During an embrace it is torn off, and enters the mantle-sac of the female. It swims independently as a worm, and several are sometimes found in one female. The spermatozoöids are supposed to be discharged into the vagina by the hollow thread.

Many opisthobranchs are self-impregnating. Pulmonata impregnate each other, while in *Lymnæa* an individual impregnates a second, and is impregnated by a third, forming thus a chain of individuals.

In Arthropoda the sexes are always in separate individuals (diœcious), excepting in the lowest Crustacea (Cirripedia) and the lowest Arachnida (Tardigrada). These orders are either sessile or with but little power of movement; hence the appropriateness of their monœcious condition. The sexes of Arthropoda are generally distinguishable by external characters, but it is in the Insecta and Entomostraca (Lernæoida) that this difference becomes most remarkable. Thus in Hymenoptera (bees and ants) and Neuroptera (termites) not only are the sexes very distinct, but there are other forms (neuters, workers, soldiers, etc.) produced in connection with imperfect development of the reproductive organs. In the bees and wasps the additional forms are repressed males; in ants, repressed females. In termites it is asserted that both sexes contribute to produce them.

The external orifices of the reproductive system are confined to the abdomen, and are below and before the vent of the alimentary canal. In most orders they are posterior, but in Myriopoda, scorpions, and some higher Crustacea they are in front of the abdomen. The female internal organs consist of ovary and oviduct on each side, or the two oviducts may unite into one on the middle line, or there may be a single median ovary. On the oviduct are usually found diverticula, the receptaculum seminis (which is wanting in Crustacea, except *Ostracoda*) and another sac of uncertain use. The lower part of the oviduct is enlarged and the muscular walls are thick, forming a vagina, which often continues past the proximal part of the oviduct as bursa copulatrix. The ovaries consist of cæca of varying forms. In Crustacea, Arachnida, and Myriopoda they are few in number, but in Insecta they are very numerous, forming a gland-like body whose component cæca are bound together by connective tissue. In Termes their number reaches 2000 to 3000. Other glands (glandulæ sebaceæ) pour their contents into the oviducts, which serve many important purposes—*i. e.*, to attach the eggs to a solid base (*arilus*) or to the parent's body; to construct a shell (*Blatta*) or cocoon. In certain low Crustacea (Lernæoida, Isopoda, etc.) these glands open outwardly independently of the oviducts, and the secretion forms a sac round the eggs, by which they are suspended externally. The last abdominal segments in many insects are modified into organs designed for the conduct of eggs to a proper nidus; thus, in Orthoptera it is composed of sabre-shaped plates with saws within; in Hymenoptera it is partly represented by an offensive weapon, the sting. In Chrysididæ, Dipters, and Phalangia and *Acari* they are modified into a tube which is projected telescope-fashion.

The male organs of Arthropoda consist of testes, vasa deferentia, glands, vesiculi seminales, and penis. The testes resemble the ovaries of the female in structure and position, but are frequently less complex. They are more commonly also united on the median line, as in low Crustacea (Cyclopidæ, Cyprididæ, Myriopoda), and among Insecta in Lepidoptera, many Hymenoptera, Orthoptera, etc. The vasa deferentia on the other hand remain distinct in these cases, except in Scolopendra and various Entomostraca. In many Crustacea and chilognath Myriopoda the vasa deferentia issue externally separately, but in many others unite to form a ductus ejaculatorius, which is enlarged in diameter. The muscles of this region are especially developed where a penis is well developed. Glandulæ mucosæ discharge into these ducts in insects and myriopods, but are wanting or rare in Crustacea and Arachnida. They are sometimes sac-like, sometimes filiform. They secrete a substance which hardens round a body of seminal secretions, forming a capsule which is usually taken into the female vagina, but may be attached to the body externally, or even (Chilopoda) to external objects.

The penis is present in most Arthropoda, but is wanting in Entomostraca, Chilopoda, and scorpions. In Crustacea, Brachyura, and Isopoda, etc., it is double. In all cases it is composed of a modified pair of limbs, which is especially clear in crabs. The intromittent organ is occasionally far removed from the orifice of the vasa deferentia. In spiders (Aranea) the extremity of the palpus bears a receptaculum seminis and penis, which the animal fills voluntarily by application to the external orifice, and discharges in the oviduct of the female. In *Argulus* a similar mode of connec-

tion depends on the structure of one of the legs, and in chilognath Myriopoda a pair of legs is altered for a similar purpose. In certain tailed Decapoda there are two pairs of such organs, those on the last segment of the post-abdomen serving as conductors from receptacles in the fifth pair of legs. In dragon-flies the exceptional case occurs where the accessory organ is a fissure in the second abdominal segment.

In Vermes the type of the reproductive system presents the varieties seen in Mollusca. Thus, they are androgynous, monœcious, and diœcious. Many of them develop by an alternation of generation, the one produced by true reproduction, the other stages by gemmation. In Turbellaria (or planarians) the Dendrocœla are bi-sexual, but the Rhabdocœla possess a common outlet for the two organs, testis and ovarium. Trematodes (flukes) are monœcious, each animal possessing distinct sexual organs of both kinds. The developmental stages of the young vary from three to six, and all but the first of these are due to gemmation in the cavity of preceding stages, or metamorphosis while encysted, etc. In tape-worms (Cestodes) the animal is made up of a head with organs of attachment, which, posterior to a long neck, is followed by a great number of identical segments. These contain each male and female organs, and a water-vascular system. The ovary and testis are at opposite ends of the segment, and between them is the branched uterus. This terminates in a vagina, which is approximated by a sheath containing a penis, which is perforated by the vas deferens. There are glands attached to the female organs. Each segment of a cestode is then self-impregnating. In Acanthocephala and Nematoda we have the higher condition of an entire separation of the sexes. In the former there is a penis which is retracted in a bursa which is prehensile in function. In this order there are alternate generations produced by gemmation in the body of the nurse stage. In Nematodes many genera (Strongyliidæ, Ascaridæ, and Filariidæ) are furnished with a penis and bursa at its base. In the last family *Trichocephalus* has a bristle-like penis, one-third the length of the body, which, when projected, is accompanied by an extended sheath. In Ascaridæ the penes or "spicula" are two in number. In *Sclerostomum* (gape-worm) the male is much smaller than the female, and becomes attached to her permanently. In *Heterura* he remains attached for considerable periods. Cucullanidæ are without bursa. In *Anguillula* and other genera there are two oviducts, which unite to form a single vagina.

aa. The Urinary Organs.—These are present in Mollusca from the Acephala upward. In the latter they are represented by a pair of kidneys and their discharge ducts only. These are called "Bojanus' organs;" they are relatively of large size, and lie one on each side above the heart, etc., extending from muscle to muscle. They are frequently united together along the middle line. They are hollow and spongy, and their fibres are lined with secreting cells. They terminate either by a single duct near that of the reproductive system, or unite with the latter, or the genital duct enters that of Bojanus' bodies. These bodies have communication with the external water, and by a cribriform surface with the heart-sac; likewise with the capillary veins. The function of the organs is not only that of a kidney, but as a mingler of water with the blood.

In Gasteropoda the kidney is single and contains calcareous nodules; its secretion is purple in *Murex;* it is large and hollow, and contains water. It is surrounded by a network of veins, which frequently open into it, so that blood-corpuscles are found in it, as well as its products in the blood. It usually opens directly into the mantle-sac, but otherwise by a ureter, and always independently of the rectum, vagina, or vas deferens.

The kidneys of Cephalopoda differ much from those of other classes, and for a long time their nature was considered doubtful. They form a large, rather loose mass on that part of the vena cava which approaches the gills, and on the gill-veins as well, consisting of a great number of minute sacs with bifurcations and internal processes. Each principal one opens by a fissure in the walls of the vein. They are constantly in motion.

In Arthropoda the existence of kidneys is a matter of question. The vasa Malpighii (described under the "Digestive System") are diverticula of the alimentary canal, and their function was formerly believed to be that of the liver. Gall has, however, never been found in them, but on the contrary uric acid. This has also been found in the intestine and in the corpus adiposum.

2. *In Vertebrata.*—*a. The Reproductive System.*—Vertebrates are usually diœcious, but a few fishes—viz., the eels and certain Serrani—are hermaphrodites. The organs of the female are primarily an ovary; an oviduct may or may not be present. Thus, in the Leptocardii the ovaries are collections of cells along the sides of the abdominal cavity, which drop their ova into it, which are discharged by an orifice anterior to the anus. In Dermopteri the structure is similar, except that the ovarian cells are collected into plate-like masses. In Elasmobranchii the ovaria are included in a peritoneal sac; occasionally, as in Squalidæ and Scylliidæ, there is but one, medial and symmetrical. The oviducts are here present, and are homologous with the tubæ Fallopii of mammals; each dilates into a uterus, and empties into a common uro-rectal cloaca. Their proximal ends are open and expanded, presenting the so-called fontanelles. In true fishes we have various structures: in the Salmonidæ and some Clupeidæ there are no oviducts, but the eggs fall into the abdominal cavity and are expelled through a pore. In most other fishes and in *Lepidosteus* the ovarian membrane is prolonged as an oviduct, and usually discharges externally without union with other canals; in *Lepidosteus* they enter the ureters. They are united in various Physoclysti. They are, as in Elasmobranchii, open as internal fontanelles in *Amia*, *Chondrosteï*, and *Polypterus;* in all they have a common external opening with the ureters.

In Batrachia the tubæ Fallopii are proximally open, and extend in many coils far in front of the ovaries. They are distally united with the ureters. In Reptilia, Aves, and Mammalia, the oviducts (or tubæ Fallopii) are not ordinarily connected with the ovaries, but only at certain seasons by their trumpet-shaped fontanelles. In birds these organs are not developed on one side of the body. In reptiles, birds, and monotrematous mammals, the genital, urinary, and digestive canals have a common exit or cloaca. In marsupials and placentals the genito-urinal excretory ducts are separated from the digestive, being in the female distinct or opening into a common vulva, but in the male are united for some length. In Mammalia the females are viviparous, and the ovum is hatched in expansions of the oviducts, or uteri. In marsupials these are separate, and the distal parts of the oviducts are not united into a vagina. In placental mammals, on the contrary, the oviducts unite, forming a single undivided vagina. In Edentata and Rodentia this union does not produce an expanded uterus, as the young are developed in the separate oviducts; but in higher mammals the enlarged oviducts unite into a muscular chamber, the uterus. A false uterus occurs in the kangaroos by the union of the cavities of the oviducts near the middle of their length; two opposite symmetrical curvatures are in contact, and their adjacent walls disappear; they then turn shortly back (forward in the animal) and make another short bend before they take a direction to the external orifice.

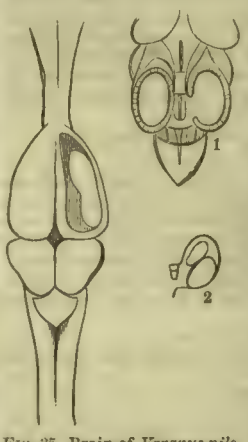

FIG. 35. Brain of *Varanus niloticus:* 1, horizontal section of optic lobes; 2, vertical section.

In placental mammals the embryo is attached to the wall of the uterus by a body called the placenta. It is on the allantois, and presents to the wall great numbers of villi, which interdigitate with corresponding processes from the mother. Both are furnished with abundant blood-vessels, which maintain intercommunication with each other, thus nourishing the embryo. As we descend the scale we only find a trace of this structure in some of the sharks. The allantois is an embryonic structure which characterizes exclusively vertebrates above and including Reptilia. The amnion is another sac, formed by the folding of the germinal layer of the embryo over its back; the edges of the folds then uniting, the two inner enclose the amniotic sac; the outer becomes the chorion. The amnion is absent, like the allantois, in all classes below Reptilia.

The placenta exhibits several distinct typal forms in Mammalia; it may be disciform or ring-like (zonary), or may be scattered in tufted bodies over the chorion (cotyledonary), or the villi may be scattered all over the same (diffuse). The orders of mammals may be thus arranged in this respect:

1. With decidua, placenta discoidal: Primates, Cheiroptera, Insectivora, Rodentia, Edentata (Orycteropidæ, Dasypidæ).

2. With decidua, zonary: Carnivora, Proboscidia, Hyracoidea.

3. Without decidua, cotyledonary: Perissodactyla, Artiodactyla, and Ruminantia, Edentata (Bradypidæ).

4. Diffuse: Artiodactyla-Omnivora, Cetacea, Edentata (Manidæ).

The male organs are, in the early stages of growth, as in the lower animals, undistinguishable in structure. They are generally homologous with the female in details, even when most distinct. The relation may be thus expressed:

♂	♀
Testis.	Ovary.
Vas deferens, Uterus masculinus.	Oviduct, Uterus.
Cowper's glands.	Cowper's glands.
Penis.	Clitoris.
Scrotum.	Labia majora.
Preputium.	Labia minora.

The vas deferens is, however, generally a persistent Wolffian duct, which in the embryo is the excretor of the embryonic bodies (Wolff's) which precede the kidneys. The Fallopian tube of higher mammals, on the other hand, is the persistent Müllerian duct, which passes outside of the former. In the batrachian Urodela the efferent ducts of the testis pass through the kidney and empty into a genito-urinary duct, while in Anura (except Discoglossidæ) they only pass through the edge of the kidney and discharge into the ureter.

Among reptiles the penis is present in the tortoises and crocodiles only, and in no lower forms; it is merely grooved beneath. In the ostrich it is quite similar. In the lower groups of birds it is present, but wanting in the more specialized; in Mammalia it is universal. It is composed of two superior bodies, the corpora cavernosa, originating from the pubis, and the corpus spongiosum, whose lower face embraces the urethral tube, and whose extremity forms the glans or head. The testes are almost universally situated near the kidneys, in the abdominal cavity, but in the higher mammals they descend from that position, and carrying a fold of the serous membrane (tunica vaginalis) and muscle

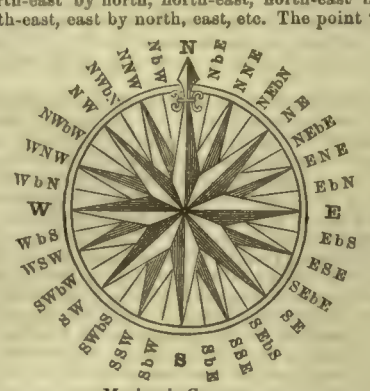
(cremaster), they are suspended externally, generally behind the penis; in Marsupialia in front of it. In some rodents and others this descent of the testes is periodical.

aa. Urinary organs.

Kidneys are present in the higher Vertebrata, inclusive of the Reptilia, but are supposed to be represented in Batrachia and fishes by structures which are embryonic in the former—*i. e.*, the Wolffian bodies. The latter consist of two bodies, one on each side of the vertebral column, and are composed of transverse tubuli terminating in expansions which embrace convoluted capillaries, the "Malpighian tufts." The Wolffian tubules empty in the Wolffian duct, which extends along their outer side, and empties in the embryo into the allantois. The kidneys appear later in embryonic life, behind the Wolffian bodies, and have a similar structure. They also discharge by a duct on each side, which is distinct from the Wolffian, and constitutes the ureter. This discharges at first into the allantois, but with the approach of the lateral walls in the embryo, and the closing of the ventral fissure, a portion of the allantois is included, and becomes the urinary bladder.

The Leptocardii are not known to possess either Wolffian bodies or kidneys. In the Pisces the connection of the ureters with the oviducts is various. Thus in *Polypterus* they unite and enter a single tube, the united ureters. In *Lepidosteus* each ureter receives its corresponding oviduct; in *Amia* the oviducts are open proximally. In Batrachia the ureters are always connected with the oviducts. In the tailed order the ureter becomes a genito-urinary duct, because it receives the vasa efferentia of the testis, which pass through the kidney to reach it; it empties into the cloaca. In the Anura the vasa efferentia enter the kidney, but do not reach the ureter, but are collected into a special duct analogous to the deferens, which enters the ureter at its lower part. This tube also receives the secretion of the kidneys, so that the original ureter becomes useless, and is atrophied in the frogs, or persists as a cæcum in the toads. In the discoglossid frogs the arrangement is as in the salamanders. In the allantoidal vertebrates the ureters discharge into the urinary bladder, which in turn empties by a single urethra, of greater or less length, into a genito-urinary chamber in the higher Mammalia, or the cloaca in the other classes. It is continued throughout the penis in those males that possess that organ. The kidneys in most Carnivora, in the Cetacea, and some Artiodactyla, are lobulate, or like a bunch of grapes in form, as is seen in the embryos of man and other mammals. In the cats (Felidæ) the divisions are not visible externally.

The osseous system will be discussed in an article especially devoted to that subject. EDWARD D. COPE.



Compar'ative Philol'ogy is that branch of the science of language which examines and classifies languages as undivided wholes—not, like etymology, tracing individual words through the various languages in which they occur, but comparing languages chiefly by the study of the general character of their vocabularies. It, however, does not confine itself to the mere collation of vocabularies and to the study of grammatical forms. By the study and comparison of literatures, of the literary history of nations, of popular traditions, mythologies and creeds, and of the dialectic variations of time or place, it seeks to discover the marks which integrate languages into groups, and which differentiate these groups from each other. It thus renders important services to the nearly related science of ethnology, since, with some limitations, kinship in language implies kinship in blood—a doctrine the truth of which is now generally admitted, though formerly opposed by eminent philologists.
